	24	Receive Flit Overrun	If 1, sender sent too many QPI flits to the receiver.
	25	Received Failed Response	If 1, indicates that sender sent a failed response to receiver.
	26	Receiver Clock Jitter	If 1, clock jitter detected in the internal QPI clocking.
	56:27	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:
1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

Table 18-9. Intel® QPI Machine Check Error Codes for IA32_MC0_MISC and IA32_MC1_MISC

Type	Bit No.	Bit Function	Bit Description
Model Specific Errors[1]	7:0	QPI Opcode	Message class and opcode from the packet with the error.
	13:8	RTID	QPI Request Transaction ID.
	15:14	Reserved	Reserved
	18:16	RHNID	QPI Requestor/Home Node ID.
	23:19	Reserved	Reserved
	24	IIB	QPI Interleave/Head Indication Bit.

NOTES:
1. Which of these fields are valid depends on the error type.

18.3.2 Internal Machine Check Errors

Table 18-10. Machine Check Error Codes for IA32_MC7_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	
Model Specific Errors	23:16	Reserved	Reserved
	31:24	Reserved, except for the following	00H: No error. 03H: Reset firmware did not complete. 08H: Received an invalid CMPD. 0AH: Invalid Power Management Request. 0DH: Invalid S-state transition. 11H: VID controller does not match POC controller selected. 1AH: MSID from POC does not match CPU MSID.
	56:32	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.3.3 Memory Controller Errors

Table 18-11. Incremental Memory Controller Error Codes of Machine Check for IA32_MC8_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Memory error format: 1MMMCCCC
Model Specific Errors	16	Read ECC Error	If 1, ECC occurred on a read.
	17	RAS ECC Error	If 1, ECC occurred on a scrub.
	18	Write Parity Error	If 1, bad parity on a write.
	19	Redundancy Loss	if 1, error in half of redundant memory.
	20	Reserved	Reserved
	21	Memory Range Error	If 1, memory access out of range.
	22	RTID Out of Range	If 1, Internal ID invalid.
	23	Address Parity Error	If 1, bad address parity.
	24	Byte Enable Parity Error	If 1, bad enable parity.
Other Information	37:25	Reserved	Reserved
	52:38	CORE_ERR_CNT	Corrected error count.
	56:53	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

Table 18-12. Incremental Memory Controller Error Codes of Machine Check for IA32_MC8_MISC

Type	Bit No.	Bit Function	Bit Description
Model Specific Errors[1]	7:0	RTID	Transaction Tracker ID.
	15:8	Reserved	Reserved
	17:16	DIMM	DIMM ID which received the error.
	19:18	Channel	Channel ID which received the error.
	31:20	Reserved	Reserved
	63:32	Syndrome	ECC Syndrome.

NOTES:
1. Which of these fields are valid depends on the error type.

18.4 INCREMENTAL DECODING INFORMATION: INTEL® XEON® PROCESSOR E5 FAMILY, MACHINE ERROR CODES FOR MACHINE CHECK

Table 18-13 through Table 18-15 provide information for interpreting additional model-specific fields for memory controller errors relating to the Intel® Xeon® processor E5 Family with CPUID DisplayFamily_DisplaySignature 06_2DH, which supports Intel QuickPath Interconnect links. Incremental MC error codes related to the Intel QPI links are reported in the register banks IA32_MC6 and IA32_MC7, incremental error codes for internal machine check error from PCU controller are reported in the register bank IA32_MC4, and incremental error codes for the memory controller unit are reported in the register banks IA32_MC8—IA32_MC11.

18.4.1 Internal Machine Check Errors

Table 18-13. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	
Model Specific Errors	19:16	Reserved, except for the following	0000b: No Error 0001b: Non_IMem_Sel 0010b: I_Parity_Error 0011b: Bad_OpCode 0100b: I_Stack_Underflow 0101b: I_Stack_Overflow 0110b: D_Stack_Underflow 0111b: D_Stack_Overflow 1000b: Non-DMem_Sel 1001b: D_Parity_Error

Type	Bit No.	Bit Function	Bit Description
	23:20	Reserved	Reserved
	31:24	Reserved, except for the following	00H: No Error 0DH: MC_IMC_FORCE_SR_S3_TIMEOUT 0EH: MC_CPD_UNCPD_ST_TIMEOUT 0FH: MC_PKGS_SAFE_WP_TIMEOUT 43H: MC_PECI_MAILBOX_QUIESCE_TIMEOUT 5CH: MC_MORE_THAN_ONE_LT_AGENT 60H: MC_INVALID_PKGS_REQ_PCH 61H: MC_INVALID_PKGS_REQ_QPI 62H: MC_INVALID_PKGS_RES_QPI 63H: MC_INVALID_PKGC_RES_PCH 64H: MC_INVALID_PKG_STATE_CONFIG 70H: MC_WATCHDG_TIMEOUT_PKGC_SECONDARY 71H: MC_WATCHDG_TIMEOUT_PKGC_MAIN 72H: MC_WATCHDG_TIMEOUT_PKGS_MAIN 7AH: MC_HA_FAILSTS_CHANGE_DETECTED 81H: MC_RECOVERABLE_DIE_THERMAL_TOO_HOT
	56:32	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:
1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.4.2 Intel® QPI Machine Check Errors

Table 18-14. Intel® QPI MC Error Codes for IA32_MC6_STATUS and IA32_MC7_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Bus error format: 1PPTRRRRIILL
Model Specific Errors	56:16	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:
1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.4.3 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the IA32_MC8_STATUS–IA32_MC11_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture." MSR_ERROR_CONTROL.[bit 1] can enable additional information logging of the IMC. The additional error information logged by the IMC is stored in the IA32_MCi_STATUS and IA32_MCi_MISC, where i = 8, 11.

Table 18-15. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 8, 11)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Bus error format: 1PPTRRRRIILL
Model Specific Errors	31:16	Reserved, except for the following	001H: Address parity error. 002H: HA Wrt buffer Data parity error. 004H: HA Wrt byte enable parity error. 008H: Corrected patrol scrub error. 010H: Uncorrected patrol scrub error. 020H: Corrected spare error. 040H: Uncorrected spare error.
	36:32	Other Info	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log first device error when corrected error is detected during normal read.
	37	Reserved	Reserved
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

Table 18-16. Intel IMC MC Error Codes for IA32_MCi_MISC (i= 8, 11)

Type	Bit No.	Bit Function	Bit Description
MCA Addr Info[1]	8:0		See Chapter 17, "Machine-Check Architecture."
Model Specific Errors	13:9		▪ When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log second device error when corrected error is detected during normal read. ▪ Otherwise, contains parity error if MCi_Status indicates HA_WB_Data or HA_W_BE parity error.
	29:14	ErrMask_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log first-device error bit mask.
	45:30	ErrMask_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log second-device error bit mask.
	50:46	FailRank_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log first-device error failing rank.
	55:51	FailRank_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log second-device error failing rank.
	58:56	Reserved	Reserved
	61:59	Reserved	Reserved
	62	Valid_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, indicates the iMC has logged valid data from the first correctable error in a memory device.
	63	Valid_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, indicates the iMC has logged valid data due to a second correctable error in a memory device. Use this information only after there is valid first error information indicated by bit 62.

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.5 INCREMENTAL DECODING INFORMATION: INTEL® XEON® PROCESSOR E5 V2 AND INTEL® XEON® PROCESSOR E7 V2 FAMILIES, MACHINE ERROR CODES FOR MACHINE CHECK

The Intel® Xeon® processor E5 v2 family and the Intel® Xeon® processor E7 v2 family are based on the Ivy Bridge-EP microarchitecture and can be identified with CPUID DisplayFamily_DisplaySignature 06_3EH. Incremental error codes for internal machine check error from the PCU controller is reported in the register bank IA32_MC4; Table 18-17 lists model-specific fields to interpret error codes applicable to IA32_MC4_STATUS. Incremental MC error codes related to the Intel QPI links are reported in the register bank IA32_MC5. Information listed in Table 18-14 for QPI MC error codes apply to IA32_MC5_STATUS. Incremental error codes for the memory controller unit are reported in the register banks IA32_MC9—IA32_MC16. Table 18-18 lists model-specific error codes that apply to IA32_MCi_STATUS, where i = 9-16.

18.5.1 Internal Machine Check Errors

Table 18-17. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	
Model Specific Errors	19:16	Reserved, except for the following	0000b: No Error 0001b: Non_IMem_Sel 0010b: I_Parity_Error 0011b: Bad_OpCode 0100b: I_Stack_Underflow 0101b: I_Stack_Overflow 0110b: D_Stack_Underflow 0111b: D_Stack_Overflow 1000b: Non-DMem_Sel 1001b: D_Parity_Error
	23:20	Reserved	Reserved
	31:24	Reserved, except for the following	00H: No Error 0DH: MC_IMC_FORCE_SR_S3_TIMEOUT 0EH: MC_CPD_UNCPD_ST_TIMEOUT 0FH: MC_PKGS_SAFE_WP_TIMEOUT 43H: MC_PECI_MAILBOX_QUIESCE_TIMEOUT 44H: MC_CRITICAL_VR_FAILED 45H: MC_ICC_MAX-NOTSUPPORTED 5CH: MC_MORE_THAN_ONE_LT_AGENT 60H: MC_INVALID_PKGS_REQ_PCH 61H: MC_INVALID_PKGS_REQ_QPI 62H: MC_INVALID_PKGS_RES_QPI 63H: MC_INVALID_PKGC_RES_PCH 64H: MC_INVALID_PKG_STATE_CONFIG 70H: MC_WATCHDG_TIMEOUT_PKGC_SECONDARY 71H: MC_WATCHDG_TIMEOUT_PKGC_MAIN 72H: MC_WATCHDG_TIMEOUT_PKGS_MAIN

Table 18-17. Machine Check Error Codes for IA32_MC4_STATUS (Contd.)

Type	Bit No.	Bit Function	Bit Description
			7AH: MC_HA_FAILSTS_CHANGE_DETECTED 7BH: MC_PCIE_R2PCIE-RW_BLOCK_ACK_TIMEOUT 81H: MC_RECOVERABLE_DIE_THERMAL_TOO_HOT
	56:32	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.5.2 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the IA32_MC9_STATUS–IA32_MC16_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

MSR_ERROR_CONTROL.[bit 1] can enable additional information logging of the IMC. The additional error information logged by the IMC is stored in IA32_MCi_STATUS and IA32_MCi_MISC, where i = 9—16.

IA32_MCi_STATUS (i=9—12) logs errors from the first memory controller. The second memory controller logs errors into IA32_MCi_STATUS (i=13—16).

Table 18-18. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 9—16)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Memory Controller error format: 000F 0000 1MMM CCCC
Model Specific Errors	31:16	Reserved, except for the following	001H: Address parity error. 002H: HA Wrt buffer data parity error. 004H: HA Wrt byte enable parity error. 008H: Corrected patrol scrub error.
			010H: Uncorrected patrol scrub error. 020H: Corrected spare error. 040H: Uncorrected spare error. 080H: Corrected memory read error. (Only applicable with iMC's "Additional Error logging" Mode-1 enabled.) 100H - iMC, WDB, parity errors
	36:32	Other Info	When MSR_ERROR_CONTROL.[1] is set, logs an encoded value from the first error device.
	37	Reserved	Reserved
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

Table 18-19. Intel IMC MC Error Codes for IA32_MCi_MISC (i= 9—16)

Type	Bit No.	Bit Function	Bit Description
MCA Addr Info[1]	8:0		See Chapter 17, "Machine-Check Architecture."
Model Specific Errors	13:9		If the error logged is a MCWrDataPar error or a MCWrBEPar error, this field is the WDB ID that has the parity error; OR if the second error logged is a correctable read error, MC logs the second error device in this field.
	29:14	ErrMask_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log first-device error bit mask.
	45:30	ErrMask_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log second-device error bit mask.
	50:46	FailRank_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log first-device error failing rank.
	55:51	FailRank_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log second-device error failing rank.
	61:56		Reserved
	62	Valid_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, indicates the iMC has logged valid data from a correctable error from memory read associated with first error device.
	63	Valid_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, indicates the iMC has logged valid data due to a second correctable error in a memory device. Use this information only after there is valid first error info indicated by bit 62.

NOTES:
1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.5.3 Home Agent Machine Check Errors

Memory errors from the first memory controller may be logged in the IA32_MC7_{STATUS,ADDR,MISC} registers, while the second memory controller logs errors to the IA32_MC8_{STATUS,ADDR,MISC} registers.

18.6 INCREMENTAL DECODING INFORMATION: INTEL® XEON® PROCESSOR E5 V3 FAMILY, MACHINE ERROR CODES FOR MACHINE CHECK

The Intel® Xeon® processor E5 v3 family is based on the Haswell-E microarchitecture and can be identified with CPUID DisplayFamily_DisplaySignature 06_3FH. Incremental error codes for internal machine check errors from the PCU controller are reported in the register bank IA32_MC4. Table 18-20 lists model-specific fields to interpret error codes applicable to IA32_MC4_STATUS. Incremental MC error codes related to the Intel QPI links are reported in the register banks IA32_MC5, IA32_MC20, and IA32_MC21. Table 18-21 contains information for QPI MC error codes. Incremental error codes for the memory controller unit are reported in the register banks IA32_MC9—IA32_MC16. Table 18-22 lists model-specific error codes that apply to IA32_MCi_STATUS, where i = 9—16.

18.6.1 Internal Machine Check Errors

Table 18-20. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	
MCACOD[2]	15:0	Internal Errors	0402H: PCU internal errors. 0403H: PCU internal errors. 0406H: Intel TXT errors 0407H: Other UBOX internal errors. An IERR caused by a core 3-strike the IA32_MC3_STATUS (MLC) is copied to the IA32_MC4_STATUS. After a 3-strike, the core MCA banks will be unavailable.
Model Specific Errors	19:16	Reserved, except for the following	0000b: No error. 00xxb: PCU internal error.
	23:20	Reserved	Reserved
	31:24	Reserved, except for the following	00H: No Error 09H: MC_MESSAGE_CHANNEL_TIMEOUT 13H: MC_DMI_TRAINING_TIMEOUT 15H: MC_DMI_CPU_RESET_ACK_TIMEOUT 1EH: MC_VR_ICC_MAX_LT_FUSED_ICC_MAX 25H: MC_SVID_COMMAND_TIMEOUT 29H: MC_VR_VOUT_MAC_LT_FUSED_SVID 2BH: MC_PKGC_WATCHDOG_HANG_CBZ_DOWN 2CH: MC_PKGC_WATCHDOG_HANG_CBZ_UP 44H: MC_CRITICAL_VR_FAILED 46H: MC_VID_RAMP_DOWN_FAILED 49H: MC_SVID_WRITE_REG_VOUT_MAX_FAILED 4BH: MC_BOOT_VID_TIMEOUT; timeout setting boot VID for DRAM 0. 4FH: MC_SVID_COMMAND_ERROR 52H: MC_FIVR_CATAS_OVERVOL_FAULT 53H: MC_FIVR_CATAS_OVERCUR_FAULT 57H: MC_SVID_PKGC_REQUEST_FAILED 58H: MC_SVID_IMON_REQUEST_FAILED 59H: MC_SVID_ALERT_REQUEST_FAILED 62H: MC_INVALID_PKGS_RSP_QPI 64H: MC_INVALID_PKG_STATE_CONFIG 67H: MC_HA_IMC_RW_BLOCK_ACK_TIMEOUT 6AH: MC_MSGCH_PMREQ_CMP_TIMEOUT 72H: MC_WATCHDG_TIMEOUT_PKGS_MASTER 81H: MC_RECOVERABLE_DIE_THERMAL_TOO_HOT
	56:32	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.
2. The internal error codes may be model-specific.

18.6.2 Intel® QPI Machine Check Errors

MC error codes associated with the Intel QPI agents are reported in the IA32_MC5_STATUS, IA32_MC20_STATUS, and IA32_MC21_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1PPTRRRRIILL**; see Chapter 17, "Machine-Check Architecture."

Table 18-21 lists model-specific fields to interpret error codes applicable to IA32_MC5_STATUS, IA32_MC20_STATUS, and IA32_MC21_STATUS.

Table 18-21. Intel® QPI MC Error Codes for IA32_MCi_STATUS (i = 5, 20, 21)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Bus error format: 1PPTRRRRIILL
Model Specific Errors	31:16	MSCOD	02H: Intel QPI physical layer detected drift buffer alarm. 03H: Intel QPI physical layer detected latency buffer rollover. 10H: Intel QPI link layer detected control error from R3QPI. 11H: Rx entered LLR abort state on CRC error. 12H: Unsupported or undefined packet. 13H: Intel QPI link layer control error. 15H: RBT used un-initialized value. 20H: Intel QPI physical layer detected a QPI in-band reset but aborted initialization. 21H: Link failover data self-healing. 22H: Phy detected in-band reset (no width change). 23H: Link failover clock failover. 30H: Rx detected CRC error; successful LLR after Phy re-init. 31H: Rx detected CRC error; successful LLR without Phy re-init. All other values are reserved.
	37:32	Reserved	Reserved
	52:38	Corrected Error Cnt	
	56:53	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.6.3 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the IA32_MC9_STATUS—IA32_MC16_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

MSR_ERROR_CONTROL.[bit 1] can enable additional information logging of the IMC. The additional error information logged by the IMC is stored in IA32_MCi_STATUS and IA32_MCi_MISC, where i = 9—16.

IA32_MCi_STATUS (i=9—12) logs errors from the first memory controller. The second memory controller logs errors into IA32_MCi_STATUS (i=13—16).

Table 18-22. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 9—16)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Memory Controller error format: 0000 0000 1MMM CCCC
Model Specific Errors	31:16	Reserved, except for the following	0001H: DDR3 address parity error. 0002H: Uncorrected HA write data error.
			0004H: Uncorrected HA data byte enable error. 0008H: Corrected patrol scrub error. 0010H: Uncorrected patrol scrub error. 0020H: Corrected spare error. 0040H: Uncorrected spare error. 0080H: Corrected memory read error. (Only applicable with iMC's "Additional Error logging" Mode-1 enabled.) 0100H: iMC, write data buffer parity errors. 0200H: DDR4 command address parity error.
	36:32	Other Info	When MSR_ERROR_CONTROL.[1] is set, logs an encoded value from the first error device.
	37	Reserved	Reserved
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

Table 18-23. Intel IMC MC Error Codes for IA32_MCi_MISC (i= 9—16)

Type	Bit No.	Bit Function	Bit Description
MCA Addr Info[1]	8:0		See Chapter 17, "Machine-Check Architecture."
Model Specific Errors	13:9		If the error logged is an MCWrDataPar error or an MCWrBEPar error, this field is the WDB ID that has the parity error; OR if the second error logged is a correctable read error, MC logs the second error device in this field.
	29:14	ErrMask_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log first-device error bit mask.
	45:30	ErrMask_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log second-device error bit mask.
	50:46	FailRank_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log first-device error failing rank.
	55:51	FailRank_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, allows the iMC to log second-device error failing rank.
	61:56	Reserved	Reserved
	62	Valid_1stErrDev	When MSR_ERROR_CONTROL.[1] is set, indicates the iMC has logged valid data from a correctable error from a memory read associated with first error device.
	63	Valid_2ndErrDev	When MSR_ERROR_CONTROL.[1] is set, indicates the iMC has logged valid data due to a second correctable error in a memory device. Use this information only after there is valid first error information indicated by bit 62.

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.6.4 Home Agent Machine Check Errors

Memory errors from the first memory controller may be logged in the IA32_MC7_{STATUS,ADDR,MISC} registers, while the second memory controller logs errors in the IA32_MC8_{STATUS,ADDR,MISC} registers.

18.7 INCREMENTAL DECODING INFORMATION: INTEL® XEON® PROCESSOR D FAMILY, MACHINE ERROR CODES FOR MACHINE CHECK

The Intel® Xeon® processor D family is based on the Broadwell microarchitecture and can be identified with CPUID DisplayFamily_DisplaySignature 06_56H. Incremental error codes for internal machine check error from the PCU controller are reported in the register bank IA32_MC4. Table 18-24 lists model-specific fields to interpret error codes applicable to IA32_MC4_STATUS. Incremental error codes for the memory controller unit are reported in the register banks IA32_MC9—IA32_MC10. Table 18-18 lists model-specific error codes that apply to IA32_M-Ci_STATUS, where i = 9—10.

18.7.1 Internal Machine Check Errors

Table 18-24. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	
MCACOD[2]	15:0	Internal Errors	0402H: PCU internal errors. 0403H: Internal errors. 0406H: Intel TXT errors. 0407H: Other UBOX internal errors. On an IERR caused by a core 3-strike, the IA32_MC3_STATUS (MLC) is copied to the IA32_MC4_STATUS. After a 3-strike, the core MCA banks will be unavailable.
Model Specific Errors	19:16	Reserved, except for the following	0000b: No error. 00x1b: PCU internal error. 001xb: PCU internal error.
	23:20	Reserved, except for the following	x1xxb: UBOX error.
	31:24	Reserved, except for the following	00H: No Error 09H: MC_MESSAGE_CHANNEL_TIMEOUT 13H: MC_DMI_TRAINING_TIMEOUT 15H: MC_DMI_CPU_RESET_ACK_TIMEOUT 1EH: MC_VR_ICC_MAX_LT_FUSED_ICC_MAX 25H: MC_SVID_COMMAND_TIMEOUT 26H: MCA_PKGC_DIRECT_WAKE_RING_TIMEOUT 29H: MC_VR_VOUT_MAC_LT_FUSED_SVID 2BH: MC_PKGC_WATCHDOG_HANG_CBZ_DOWN 2CH: MC_PKGC_WATCHDOG_HANG_CBZ_UP 44H: MC_CRITICAL_VR_FAILED 46H: MC_VID_RAMP_DOWN_FAILED 49H: MC_SVID_WRITE_REG_VOUT_MAX_FAILED

Table 18-24. Machine Check Error Codes for IA32_MC4_STATUS (Contd.)

Type	Bit No.	Bit Function	Bit Description

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.
2. The internal error codes may be model-specific.

18.7.2 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the IA32_MC9_STATUS—IA32_MC10_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

MSR_ERROR_CONTROL.[bit 1] can enable additional information logging of the IMC. The additional error information logged by the IMC is stored in IA32_MCi_STATUS and IA32_MCi_MISC, where i = 9—10.

Table 18-25. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 9—10)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Memory Controller error format: 0000 0000 1MMM CCCC
Model Specific Errors	31:16	Reserved, except for the following	0001H: DDR3 address parity error. 0002H: Uncorrected HA write data error. 0004H: Uncorrected HA data byte enable error. 0008H: Corrected patrol scrub error. 0010H: Uncorrected patrol scrub error. 0100H: iMC, write data buffer parity errors. 0200H: DDR4 command address parity error.
	36:32	Other Info	Reserved
	37	Reserved	Reserved
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:
1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.8 INCREMENTAL DECODING INFORMATION: INTEL® XEON® PROCESSOR E5 V4 FAMILY, MACHINE ERROR CODES FOR MACHINE CHECK

The Intel® Xeon® processor E5 v4 family is based on the Broadwell microarchitecture and can be identified with CPUID DisplayFamily_DisplaySignature 06_4FH. Incremental error codes for internal machine check errors from the PCU controller are reported in the register bank IA32_MC4. Table 18-20 in Section 18.6.1 lists model-specific fields to interpret error codes applicable to IA32_MC4_STATUS.

Incremental MC error codes related to the Intel QPI links are reported in the register banks IA32_MC5, IA32_MC20, and IA32_MC21. Information listed in Table 18-21 of Section 18.6.1 covers QPI MC error codes.

18.8.1 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the IA32_MC9_STATUS—IA32_MC16_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

Table 18-26 lists model-specific error codes that apply to IA32_MCi_STATUS, where i = 9—16.

IA32_MCi_STATUS (i=9—12) logs errors from the first memory controller. The second memory controller logs errors into IA32_MCi_STATUS (i=13—16).

Table 18-26. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 9—16)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Memory Controller error format: 0000 0000 1MMM CCCC
Model Specific Errors	31:16	Reserved, except for the following	0001H: DDR3 address parity error. 0002H: Uncorrected HA write data error. 0004H: Uncorrected HA data byte enable error. 0008H: Corrected patrol scrub error. 0010H: Uncorrected patrol scrub error. 0020H: Corrected spare error. 0040H: Uncorrected spare error. 0100H: iMC, write data buffer parity errors. 0200H: DDR4 command address parity error.
	36:32	Other Info	Reserved
	37	Reserved	Reserved
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:
1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.8.2 Home Agent Machine Check Errors

MC error codes associated with mirrored memory corrections are reported in the IA32_MC7_MISC and IA32_MC8_MISC MSRs. Table 18-27 lists model-specific error codes that apply to IA32_MCi_MISC, where i = 7, 8.

Memory errors from the first memory controller may be logged in the IA32_MC7_{STATUS,ADDR,MISC} registers, while the second memory controller logs errors in the IA32_MC8_{STATUS,ADDR,MISC} registers.

Table 18-27. Intel HA MC Error Codes for IA32_MCi_MISC (i= 7, 8)

Bit No.	Bit Function	Bit Description
5:0	LSB	See Figure 17-8.
8:6	Address Mode	See Table 17-3.
40:9	Reserved	Reserved
41	Failover	Error occurred at a pair of mirrored memory channels. Error was corrected by mirroring with channel failover.
42	Mirrorcorr	Error was corrected by mirroring and primary channel scrubbed successfully.
63:43	Reserved	Reserved

18.9 INCREMENTAL DECODING INFORMATION: INTEL® XEON® SCALABLE PROCESSOR FAMILY, MACHINE ERROR CODES FOR MACHINE CHECK

In the Intel® Xeon® Scalable Processor Family with CPUID DisplayFamily_DisplaySignature 06_55H, incremental error codes for internal machine check errors from the PCU controller are reported in the register bank IA32_MC4. Table 18-28 in Section 18.9.1 lists model-specific fields to interpret error codes applicable to IA32_MC4_STATUS.

18.9.1 Internal Machine Check Errors

Table 18-28. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	
MCACOD[2]	15:0	Internal Errors	0402H: PCU internal errors. 0403H: PCU internal errors. 0406H: Intel TXT errors. 0407H: Other UBOX internal errors. On an IERR caused by a core 3-strike, the IA32_MC3_STATUS (MLC) is copied to the IA32_MC4_STATUS. After a 3-strike, the core MCA banks will be unavailable.
Model Specific Errors	19:16	Reserved, except for the following	0000b: No error. 00xxb: PCU internal error.

Table 18-28. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description

Table 18-28. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
	56:55	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.
2. The internal error codes may be model-specific.

18.9.2 Interconnect Machine Check Errors

MC error codes associated with the link interconnect agents are reported in the IA32_MC5_STATUS, IA32_MC12_STATUS, and IA32_MC19_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1PPTRRRRIILL**; see Chapter 17, "Machine-Check Architecture."

Table 18-29 lists model-specific fields to interpret error codes applicable to IA32_MCi_STATUS, i= 5, 12, 19.

Table 18-29. Interconnect MC Error Codes for IA32_MCi_STATUS (i = 5, 12, 19)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Bus error format: 1PPTRRRRIILL The two supported compound error codes: ▪ 0x0C0F: Unsupported/Undefined Packet. ▪ 0x0E0F: For all other corrected and uncorrected errors.
Model Specific Errors	21:16	MSCOD	The encoding of Uncorrectable (UC) errors are: 00H: UC Phy Initialization Failure. 01H: UC Phy detected drift buffer alarm. 02H: UC Phy detected latency buffer rollover. 10H: UC link layer Rx detected CRC error: unsuccessful LLR entered abort state. 11H: UC LL Rx unsupported or undefined packet. 12H: UC LL or Phy control error. 13H: UC LL Rx parameter exchange exception. 1FH: UC LL detected control error from the link-mesh interface. The encoding of correctable (COR) errors are: 20H: COR Phy initialization abort. 21H: COR Phy reset. 22H: COR Phy lane failure, recovery in x8 width. 23H: COR Phy L0c error corrected without Phy reset. 24H: COR Phy L0c error triggering Phy reset. 25H: COR Phy L0p exit error corrected with Phy reset. 30H: COR LL Rx detected CRC error; successful LLR without Phy re-init. 31H: COR LL Rx detected CRC error; successful LLR with Phy re-init. All other values are reserved.

Table 18-29. Interconnect MC Error Codes for IA32_MCi_STATUS (i = 5, 12, 19)

Type	Bit No.	Bit Function	Bit Description
	31:22	MSCOD_SPARE	The definition below applies to MSCOD 12h (UC LL or Phy Control Errors) [Bit 22] : Phy Control Error. [Bit 23] : Unexpected Retry.Ack flit. [Bit 24] : Unexpected Retry.Req flit. [Bit 25] : RF parity error. [Bit 26] : Routeback Table error. [Bit 27] : Unexpected Tx Protocol flit (EOP, Header or Data). [Bit 28] : Rx Header-or-Credit BGF credit overflow/underflow. [Bit 29] : Link Layer Reset still in progress when Phy enters L0 (Phy training should not be enabled until after LL reset is complete as indicated by KTILCL.LinkLayerReset going back to 0). [Bit 30] : Link Layer reset initiated while protocol traffic not idle. [Bit 31] : Link Layer Tx Parity Error.
	37:32	Reserved	Reserved
	52:38	Corrected Error Cnt	
	56:53	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.9.3 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the IA32_MC13_STATUS—IA32_MC18_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

IA32_MCi_STATUS (i=13,14,17) logs errors from the first memory controller. The second memory controller logs errors into IA32_MCi_STATUS (i=15,16,18).

Table 18-30. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 13—18)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Memory Controller error format: 0000 0000 1MMM CCCC
Model Specific Errors	31:16	Reserved, except for the following	0001H: Address parity error. 0002H: HA write data parity error. 0004H: HA write byte enable parity error. 0008H: Corrected patrol scrub error. 0010H: Uncorrected patrol scrub error. 0020H: Corrected spare error. 0040H: Uncorrected spare error. 0080H: Any HA read error. 0100H: WDB read parity error. 0200H: DDR4 command address parity error. 0400H: Uncorrected address parity error. 0800H: Unrecognized request type. 0801H: Read response to an invalid scoreboard entry. 0802H: Unexpected read response. 0803H: DDR4 completion to an invalid scoreboard entry. 0804H: Completion to an invalid scoreboard entry. 0805H: Completion FIFO overflow. 0806H: Correctable parity error. 0807H: Uncorrectable error. 0808H: Interrupt received while outstanding interrupt was not ACKed. 0809H: ERID FIFO overflow. 080AH: Error on Write credits. 080BH: Error on Read credits. 080CH: Scheduler error. 080DH: Error event.
	36:32	Other Info	MC logs the first error device. This is an encoded 5-bit value of the device.
	37	Reserved	Reserved
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.9.4 M2M Machine Check Errors

MC error codes associated with M2M are reported in the IA32_MC7_STATUS and IA32_MC8_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

Table 18-31. M2M MC Error Codes for IA32_MCi_STATUS (i= 7, 8)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Compound error format: 0000 0000 1MMM CCCC
Model Specific Errors	16	MscodDataRdErr	Logged an MC read data error.
	17	Reserved	Reserved
	18	MscodPtlWrErr	Logged an MC partial write data error.
	19	MscodFullWrErr	Logged a full write data error.
	20	MscodBgfErr	Logged an M2M clock-domain-crossing buffer (BGF) error.
	21	MscodTimeOut	Logged an M2M time out.
	22	MscodParErr	Logged an M2M tracker parity error.
	23	MscodBucket1Err	Logged a fatal Bucket1 error.
	31:24	Reserved	Reserved
	36:32	Other Info	MC logs the first error device. This is an encoded 5-bit value of the device.
	37	Reserved	Reserved
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.9.5 Home Agent Machine Check Errors

MC error codes associated with mirrored memory corrections are reported in the IA32_MC7_MISC and IA32_MC8_MISC MSRs. Table 18-32 lists model-specific error codes that apply to IA32_MCi_MISC, where i = 7, 8.

Memory errors from the first memory controller may be logged in the IA32_MC7_{STATUS,ADDR,MISC} registers, while the second memory controller logs errors in the IA32_MC8_{STATUS,ADDR,MISC} registers.

Table 18-32. Intel HA MC Error Codes for IA32_MCi_MISC (i= 7, 8)

Bit No.	Bit Function	Bit Description
5:0	LSB	See Figure 17-8.
8:6	Address Mode	See Table 17-3.
40:9	Reserved	Reserved
61:41	Reserved	Reserved
62	Mirrorcorr	Error was corrected by mirroring and primary channel scrubbed successfully.
63	Failover	Error occurred at a pair of mirrored memory channels. Error was corrected by mirroring with channel failover.

18.10 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY WITH CPUID DISPLAYFAMILY_DISPLAYMODEL SIGNATURE 06_5FH, MACHINE ERROR CODES FOR MACHINE CHECK

In Intel Atom® processors based on Goldmont Microarchitecture with CPUID DisplayFamily_DisplaySignature 06_5FH (Denverton), incremental error codes for the memory controller unit are reported in the register banks IA32_MC7 and IA32_MC8. Table 18-33 in Section 18.10.1 lists model-specific fields to interpret error codes applicable to IA32_MCi_STATUS, where i = 7, 8.

18.10.1 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the IA32_MC7_STATUS and IA32_MC8_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

Table 18-33. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 7, 8)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	
Model Specific Errors	31:16	Reserved, except for the following	01H: Cmd/Addr parity. 02H: Corrected Demand/Patrol Scrub error. 04H: Uncorrected patrol scrub error. 08H: Uncorrected demand read error. 10H: WDB read ECC.
	36:32	Other Info

	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.11 INCREMENTAL DECODING INFORMATION: 3RD GENERATION INTEL® XEON® SCALABLE PROCESSOR FAMILY, MACHINE ERROR CODES FOR MACHINE CHECK

In the 3rd generation Intel® Xeon® Scalable Processor Family with CPUID DisplayFamily_DisplaySignatures of 06_6AH and 06_6CH, incremental error codes for internal machine check errors from the PCU controller are reported in the register bank IA32_MC4. Table 18-34 in Section 18.11.1 lists model-specific fields to interpret error codes applicable to IA32_MC4_STATUS.

18.11.1 Internal Machine Check Errors

Table 18-34. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
Machine Check Error Codes[1]	15:0	MCCOD	
MCCOD	15:0	Internal Errors	The value of this field will be 0402H for the PCU and 0406H for internal firmware errors. This applies for any logged error.
Model Specific Errors	19:16	Reserved, except for the following	Model specific error code bits 19:16. This logs the type of HW UC (PCU/VCU) error that has occurred. There are 7 errors defined. 01H: Instruction address out of valid space. 02H: Double bit RAM error on Instruction Fetch. 03H: Invalid OpCode seen. 04H: Stack Underflow. 05H: Stack Overflow. 06H: Data address out of valid space. 07H: Double bit RAM error on Data Fetch.
	23:20	Reserved, except for the following	Model specific error code bits 23:20. This logs the type of HW FSM error that has occurred. There are 3 errors defined. 04H: Clock/power IP response timeout. 05H: SMBus controller raised SMI. 09H: PM controller received invalid transaction.
	31:24	Reserved, except for the following	0DH: MCA_LLC_BIST_ACTIVE_TIMEOUT 0EH: MCA_DMI_TRAINING_TIMEOUT 0FH: MCA_DMI_STRAP_SET_ARRIVAL_TIMEOUT 10H: MCA_DMI_CPU_RESET_ACK_TIMEOUT 11H: MCA_MORE_THAN_ONE_LT_AGENT 14H: MCA_INCOMPATIBLE_PCH_TYPE 1EH: MCA_BIOS_RST_CPL_INVALID_SEQ 1FH: MCA_BIOS_INVALID_PKG_STATE_CONFIG 2DH: MCA_PCU_PMAX_CALIB_ERROR 2EH: MCA_TSC100_SYNC_TIMEOUT 3AH: MCA_GPSB_TIMEOUT 3BH: MCA_PMSB_TIMEOUT 3EH: MCA_IOSFSB_PMREQ_CMP_TIMEOUT 40H: MCA_SVID_VCCIN_VR_ICC_MAX_FAILURE 42H: MCA_SVID_VCCIN_VR_VOUT_FAILURE 43H: MCA_SVID_CPU_VR_CAPABILITY_ERROR 44H: MCA_SVID_CRITICAL_VR_FAILED 45H: MCA_SVID_SA_ITD_ERROR 46H: MCA_SVID_READ_REG_FAILED 47H: MCA_SVID_WRITE_REG_FAILED 4AH: MCA_SVID_PKGC_REQUEST_FAILED

Table 18-34. Machine Check Error Codes for IA32_MC4_STATUS (Contd.)

Type	Bit No.	Bit Function	Bit Description
			4BH: MCA_SVID_IMON_REQUEST_FAILED 4CH: MCA_SVID_ALERT_REQUEST_FAILED 4DH: MCA_SVID_MCP_VR_RAMP_ERROR 56H: MCA_FIVR_PD_HARDERR 58H: MCA_WATCHDOG_TIMEOUT_PKGC_SECONDARY 59H: MCA_WATCHDOG_TIMEOUT_PKGC_MAIN 5AH: MCA_WATCHDOG_TIMEOUT_PKGS_MAIN 5BH: MCA_WATCHDOG_TIMEOUT_MSG_CH_FSM 5CH: MCA_WATCHDOG_TIMEOUT_BULK_CR_FSM 5DH: MCA_WATCHDOG_TIMEOUT_IOSFSB_FSM 60H: MCA_PKGS_SAFE_WP_TIMEOUT 61H: MCA_PKGS_CPD_UNCPD_TIMEOUT 62H: MCA_PKGS_INVALID_REQ_PCH 63H: MCA_PKGS_INVALID_REQ_INTERNAL 64H: MCA_PKGS_INVALID_RSP_INTERNAL 65H-7AH: MCA_PKGS_RESET_PREP_TIMEOUT 7BH: MCA_PKGS_SMBUS_VPP_PAUSE_TIMEOUT 7CH: MCA_PKGS_SMBUS_MCP_PAUSE_TIMEOUT 7DH: MCA_PKGS_SMBUS_SPD_PAUSE_TIMEOUT 80H: MCA_PKGC_DISP_BUSY_TIMEOUT 81H: MCA_PKGC_INVALID_RSP_PCH 83H: MCA_PKGC_WATCHDOG_HANG_CBZ_DOWN 84H: MCA_PKGC_WATCHDOG_HANG_CBZ_UP 87H: MCA_PKGC_WATCHDOG_HANG_C2_BLKMASTER 88H: MCA_PKGC_WATCHDOG_HANG_C2_PSLIMIT 89H: MCA_PKGC_WATCHDOG_HANG_SETDISP 8BH: MCA_PKGC_ALLOW_L1_ERROR 90H: MCA_RECOVERABLE_DIE_THERMAL_TOO_HOT A0H: MCA_ADR_SIGNAL_TIMEOUT A1H: MCA_BCLK_FREQ_OC_ABOVE_THRESHOLD B0H: MCA_DISPATCHER_RUN_BUSY_TIMEOUT
	37:32	ENH_MCA_AVAIL0	Available when Enhanced MCA is in use.
	52:38	CORR_ERR_COUNT	Correctable error count.
	54:53	CORRERRORSTATUSIND	These bits are used to indicate when the number of corrected errors has exceeded the safe threshold to the point where an uncorrected error has become more likely to happen. Table 3 shows the encoding of these bits.
	56:55	ENH_MCA_AVAIL1	Available when Enhanced MCA is in use.
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.11.2 Interconnect Machine Check Errors

MC error codes associated with the link interconnect agents are reported in the IA32_MC5_STATUS, IA32_MC7_STATUS, and IA32_MC8_STATUS MSRs. The supported error codes follow the architectural MCACOD definition type **1PPTRRRRIILL**; see Chapter 17, "Machine-Check Architecture."

NOTE

The interconnect machine check errors in this section apply only to the 3rd generation Intel Xeon Scalable Processor Family with a CPUID DisplayFamily_DisplaySignature of 06_6AH. These do not apply to the 3rd generation Intel Xeon Scalable Processor Family with a CPUID DisplayFamily_DisplaySignature of 06_6CH.

Table 18-35 lists model-specific fields to interpret error codes applicable to IA32_MCi_STATUS, where i= 5, 7, 8.

Table 18-35. Interconnect MC Error Codes for IA32_MCi_STATUS (i = 5, 7, 8)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Bus error format: 1PPTRRRRIILL The two supported compound error codes: ▪ 0x0C0F: Unsupported/Undefined Packet. ▪ 0x0E0F: For all other corrected and uncorrected errors.
Model Specific Errors	21:16	MSCOD	The encoding of Uncorrectable (UC) errors are: 00H: Phy Initialization Failure (NumInit). 01H: Phy Detected Drift Buffer Alarm. 02H: Phy Detected Latency Buffer Rollover. 10H: LL Rx detected CRC error: unsuccessful LLR (entered Abort state). 11H: LL Rx Unsupported/Undefined packet. 12H: LL or Phy Control Error. 13H: LL Rx Parameter Exception. 1FH: LL Detected Control Error. The encoding of correctable (COR) errors are: 20H: Phy Initialization Abort. 21H: Phy Inband Reset. 22H: Phy Lane failure, recovery in x8 width. 23H: Phy L0c error corrected without Phy reset. 24H: Phy L0c error triggering Phy reset. 25H: Phy L0p exit error corrected with reset. 30H: LL Rx detected CRC error: successful LLR without Phy Re-init. 31H: LL Rx detected CRC error: successful LLR with Phy Re-init. 32H: Tx received LLR. All other values are reserved.

Table 18-35. Interconnect MC Error Codes for IA32_MCi_STATUS (i = 5, 7, 8) (Contd.)

Type	Bit No.	Bit Function	Bit Description
	31:22	MSCOD_SPARE	The definition below applies to MSCOD 12h (UC LL or Phy Control Errors). [Bit 22] : Phy Control Error. [Bit 23] : Unexpected Retry.Ack flit. [Bit 24] : Unexpected Retry.Req flit. [Bit 25] : RF parity error. [Bit 26] : Routeback Table error. [Bit 27] : Unexpected Tx Protocol flit (EOP, Header or Data). [Bit 28] : Rx Header-or-Credit BGF credit overflow/underflow. [Bit 29] : Link Layer Reset still in progress when Phy enters L0 (Phy training should not be enabled until after LL reset is complete as indicated by KTILCL.LinkLayerReset going back to 0). [Bit 30] : Link Layer reset initiated while protocol traffic not idle. [Bit 31] : Link Layer Tx Parity Error.

18.11.3 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers for the 3rd generation Intel® Xeon® Scalable Processor Family based on Ice Lake microarchitecture are defined in Table 18-37.

The MSRs reporting MC error codes differ depending on the CPUID DisplayFamily_DisplaySignature of the processor. See Table 18-36 for details.

Table 18-36. MSRs Reporting MC Error Codes by CPUID DisplayFamily_DisplaySignature

Processor	CPUID DisplayFamily_DisplaySignature	MSRs Reporting MC Error Codes
3rd generation Intel® Xeon® Scalable Processor Family based on Ice Lake microarchitecture	06_6AH	IA32_MC13_STATUS–IA32_MC14_STATUS IA32_MC17_STATUS–IA32_MC18_STATUS IA32_MC21_STATUS–IA32_MC22_STATUS IA32_MC25_STATUS–IA32_MC26_STATUS
3rd generation Intel® Xeon® Scalable Processor Family based on Ice Lake microarchitecture	06_6CH	IA32_MC13_STATUS–IA32_MC14_STATUS IA32_MC17_STATUS–IA32_MC18_STATUS

The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

Table 18-37. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 13—14, 17—18, 21—22, 25—26)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Memory Controller error format: 0000 0000 1MMM CCCC
Model Specific Errors	27:16	Error Codes	0000H: Uncorrectable spare error. 0001H: End to End address parity error. 0002H: Write data parity error. 0003H: End to End uncorrectable/correctable write data ECC error. 0004H: Write byte enable parity error. 0007H: Transaction ID parity error. 0008H: Correctable patrol scrub error. 0010H: Uncorrectable patrol scrub error. 0020H: Correctable spare error. 0080H: Transient or correctable error for demand or underfill reads or read 2LM metadata error. 00A0H: Uncorrectable error for demand or underfill reads. 0100H: WDB read parity error. 0108H: DDR/DDRT link failure. 0111H: PCLS address CSR parity error. 0112H: PCLS illegal ADDDC configuration error. 0200H: DDR4 command / address parity error. 0400H: RPQ scheduler address parity error. 0800H: 2LM unrecognized request type. 0801H: 2LM read response to an invalid scoreboard entry. 0802H: 2LM unexpected read response. 0803H: 2LM DDR4 completion to an invalid scoreboard entry. 0804H: 2LM DDRT completion to an invalid scoreboard entry. 0805H: 2LM completion FIFO overflow. 0806H: DDRT link parity error. 0807H: DDRT RID uncorrectable error. 0809H: DDRT RID FIFO overflow. 080AH: DDRT error on FNV write credits. 080BH: DDRT error on FNV read credits. 080CH: DDRT scheduler error. 080DH: DDRT FNV error. 080EH: DDRT FNV thermal error. 080FH: DDRT unexpected data packet during CMI idle. 0810H: DDRT RPQ request parity error. 0811H: DDRT WPQ request parity error. 0812H: 2LM NmFillWr CAM multiple hit error. 0813H: CMI credit oversubscription error. 0814H: CMI total credit count error. 0815H: CMI reserved credit pool error. 0816H: DDRT link ECC error.

Table 18-37. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 13—14, 17—18, 21—22, 25—26) (Contd.)

Type	Bit No.	Bit Function	Bit Description
			0817H: WDB FIFO overflow or underflow errors. 0818H: CMI request FIFO overflow error. 0819H: CMI request FIFO underflow error. 081AH: CMI response FIFO overflow error. 081BH: CMI response FIFO underflow error. 081CH: CMI miscellaneous credit errors. 081DH: CMI MC arbiter errors. 081EH: DDRT write completion FIFO overflow error. 081FH: DDRT write completion FIFO underflow error. 0820H: CMI read completion FIFO overflow error. 0821H: CMI read completion FIFO underflow error. 0822H: TME key RF parity error. 0823H: TME miscellaneous CMI errors. 0824H: TME CMI overflow error. 0825H: TME CMI underflow error. 0826H: Intel® SGX TEM secure bit mismatch detected on demand read. 0827H: TME detected underfill read completion data parity error. 0828H: 2LM Scoreboard Overflow Error. 1008H: Correctable patrol scrub error (mirror secondary example).
	28	Mirror secondary error.	Mirror secondary error.
	31:29	Reserved	Reserved
	37:32	Other Info	Other Info.
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

Additional information is reported in the IA32_MC13_MISC–IA32_MC14_MISC, IA32_MC17_MISC–IA32_MC18_MISC, IA32_MC21_MISC–IA32_MC22_MISC, and IA32_MC25_MISC–IA32_MC26_MISC MSRs. Table 18-38 lists the information reported in IA32_MCi_MISC, where i = 13–14, 17–18, 21–22, and 25–26.

Table 18-38. Additional Information Reported in IA32_MCi_MISC (i= 13–14, 17–18, 21–22, 25–26)

Bit No.	Bit Function	Bit Description
5:0	LSB	See Figure 17-8.
8:6	Address Mode	See Table 17-3.
18:9	Column	Component of sub-DIMM address. Bits 18-17: Reserved. Bit 16: Column 9. Bit 15: Column 8. Bit 14: Column 7. Bit 13: Column 6. Bit 12: Column 5. Bit 11: Column 4. Bit 10: Column 3. Bit 9: Reserved.
39:19	Row	Component of sub-DIMM address.
45:40	Bank	Component of sub-DIMM address. Bit 45: Reserved. Bit 44: Bank group 2. Bit 43: Bank address 1. Bit 42: Bank address 0. Bit 41: Bank group 1. Bit 40: Bank group 0.
51:46	Failed Device	Failing device for correctable error (not valid for uncorrectable or transient errors).
55:52	CBit	CBit
58:56	Chip Select	Chip Select
62:59	ECC Mode	0000b: SDDC 2LM. 0001b: SDDC 1LM. 0010b: SDDC + 1 2LM. 0011b: SDDC + 1 1LM. 0100b: ADDDC 2LM. 0101b: ADDDC 1LM. 0110b: ADDDC + 1 2LM. 0111b: ADDDC + 1 1LM. 1000b: Read from DDRT. 1001b: x8 SDDC. 1010b: x8 SDDC + 1. 1011b: Not a valid ECC mode. Other values: Reserved.
63	Transient	0b: 1b: Error was transient.

18.11.4 M2M Machine Check Errors

MC error codes associated with M2M for the 3rd generation Intel Xeon Scalable Processor Family with a CPUID DisplayFamily_DisplaySignature of 06_6AH are reported in the IA32_MC12_STATUS, IA32_MC16_STATUS, IA32_MC20_STATUS, and IA32_MC24_STATUS MSRs.

MC error codes associated with M2M for the 3rd generation Intel Xeon Scalable Processor Family with a CPUID DisplayFamily_DisplaySignature of 06_6CH are reported in the IA32_MC12_STATUS and IA32_MC16_STATUS MSRs.

The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

Table 18-39. M2M MC Error Codes for IA32_MCi_STATUS (i= 12, 16, 20, 24)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Compound error format: 0000 0000 1MMM CCCC
Model Specific Errors	23:16	MSCOD	Logged an MC error.
	25:24	MscodDDRType	Logged a DDR/DDRT specific error.
	26	MscodFailoverWhileResetPrep	Logged a failover specific error while preparing to reset.
	31:27	Reserved	Reserved
	37:32	Other Info	Other information.
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

MC error codes associated with mirrored memory corrections are reported in the IA32_MC12_MISC, IA32_MC16_MISC, IA32_MC20_MISC, and IA32_MC24_MISC MSRs. The model-specific error codes listed in Table 18-32 also apply to IA32_MCi_MISC, where i = 12, 16, 20, 24.

18.12 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY WITH CPUID DISPLAYFAMILY_DISPLAYMODEL SIGNATURE 06_86H, MACHINE ERROR CODES FOR MACHINE CHECK

In Intel Atom® processors based on Tremont microarchitecture with CPUID DisplayFamily_DisplaySignature 06_86H, incremental error codes for internal machine check errors from the PCU controller are reported in the register bank IA32_MC4. Table 18-34 in Section 18.11.1 lists model-specific fields to interpret error codes applicable to IA32_MC4_STATUS.

18.12.1 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers are reported in the MSRs IA32_MC13_STATUS–IA32_MC15_STATUS. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

The IA32_MCi_STATUS MSR (where i = 13, 14, 15) contains information related to a machine check error if its VAL(valid) flag is set. Bit definitions are the same as those found in Table 18-37 "Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 13—14, 17—18, 21—22, 25—26)."

The IA32_MCi_MISC MSR (where i = 13, 14, 15) contains information related memory corrections. Bit definitions are the same as those found in Table 18-38 "Additional Information Reported in IA32_MCi_MISC (i= 13—14, 17—18, 21—22, 25—26)."

18.12.2 M2M Machine Check Errors

MC error codes associated with M2M are reported in the IA32_MC12_STATUS MSR. The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

Bit definitions are the same as those found in Table 18-39 "M2M MC Error Codes for IA32_MCi_STATUS (i= 12, 16, 20, 24)."

18.13 INCREMENTAL DECODING INFORMATION: 4TH GENERATION INTEL® XEON® SCALABLE PROCESSOR FAMILY, MACHINE ERROR CODES FOR MACHINE CHECK

In the 4th generation Intel® Xeon® Scalable Processor Family with CPUID DisplayFamily_DisplaySignature of 06_8FH, incremental error codes for internal machine check errors from the PCU controller are reported in the register bank IA32_MC4. Table 18-40 in Section 18.13.1 lists model-specific fields to interpret error codes applicable to IA32_MC4_STATUS.

18.13.1 Internal Machine Check Errors

Table 18-40. Machine Check Error Codes for IA32_MC4_STATUS

Type	Bit No.	Bit Function	Bit Description
MCACOD[1]	15:0	Internal Errors	The value of this field will be 0402H for the PCU and 0406H for internal firmware errors. This applies for any logged error.
Model Specific Errors	19:16	Reserved, except for the following	Model specific error code bits 19:16. If MACOD = 40CH, MSCOD encoding should be interpreted as: 01H: MCE when CR4.MCE is clear. 02H: MCE when MCIP bit is set. 03H: MCE under WPS. 04H: Unrecoverable error during security flow execution. 05H: Software triple fault shutdown. 06H: VMX-exit-consistency-check failures. 07H: RSM-consistency-check failures. 08H: Invalid conditions on protected mode SMM entry. 09H: Unrecoverable error during security flow execution. For all other MACOD values, MSCOD logs the type of hardware UC (PCU/VCU) error that has occurred. There are seven errors defined: 01H: Instruction address out of valid space. 02H: Double bit RAM error on Instruction Fetch. 03H: Invalid OpCode seen. 04H: Stack Underflow. 05H: Stack Overflow. 06H: Data address out of valid space. 07H: Double bit RAM error on Data Fetch.

Table 18-40. Machine Check Error Codes for IA32_MC4_STATUS (Contd.)

Type	Bit No.	Bit Function	Bit Description
	23:20	Reserved, except for the following	Model specific error code bits 23:20. This logs the type of HW FSM error that has occurred. There are 3 errors defined: 04H: Clock/power IP response timeout. 05H: SMBus controller raised SMI. 09H: PM controller received invalid transaction.
	31:24	Reserved, except for the following	0DH: MCA_LLC_BIST_ACTIVE_TIMEOUT 0EH: MCA_DMI_TRAINING_TIMEOUT 0FH: MCA_DMI_STRAP_SET_ARRIVAL_TIMEOUT 10H: MCA_DMI_CPU_RESET_ACK_TIMEOUT 11H: MCA_MORE_THAN_ONE_LT_AGENT 14H: MCA_INCOMPATIBLE_PCH_TYPE 1EH: MCA_BIOS_RST_CPL_INVALID_SEQ 1FH: MCA_BIOS_INVALID_PKG_STATE_CONFIG 2DH: MCA_PCU_PMAX_CALIB_ERROR 2EH: MCA_TSC100_SYNC_TIMEOUT 3AH: MCA_GPSB_TIMEOUT 3BH: MCA_PMSB_TIMEOUT 3EH: MCA_IOSFSB_PMREQ_CMP_TIMEOUT 40H: MCA_SVID_VCCIN_VR_ICC_MAX_FAILURE 42H: MCA_SVID_VCCIN_VR_VOUT_FAILURE 43H: MCA_SVID_CPU_VR_CAPABILITY_ERROR 44H: MCA_SVID_CRITICAL_VR_FAILED 45H: MCA_SVID_SA_ITD_ERROR 46H: MCA_SVID_READ_REG_FAILED 47H: MCA_SVID_WRITE_REG_FAILED 4AH: MCA_SVID_PKGC_REQUEST_FAILED 4BH: MCA_SVID_IMON_REQUEST_FAILED 4CH: MCA_SVID_ALERT_REQUEST_FAILED 4DH: MCA_SVID_MCP_VR_RAMP_ERROR 56H: MCA_FIVR_PD_HARDERR 58H: MCA_WATCHDOG_TIMEOUT_PKGC_SECONDARY 59H: MCA_WATCHDOG_TIMEOUT_PKGC_MAIN 5AH: MCA_WATCHDOG_TIMEOUT_PKGS_MAIN 5BH: MCA_WATCHDOG_TIMEOUT_MSG_CH_FSM 5CH: MCA_WATCHDOG_TIMEOUT_BULK_CR_FSM 5DH: MCA_WATCHDOG_TIMEOUT_IOSFSB_FSM 60H: MCA_PKGS_SAFE_WP_TIMEOUT 61H: MCA_PKGS_CPD_UNCPD_TIMEOUT 62H: MCA_PKGS_INVALID_REQ_PCH 63H: MCA_PKGS_INVALID_REQ_INTERNAL 64H: MCA_PKGS_INVALID_RSP_INTERNAL 65H-7AH: MCA_PKGS_RESET_PREP_TIMEOUT 7BH: MCA_PKGS_SMBUS_VPP_PAUSE_TIMEOUT

Table 18-40. Machine Check Error Codes for IA32_MC4_STATUS (Contd.)

Type	Bit No.	Bit Function	Bit Description
			7CH: MCA_PKGS_SMBUS_MCP_PAUSE_TIMEOUT 7DH: MCA_PKGS_SMBUS_SPD_PAUSE_TIMEOUT 80H: MCA_PKGC_DISP_BUSY_TIMEOUT 81H: MCA_PKGC_INVALID_RSP_PCH 83H: MCA_PKGC_WATCHDOG_HANG_CBZ_DOWN 84H: MCA_PKGC_WATCHDOG_HANG_CBZ_UP 87H: MCA_PKGC_WATCHDOG_HANG_C2_BLKMASTER 88H: MCA_PKGC_WATCHDOG_HANG_C2_PSLIMIT 89H: MCA_PKGC_WATCHDOG_HANG_SETDISP 8BH: MCA_PKGC_ALLOW_L1_ERROR 90H: MCA_RECOVERABLE_DIE_THERMAL_TOO_HOT A0H: MCA_ADR_SIGNAL_TIMEOUT A1H: MCA_BCLK_FREQ_OC_ABOVE_THRESHOLD B0H: MCA_DISPATCHER_RUN_BUSY_TIMEOUT C0H: MCA_DISPATCHER_RUN_BUSY_TIMEOUT
	37:32	ENH_MCA_AVAIL0	Available when Enhanced MCA is in use.
	52:38	CORR_ERR_COUNT	Correctable error count.
	54:53	CORRERRORSTATUSIND	These bits are used to indicate when the number of corrected errors has exceeded the safe threshold to the point where an uncorrected error has become more likely to happen. Table 3 shows the encoding of these bits.
	56:55	ENH_MCA_AVAIL1	Available when Enhanced MCA is in use.
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.13.2 Interconnect Machine Check Errors

MC error codes associated with the link interconnect agents are reported in the IA32_MC5_STATUS MSR. The supported error codes follow the architectural MCACOD definition type **1PPTRRRRIILL**; see Chapter 17, "Machine-Check Architecture."

Table 18-41 lists model-specific fields to interpret error codes applicable to IA32_MC5_STATUS.

Table 18-41. Interconnect MC Error Codes for IA32_MC5_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Bus error format: 1PPTRRRRIILL The two supported compound error codes: ▪ 0x0C0F: Unsupported/Undefined Packet. ▪ 0x0E0F: For all other corrected and uncorrected errors.
Model Specific Errors	21:16	MSCOD	The encoding of Uncorrectable (UC) errors are: 00H: UC Phy Initialization Failure. 01H: UC Phy Detected Drift Buffer Alarm. 02H: UC Phy Detected Latency Buffer Rollover. 10H: UC LL Rx detected CRC error: unsuccessful LLR (entered Abort state). 11H: UC LL Rx Unsupported/Undefined packet. 12H: UC LL or Phy Control Error. 13H: UC LL Rx Parameter Exception. 15H: UC LL Rx SGX MAC Error. 1FH: UC LL Detected Control Error. The encoding of correctable (COR) errors are: 20H: COR Phy Initialization Abort. 21H: COR Phy Inband Reset. 22H: COR Phy Lane failure, recovery in x8 width. 23H: COR Phy L0c error corrected without Phy reset. 24H: COR Phy L0c error triggering Phy reset. 25H: COR Phy L0p exit error corrected with reset. 30H: COR LL Rx detected CRC error: successful LLR without Phy Re-init. 31H: COR LL Rx detected CRC error: successful LLR with Phy Re-init. All other values are reserved.
	31:22	MSCOD_SPARE	The definition below applies to MSCOD 12H (UC LL or Phy Control Errors). [Bit 22]: Phy Control Error. [Bit 23]: Unexpected Retry.Ack flit. [Bit 24]: Unexpected Retry.Req flit. [Bit 25]: RF parity error. [Bit 26]: Routeback Table error. [Bit 27]: Unexpected Tx Protocol flit (EOP, Header, or Data). [Bit 28]: Rx Header-or-Credit BGF credit overflow/underflow. [Bit 29]: Link Layer Reset still in progress when Phy enters L0 (Phy training should not be enabled until after LL reset is complete as indicated by KTILCL.LinkLayerReset going back to 0). [Bit 30]: Link Layer reset initiated while protocol traffic not idle. [Bit 31]: Link Layer Tx Parity Error.
	37:32	OTHER_INFO	Other Info.
	56:38	Corrected Error Cnt	See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.13.3 Integrated Memory Controller Machine Check Errors

MC error codes associated with integrated memory controllers for the 4th generation Intel® Xeon® Scalable Processor Family based on Sapphire Rapids microarchitecture are reported in the IA32_MC13_STATUS—IA32_MC20_STATUS MSRs.

The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

Table 18-42. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 13—20)

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Memory Controller error format: 0000 0000 1MMM CCCC
Model Specific Errors	31:16	Reserved, except for the following	0001H: Address parity error. 0002H: Data parity error. 0003H: Data ECC error. 0004H: Data byte enable parity error. 0007H: Transaction ID parity error. 0008H: Corrected patrol scrub error. 0010H: Uncorrected patrol scrub error. 0020H: Corrected spare error. 0040H: Uncorrected spare error. 0080H: Corrected read error. 00A0H: Uncorrected read error. 00C0H: Uncorrected metadata. 0100H: WDB read parity error. 0108H: DDR link failure. 0200H: DDR5 command / address parity error. 0400H: RPQ0 parity (primary) error. 0800H: DDR-T bad request. 0801H: DDR Data response to an invalid entry. 0802H: DDR data response to an entry not expecting data. 0803H: DDR5 completion to an invalid entry. 0804H: DDR-T completion to an invalid entry. 0805H: DDR data/completion FIFO overflow. 0806H: DDR-T ERID correctable parity error. 0807H: DDR-T ERID uncorrectable error. 0808H: DDR-T interrupt received while outstanding interrupt was not ACKed. 0809H: ERID FIFO overflow. 080AH: DDR-T error on FNV write credits. 080BH: DDR-T error on FNV read credits. 080CH: DDR-T scheduler error. 080DH: DDR-T FNV error event. 080EH: DDR-T FNV thermal event. 080FH: CMI packet while idle. 0810H: DDR_T_RPQ_REQ_PARITY_ERR. 0811H: DDR_T_WPQ_REQ_PARITY_ERR. 0812H: 2LM_NMFILLWR_CAM_ERR.

Table 18-42. Intel IMC MC Error Codes for IA32_MCi_STATUS (i= 13—20)

Type	Bit No.	Bit Function	Bit Description
			0813H: CMI_CREDIT_OVERSUB_ERR. 0814H: CMI_CREDIT_TOTAL_ERR. 0815H: CMI_CREDIT_RSVD_POOL_ERR. 0816H: DDR_T_RD_ERROR. 0817H: WDB_FIFO_ERR. 0818H: CMI_REQ_FIFO_OVERFLOW. 0819H: CMI_REQ_FIFO_UNDERFLOW. 081AH: CMI_RSP_FIFO_OVERFLOW. 081BH: CMI_RSP_FIFO_UNDERFLOW. 081CH: CMI_MISC_MC_CRDT_ERRORS. 081DH: CMI_MISC_MC_ARB_ERRORS. 081EH: DDR_T_WR_CMPL_FIFO_OVERFLOW. 081FH: DDR_T_WR_CMPL_FIFO_UNDERFLOW. 0820H: CMI_RD_CPL_FIFO_OVERFLOW. 0821H: CMI_RD_CPL_FIFO_UNDERFLOW. 0822H: TME_KEY_PAR_ERR. 0823H: TME_CMI_MISC_ERR. 0824H: TME_CMI_OVFL_ERR. 0825H: TME_CMI_UFL_ERR. 0826H: TME_TEM_SECURE_ERR. 0827H: TME_UFILL_PAR_ERR. 0829H: INTERNAL_ERR. 082AH: TME_INTEGRITY_ERR. 082BH: TME_TDX_ERR 082CH: TME_UFILL_TEM_SECURE_ERR. 082DH: TME_KEY_POISON_ERR. 082EH: TME_SECURITY_ENGINE_ERR. 1008H: CORR_PATSCRUB_MIRR2ND_ERR. 1010H: UC_PATSCRUB_MIRR2ND_ERR. 1020H: COR_SPARE_MIRR2ND_ERR. 1040H: UC_SPARE_MIRR2ND_ERR. 1080H: HA_RD_MIRR2ND_ERR. 10A0H: HA_UNCORR_RD_MIRR2ND_ERR.

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

Additional information is reported in the IA32_MC13_MISC—IA32_MC20_MISC MSRs. Table 18-43 lists the information reported in IA32_MCi_MISC, where i = 13—20.

Table 18-43. Additional Information Reported in IA32_MCi_MISC (i= 13—20)

Bit No.	Bit Function	Bit Description
5:0	LSB	See Figure 17-8.
8:6	Address Mode	See Table 17-3.
18:9	Column	Column address for the last retry. To get the real column address from this field, shift the value left by 2.
36:19	Row	Component of sub-DIMM address.
42:37	Bank ID	Component of sub-DIMM address. Bit 42: Reserved. Bit 41: Bank group 2. Bit 40: Bank address 1. Bit 39: Bank address 0. Bit 38: Bank group 1. Bit 37: Bank group 0.
48:43	Failed Device	Failing device for correctable error (not valid for uncorrectable or transient errors).
50:49	Reserved	Reserved
55:51	Failed Device Number	In HBM mode, holds the failed device number for upper 32 bytes.
55:52	CBit	In DDR mode, bits 54-52: sub_rank[2:0]; bit 55: reserved.
58:56	Chip Select	Chip Select
62:59	ECC Mode	0000b: SDDC 2LM. 0001b: SDDC 1LM. 0010b: SDDC + 1 2LM. 0011b: SDDC + 1 1LM. 0100b: ADDDC 2LM. 0101b: ADDDC 1LM. 0110b: ADDDC + 1 2LM. 0111b: ADDDC + 1 1LM. 1000b: Read from DDRT. 1011b: Not a valid ECC mode. For HBM mode: 0001b: 64B read. 1001b: 32B read. Other values: Reserved.
63	Transient	Indicates if the error was a transient error. A transient error is only indicated for demand reads, underfill reads, and patrol. If there was a WDBParity Error, this field indicates the WDB ID bit 6.

18.13.4 M2M Machine Check Errors

MC error codes associated with M2M for the 4th generation Intel Xeon Scalable Processor Family with a CPUID DisplayFamily_DisplaySignature of 06_8FH are reported in the IA32_MC12_STATUS MSR.

The supported error codes follow the architectural MCACOD definition type **1MMMCCCC**; see Chapter 17, "Machine-Check Architecture."

Table 18-44. M2M MC Error Codes for IA32_MC12_STATUS

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0	MCACOD	Compound error format: 0000 0000 1MMM CCCC
Model Specific Errors	23:16	MscodDataRdErr	00H: No error (default). 01H: Read ECC error (MemSpecRd; MemRd; MemRdData; MemRdXto*; MemInv; MemInvXto*; MemInvItoX). 02H: Bucket1 error. 03H: RdTrkr Parity error. 05H: Prefetch channel mismatch. 07H: Read completion parity error. 08H: Response parity error. 09H: Timeout error. 0AH: CMI reserved credit pool error. 0BH: CMI total credit count error. 0CH: CMI credit oversubscription error.
	25:24	MscodDDRType	00: Not logged, whether error on DDR4 or DDRT. 01: HBM errors.
	31:26	Reserved	Reserved
	37:32	Other Info	Other Info.
	56:38		See Chapter 17, "Machine-Check Architecture."
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

18.13.5 High Bandwidth Memory Machine Check Errors

MC error codes associated with high bandwidth memory for the 4th generation Intel Xeon Scalable Processor Family are reported in the IA32_MC29_STATUS—IA32_MC31_STATUS MSRs.

18.14 INCREMENTAL DECODING INFORMATION: PROCESSOR FAMILY 0FH, MACHINE ERROR CODES FOR MACHINE CHECK

Table 18-45 provides information for interpreting additional family 0FH model-specific fields for external bus errors. These errors are reported in the IA32_MCi_STATUS MSRs. They are reported architecturally as compound errors with a general form of **0000 1PPT RRRR IILL** in the MCA error code field. See Chapter 17 for information on the interpretation of compound error codes.

Table 18-45. Incremental Decoding Information: Processor Family 0FH, Machine Error Codes for Machine Check

Type	Bit No.	Bit Function	Bit Description
MCA Error Codes[1]	15:0		
Model-Specific Error Codes	16	FSB Address Parity	Address parity error detected: 1: Address parity error detected. 0: No address parity error.
	17	Response Hard Fail	Hardware failure detected on response.
	18	Response Parity	Parity error detected on response.
	19	PIC and FSB Data Parity	Data Parity detected on either PIC or FSB access.
	20	Processor Signature = 00000F04H: Invalid PIC Request All other processors: Reserved	Processor Signature = 00000F04H: Indicates error due to an invalid PIC request access was made to PIC space with WB memory): 1: Invalid PIC request error. 0: No Invalid PIC request error. Reserved
	21	Pad State Machine	The state machine that tracks P and N data-strobe relative timing has become unsynchronized or a glitch has been detected.
	22	Pad Strobe Glitch	Data strobe glitch.
	23	Pad Address Glitch	Address strobe glitch.
Other Information	56:24	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

Table 18-10 provides information on interpreting additional family 0FH model specific fields for cache hierarchy errors. These errors are reported in one of the IA32_MCi_STATUS MSRs. These errors are reported, architecturally, as compound errors with a general form of **0000 0001 RRRR TTLL** in the MCA error code field. See Chapter 17 for how to interpret the compound error code.

18.14.1 Model-Specific Machine Check Error Codes for the Intel® Xeon® Processor MP 7100 Series

The Intel Xeon processor MP 7100 series has five register banks which contain information related to Machine Check Errors. MCi_STATUS[63:0] refers to all five register banks. MC0_STATUS[63:0] through MC3_STATUS[63:0] is the same as previous generations of Intel Xeon processors within Family 0FH. MC4_STATUS[63:0] is the main error logging for the processor's L3 and front side bus errors. It supports the L3 Errors, Bus and Interconnect Errors Compound Error Codes in the MCA Error Code Field.

Table 18-46. MCi_STATUS Register Bit Definition

Bit Field Name	Bits	Description
MCA_Error_Code	15:0	This field specifies the machine check architecture defined error code for the machine check error condition detected. The machine check architecture defined error codes are guaranteed to be the same for all Intel Architecture processors that implement the machine check architecture. See tables below.
Model_Specific_Error_Code	31:16	This field specifies the model specific error code that uniquely identifies the machine check error condition detected. The model specific error codes may differ among Intel Architecture processors for the same Machine Check Error condition. See tables below.
Other_Info	56:32	The functions of the bits in this field are implementation specific and are not part of the machine check architecture. Software that is intended to be portable among Intel Architecture processors should not rely on the values in this field.
PCC	57	The Processor Context Corrupt flag indicates that the state of the processor might have been corrupted by the error condition detected and that reliable restarting of the processor may not be possible. When clear, this flag indicates that the error did not affect the processor's state. This bit will always be set for MC errors, which are not corrected.
ADDRV	58	The MC_ADDR register valid flag indicates that the MC_ADDR register contains the address where the error occurred. When clear, this flag indicates that the MC_ADDR register does not contain the address where the error occurred. The MC_ADDR register should not be read if the ADDRV bit is clear.
MISCV	59	The MC_MISC register valid flag indicates that the MC_MISC register contains additional information regarding the error. When clear, this flag indicates that the MC_MISC register does not contain additional information regarding the error. MC_MISC should not be read if the MISCV bit is not set.
EN	60	The error enabled flag indicates that reporting of the machine check exception for this error was enabled by the associated flag bit of the MC_CTL register. Note that correctable errors do not have associated enable bits in the MC_CTL register so the EN bit should be clear when a correctable error is logged.
UC	61	The error uncorrected flag indicates that the processor did not correct the error condition. When clear, this flag indicates that the processor was able to correct the event condition.
OVER	62	The machine check overflow flag indicates that a machine check error occurred while the results of a previous error were still in the register bank (i.e., the VAL bit was already set in the MC_STATUS register). The processor sets the OVER flag and software is responsible for clearing it. Enabled errors are written over disabled errors, and uncorrected errors are written over corrected events. Uncorrected errors are not written over previous valid uncorrected errors.
VAL	63	The MC_STATUS register valid flag indicates that the information within the MC_STATUS register is valid. When this flag is set, the processor follows the rules given for the OVER flag in the MC_STATUS register when overwriting previously valid entries. The processor sets the VAL flag and software is responsible for clearing it.

18.14.1.1 Processor Machine Check Status Register MCA Error Code Definition

The Intel Xeon processor MP 7100 series uses compound MCA Error Codes for logging its CBC internal machine check errors, L3 Errors, and Bus/Interconnect Errors. It defines additional Machine Check error types (IA32_MC4_STATUS[15:0]) beyond those defined in Chapter 17. Table 18-47 lists these model-specific MCA error codes. Error code details are specified in MC4_STATUS [31:16]; see Section 18.14.3, the "Model Specific Error Code" field. The information in the "Other_Info" field (MC4_STATUS[56:32]) is common to the three processor error types and contains a correctable event count and specifies the MC4_MISC register format.

Table 18-47. Incremental MCA Error Code for Intel® Xeon® Processor MP 7100

Processor MCA_Error_Code (MC4_STATUS[15:0])			
Type	**Error Code**	**Binary Encoding**	**Meaning**
C	Internal Error	0000 0100 0000 0000	Internal Error Type Code.
A	L3 Tag Error	0000 0001 0000 1011	L3 Tag Error Type Code.
B	Bus and Interconnect Error	0000 100x 0000 1111	Not used, but this encoding is reserved for compatibility with other MCA implementations.
		0000 101x 0000 1111	Not used, but this encoding is reserved for compatibility with other MCA implementations.
		0000 110x 0000 1111	Not used, but this encoding is reserved for compatibility with other MCA implementations.
		0000 1110 0000 1111	Bus and Interconnection Error Type Code.
		0000 1111 0000 1111	Not used, but this encoding is reserved for compatibility with other MCA implementations.

The **bold faced** binary encodings are the only encodings used by the processor for MC4_STATUS[15:0].

18.14.2 Other_Info Field (All MCA Error Types)

The MC4_STATUS[56:32] field is common to the processor's three MCA error types (A, B, and C).

Table 18-48. Other Information Field Bit Definition

Bit Field Name	Bits	Description
39:32	8-bit Correctable Event Count	This field holds a count of the number of correctable events since cold reset. This is a saturating counter; the counter begins at 1 (with the first error) and saturates at a count of 255.
41:40	MC4_MISC Format Type	The value in this field specifies the format of information in the MC4_MISC register. Currently, only two values are defined. Valid only when MISCV is asserted.
43:42	Reserved	Reserved
51:44	ECC Syndrome	ECC syndrome value for a correctable ECC event when the "Valid ECC syndrome" bit is asserted.
52	Valid ECC Syndrome	Set when a correctable ECC event supplies the ECC syndrome.
54:53	Threshold-Based Error Status	00: No tracking. No hardware status tracking is provided for the structure reporting this event. 01: Green. Status tracking is provided for the structure posting the event; the current status is green (below threshold). 10: Yellow. Status tracking is provided for the structure posting the event; the current status is yellow (above threshold). 11: Reserved for future use. Valid only if the Valid bit (bit 63) is set. Undefined if the UC bit (bit 61) is set.
56:55	Reserved	Reserved

18.14.3 Processor Model Specific Error Code Field

18.14.3.1 MCA Error Type A: L3 Error

Note: The Model Specific Error Code field in MC4_STATUS (bits 31:16).

Table 18-49. Type A: L3 Error Codes

Bit Num	Sub-Field Name	Description	Legal Value(s)
18:16	L3 Error Code	Describes the L3 error encountered	000: No error. 001: More than one way reporting a correctable event. 010: More than one way reporting an uncorrectable error. 011: More than one way reporting a tag hit. 100: No error. 101: One way reporting a correctable event. 110: One way reporting an uncorrectable error. 111: One or more ways reporting a correctable event while one or more ways are reporting an uncorrectable error.
20:19	---	Reserved	00
31:21	---	Fixed pattern	0010_0000_000

18.14.3.2 Processor Model Specific Error Code Field Type B: Bus and Interconnect Error

Note: The Model Specific Error Code field in MC4_STATUS (bits 31:16).

Table 18-50. Type B: Bus and Interconnect Error Codes

Bit Num	Sub-Field Name	Description
16	FSB Request Parity	Parity error detected during FSB request phase.
17	Core0 Addr Parity	Parity error detected on Core 0 request's address field.
18	Core1 Addr Parity	Parity error detected on Core 1 request's address field.
19	Reserved	Reserved
20	FSB Response Parity	Parity error on FSB response field detected.
21	FSB Data Parity	FSB data parity error on inbound data detected.
22	Core0 Data Parity	Data parity error on data received from Core 0 detected.
23	Core1 Data Parity	Data parity error on data received from Core 1 detected.
24	IDS Parity	Detected an Enhanced Defer parity error (phase A or phase B).
25	FSB Inbound Data ECC	Data ECC event to error on inbound data (correctable or uncorrectable).
26	FSB Data Glitch	Pad logic detected a data strobe 'glitch' (or sequencing error).
27	FSB Address Glitch	Pad logic detected a request strobe 'glitch' (or sequencing error).
31:28	Reserved	Reserved

Exactly one of the bits defined in the preceding table will be set for a Bus and Interconnect Error. The Data ECC can be correctable or uncorrectable; the MC4_STATUS.UC bit distinguishes between correctable and uncorrectable cases with the Other_Info field possibly providing the ECC Syndrome for correctable errors. All other errors for this processor MCA Error Type are uncorrectable.

18.14.3.3 Processor Model Specific Error Code Field Type C: Cache Bus Controller Error

Table 18-51. Type C: Cache Bus Controller Error Codes

MC4_STATUS[31:16] (MSCE) Value	Error Description
0000_0000_0000_0001 0001H	Inclusion Error from Core 0.
0000_0000_0000_0010 0002H	Inclusion Error from Core 1.
0000_0000_0000_0011 0003H	Write Exclusive Error from Core 0.
0000_0000_0000_0100 0004H	Write Exclusive Error from Core 1.
0000_0000_0000_0101 0005H	Inclusion Error from FSB.
0000_0000_0000_0110 0006H	SNP Stall Error from FSB.
0000_0000_0000_0111 0007H	Write Stall Error from FSB.
0000_0000_0000_1000 0008H	FSB Arb Timeout Error.
0000_0000_0000_1001 0009H	CBC OOD Queue Underflow/overflow.
0000_0001_0000_0000 0100H	Enhanced Intel SpeedStep Technology TM1-TM2 Error.
0000_0010_0000_0000 0200H	Internal Timeout Error.
0000_0011_0000_0000 0300H	Internal Timeout Error.
0000_0100_0000_0000 0400H	Intel® Cache Safe Technology Queue Full Error or Disabled-ways-in-a-set overflow.
1100_0000_0000_0001 C001H	Correctable ECC event on outgoing FSB data.
1100_0000_0000_0010 C002H	Correctable ECC event on outgoing Core 0 data.
1100_0000_0000_0100 C004H	Correctable ECC event on outgoing Core 1 data.
1110_0000_0000_0001 E001H	Uncorrectable ECC error on outgoing FSB data.
1110_0000_0000_0010 E002H	Uncorrectable ECC error on outgoing Core 0 data.
1110_0000_0000_0100 E004H	Uncorrectable ECC error on outgoing Core 1 data.
— All other encodings —	Reserved

All errors, except for the correctable ECC types, in this table are uncorrectable. The correctable ECC events may supply the ECC syndrome in the Other_Info field of the MC4_STATUS MSR.

Table 18-52. Decoding Family 0FH Machine Check Codes for Cache Hierarchy Errors

Type	Bit No.	Bit Function	Bit Description
MCA error codes[1]	15:0		
Model Specific Error Codes	17:16	Tag Error Code	Contains the tag error code for this machine check error: 00: No error detected. 01: Parity error on tag miss with a clean line. 10: Parity error/multiple tag match on tag hit. 11: Parity error/multiple tag match on tag miss.
	19:18	Data Error Code	Contains the data error code for this machine check error: 00: No error detected. 01: Single bit error. 10: Double bit error on a clean line. 11: Double bit error on a modified line.
	20	L3 Error	This bit is set if the machine check error originated in the L3 (it can be ignored for invalid PIC request errors): 1: L3 error. 0: L2 error.
	21	Invalid PIC Request	Indicates error due to invalid PIC request access was made to PIC space with WB memory: 1: Invalid PIC request error. 0: No invalid PIC request error.
	31:22	Reserved	Reserved
Other Information	39:32	8-bit Error Count	Holds a count of the number of errors since reset. The counter begins at 0 for the first error and saturates at a count of 255.
	56:40	Reserved	Reserved
Status Register Validity Indicators[1]	63:57		

NOTES:

1. These fields are architecturally defined. Refer to Chapter 17, "Machine-Check Architecture," for more information.

19. Updates to Chapter 20, Volume 3B

Change bars and violet text show changes to Chapter 20 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B:* System Programming Guide, Part 2.

Changes to this chapter:

- Added Section 20.1.3.6, "LBR Event Logging."

CHAPTER 20
LAST BRANCH RECORDS

NOTE

This chapter defines a last-branch recording (LBR) facility that is architectural and part of the Intel 64 architecture. This facility is an enhancement of but distinct from earlier LBR facilities that were not architectural. Those earlier facilities are documented in Chapter 19.

Support of the architectural LBR feature in a logical processor is reported in CPUID.(EAX=07H, ECX=0H):EDX[19]=1. When the architectural LBR feature is supported, capability details like the number of LBR records that are available is indicated in CPUID.1CH:EAX[7:0]. The number of LBR records available varies across processor generations, so software should only access the available LBR records indicated by CPUID.1CH:EAX[7:0].

Last Branch Records (LBRs) enable recording of software path history by logging taken branches and other control flow transfers within processor registers. Each LBR record or entry is comprised of three MSRs:

- IA32_LBR_x_FROM_IP — Holds the source IP of the operation.
- IA32_LBR_x_TO_IP — Holds the destination IP of the operation.
- IA32_LBR_x_INFO — Holds metadata for the operation, including mispredict, TSX, and elapsed cycle time information.

LBR records are stored in age order. The most recent LBR entry is stored in IA32_LBR_0_*, the next youngest in IA32_LBR_1_*, and so on. When an operation to be recorded completes (retires) with LBRs enabled (IA32_LBR_CTL.LBREn=1), older LBR entries are shifted in the LBR array by one entry, then a record of the new operation is written into entry 0. See Section 20.1.1 for the list of recorded operations.

The number of LBR entries available for recording operations is dictated by the value in IA32_LBR_DEPTH.DEPTH. By default, the DEPTH value matches the maximum number of LBRs supported by the processor, but software may opt to use fewer in order to achieve reduced context switch latency.

In addition to the LBRs, there is a single Last Event Record (LER). It records the last taken branch preceding the last exception, hardware interrupt, or software interrupt. Like LBRs, the LER is comprised of three MSRs (IA32_LER_FROM_IP, IA32_LER_TO_IP, IA32_LER_INFO), and is subject to the same dependencies on enabling and filtering.

Which operations are recorded in LBRs depends upon a series of factors:

- Branch Type Filtering — Software must opt in to the types of branches to be logged; see Section 20.1.2.3.
- Current Privilege Level (CPL) — LBRs can be filtered based on CPL; see Section 20.1.2.5.
- LBR Freeze — LBR and LER recording can be suspended by setting IA32_PERF_GLOBAL_STATUS.LBR_FRZ to 1. See Section 19.4.7 for details on LBR_FRZ.

On some implementations, recording LBRs may require constraining the number of operations that can complete in a cycle. As a result, on these implementations, enabling LBRs may have some performance overhead.

20.1 BEHAVIOR

20.1.1 Logged Operations

LBRs can log most control flow transfer operations.

The source IP recorded for a branch instruction is the IP of that instruction. For events that take place between instructions, the source IP recorded is the IP of the next sequential instruction.

The destination IP recorded is always the target of the branch or event, the next instruction that will execute.

The full list of operations and the respective IPs recorded is shown in Table 20-1.

Table 20-1. LBR IP Values for Various Operations

Operation	FROM_IP	TO_IP
Taken Branch[1], Exception, INT3, INTn, INTO, TSX Abort	Current IP	Target IP
Interrupt	Next IP	Target IP
INIT (BSP)	Next IP	Reset Vector
INIT (AP) + SIPI	Next IP	SIPI Vector
EENTER/ERESUME + EEXIT/AEX	Current IP	Target or Trampoline IP
RSM[2]	Target IP	Target IP
#DB, #SMI, VM exit, VM entry	None	None

NOTES:

1. Direct CALLs with displacement zero, for which the target is typically the next sequential IP, are not treated as taken branches by LBRs.
2. RSM is only recorded in LBRs when IA32_DEBUGCTL.FREEZE_WHILE_SMM is set to 0.

20.1.2 Configuration

20.1.2.1 Enabling and Disabling

LBRs are enabled by setting IA32_LBR_CTL.LBREn to 1.

Some operations, such as entry to a secure mode like SMM or Intel SGX, can cause LBRs to be temporarily disabled. Other operations, such as debug exceptions or some SMX operations, disable LBRs and require software to re-enable them. Details on these interactions can be found in Section 20.1.4.

20.1.2.2 LBR Depth

The number of LBRs used by the processor can be constrained by modifying the IA32_LBR_DEPTH.DEPTH value. DEPTH defaults to the maximum number of LBRs supported by the processor. Allowed DEPTH values can be found in CPUID.1CH:EAX[7:0].

Reducing the LBR depth can result in improved performance, by reducing the number of LBRs that need to be read and/or context switched.

On a software write to IA32_LBR_DEPTH, all LBR entries are reset to 0. LERs are not impacted.

A RDMSR or WRMSR to any IA32_LBR_x_* MSRs, such that x ≥ DEPTH, will generate a #GP exception. Note that the XSAVES and XRSTORS instructions access only the LBRs associated with entries 0 to DEPTH-1.

By clearing the LBR entries on writes to IA32_LBR_DEPTH, and forbidding any software writes to LBRs ≥ DEPTH, it is thereby guaranteed that any LBR entries equal to or above DEPTH will have value 0.

20.1.2.3 Branch Type Enabling and Filtering

Software must opt in to the types of branches that are desired to be recorded. These elections are made in IA32_LBR_CTL; see Section 20.2. Branch type options are listed in Table 20-2; only those enabled will be recorded.

Table 20-2. Branch Type Filtering Details

Branch Type	Operations Recorded
COND	Jcc, J*CXZ, and LOOP*
NEAR_IND_JMP	JMP r/m*
NEAR_REL_JMP	JMP rel*
NEAR_IND_CALL	CALL r/m*
NEAR_REL_CALL	CALL rel* (excluding CALLs to the next sequential IP)
NEAR_RET	RET (0C3H)
OTHER_BRANCH	JMP/CALL ptr*, JMP/CALL m*, RET (0C8H), SYS*, interrupts, exceptions (other than debug exceptions), IRET, INT3, INTn, INTO, TSX Abort, EENTER, ERESUME, EEXIT, AEX, INIT, SIPI, RSM

These encodings match those in IA32_LBR_x_INFO.BR_TYPE.

Control flow transfers that are not recorded include #DB, VM exit, VM entry, and #SMI.

20.1.2.4 Call-Stack Mode

The LBR array is, by default, treated as a ring buffer that captures control flow transitions. However, the finite depth of the LBR array can be limiting when profiling certain high-level languages (e.g., C++), where a transition of the execution flow is accompanied by a large number of leaf function calls. These calls to leaf functions, and their returns, are likely to displace the main execution context from the LBRs.

When call-stack mode is enabled, the LBR array can capture unfiltered call data normally, but as return instructions are executed the last captured branch (call) record is flushed from the LBRs in a last-in first-out (LIFO) manner. Thus, branch information pertaining to completed leaf functions will not be retained, while preserving the call stack information of the main line execution path.

Call-stack mode is enabled by setting IA32_LBR_CTL.CALL_STACK to 1. When enabled, near RET instructions receive special treatment. Rather than adding a new record in LBR_0, a near RET will instead "pop" the CALL entry at LBR_0 by shifting entries LBR_1..LBR_[DEPTH-1] up to LBR_0..LBR_[DEPTH-2], and clearing LBR_[DEPTH-1] to 0. Thus, LBR processing software can consume only valid call-stack entries by reading until finding an entry that is all zeros.

Call-stack mode should be used with branch type enabling configured to capture only CALLs (NEAR_REL_CALL and NEAR_IND_CALL) and RETs (NEAR_RET). When configured in this manner, the LBR array emulates a call stack, where CALLs are "pushed" and RETs "pop" them off the stack. If other branch types (JCC, NEAR_*_JMP, or OTHER_BRANCH) are enabled for recording with call-stack mode, LBR behavior may be undefined.

It is recommended that call-stack mode be used along with CPL filtering, by setting at most one of the OS and USR bits in the IA32_LBR_CTL MSR. Call-stack mode does not emulate the stack switch that can occur on CPL transitions, and hence monitoring all CPLs may result in a corrupted LBR call stack.

Call-Stack Mode and LBR Freeze

When IA32_DEBUGCTL.FREEZE_LBRS_ON_PMI=1, IA32_PERF_GLOBAL_STATUS.LBR_FRZ will be set to 1 when a PMI is pended. That will cause LBRs and LERs to cease recording branches until LBR_FRZ is cleared. Because there may be some "skid", or instructions retiring, in between the PMI being pended and the PMI being taken, it is possible that some branches may be missing from the LBRs. In the case of call-stack mode, if a CALL or RET is missed, that can lead to confusing results where CALL entries fail to get "popped" off the stack, and RETs "pop" the wrong CALLs.

An alternative is to utilize CPL filtering to limit LBR recording to less privileged modes only (CPL>3) instead of using the FREEZE_LBRS_ON_PMI=1 feature. This will record branches in the "skid", but avoid recording any branches in the privilege level 0 handler.

20.1.2.5 CPL Filtering

Software must opt in to which CPL(s) will have branches recorded. If IA32_LBR_CTL.OS=1, then branches in CPL=0 can be recorded. If IA32_LBR_CTL.USR=1, then branches in CPL>0 can be recorded. For operations which change the CPL, the operation is recorded in LBRs only if the CPL at the end of the operation is enabled for LBR recording. In cases where the CPL transitions from a value that is filtered out to a value that is enabled for LBR recording, the FROM_IP address for the recorded CPL transition branch or event will be 0FFFFFFFFFFFFFFFH.

20.1.3 Record Data

20.1.3.1 IP Fields

The source and destination IP values in IA32_LBR_x_[FROM|TO]_IP and IA32_LER_x_[FROM|TO]_IP may hold effective IPs or linear IPs (LIPs), depending on the processor generation. The effective IP is the offset from the CS base address, while LIP includes the CS base address. Which IP type is used is indicated in CPUID.1CH:EAX[bit 31].

The value read from this field will always be canonical. Note that this includes the case where a canonical violation (#GP) results from executing sequential code that runs precisely to the end of the lower canonical address space (where IP[63:MAXLINADDR-1] is 0, but IP[MAXLINADDR-2:0] is all ones). In this case, the FROM_IP will hold the lowest canonical address in the upper canonical space, such that IP[63:MAXLINADDR-1] is all ones, and IP[MAXLINADDR-2:0] is 0.

In some cases, due to CPL filtering, the FROM_IP of the recorded operation may be filtered out. In this case 0FFFFFFFFFFFFFFFH will be recorded. See Section 20.1.2.5 for details.

Writes of these fields will be forced canonical, such that the processor ignores the value written to the upper bits (IP[63:MAXLINADDR-1]).

20.1.3.2 Branch Types

The IA32_LBR_x_INFO.BR_TYPE and IA32_LER_INFO.BR_TYPE fields encode the branch types as shown in Table 20-3.

Table 20-3. IA32_LBR_x_INFO and IA32_LER_INFO Branch Type Encodings

Encoding	Branch Type
0000B	COND
0001B	NEAR_IND_JMP
0010B	NEAR_REL_JMP
0011B	NEAR_IND_CALL
0100B	NEAR_REL_CALL
0101B	NEAR_RET
011xB	Reserved
1xxxB	OTHER_BRANCH

For a list of branch operations that fall into the categories above, see Table 20-2. In future generations, BR_TYPE bits 2:0 may be used to distinguish between differing types of OTHER_BRANCH.

20.1.3.3 Cycle Time

Each time an operation is recorded in an LBR, the value of the LBR cycle timer is recorded in IA32_LBR_x_INFO.CYC_CNT. The LBR cycle timer is a saturating counter that counts at the processor clock rate. Each time an operation is recorded in an LBR, the counter is reset but continues counting.

There is an LBR cycle counter valid bit, IA32_LBR_x_INFO.CYC_CNT_VALID. When set, the CYC_CNT field holds a valid value, the number of elapsed cycles since the last operation recorded in an LBR (up to 0FFFFH).

Some implementations may opt to reduce the granularity of the CYC_CNT field for larger values. The implication of this is that the least significant bits may be forced to 1 in cases where the count has reached some minimum threshold. It is guaranteed that this reduced granularity will never result in an inaccuracy of more than 10%.

20.1.3.4 Mispredict Information

IA32_LBR_x_INFO.MISPRED provides an indication of whether the recorded branch was predicted incorrectly by the processor. The bit is set if either the taken/not-taken direction of a conditional branch was mispredicted, or if the target of an indirect branch was mispredicted.

20.1.3.5 Intel® TSX Information

IA32_LBR_x_INFO.IN_TSX indicates whether the operation recorded retired during a TSX transaction. IA32_LBR_x_INFO.TSX_ABORT indicates that the operation is a TSX Abort.

20.1.3.6 LBR Event Logging

LBR Event Logging provides a means to log PMU event data in LBRs. This event data can be used to provide some causality information for the Cycle Time metadata currently recorded in the LBRs' IA32_LBR_x_INFO.CYC_CNT field (also known as Timed LBR).

When a programmable counter is enabled for a precise event and LBR is enabled, setting EN_LBR_LOG (bit 35) in the associated IA32_PERFEVTSELx MSR enables occurrences of the chosen event to be additionally logged in a new IA32_LBR_INFO.PMCx_CNT field. This two-bit field represents the number of occurrences of the event since retirement of the operation that last recorded an LBR entry, saturating at a value of 3. For example, this field is called PMC0_CNT at bits 33:32 of the IA32_LBR_x_INFO MSR for general-purpose counter 0. The same bits in the IA32_LER_x_INFO MSRs continue to be reserved.

If the event chosen in the IA32_PERFEVTSELx is MSR not precise, no counts will be logged in LBRs. The events that are precise on a given platform can be found in the online event list: https://perfmon-events.intel.com/.

When using LBR Event Logging, software should keep consistent CPL filtering settings between LBR and PerfMon. Keeping the OS/USR bits in the IA32_LBR_CTL MSR and in the IA32_PERFEVTSELx MSR consistent ensures that only events that occur in one or more chosen modes are logged. Similarly, software should keep FREEZE_LBRS_ON_PMI and FREEZE_PERFMON_ON_PMI in the IA32_DEBUGCTL MSR consistent. Other counter filtering in the IA32_PERFEVTSELx MSRs (e.g., INV, CMASK, EDGE, and IN_TX) should be cleared; otherwise the behavior and PMCx_CNT values are undefined.

Per-counter support for LBR Event Logging is indicated by the "Event Logging Supported" bitmap in CPUID.(EAX=01CH, ECX=0H).ECX[19:16].

20.1.4 Interaction with Other Processor Features

20.1.4.1 SMM

IA32_LBR_CTL.LBREn is saved and cleared on #SMI, and restored on RSM. As a result of disabling LBRs, the #SMI is not recorded. RSM is recorded only if IA32_DEBUGCTL.FREEZE_WHILE_SMM is set to 0, and the FROM_IP will be set to the same value as the TO_IP.

20.1.4.2 SMM Transfer Monitor (STM)

LBREn is not cleared on #SMI when it causes SMM VM exit. Instead, the STM should use the VMCS controls described in Section 20.1.4.3 to disable LBRs while in SMM, and to restore them on VM entries that exit SMM.

On VMCALL to configure STM, IA32_LBR_CTL is cleared.

20.1.4.3 VMX

By default, LBR operation persists across VMX transitions. However, VMCS fields have been added to enable constraining LBR usage to within non-root operation only. See details in Table 20-4.

Table 20-4. LBR VMCS Fields

Name	Type	Bit Position	Behavior
Guest IA32_LBR_CTL	Guest State Field	NA	The guest value of IA32_LBR_CTL is written to this field on all VM exits.
Load Guest IA32_LBR_CTL	Entry Control	21	When set, VM entry will write the value from the "Guest IA32_LBR_CTL" guest state field to IA32_LBR_CTL.
Clear IA32_LBR_CTL	Exit Control	26	When set, VM exit will clear IA32_LBR_CTL after the value has been saved to the "Guest IA32_LBR_CTL" guest state field.

To enable "guest-only" LBR use, a VMM should set both the "Load Guest IA32_LBR_CTL" entry control and the "Clear IA32_LBR_CTL" exit control. For "system-wide" LBR use, where LBRs remain enabled across host and guest(s), a VMM should keep both new VMCS controls clear.

VM entry checks that, if the "Load Guest IA32_LBR_CTL" entry control is 1, bits reserved in the IA32_LBR_CTL MSR must be 0 in the field for that register.

For additional information relating to VMX transitions, see Chapter 26, Chapter 28, and Chapter 29 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C.

20.1.4.4 Intel® SGX

On entry to an enclave, via EENTER or ERESUME, logging of LBR entries is suspended. On enclave exit, via EEXIT or AEX, logging resumes. The cycle counter will continue to run during enclave execution.

An exception to the above is made for opt-in debug enclaves. For such enclaves, LBR logging is not impacted.

20.1.4.5 Debug Exceptions

When a branch happens because of a #DB exception, IA32_LBR_CTL.LBREn is cleared. As a result, the operation is not recorded.

20.1.4.6 SMX

On GETSEC leaves SENTER or ENTERACCS, IA32_LBR_CTL is cleared. As a result, the operation is not recorded.

20.1.4.7 MWAIT

On an MWAIT that requests a C-state deeper than C1, IA32_LBR_x_* MSRs may be cleared to 0. IA32_LBR_CTL, IA32_LBR_DEPTH, and IA32_LER_* MSRs will be preserved.

For an MWAIT that enters a C-state equal to or less deep than C1, and all C-states that enter as a result of Hardware Duty Cycling (HDC), all LBR MSRs are preserved.

20.1.4.8 Processor Event-Based Sampling (PEBS)

PEBS records can be configured to include LBRs, by setting PEBS_DATA_CFG.LBREn[3]=1. The number of LBRs to include in the record is also configurable, via PEBS_DATA_CFG.NUM_LBRS[28:24]. For details on PEBS, see Section 21.9 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B.

If NUM_LBRS is set to a value greater than LBR_DEPTH, then only LBR_DEPTH entries will be written into the PEBS record. Further, the Record Size field will be decreased to match the actual size of the record to be written, and the

Record Format field will replace the value of NUM_LBRS with the value of LBR_DEPTH. These adjustments ensure that software is able to properly interpret the PEBS record.

20.2 MSRS

The MSRs that represent the LBR entries (IA32_LBR_x_[TO|FROM|INFO]) and the LER entry (IA32_LER_[TO|FROM|INFO]) do not fault on writes. Any address field written will force sign-extension based on the maximum linear address width supported by the processor, and any non-zero value written to undefined bits may be ignored such that subsequent reads return 0.

On a warm reset, all LBR MSRs, including IA32_LBR_DEPTH, have their values preserved. However, IA32_L-BR_CTL.LBREn is cleared to 0, disabling LBRs. If a warm reset is triggered while the processor is in the C6 idle state, also known as warm init, all LBR MSRs will be reset to their initial values.

See Table 2-2 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4, for details on LBR MSRs.

20.3 FAST LBR READ ACCESS

XSAVES provides a faster means than RDMSR for software to read all LBRs. When using XSAVES for reading LBRs rather than for context switch, software should take care to ensure that XSAVES does not write LBR state to an area of memory that has been or will be used by XRSTORS. This could corrupt INIT tracking.

20.4 OTHER IMPACTS

20.4.1 Branch Trace Store on Intel Atom® Processors

Branch Trace Store (BTS) on Intel Atom processors that support the architectural form of the LBR feature has dependencies on the LBR configuration. BTS will store out the LBR_0 (TOS) record each time a taken branch or event retires. If any filtering of LBRs is employed, or if LBRs are disabled, some duplicate entries may be stored by BTS. Like LBRs and LERs, BTS is suspended when IA32_PERF_GLOBAL_STATUS.LBR_FRZ is set to 1.

BTS will change to cease issuing branch records for direct near CALLs with displacement zero to align with LBR behavior.

20.4.2 IA32_DEBUGCTL

On processors that do not support model-specific LBRs, IA32_DEBUGCTL[bit 0] has no meaning. It can be written to 0 or 1, but reads will always return 0.

20.4.3 IA32_PERF_CAPABILITIES

On processors that do not support model-specific LBRs, IA32_PERF_CAPABILITIES.LBR_FMT will have the value 03FH.

20. Updates to Chapter 21, Volume 3B

Change bars and violet text show changes to Chapter 21 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B:* System Programming Guide, Part 2.

Changes to this chapter:

- Updated Section 21.1, "Performance Monitoring Overview," with the performance monitoring GitHub location.
- Added a note to the end of Section 21.2.1, "Architectural Performance Monitoring Version 1," to indicate that a non-zero write of a field that is introduced in a later architectural performance monitoring version results in a general-protection (#GP) exception if that field is not supported by prior versions.
- Updated Table 21-1, "Association of Fixed-Function Performance Counters with Architectural Performance Events," with additional counters.
- Added Section 21.2.6, "Architectural Performance Monitoring Version 6."
- Update Table 21-3 and the surrounding text in Section 21.2.7, "Pre-defined Architectural Performance Events," to add new events.
- Added Section 21.2.9, "Scalable Enumeration Architecture."
- Updated Section 21.3.10, "12th and 13th Generation Intel® Core™ Processors, and 4th and 5th Generation Intel® Xeon® Scalable Processor Family Performance Monitoring Facility," to add information on 5th Generation Intel Xeon Scalable processors.
- Added Section 21.3.11, "Intel® Series 2 Core™ Ultra Processor Performance Monitoring Facility."
- Updated Section 21.6.2.4.2 "PEBS Record Format," with an additional encoding value.
- Updated Section 21.8, "IA32_PERF_CAPABILITIES MSR Enumeration," with information about IA32_PERF_CAPABILITIES.PEBS_TIMING_INFO[17] and IA32_PERF_CAPABILITIES.RDPMC_METRICS_CLEAR[19].
- Updated Section 21.9.2.3, "MSR_PEBS_DATA_CFG."
- Updated Section 21.9.6, "PDist: Precise Distribution."
- Updated Section 21.9.7, "Load Latency Facility."
- Added Section 21.9.9, "Timed Processor Event Based Sampling."
- Added Section 21.9.10, "Counters Snapshotting."
- Added Section 21.9.11, "Auto Counter Reload."

CHAPTER 21
PERFORMANCE MONITORING

Intel 64 and IA-32 architectures provide facilities for monitoring performance via a PMU (Performance Monitoring Unit).

NOTE

Performance monitoring events can be found here: https://perfmon-events.intel.com/.

Additionally, performance monitoring event files for Intel processors are hosted by the Intel Open Source Technology Center. These files can be downloaded here: https://download.01.org/perfmon/.

21.1 PERFORMANCE MONITORING OVERVIEW

Performance monitoring was introduced in the Pentium processor with a set of model-specific performance-monitoring counter MSRs. These counters permit selection of processor performance parameters to be monitored and measured. The information obtained from these counters can be used for tuning system and compiler performance.

In Intel P6 family of processors, the performance monitoring mechanism was enhanced to permit a wider selection of events to be monitored and to allow greater control events to be monitored. Next, Intel processors based on Intel NetBurst microarchitecture introduced a distributed style of performance monitoring mechanism and performance events.

The performance monitoring mechanisms and performance events defined for the Pentium, P6 family, and Intel processors based on Intel NetBurst microarchitecture are not architectural. They are all model specific (not compatible among processor families). Intel Core Solo and Intel Core Duo processors support a set of architectural performance events and a set of non-architectural performance events. Newer Intel processor generations support enhanced architectural performance events and non-architectural performance events.

Starting with Intel Core Solo and Intel Core Duo processors, there are two classes of performance monitoring capabilities. The first class supports events for monitoring performance using counting or interrupt-based event sampling usage. These events are non-architectural and vary from one processor model to another. They are similar to those available in Pentium M processors. These non-architectural performance monitoring events are specific to the microarchitecture and may change with enhancements. They are discussed in Section 21.6.3, "Performance Monitoring (Processors Based on Intel NetBurst® Microarchitecture)." Non-architectural events for a given microarchitecture cannot be enumerated using CPUID; and they can be found at: https://perfmon-events.intel.com/ or at https://github.com/intel/perfmon/.

The second class of performance monitoring capabilities is referred to as architectural performance monitoring. This class supports the same counting and Interrupt-based event sampling usages, with a smaller set of available events. The visible behavior of architectural performance events is consistent across processor implementations. Availability of architectural performance monitoring capabilities is enumerated using the CPUID.0AH. These events are discussed in Section 21.2.

21.2 ARCHITECTURAL PERFORMANCE MONITORING

Performance monitoring events are architectural when they behave consistently across microarchitectures. Intel Core Solo and Intel Core Duo processors introduced architectural performance monitoring. The feature provides a mechanism for software to enumerate performance events and provides configuration and counting facilities for events.

Architectural performance monitoring does allow for enhancement across processor implementations. The CPUID.0AH leaf provides version ID for each enhancement. Intel Core Solo and Intel Core Duo processors support base level functionality identified by version ID of 1. Processors based on Intel Core microarchitecture support, at a minimum, the base level functionality of architectural performance monitoring. Intel Core 2 Duo processor T

7700 and newer processors based on Intel Core microarchitecture support both the base level functionality and enhanced architectural performance monitoring identified by version ID of 2.

45 nm and 32 nm Intel Atom processors and Intel Atom processors based on the Silvermont microarchitecture support the functionality provided by versionID 1, 2, and 3; CPUID.0AH:EAX[7:0] reports versionID = 3 to indicate the aggregate of architectural performance monitoring capabilities. Intel Atom processors based on the Airmont microarchitecture support the same performance monitoring capabilities as those based on the Silvermont microarchitecture. Intel Atom processors based on the Goldmont and Goldmont Plus microarchitectures support versionID 4. Intel Atom processors starting with processors based on the Tremont microarchitecture support versionID 5.

Intel Core processors and related Intel Xeon processor families based on the Nehalem through Broadwell microarchitectures support version ID 3. Intel processors based on the Skylake through Coffee Lake microarchitectures support versionID 4. Intel processors starting with processors based on the Ice Lake microarchitecture support versionID 5.

21.2.1 Architectural Performance Monitoring Version 1

Configuring an architectural performance monitoring event involves programming performance event select registers. There are a finite number of performance event select MSRs (IA32_PERFEVTSELx MSRs). The result of a performance monitoring event is reported in a performance monitoring counter (IA32_PMCx MSR). Performance monitoring counters are paired with performance monitoring select registers.

Performance monitoring select registers and counters are architectural in the following respects:

- The bit field layout of IA32_PERFEVTSELx is consistent across microarchitectures. A non-zero write of a field that is introduced after the initial implementation of architectural performance monitoring (Version 1) results in #GP if that field is not supported.
- Addresses of IA32_PERFEVTSELx MSRs remain the same across microarchitectures.
- Addresses of IA32_PMC MSRs remain the same across microarchitectures.
- Each logical processor has its own set of IA32_PERFEVTSELx and IA32_PMCx MSRs. Configuration facilities and counters are not shared between logical processors sharing a processor core.

Architectural performance monitoring provides a CPUID mechanism for enumerating the following information:

- Number of performance monitoring counters available to software in a logical processor (each IA32_PERFEVTSELx MSR is paired to the corresponding IA32_PMCx MSR).
- Number of bits supported in each IA32_PMCx.
- Number of architectural performance monitoring events supported in a logical processor.

Software can use CPUID to discover architectural performance monitoring availability (CPUID.0AH). The architectural performance monitoring leaf provides an identifier corresponding to the version number of architectural performance monitoring available in the processor.

The version identifier is retrieved by querying CPUID.0AH:EAX[bits 7:0] (see Chapter 3, "Instruction Set Reference, A-L," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A). If the version identifier is greater than zero, architectural performance monitoring capability is supported. Software queries the CPUID.0AH for the version identifier first; it then analyzes the value returned in CPUID.0AH.EAX, CPUID.0AH.EBX to determine the facilities available.

In the initial implementation of architectural performance monitoring; software can determine how many IA32_PERFEVTSELx/ IA32_PMCx MSR pairs are supported per core, the bit-width of PMC, and the number of architectural performance monitoring events available.

Architectural performance monitoring facilities include a set of performance monitoring counters and performance event select registers. These MSRs have the following properties:

- IA32_PMCx MSRs start at address 0C1H and occupy a contiguous block of MSR address space; the number of MSRs per logical processor is reported using CPUID.0AH:EAX[15:8]. Note that this may vary from the number of physical counters present on the hardware, because an agent running at a higher privilege level (e.g., a VMM) may not expose all counters.

- IA32_PERFEVTSELx MSRs start at address 186H and occupy a contiguous block of MSR address space. Each performance event select register is paired with a corresponding performance counter in the 0C1H address block. Note the number of IA32_PERFEVTSELx MSRs may vary from the number of physical counters present on the hardware, because an agent running at a higher privilege level (e.g., a VMM) may not expose all counters.
- The bit width of an IA32_PMCx MSR is reported using the CPUID.0AH:EAX[23:16]. This the number of valid bits for read operation. On write operations, the lower-order 32 bits of the MSR may be written with any value, and the high-order bits are sign-extended from the value of bit 31.
- Bit field layout of IA32_PERFEVTSELx MSRs is defined architecturally.

See Figure 21-1 for the bit field layout of IA32_PERFEVTSELx MSRs. The bit fields are:

- **Event select field (bits 0 through 7) —** Selects the event logic unit used to detect microarchitectural conditions (see Table 21-3, for a list of architectural events and their 8-bit codes). The set of values for this field is defined architecturally; each value corresponds to an event logic unit for use with an architectural performance event. The number of architectural events is queried using CPUID.0AH:EAX. A processor may support only a subset of pre-defined values.

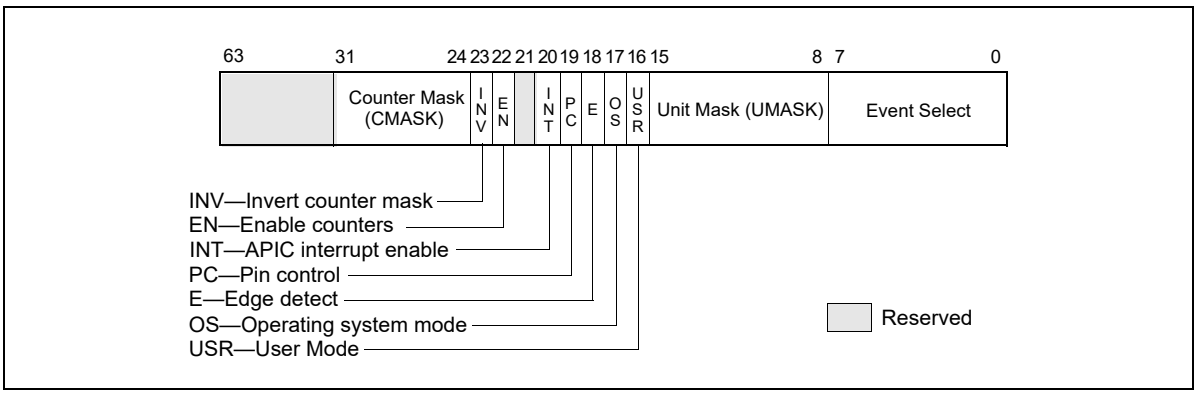

Figure 21-1. Layout of IA32_PERFEVTSELx MSRs

- **Unit mask (UMASK) field (bits 8 through 15)** — These bits qualify the condition that the selected event logic unit detects. Valid UMASK values for each event logic unit are specific to the unit. For each architectural performance event, its corresponding UMASK value defines a specific microarchitectural condition.

  A pre-defined microarchitectural condition associated with an architectural event may not be applicable to a given processor. The processor then reports only a subset of pre-defined architectural events. Pre-defined architectural events are listed in Table 21-3; support for pre-defined architectural events is enumerated using CPUID.0AH:EBX.
- **USR (user mode) flag (bit 16) —** Specifies that the selected microarchitectural condition is counted when the logical processor is operating at privilege levels 1, 2 or 3. This flag can be used with the OS flag.
- **OS (operating system mode) flag (bit 17) —** Specifies that the selected microarchitectural condition is counted when the logical processor is operating at privilege level 0. This flag can be used with the USR flag.
- **E (edge detect) flag (bit 18) —** Enables (when set) edge detection of the selected microarchitectural condition. The logical processor counts the number of deasserted to asserted transitions for any condition that can be expressed by the other fields. The mechanism does not permit back-to-back assertions to be distinguished.

  This mechanism allows software to measure not only the fraction of time spent in a particular state, but also the average length of time spent in such a state (for example, the time spent waiting for an interrupt to be serviced).
- **PC (pin control) flag (bit 19) —** Beginning with Sandy Bridge microarchitecture, this bit is reserved (not writeable). On processors based on previous microarchitectures, the logical processor toggles the PM*i* pins and increments the counter when performance-monitoring events occur; when clear, the processor toggles the PM*i* pins when the counter overflows. The toggling of a pin is defined as assertion of the pin for a single bus clock followed by deassertion.

- **INT (APIC interrupt enable) flag (bit 20) —** When set, the logical processor generates an exception through its local APIC on counter overflow.
- **EN (Enable Counters) Flag (bit 22) —** When set, performance counting is enabled in the corresponding performance-monitoring counter; when clear, the corresponding counter is disabled. The event logic unit for a UMASK must be disabled by setting IA32_PERFEVTSELx[bit 22] = 0, before writing to IA32_PMCx.
- **INV (invert) flag (bit 23) —** When set, inverts the counter-mask (CMASK) comparison, so that both greater than or equal to and less than comparisons can be made (0: greater than or equal; 1: less than). Note if counter-mask is programmed to zero, INV flag is ignored.
- **Counter mask (CMASK) field (bits 24 through 31) —** When this field is not zero, a logical processor compares this mask to the events count of the detected microarchitectural condition during a single cycle. If the event count is greater than or equal to this mask, the counter is incremented by one. Otherwise the counter is not incremented.

  This mask is intended for software to characterize microarchitectural conditions that can count multiple occurrences per cycle (for example, two or more instructions retired per clock; or bus queue occupations). If the counter-mask field is 0, then the counter is incremented each cycle by the event count associated with multiple occurrences.

NOTE

A non-zero write of a field that is introduced in a later architectural performance monitoring version results in a general-protection (#GP) exception if that field is not supported by prior versions.

21.2.2 Architectural Performance Monitoring Version 2

The enhanced features provided by architectural performance monitoring version 2 include the following:

- **Fixed-function performance counter register and associated control register** — Three of the architectural performance events are counted using three fixed-function MSRs (IA32_FIXED_CTR0 through IA32_-FIXED_CTR2). Each of the fixed-function PMC can count only one architectural performance event.

  Configuring the fixed-function PMCs is done by writing to bit fields in the MSR (IA32_FIXED_CTR_CTRL) located at address 38DH. Unlike configuring performance events for general-purpose PMCs (IA32_PMCx) via UMASK field in (IA32_PERFEVTSELx), configuring, programming IA32_FIXED_CTR_CTRL for fixed-function PMCs do not require any UMASK.
- **Simplified event programming** — Most frequent operation in programming performance events are enabling/disabling event counting and checking the status of counter overflows. Architectural performance event version 2 provides three architectural MSRs:
  - IA32_PERF_GLOBAL_CTRL allows software to enable/disable event counting of all or any combination of fixed-function PMCs (IA32_FIXED_CTRx) or any general-purpose PMCs via a single WRMSR.
  - IA32_PERF_GLOBAL_STATUS allows software to query counter overflow conditions on any combination of fixed-function PMCs or general-purpose PMCs via a single RDMSR.
  - IA32_PERF_GLOBAL_OVF_CTRL allows software to clear counter overflow conditions on any combination of fixed-function PMCs or general-purpose PMCs via a single WRMSR.
- **PMI Overhead Mitigation** — Architectural performance monitoring version 2 introduces two bit field interface in IA32_DEBUGCTL for PMI service routine to accumulate performance monitoring data and LBR records with reduced perturbation from servicing the PMI. The two bit fields are:
  - IA32_DEBUGCTL.Freeze_LBR_On_PMI(bit 11). In architectural performance monitoring version 2, only the legacy semantic behavior is supported. See Section 19.4.7 for details of the legacy Freeze LBRs on PMI control.
  - IA32_DEBUGCTL.Freeze_PerfMon_On_PMI(bit 12). In architectural performance monitoring version 2, only the legacy semantic behavior is supported. See Section 19.4.7 for details of the legacy Freeze LBRs on PMI control.

The facilities provided by architectural performance monitoring version 2 can be queried from CPUID leaf 0AH by examining the content of register EDX:

- Bits 0 through 4 of CPUID.0AH.EDX indicates the number of fixed-function performance counters available per core,
- Bits 5 through 12 of CPUID.0AH.EDX indicates the bit-width of fixed-function performance counters. Bits beyond the width of the fixed-function counter are reserved and must be written as zeros.

NOTE

Early generation of processors based on Intel Core microarchitecture may report in CPUID.0AH:EDX of support for version 2 but indicating incorrect information of version 2 facilities.

The IA32_FIXED_CTR_CTRL MSR include multiple sets of 4-bit field, each 4 bit field controls the operation of a fixed-function performance counter. Figure 21-2 shows the layout of 4-bit controls for each fixed-function PMC. Two sub-fields are currently defined within each control. The definitions of the bit fields are:

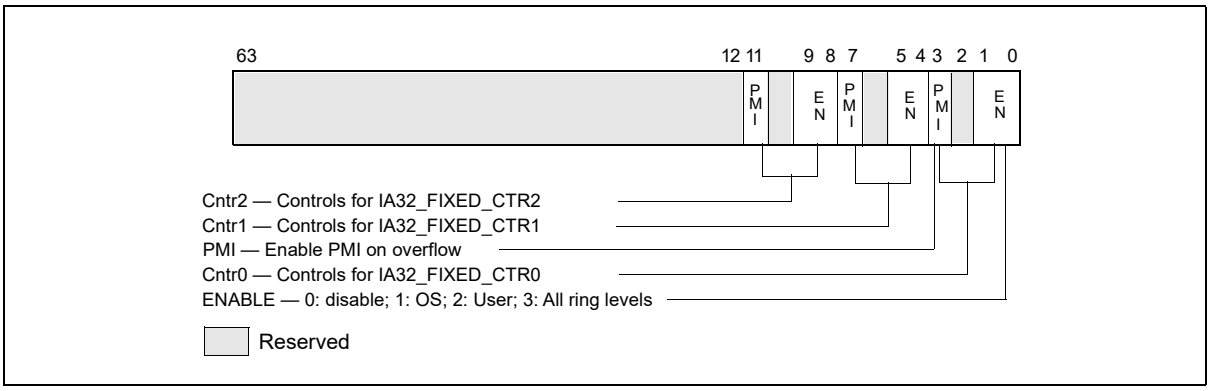

Figure 21-2. Layout of IA32_FIXED_CTR_CTRL MSR

- **Enable field (lowest 2 bits within each 4-bit control)** — When bit 0 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment while the target condition associated with the architecture performance event occurred at ring 0. When bit 1 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment while the target condition associated with the architecture performance event occurred at ring greater than 0. Writing 0 to both bits stops the performance counter. Writing a value of 11B enables the counter to increment irrespective of privilege levels.
- **PMI field (the fourth bit within each 4-bit control)** — When set, the logical processor generates an exception through its local APIC on overflow condition of the respective fixed-function counter.

IA32_PERF_GLOBAL_CTRL MSR provides single-bit controls to enable counting of each performance counter. Figure 21-3 shows the layout of IA32_PERF_GLOBAL_CTRL. Each enable bit in IA32_PERF_GLOBAL_CTRL is AND'ed with the enable bits for all privilege levels in the respective IA32_PERFEVTSELx or IA32_PERF_FIXED_CTR_CTRL MSRs to start/stop the counting of respective counters. Counting is enabled if the AND'ed results is true; counting is disabled when the result is false.

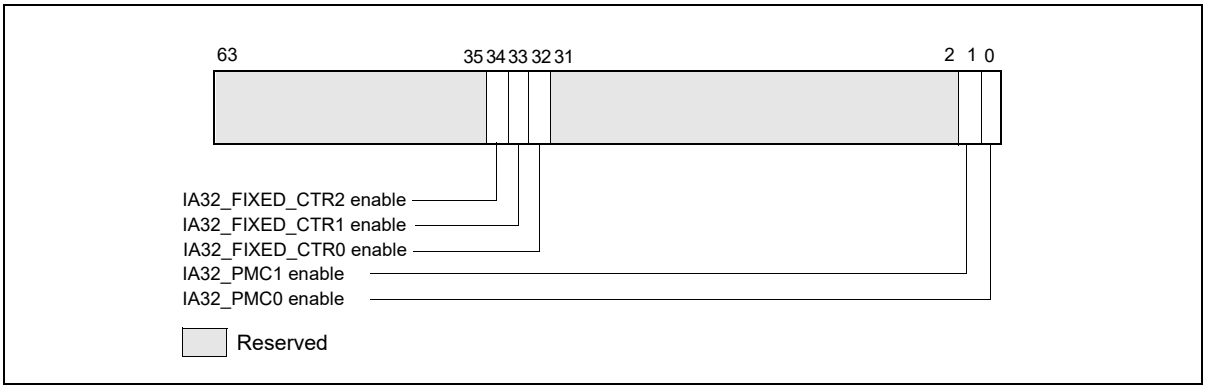

Figure 21-3. Layout of IA32_PERF_GLOBAL_CTRL MSR

The behavior of the fixed function performance counters supported by architectural performance version 2 is expected to be consistent on all processors that support those counters, and is defined as follows.

Table 21-1. Association of Fixed-Function Performance Counters with Architectural Performance Events

Fixed-Function Performance Counter	Address	Event Mask Mnemonic	Description
IA32_FIXED_CTR0	309H	INST_RETIRED.ANY	This event counts the number of instructions that retire execution. For instructions that consist of multiple uops, this event counts the retirement of the last uop of the instruction. The counter continues counting during hardware interrupts, traps, and in-side interrupt handlers.
IA32_FIXED_CTR1	30AH	CPU_CLK_UNHALTED.THREAD CPU_CLK_UNHALTED.CORE	The CPU_CLK_UNHALTED.THREAD event counts the number of core cycles while the logical processor is not in a halt state. If there is only one logical processor in a processor core, CPU_CLK_UNHALTED.CORE counts the unhalted cycles of the processor core. The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time.
IA32_FIXED_CTR2	30BH	CPU_CLK_UNHALTED.REF_TSC	This event counts the number of reference cycles at the TSC rate when the core is not in a halt state and not in a TM stop-clock state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction. This event is not affected by core frequency changes (e.g., P states) but counts at the same frequency as the time stamp counter. This event can approximate elapsed time while the core was not in a halt state and not in a TM stopclock state.
IA32_FIXED_CTR3	30CH	TOPDOWN.SLOTS	This event counts the number of available slots for an unhalted logical processor. The event increments by machine-width of the narrowest pipeline as employed by the Top-down Microarchitecture Analysis method. The count is distributed among unhalted logical processors (hyper-threads) who share the same physical core. Software can use this event as the denominator for the top-level metrics of the Top-down Microarchitecture Analysis method.

Table 21-1. Association of Fixed-Function Performance Counters with Architectural Performance Events

Fixed-Function Performance Counter	Address	Event Mask Mnemonic	Description
IA32_FIXED_CTR4[1]	30DH	TOPDOWN_BAD_SPECULATION	This event counts Topdown slots that were not consumed by the backend due to a pipeline flush, such as a mispredicted branch or a machine clear. It provides a value equivalent to a general-purpose counter configured with UMask=00H and EventSelect=73H.
IA32_FIXED_CTR5<Super scriptARIAL>1	30EH	TOPDOWN_FE_BOUND	This event counts Topdown slots where uops were not provided to the backend due to frontend limitations, such as instruction cache/TLB miss delays or decoder limitations. It provides a value equivalent to a general purpose counter configured with UMask=01H and EventSelect=9CH.
IA32_FIXED_CTR6<Super scriptARIAL>1	30FH	TOPDOWN_RETIRING	This event counts Topdown slots that were committed (retired) by the backend. It provides a value equivalent to a general purpose counter configured with UMask=02H and EventSelect=C2H.

NOTES:

1. If this counter is supported, it will be accessible in the following MSRs: IA32_PERF_GLOBAL_STATUS (38EH), IA32_PERF_GLOBAL_CTRL (38FH), IA32_PERF_GLOBAL_STATUS_RESET (390H), and IA32_PERF_GLOBAL_STATUS_SET (391H).

IA32_PERF_GLOBAL_STATUS MSR provides single-bit status for software to query the overflow condition of each performance counter. IA32_PERF_GLOBAL_STATUS[bit 62] indicates overflow conditions of the DS area data buffer. IA32_PERF_GLOBAL_STATUS[bit 63] provides a CondChgd bit to indicate changes to the state of performance monitoring hardware. Figure 21-4 shows the layout of IA32_PERF_GLOBAL_STATUS. A value of 1 in bits 0, 1, 32 through 34 indicates a counter overflow condition has occurred in the associated counter.

When a performance counter is configured for PEBS, overflow condition in the counter generates a performance-monitoring interrupt signaling a PEBS event. On a PEBS event, the processor stores data records into the buffer area (see Section 18.15.5), clears the counter overflow status., and sets the "OvfBuffer" bit in IA32_PERF_-GLOBAL_STATUS.

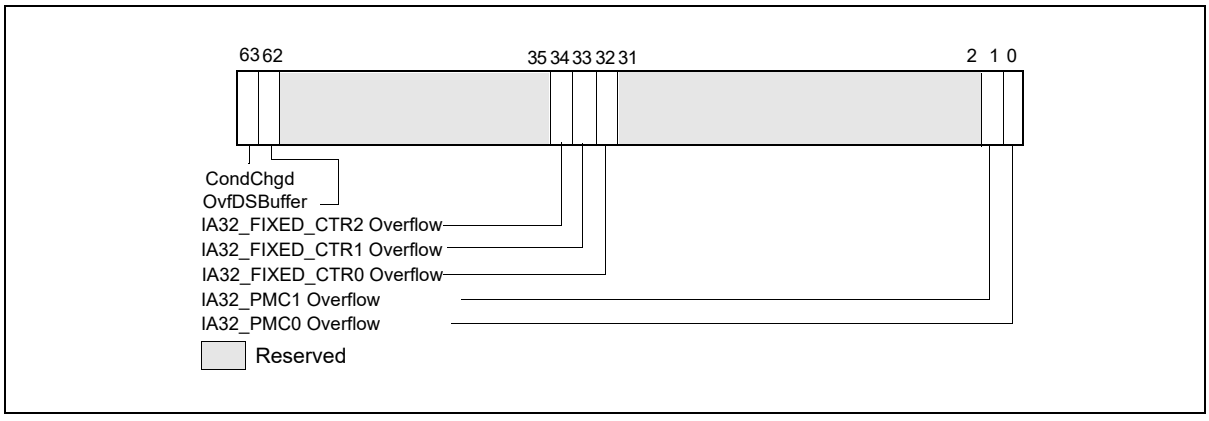

Figure 21-4. Layout of IA32_PERF_GLOBAL_STATUS MSR

IA32_PERF_GLOBAL_OVF_CTL MSR allows software to clear overflow indicator(s) of any general-purpose or fixed-function counters via a single WRMSR. Software should clear overflow indications when

- Setting up new values in the event select and/or UMASK field for counting or interrupt-based event sampling.
- Reloading counter values to continue collecting next sample.

- Disabling event counting or interrupt-based event sampling.

The layout of IA32_PERF_GLOBAL_OVF_CTL is shown in Figure 21-5.

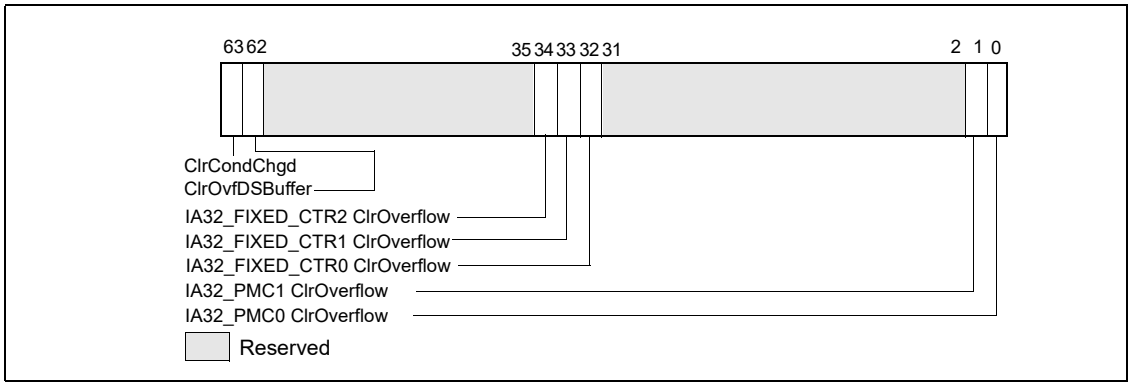

Figure 21-5. Layout of IA32_PERF_GLOBAL_OVF_CTRL MSR

21.2.3 Architectural Performance Monitoring Version 3

Processors supporting architectural performance monitoring version 3 also supports version 1 and 2, as well as capability enumerated by CPUID leaf 0AH. Specifically, version 3 provides the following enhancement in performance monitoring facilities if a processor core comprising of more than one logical processor, i.e., a processor core supporting Intel Hyper-Threading Technology or simultaneous multi-threading capability:

- AnyThread counting for processor core supporting two or more logical processors. The interface that supports AnyThread counting include:
  - Each IA32_PERFEVTSELx MSR (starting at MSR address 186H) support the bit field layout defined in Figure 21-6.

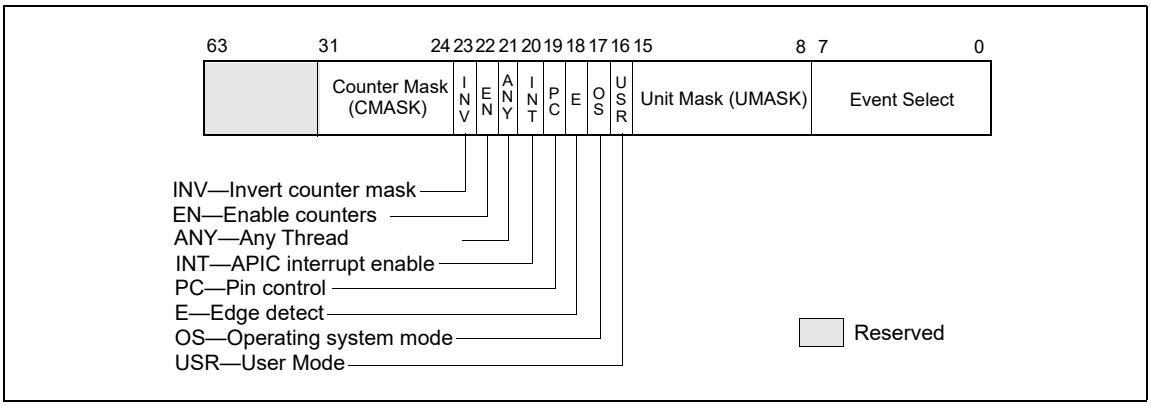

Figure 21-6. Layout of IA32_PERFEVTSELx MSRs Supporting Architectural Performance Monitoring Version 3

Bit 21 (AnyThread) of IA32_PERFEVTSELx is supported in architectural performance monitoring version 3 for processor core comprising of two or more logical processors. When set to 1, it enables counting the associated event conditions (including matching the thread's CPL with the OS/USR setting of IA32_PERFEVTSELx) occurring across all logical processors sharing a processor core. When bit 21 is 0, the counter only increments the associated event conditions (including matching the thread's CPL with the OS/USR setting of IA32_PERFEVTSELx) occurring in the logical processor which programmed the IA32_PERFEVTSELx MSR.

  - Each fixed-function performance counter IA32_FIXED_CTRx (starting at MSR address 309H) is configured by a 4-bit control block in the IA32_PERF_FIXED_CTR_CTRL MSR. The control block also allows thread-specificity configuration using an AnyThread bit for fixed-function counters 0, 1, and 2. The layout of IA32_PERF_FIXED_CTR_CTRL MSR is shown.

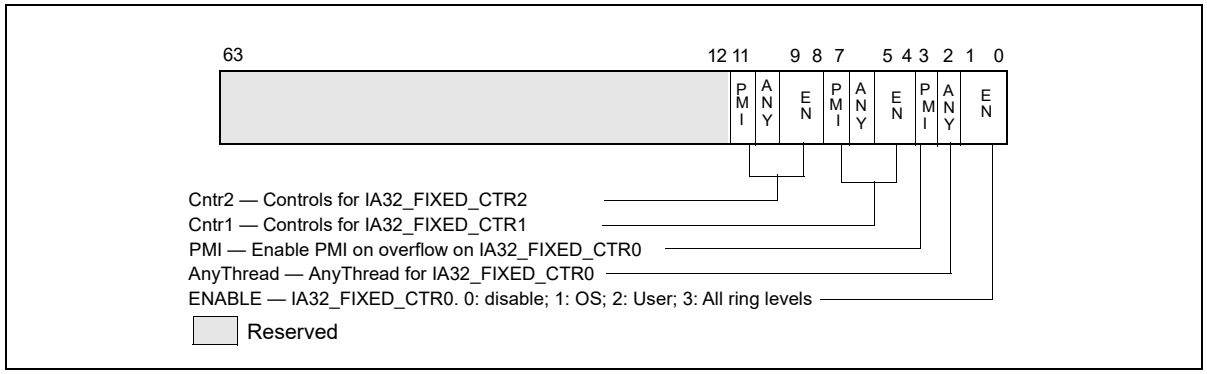

Figure 21-7. IA32_FIXED_CTR_CTRL MSR Supporting Architectural Performance Monitoring Version 3

Each control block for a fixed-function performance counter provides an **AnyThread** (bit position 2 + 4*N, N= 0, 1, etc.) bit. When set to 1, it enables counting the associated event conditions (including matching the thread's CPL with the ENABLE setting of the corresponding control block of IA32_PERF_FIXED_CTR_CTRL) occurring across all logical processors sharing a processor core. When an **AnyThread** bit is 0 in IA32_PERF_FIXED_CTR_CTRL, the corresponding fixed-function counter only increments the associated event conditions occurring in the logical processor which programmed the IA32_PERF_FIXED_CTR_CTRL MSR.

- The IA32_PERF_GLOBAL_CTRL, IA32_PERF_GLOBAL_STATUS, IA32_PERF_GLOBAL_OVF_CTRL MSRs provide single-bit controls/status for each general-purpose and fixed-function performance counter. Figure 21-8 and Figure 21-9 show the layout of these MSRs for N general-purpose performance counters (where N is reported by CPUID.0AH:EAX[15:8]) and three fixed-function counters.

NOTE

The number of general-purpose performance monitoring counters (i.e., N in Figure 21-9) can vary across processor generations within a processor family, across processor families, or could be different depending on the configuration chosen at boot time in the BIOS regarding Intel Hyper Threading Technology, (e.g., N=2 for 45 nm Intel Atom processors; N =4 for processors based on the Nehalem microarchitecture; for processors based on the Sandy Bridge microarchitecture, N = 4 if Intel Hyper Threading Technology is active and N=8 if not active). In addition, the number of counters may vary from the number of physical counters present on the hardware, because an agent running at a higher privilege level (e.g., a VMM) may not expose all counters.

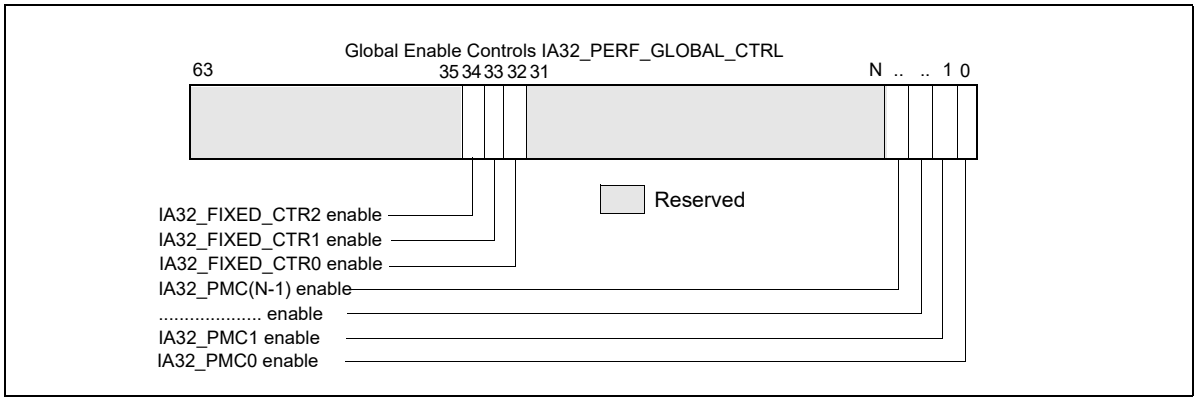

Figure 21-8. Layout of Global Performance Monitoring Control MSR

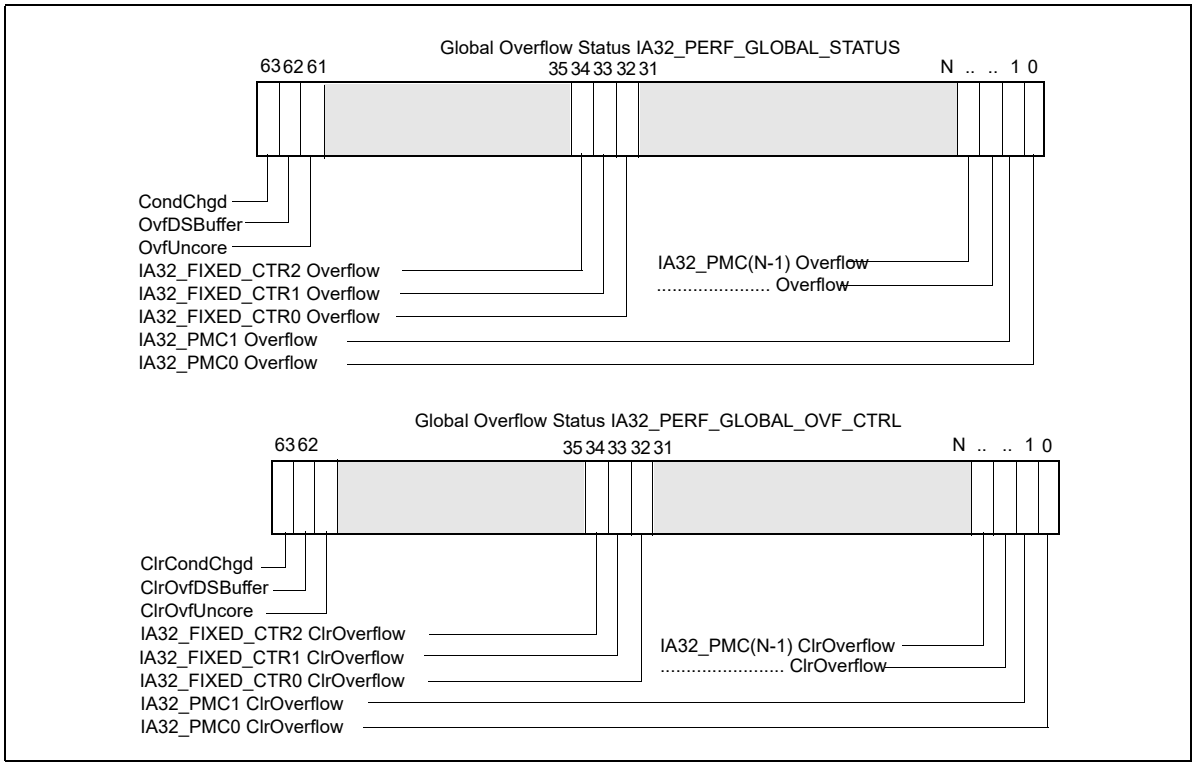

Figure 21-9. Global Performance Monitoring Overflow Status and Control MSRs

21.2.3.1 AnyThread Counting and Software Evolution

The motivation for characterizing software workload over multiple software threads running on multiple logical processors of the same processor core originates from a time earlier than the introduction of the AnyThread interface in IA32_PERFEVTSELx and IA32_FIXED_CTR_CTRL. While AnyThread counting provides some benefits in simple software environments of an earlier era, the evolution contemporary software environments introduce certain concepts and pre-requisites that AnyThread counting does not comply with.

One example is the proliferation of software environments that support multiple virtual machines (VM) under VMX (see Chapter 25, “Introduction to Virtual Machine Extensions”) where each VM represents a domain separated from one another.

A Virtual Machine Monitor (VMM) that manages the VMs may allow an individual VM to employ performance monitoring facilities to profiles the performance characteristics of a workload. The use of the Anythread interface in IA32_PERFEVTSELx and IA32_FIXED_CTR_CTRL is discouraged with software environments supporting virtualization or requiring domain separation.

Specifically, Intel recommends VMM:

- Configure the MSR bitmap to cause VM-exits for WRMSR to IA32_PERFEVTSELx and IA32_FIXED_CTR_CTRL in VMX non-Root operation (see Chapter 26 for additional information),
- Clear the AnyThread bit of IA32_PERFEVTSELx and IA32_FIXED_CTR_CTRL in the MSR-load lists for VM exits and VM entries (see Chapter 26, Chapter 28, and Chapter 29).

Even when operating in simpler legacy software environments which might not emphasize the pre-requisites of a virtualized software environment, the use of the AnyThread interface should be moderated and follow any event-specific guidance where explicitly noted.

21.2.4 Architectural Performance Monitoring Version 4

Processors supporting architectural performance monitoring version 4 also supports version 1, 2, and 3, as well as capability enumerated by CPUID leaf 0AH. Version 4 introduced a streamlined PMI overhead mitigation interface that replaces the legacy semantic behavior but retains the same control interface in IA32_DEBUGCTL.Freeze_LBRs_On_PMI and Freeze_PerfMon_On_PMI. Specifically version 4 provides the following enhancements:

- New indicators (LBR_FRZ, CTR_FRZ) in IA32_PERF_GLOBAL_STATUS, see Section 21.2.4.1.
- Streamlined Freeze/PMI Overhead management interfaces to use IA32_DEBUGCTL.Freeze_LBRs_On_PMI and IA32_DEBUGCTL.Freeze_PerfMon_On_PMI: see Section 21.2.4.1. Legacy semantics of Freeze_LBRs_On_PMI and Freeze_PerfMon_On_PMI (applicable to version 2 and 3) are not supported with version 4 or higher.
- Fine-grain separation of control interface to manage overflow/status of IA32_PERF_GLOBAL_STATUS and read-only performance counter enabling interface in IA32_PERF_GLOBAL_STATUS: see Section 21.2.4.2.
- Performance monitoring resource in-use MSR to facilitate cooperative sharing protocol between perfmon-managing privilege agents.

21.2.4.1 Enhancement in IA32_PERF_GLOBAL_STATUS

The IA32_PERF_GLOBAL_STATUS MSR provides the following indicators with architectural performance monitoring version 4:

- IA32_PERF_GLOBAL_STATUS.LBR_FRZ[bit 58]: This bit is set due to the following conditions:
  - IA32_DEBUGCTL.FREEZE_LBR_ON_PMI has been set by the profiling agent, and
  - A performance counter, configured to generate PMI, has overflowed to signal a PMI. Consequently the LBR stack is frozen.

  Effectively, the IA32_PERF_GLOBAL_STATUS.LBR_FRZ bit also serves as a control to enable capturing data in the LBR stack. To enable capturing LBR records, the following expression must hold with architectural perfmon version 4 or higher:
  - (IA32_DEBUGCTL.LBR & (!IA32_PERF_GLOBAL_STATUS.LBR_FRZ)) =1
- IA32_PERF_GLOBAL_STATUS.CTR_FRZ[bit 59]: This bit is set due to the following conditions:
  - IA32_DEBUGCTL.FREEZE_PERFMON_ON_PMI has been set by the profiling agent, and
  - A performance counter, configured to generate PMI, has overflowed to signal a PMI. Consequently, all the performance counters are frozen.

  Effectively, the IA32_PERF_GLOBAL_STATUS.CTR_FRZ bit also serve as an read-only control to enable programmable performance counters and fixed counters in the core PMU. To enable counting with the performance counters, the following expression must hold with architectural perfmon version 4 or higher:
    - (IA32_PERFEVTSELn.EN & IA32_PERF_GLOBAL_CTRL.PMCn & (!IA32_PERF_-GLOBAL_STATUS.CTR_FRZ)) = 1 for programmable counter ‘n’, or
    - (IA32_PERF_FIXED_CRTL.ENi & IA32_PERF_GLOBAL_CTRL.FCi & (!IA32_PERF_-GLOBAL_STATUS.CTR_FRZ)) = 1 for fixed counter ‘i’

The read-only enable interface IA32_PERF_GLOBAL_STATUS.CTR_FRZ provides a more efficient flow for a PMI handler to use IA32_DEBUGCTL.Freeze_Perfmon_On_PMI to filter out data that may distort target workload analysis, see Table 19-3. It should be noted the IA32_PERF_GLOBAL_CTRL register continue to serve as the primary interface to control all performance counters of the logical processor.

For example, when the Freeze-On-PMI mode is not being used, a PMI handler would be setting IA32_PERF_-GLOBAL_CTRL as the very last step to commence the overall operation after configuring the individual counter registers, controls, and PEBS facility. This does not only assure atomic monitoring but also avoids unnecessary complications (e.g., race conditions) when software attempts to change the core PMU configuration while some counters are kept enabled.

Additionally, IA32_PERF_GLOBAL_STATUS.TraceToPAPMI[bit 55]: On processors that support Intel Processor Trace and configured to store trace output packets to physical memory using the ToPA scheme, bit 55 is set when a PMI occurred due to a ToPA entry memory buffer was completely filled.

IA32_PERF_GLOBAL_STATUS also provides an indicator to distinguish interaction of performance monitoring operations with other side-band activities, which apply Intel SGX on processors that support it (for additional information about Intel SGX, see the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D):

- IA32_PERF_GLOBAL_STATUS.ASCI[bit 60]: This bit is set when data accumulated in any of the configured performance counters (i.e., IA32_PMCx or IA32_FIXED_CTRx) may include contributions from direct or indirect operation of Intel SGX to protect an enclave (since the last time IA32_PERF_GLOBAL_STATUS.ASCI was cleared).

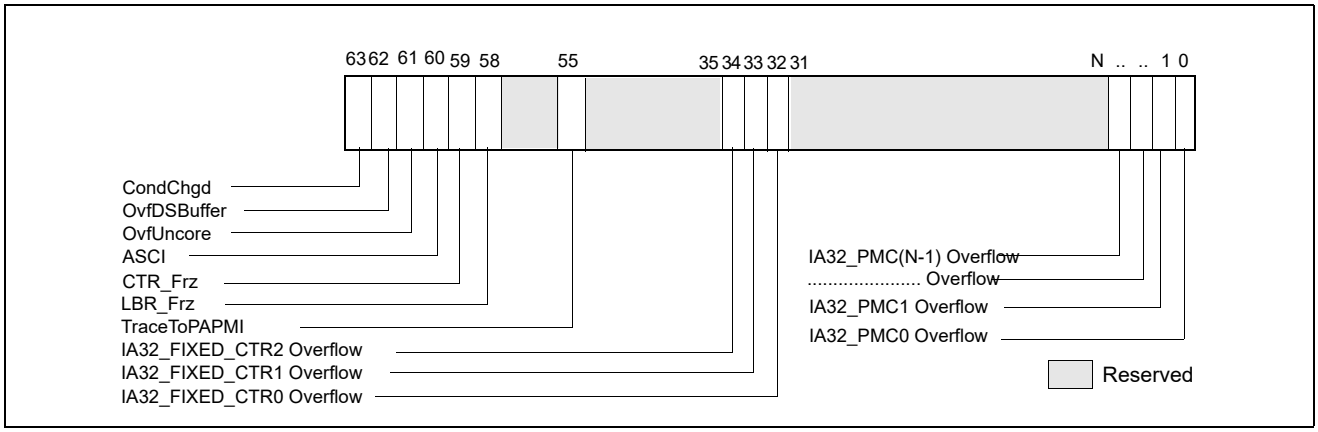

Figure 21-10. IA32_PERF_GLOBAL_STATUS MSR and Architectural Perfmon Version 4

Note, a processor's support for IA32_PERF_GLOBAL_STATUS.TraceToPAPMI[bit 55] is enumerated as a result of CPUID enumerated capability of Intel Processor Trace and the use of the ToPA buffer scheme. Support of IA32_PERF_GLOBAL_STATUS.ASCI[bit 60] is enumerated by the CPUID enumeration of Intel SGX.

21.2.4.2 IA32_PERF_GLOBAL_STATUS_RESET and IA32_PERF_GLOBAL_STATUS_SET MSRS

With architectural performance monitoring version 3 and lower, clearing of the set bits in IA32_PERF_-GLOBAL_STATUS MSR by software is done via IA32_PERF_GLOBAL_OVF_CTRL MSR. Starting with architectural performance monitoring version 4, software can manage the overflow and other indicators in IA32_PERF_-GLOBAL_STATUS using separate interfaces to set or clear individual bits.

The address and the architecturally-defined bits of IA32_PERF_GLOBAL_OVF_CTRL is inherited by IA32_PERF_-GLOBAL_STATUS_RESET (see Figure 21-11). Further, IA32_PERF_GLOBAL_STATUS_RESET provides additional bit fields to clear the new indicators in IA32_PERF_GLOBAL_STATUS described in Section 21.2.4.1.

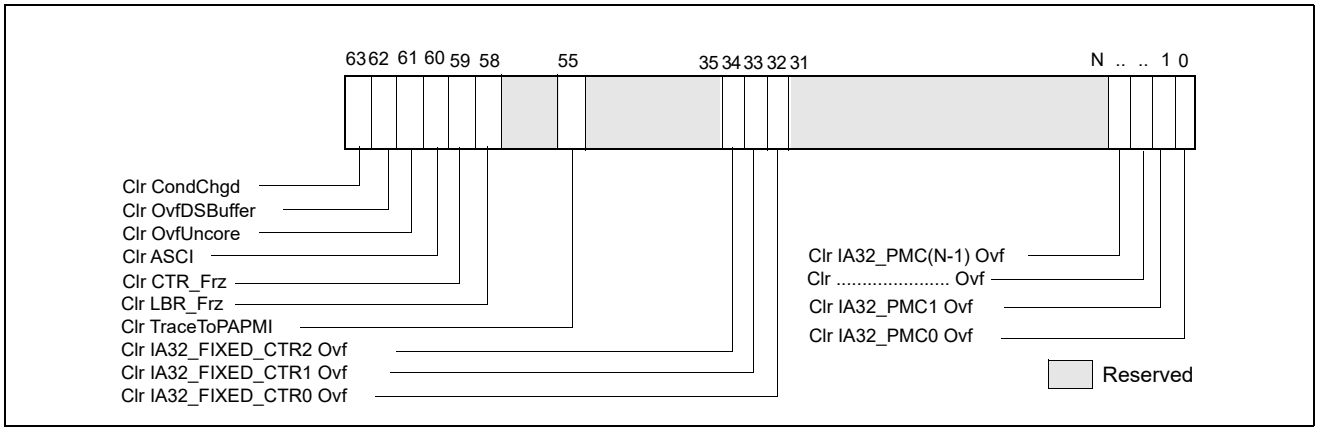

Figure 21-11. IA32_PERF_GLOBAL_STATUS_RESET MSR and Architectural Perfmon Version 4

The IA32_PERF_GLOBAL_STATUS_SET MSR is introduced with architectural performance monitoring version 4. It allows software to set individual bits in IA32_PERF_GLOBAL_STATUS. The IA32_PERF_GLOBAL_STATUS_SET interface can be used by a VMM to virtualize the state of IA32_PERF_GLOBAL_STATUS across VMs.

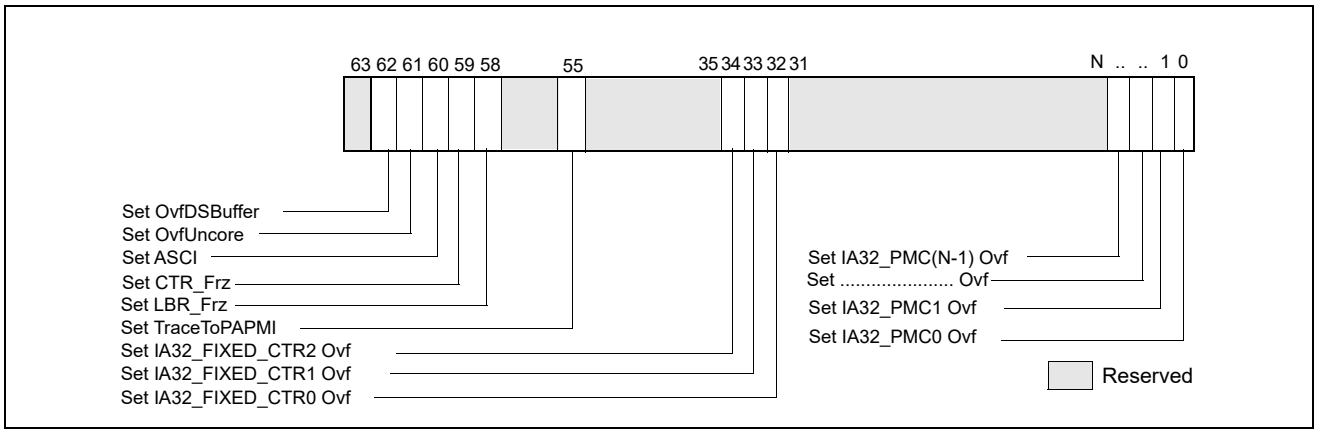

Figure 21-12. IA32_PERF_GLOBAL_STATUS_SET MSR and Architectural Perfmon Version 4

21.2.4.3 IA32_PERF_GLOBAL_INUSE MSR

In a contemporary software environment, multiple privileged service agents may wish to employ the processor's performance monitoring facilities. The IA32_MISC_ENABLE.PERFMON_AVAILABLE[bit 7] interface could not serve the need of multiple agent adequately. A white paper, "Performance Monitoring Unit Sharing Guideline"[1], proposed a cooperative sharing protocol that is voluntary for participating software agents.

Architectural performance monitoring version 4 introduces a new MSR, IA32_PERF_GLOBAL_INUSE, that simplifies the task of multiple cooperating agents to implement the sharing protocol.

The layout of IA32_PERF_GLOBAL_INUSE is shown in Figure 21-13.

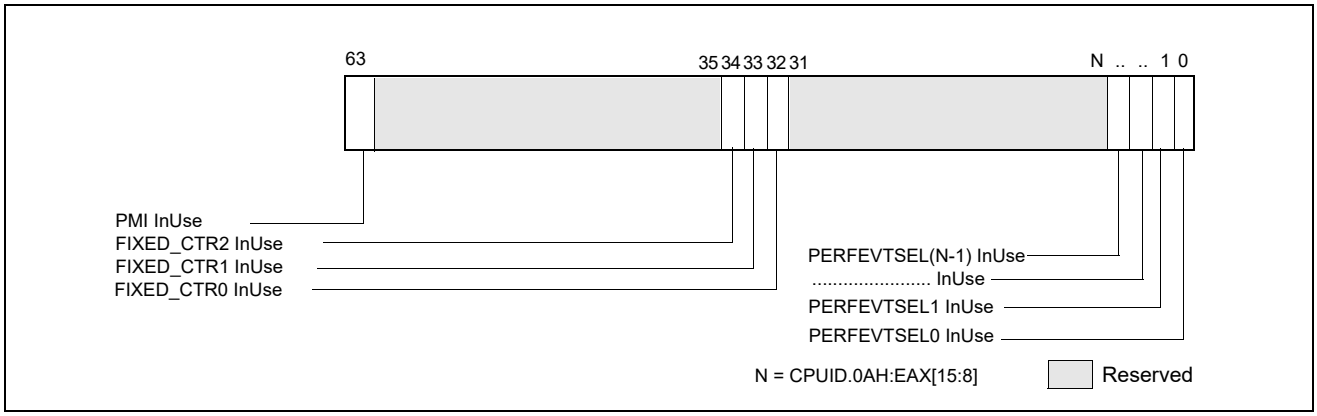

Figure 21-13. IA32_PERF_GLOBAL_INUSE MSR and Architectural Perfmon Version 4

The IA32_PERF_GLOBAL_INUSE MSR provides an "InUse" bit for each programmable performance counter and fixed counter in the processor. Additionally, it includes an indicator if the PMI mechanism has been configured by a profiling agent.

- IA32_PERF_GLOBAL_INUSE.PERFEVTSEL0_InUse[bit 0]: This bit reflects the logical state of (IA32_PERFEVTSEL0[7:0] != 0).

1. Available at http://www.intel.com/sdm

- IA32_PERF_GLOBAL_INUSE.PERFEVTSEL1_InUse[bit 1]: This bit reflects the logical state of (IA32_PERFEVTSEL1[7:0] != 0).
- IA32_PERF_GLOBAL_INUSE.PERFEVTSEL2_InUse[bit 2]: This bit reflects the logical state of (IA32_PERFEVTSEL2[7:0] != 0).
- IA32_PERF_GLOBAL_INUSE.PERFEVTSELn_InUse[bit n]: This bit reflects the logical state of (IA32_PERFEVTSELn[7:0] != 0), n < CPUID.0AH:EAX[15:8].
- IA32_PERF_GLOBAL_INUSE.FC0_InUse[bit 32]: This bit reflects the logical state of (IA32_FIXED_CTR_CTRL[1:0] != 0).
- IA32_PERF_GLOBAL_INUSE.FC1_InUse[bit 33]: This bit reflects the logical state of (IA32_FIXED_CTR_CTRL[5:4] != 0).
- IA32_PERF_GLOBAL_INUSE.FC2_InUse[bit 34]: This bit reflects the logical state of (IA32_FIXED_CTR_CTRL[9:8] != 0).
- IA32_PERF_GLOBAL_INUSE.PMI_InUse[bit 63]: This bit is set if any one of the following bit is set:
  - IA32_PERFEVTSELn.INT[bit 20], n < CPUID.0AH:EAX[15:8].
  - IA32_FIXED_CTR_CTRL.ENi_PMI, i = 0, 1, 2.
  - Any IA32_PEBS_ENABLES bit which enables PEBS for a general-purpose or fixed-function performance counter.

21.2.5 Architectural Performance Monitoring Version 5

Processors supporting architectural performance monitoring version 5 also support versions 1, 2, 3, and 4, as well as capability enumerated by CPUID leaf 0AH. Specifically, version 5 provides the following enhancements:

- Deprecation of AnyThread mode, see Section 21.2.5.1.
- Individual enumeration of Fixed counters in CPUID.0AH, see Section 21.2.5.2.
- Domain separation, see Section 21.2.5.3.

21.2.5.1 AnyThread Mode Deprecation

With Architectural Performance Monitoring Version 5, a processor that supports AnyThread mode deprecation is enumerated by CPUID.0AH.EDX[15]. If set, software will not have to follow guidelines in Section 21.2.3.1.

21.2.5.2 Fixed Counter Enumeration

With Architectural Performance Monitoring Version 5, register CPUID.0AH.ECX indicates Fixed Counter enumeration. It is a bit mask which enumerates the supported Fixed Counters in a processor. If bit 'i' is set, it implies that Fixed Counter 'i' is supported. Software is recommended to use the following logic to check if a Fixed Counter is supported on a given processor:

FxCtr[i]_is_supported := ECX[i] || (EDX[4:0] > i);

21.2.5.3 Domain Separation

When the INV flag in IA32_PERFEVTSELx is used, a counter stops counting when the logical processor exits the C0 ACPI C-state.

21.2.6 Architectural Performance Monitoring Version 6

Processors supporting architectural performance monitoring version 6 also support versions 1, 2, 3, 4, and 5, as well as the capabilities enumerated by CPUID leaves 0AH and 23H. Specifically, version 6 provides the following enhancements:

- PerfMon MSRs Aliasing, see Section 21.2.6.1.

- UnitMask2, see Section 21.2.6.2.
- Equal flag, see Section 21.2.6.3.

21.2.6.1 Performance Monitoring MSR Aliasing

Architectural performance monitoring version 6 includes a new range for the counters' MSRs in the 19xxH address range[1]. The new MSR range allows for scaling the number of general-purpose and fixed-function counters beyond the quantities in current products. Additionally, it banks registers of the same counter closer to each other.

All legacy and new counters, i.e., those enumerated in CPUID.(EAX = 23H, ECX = 01H), will be supported in this new address range. Moving forward, newer counters may be supported in the new address range, but not in the legacy one.

Table 21-2. New Performance Monitoring MSR Naming Details

Register	General Counter n	Fixed Counter m
Counter	IA32_PMC_GPn_CTR	IA32_PMC_FXm_CTR
Event-Select	IA32_PMC_GPn_CFG_A	N/A
Reload Config	IA32_PMC_GPn_CFG_B	IA32_PMC_FXm_CFG_B
Event-Select Extended	IA32_PMC_GPn_CFG_C	IA32_PMC_FXm_CFG_C

An IA32_PMC_GPn_CTR MSR can be used to access the counter value for a GP (general-purpose) counter 'n.' On processors that support CPUID leaf 23H, a general-purpose (GP) counter 'n' that is enumerated in both CPUID leaf 23H and leaf 0AH can be accessed through either IA32_PMC_GPn_CTR or the legacy MSR addresses (IA32_PMCn, IA32_A_PMCn). In contrast, a counter 'n' that is only enumerated in CPUID leaf 23H can only be accessed through IA32_PMC_GPn_CTR. This guideline also applies to the other MSR aliases described in this section (i.e., IA32_PMC_GPn_CFG_A and IA32_PERFEVTSELn, IA32_PMC_FXm_CTR and IA32_FIXED_CTRm). The IA32_PMC_GPn_CTR MSR address[2] for counter 'n' is 1900H + 4 * n, and this MSR has full-width write support.

The IA32_PMC_GPn_CFG_A MSR can be used to access the performance event select register for a GP counter 'n' and is at address[3] 1901H + 4 * n. The reload configuration MSRs for GP counter 'n,' IA32_PMC_GPn_CFG_B, is at MSR address 1902H + 4 * n. There is no legacy MSR alias to this reload configuration register. Thus, the register only exists when enumerated in CPUID leaf 23H. Similarly, no legacy MSR alias exists for the event-select extended registers, IA32_PMC_GPn_CFG_C, which are at MSR address 1903H + 4 * n for GP counter 'n.'

An IA32_PMC_FXm_CTR MSR can be used to access the counter value for a fixed-function counter 'm' if that counter is enumerated in CPUID leaf 23H. The IA32_PMC_FXm_CTR MSR address for fixed-function counter 'm' is 1980H + 4 * m. There is no alias for the fixed-function counters' reload configuration or event select extended registers (IA32_PMC_FXm_CFG_B at MSR addresses 1982H + 4 * m and IA32_PMC_FXm_CFG_C at MSR address 1983H + 4 * m, respectively).

The available general-purpose and fixed-function counters are reported by CPUID.(EAX = 23H, ECX = 01H):EAX and CPUID.(EAX = 23H, ECX = 01H):EBX, respectively. Note that not all counters enumerated in CPUID leaf 23H may have corresponding IA32_PMC_GPn_CFG_B, IA32_PMC_GPn_CFG_C, IA32_PMC_FXm_CFG_B, or IA32_PMC_FXm_CFG_C MSRs. The enumeration and usage of these MSRs are described in Section 21.9.11, "Auto Counter Reload." The enumeration in CPUID leaf 23H is true-view, and thus, the enumeration may only be set on (and the MSRs/counters they enumerate only supported on) a subset of the logical processors of the system.

The architectural performance monitoring version 6 enhanced layout of the IA32_PERFEVTSELx MSR is shown in Figure 21-14.

1. This feature is also available in a subset of processors with a CPUID signature value of DisplayFamily_DisplayModel 06_C5H or 06_C6H (though they report IA32_PERF_CAPABILITIES.PEBS_FMT as 5).
2. As an example, the IA32_PMC_GP1_CTR MSR has MSR address 1904H. Note that the legacy full-width MSR addresses for the counters, IA32_A_PMCn MSRs, remains at MSR address 4C1H + n.
3. As an example, the IA32_PMC_GP1_CFG_A MSR has MSR address 1905H. Note that the legacy MSR address for the event select registers, IA32_PERFEVTSELn MSRs, remain at MSR address 186H + n.

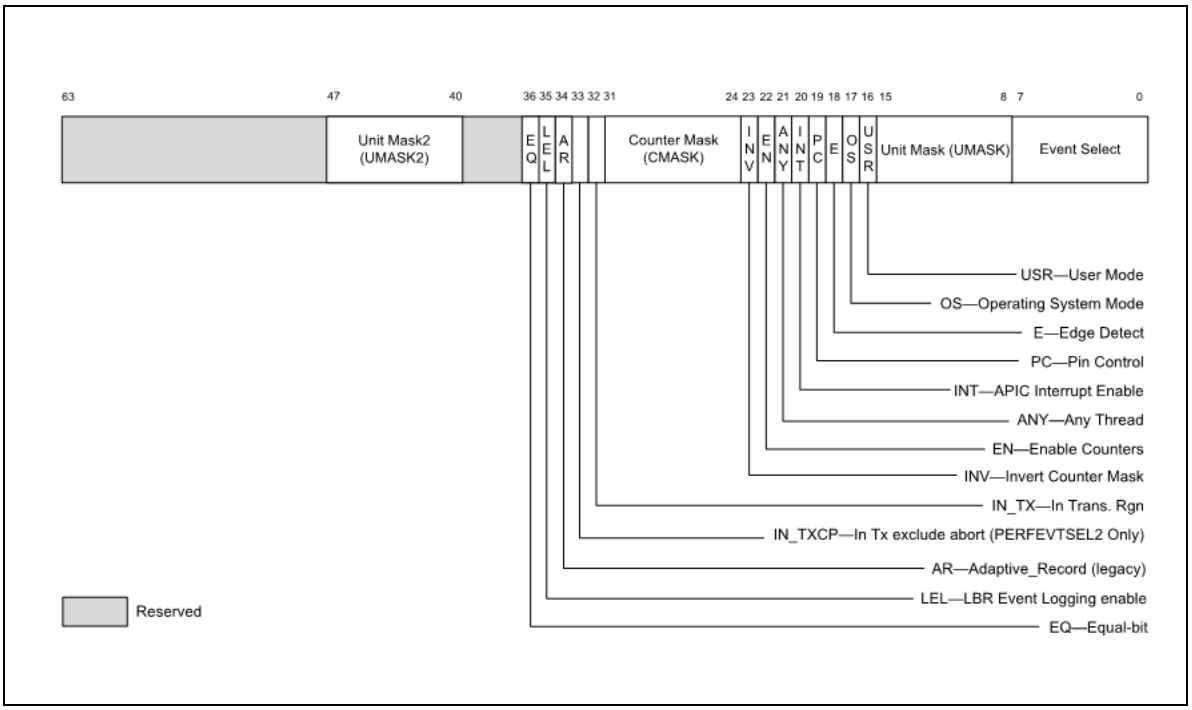

Figure 21-14. IA32_PMC_GPx_CFG_A MSR (also known as IA32_PERFEVTSELx) Supporting Architectural Performance Monitoring Version 6

NOTES

The EQ bit and UMASK2 field are added in Architectural Performance Monitoring Version 6.

The IN_TX and IN_TXCP bits are available only on processors supporting Intel TSX.

The architectural performance monitoring version 6 enhanced layout of the IA32_FIXED_CTR_CTRL MSR is shown in Figure 21-15.

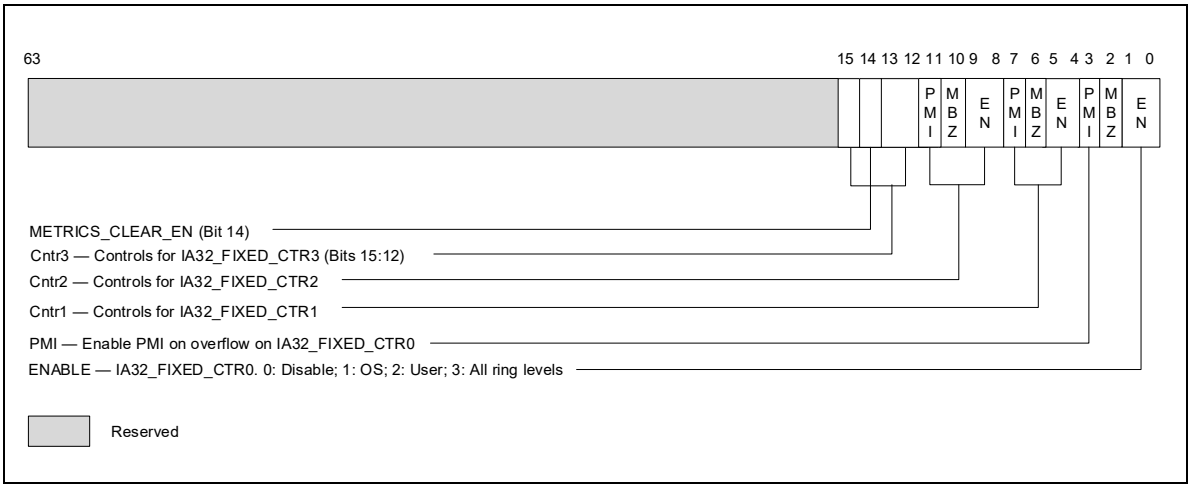

Figure 21-15. IA32_FIXED_CTR_CTRL MSR Supporting Architectural Performance Monitoring Version 6

21.2.6.2 Unit Mask 2

Architectural performance monitoring version 6 introduces a new Unit Mask 2 (UMASK2) field in the IA32_PERFEVTSELx MSRs. It is supported if enumerated by CPUID.(EAX=23H, ECX=0H):EBX[bit 0].

- UMASK2 field (bits 40 through 47): These bits qualify the condition that the selected event logic unit detects. Valid UMASK2 values for each event logic unit are specific to the unit. The new UMASK2 field may also be used in conjunction with UMASK.

21.2.6.3 Equal Flag

Architectural performance monitoring version 6 introduces a new Equal (EQ) flag in the IA32_PERFEVTSELx MSRs. It is supported if enumerated by CPUID.(EAX=23H, ECX=0H):EBX[bit 1].

- EQ flag (bit 36): When the EQ flag is set and the INV flag is clear, the comparison evaluates to true if the selected performance monitoring event (the event) is equal to the specified Counter Mask value (CMask). When the EQ flag is set and the INV flag is set, the comparison evaluates to true if the event is less than the CMask value and the event is not zero. Note that if the CMask is zero, the EQ flag is ignored.

21.2.7 Pre-defined Architectural Performance Events

Table 21-3 lists architecturally defined events.

Table 21-3. UMask and Event Select Encodings for Pre-Defined Architectural Performance Events

Bit Position CPUID.AH.EBX and CPUID.23H.03H.EAX	Event Name	UMask	Event Select
0	UnHalted Core Cycles	00H	3CH
1	Instruction Retired	00H	C0H
2	UnHalted Reference Cycles[1]	01H	3CH
3	LLC Reference	4FH	2EH
4	LLC Misses	41H	2EH
5	Branch Instruction Retired	00H	C4H
6	Branch Misses Retired	00H	C5H
7	Topdown Slots	01H	A4H
8	Topdown Backend Bound	02H	A4H
9	Topdown Bad Speculation	00H	73H
10	Topdown Frontend Bound	01H	9CH
11	Topdown Retiring	02H	C2H
12	LBR Inserts	01H	E4H

NOTES:

1. Implementations prior to the 12th generation Intel® Core™ processor P-cores count at core crystal clock, TSC, or bus clock frequency.

A processor that supports architectural performance monitoring may not support all the predefined architectural performance events (Table 21-3). The number of architectural events is reported through CPUID.0AH:EAX[31:24], while non-zero bits in CPUID.0AH:EBX indicate any architectural events that are not available.

The behavior of each architectural performance event is expected to be consistent on all processors that support that event. Minor variations between microarchitectures are noted below:

- **UnHalted Core Cycles —** Event select 3CH, Umask 00H

  This event counts core clock cycles when the clock signal on a specific core is running (not halted). The counter does not advance in the following conditions:

— An ACPI C-state other than C0 for normal operation.

— HLT.

— STPCLK# pin asserted.

— Being throttled by TM1.

— During the frequency switching phase of a performance state transition (see Chapter 16, "Power and Thermal Management").

The performance counter for this event counts across performance state transitions using different core clock frequencies.

- **Instructions Retired —** Event select C0H, Umask 00H

  This event counts the number of instructions at retirement. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. An instruction with a REP prefix counts as one instruction (not per iteration). Faults before the retirement of the last micro-op of a multi-ops instruction are not counted.

  This event does not increment under VM-exit conditions. Counters continue counting during hardware interrupts, traps, and inside interrupt handlers.

- **UnHalted Reference Cycles —** Event select 3CH, Umask 01H

  This event counts reference clock cycles at a fixed frequency while the clock signal on the core is running. The event counts at a fixed frequency, irrespective of core frequency changes due to performance state transitions. Processors may implement this behavior differently. Current implementations use the core crystal clock, TSC or the bus clock. Because the rate may differ between implementations, software should calibrate it to a time source with known frequency.

- **Last Level Cache References —** Event select 2EH, Umask 4FH

  This event counts requests originating from the core that reference a cache line in the last level on-die cache. The event count includes speculation and cache line fills due to the first-level cache hardware prefetcher, but may exclude cache line fills due to other hardware-prefetchers.

  Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.

- **Last Level Cache Misses —** Event select 2EH, Umask 41H

  This event counts each cache miss condition for references to the last level on-die cache. The event count may include speculation and cache line fills due to the first-level cache hardware prefetcher, but may exclude cache line fills due to other hardware-prefetchers.

  Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.

- **Branch Instructions Retired —** Event select C4H, Umask 00H

  This event counts branch instructions at retirement. It counts the retirement of the last micro-op of a branch instruction.

- **All Branch Mispredict Retired —** Event select C5H, Umask 00H

  This event counts mispredicted branch instructions at retirement. It counts the retirement of the last micro-op of a branch instruction in the architectural path of execution and experienced misprediction in the branch prediction hardware.

  Branch prediction hardware is implementation-specific across microarchitectures; value comparison to estimate performance differences is not recommended.

- **Topdown Slots —** Event select A4H, Umask 01H

  This event counts the total number of available slots for an unhalted logical processor.

  The event increments by machine-width of the narrowest pipeline as employed by the Top-down Microarchitecture Analysis method. The count is distributed among unhalted logical processors (hyper-threads) who share the same physical core, in processors that support Intel Hyper-Threading Technology.

  Software can use this event as the denominator for the top-level metrics of the Top-down Microarchitecture Analysis method.

NOTE

Programming decisions or software precisians on functionality should not be based on the event values or dependent on the existence of performance monitoring events.

- **Topdown Backend Bound —** Event select A4H, Umask 02H

  This event counts a subset of the Topdown Slots event that was not consumed by the backend pipeline due to lack of backend resources, as a result of memory subsystem delays, execution unit limitations, or other conditions.

  The count may be distributed among unhalted logical processors that share the same physical core, in processors that support Intel® Hyper-Threading Technology.

  Software can use this event as the numerator for the Backend Bound metric (or top-level category) of the Topdown Microarchitecture Analysis method.

  Software can also derive the Backend Bound Slots using the formula: Backend Bound Slots = (Total Slots - Bad Speculation Slots - Frontend Bound Slots - Retiring Slots).

- **Topdown Bad Speculation —** Event select 73H, Umask 00H

  This event counts a subset of the Topdown Slots event that was wasted due to incorrect speculation as a result of incorrect control-flow or data speculation. Common examples include branch mispredictions and memory ordering clears.

  The count may be distributed among impacted logical processors that share the same physical core, for some processors that support Intel Hyper-Threading Technology.

  Software can use this event as the numerator for the Bad Speculation metric (or top-level category) of the Topdown Microarchitecture Analysis method.

  Software can also derive the Bad Speculation Slots using the formula: Bad Speculation Slots = (Total Slots - Backend Bound Slots - Frontend Bound Slots - Retiring Slots).

- **Topdown Frontend Bound —** Event select 9CH, Umask 01H

  This event counts a subset of the Topdown Slots event that had no operation delivered to the backend pipeline due to instruction fetch limitations when the backend could have accepted more operations. Common examples include instruction cache misses and x86 instruction decode limitations.

  The count may be distributed among unhalted logical processors that share the same physical core, in processors that support Intel Hyper-Threading Technology.

  Software can use this event as the numerator for the Frontend Bound metric (or top-level category) of the Topdown Microarchitecture Analysis method.

- **Topdown Retiring —** Event select C2H, Umask 02H

  This event counts a subset of the Topdown Slots event that is utilized by operations that eventually get retired (committed) by the processor pipeline. Usually, this event positively correlates with higher performance as measured by the instructions-per-cycle metric.

  Software can use this event as the numerator for the Retiring metric (or top-level category) of the Topdown Microarchitecture Analysis method.

- **LBR Inserts —** Event select E4H, Umask 01H

  This event counts when an LBR (Last Branch Record) entry is inserted or removed. Inserted means an actual LBR buffer update has occurred, considering LBR configuration and filtering. An LBR entry is removed when a RET instruction is retired in LBR Call-stack mode.

  Software may use this event in usages like profile-guided optimization (PGO) for profiling collections across Intel processors and in virtualized environments.

21.2.8 Full-Width Writes to Performance Counter Registers

The general-purpose performance counter registers IA32_PMCx are writable via WRMSR instruction. However, the value written into IA32_PMCx by WRMSR is the signed extended 64-bit value of the EAX[31:0] input of WRMSR.

A processor that supports full-width writes to the general-purpose performance counters enumerated by CPUID.0AH:EAX[15:8] will set IA32_PERF_CAPABILITIES[13] to enumerate its full-width-write capability See Figure 21-67.

If IA32_PERF_CAPABILITIES.FW_WRITE[bit 13] =1, each IA32_PMCi is accompanied by a corresponding alias address starting at 4C1H for IA32_A_PMC0.

The bit width of the performance monitoring counters is specified in CPUID.0AH:EAX[23:16].

If IA32_A_PMCi is present, the 64-bit input value (EDX:EAX) of WRMSR to IA32_A_PMCi will cause IA32_PMCi to be updated by:

COUNTERWIDTH = CPUID.0AH:EAX[23:16] bit width of the performance monitoring counter
IA32_PMCi[COUNTERWIDTH-1:32] := EDX[COUNTERWIDTH-33:0]);
IA32_PMCi[31:0] := EAX[31:0];
EDX[63:COUNTERWIDTH] are reserved

21.2.9 Scalable Enumeration Architecture

An Architectural Performance Monitoring Extended (ArchPerfmonExt) leaf 23H is added to the CPUID instruction for enhanced enumeration of PMU architectural features. Additionally, the IA32_PERF_CAPABILITIES MSR enhances enumeration for PMU non-architectural features.

NOTE

CPUID leaf 0AH continues to report useful attributes, such as architectural performance monitoring version ID and counter width (# bits).

CPUID leaf 23H enhances previous enumeration of PMU capabilities:

- Employs CPUID sub-leafing to accommodate future PMU extensions.
- Exposes true-view resources per logical processor.
- Introduces a bitmap (true-view) enumeration of general-purpose counters availability.
- A bitmap (true-view) enumeration of fixed-function counters availability.
- A bitmap (true-view) enumeration of architectural performance monitoring events.

Processors that support this enhancement set CPUID.(EAX=07H, ECX=01H):EAX.ArchPerfmonExt[bit 8].

21.2.9.1 CPUID Sub-Leafing

CPUID leaf 23H contains additional architectural PMU capabilities. This leaf supports sub-leafing, providing each distinct PMU feature with an individual sub-leaf for enumerating its details.

The availability of sub-leaves is enumerated via CPUID.(EAX=23H, ECX=0H):EAX. For each bit *n* set in this field, sub-leaf *n* under CPUID leaf 23H is supported.

21.2.9.2 Reporting Per Logical Processor

CPUID leaf 23H provides a true-view of per logical processor PMU capabilities. This leaf reports the actual support of the individual logical processor that the CPUID instruction was executed on; this applies to all sub-leaves.

Software must not make assumptions that CPUID leaf 23H would report any value the same on another logical processor. It is required to read CPUID leaf 23H on every logical processor and program that logical processor only according to the values returned by the CPUID leaf 23H directly executed upon it. It is a requirement of software to compare and determine common features between logical processors if required by iterating over each logical processor's CPUID leaf 23H.

Conversely, CPUID leaf 0AH provides a maximum common set of capabilities across logical processors when a feature is not supported by all logical processors.

NOTE

Locating a PMU feature under CPUID leaf 23H alerts software that the feature may not be supported uniformly across all logical processors.

21.2.9.3 General-Purpose Counters Bitmap

CPUID.(EAX=23H, ECX=01H):EAX reports a bitmap for available general-purpose counters. (CPUID leaf 0AH reports only the total number of general-purpose counters.)

This capability enables a virtual-machine monitor to reserve lower-index counters for its own use, while exposing higher-index counters to guest software. This is especially important should the general-purpose counters not be fully homogeneous.

Software should utilize the new bitmap reporting, including for detecting the number of available general-purpose counters. To facilitate this transition, the number of general-purpose counters in CPUID leaf 0AH will not go beyond eight, even if the processor has support for more than eight general-purpose counters.

Note that general-purpose counters that are exclusively enumerated in CPUID.(EAX=23H, ECX=01H):EAX may not support the legacy MSR address range; see Section 8.5.1, "Performance Monitoring MSR Aliasing," for details.

21.2.9.4 Fixed-Function Counters True-View Bitmap

CPUID.(EAX=23H, ECX=01H):EBX reports a bitmap for available fixed-function counters. (CPUID leaf 0AH reports the common number of contiguous fixed-function counters in addition to a common bitmap of fixed-function counters availability.)

This capability enables privileged software to expose per logical processor enumeration of fixed-function counters. This is especially important should the fixed-function counters not be available on all logical processors.

Note that programmable counters that are exclusively enumerated in CPUID.(EAX=23H, ECX=01H):EAX may not support the legacy MSR address range; see Section 8.5.1, "Performance Monitoring MSR Aliasing," for details.

21.2.9.5 Architectural Performance Monitoring Events Bitmap

CPUID.(EAX=23H, ECX=03H):EAX provides a true-view of per logical processor available architectural performance monitoring events. For each bit *n* set in this field, the processor supports Architectural Performance Monitoring Event of index *n* (positive polarity).

Conversely, CPUID.0AH:EBX provides a maximum common set of architectural performance monitoring events supported by all logical processors, where if bit *n* is set, it denotes the processor does not necessarily support Architectural Performance Monitoring Event of index *n* on all logical processors (negative polarity).

21.2.9.6 TMA Slots Per Cycle

CPUID.(EAX=23H, ECX=0H):ECX[7:0] reports the number of TMA slots per cycle in a true-view per logical-processor fashion.

This number can be multiplied by the number of cycles (from CPU_CLK_UNHALTED.THREAD / CPU_CLK_UNHALTED.CORE or IA32_FIXED_CTR1) to determine the total number of TMA slots.

Because of microarchitectural reasons, some logical processors may be reporting TMA slots per cycle as 0. In such situations, software can use other methods, like programmable events or fixed counters, to understand the performance issues.

21.3 PERFORMANCE MONITORING (INTEL® CORE™ PROCESSORS AND INTEL® XEON® PROCESSORS)

21.3.1 Performance Monitoring for Processors Based on Nehalem Microarchitecture

Intel Core i7 processor family[1] supports architectural performance monitoring capability with version ID 3 (see Section 21.2.3) and a host of non-architectural monitoring capabilities. The Intel Core i7 processor family is based on Nehalem microarchitecture, and provides four general-purpose performance counters (IA32_PMC0, IA32_PMC1, IA32_PMC2, IA32_PMC3) and three fixed-function performance counters (IA32_FIXED_CTR0, IA32_-FIXED_CTR1, IA32_FIXED_CTR2) in the processor core.

Non-architectural performance monitoring in Intel Core i7 processor family uses the IA32_PERFEVTSELx MSR to configure a set of non-architecture performance monitoring events to be counted by the corresponding general-purpose performance counter. The list of non-architectural performance monitoring events can be found at: https://perfmon-events.intel.com/. Non-architectural performance monitoring events fall into two broad categories:

- Performance monitoring events in the processor core: These include many events that are similar to performance monitoring events available to processor based on Intel Core microarchitecture. Additionally, there are several enhancements in the performance monitoring capability for detecting microarchitectural conditions in the processor core or in the interaction of the processor core to the off-core sub-systems in the physical processor package. The off-core sub-systems in the physical processor package is loosely referred to as "uncore".
- Performance monitoring events in the uncore: The uncore sub-system is shared by more than one processor cores in the physical processor package. It provides additional performance monitoring facility outside of IA32_PMCx and performance monitoring events that are specific to the uncore sub-system.

Architectural and non-architectural performance monitoring events in Intel Core i7 processor family support thread qualification using bit 21 of IA32_PERFEVTSELx MSR.

The bit fields within each IA32_PERFEVTSELx MSR are defined in Figure 21-6 and described in Section and Section 21.2.3.

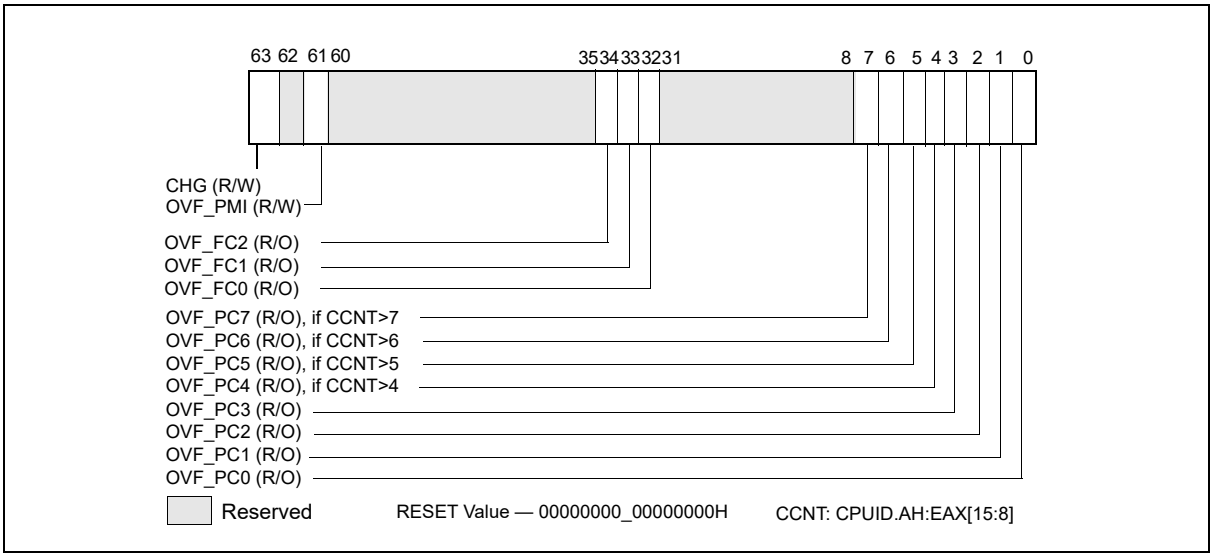

Figure 21-16. IA32_PERF_GLOBAL_STATUS MSR

1. Intel Xeon processor 5500 series and 3400 series are also based on Nehalem microarchitecture; the performance monitoring facilities described in this section generally also apply.

21.3.1.1 Enhancements of Performance Monitoring in the Processor Core

The notable enhancements in the monitoring of performance events in the processor core include:

- Four general purpose performance counters, IA32_PMCx, associated counter configuration MSRs, IA32_PERFEVTSELx, and global counter control MSR supporting simplified control of four counters. Each of the four performance counter can support processor event based sampling (PEBS) and thread-qualification of architectural and non-architectural performance events. Width of IA32_PMCx supported by hardware has been increased. The width of counter reported by CPUID.0AH:EAX[23:16] is 48 bits. The PEBS facility in Nehalem microarchitecture has been enhanced to include new data format to capture additional information, such as load latency.
- Load latency sampling facility. Average latency of memory load operation can be sampled using load-latency facility in processors based on Nehalem microarchitecture. This field measures the load latency from load's first dispatch of till final data writeback from the memory subsystem. The latency is reported for retired demand load operations and in core cycles (it accounts for re-dispatches). This facility is used in conjunction with the PEBS facility.
- Off-core response counting facility. This facility in the processor core allows software to count certain transaction responses between the processor core to sub-systems outside the processor core (uncore). Counting off-core response requires additional event qualification configuration facility in conjunction with IA32_PERFEVTSELx. Two off-core response MSRs are provided to use in conjunction with specific event codes that must be specified with IA32_PERFEVTSELx.

NOTE

The number of counters available to software may vary from the number of physical counters present on the hardware, because an agent running at a higher privilege level (e.g., a VMM) may not expose all counters. CPUID.0AH:EAX[15:8] reports the MSRs available to software; see Section 21.2.1.

21.3.1.1.1 Processor Event Based Sampling (PEBS)

All general-purpose performance counters, IA32_PMCx, can be used for PEBS if the performance event supports PEBS. Software uses IA32_MISC_ENABLE[7] and IA32_MISC_ENABLE[12] to detect whether the performance monitoring facility and PEBS functionality are supported in the processor. The MSR IA32_PEBS_ENABLE provides 4 bits that software must use to enable which IA32_PMCx overflow condition will cause the PEBS record to be captured.

Additionally, the PEBS record is expanded to allow latency information to be captured. The MSR IA32_PEBS_ENABLE provides 4 additional bits that software must use to enable latency data recording in the PEBS record upon the respective IA32_PMCx overflow condition. The layout of IA32_PEBS_ENABLE for processors based on Nehalem microarchitecture is shown in Figure 21-17.

When a counter is enabled to capture machine state (PEBS_EN_PMCx = 1), the processor will write machine state information to a memory buffer specified by software as detailed below. When the counter IA32_PMCx overflows from maximum count to zero, the PEBS hardware is armed.

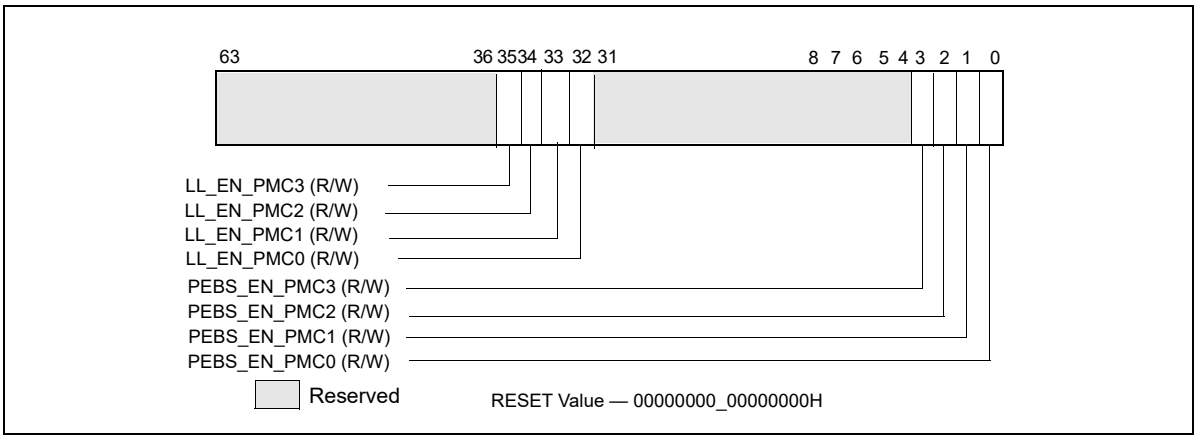

Figure 21-17. Layout of IA32_PEBS_ENABLE MSR

Upon occurrence of the next PEBS event, the PEBS hardware triggers an assist and causes a PEBS record to be written. The format of the PEBS record is indicated by the bit field IA32_PERF_CAPABILITIES[11:8] (see Figure 21-67).

The behavior of PEBS assists is reported by IA32_PERF_CAPABILITIES[6] (see Figure 21-67). The return instruction pointer (RIP) reported in the PEBS record will point to the instruction after (+1) the instruction that causes the PEBS assist. The machine state reported in the PEBS record is the machine state after the instruction that causes the PEBS assist is retired. For instance, if the instructions:

mov eax, [eax] ; causes PEBS assist

nop

are executed, the PEBS record will report the address of the nop, and the value of EAX in the PEBS record will show the value read from memory, not the target address of the read operation.

The PEBS record format is shown in Table 21-4, and each field in the PEBS record is 64 bits long. The PEBS record format, along with debug/store area storage format, does not change regardless of IA-32e mode is active or not. CPUID.01H:ECX.DTES64[bit 2] reports whether the processor's DS storage format support is mode-independent. When set, it uses 64-bit DS storage format.

Table 21-4. PEBS Record Format for Intel Core i7 Processor Family

Byte Offset	Field	Byte Offset	Field
00H	R/EFLAGS	58H	R9
08H	R/EIP	60H	R10
10H	R/EAX	68H	R11
18H	R/EBX	70H	R12
20H	R/ECX	78H	R13
28H	R/EDX	80H	R14
30H	R/ESI	88H	R15
38H	R/EDI	90H	IA32_PERF_GLOBAL_STATUS
40H	R/EBP	98H	Data Linear Address
48H	R/ESP	A0H	Data Source Encoding
50H	R8	A8H	Latency value (core cycles)

In IA-32e mode, the full 64-bit value is written to the register. If the processor is not operating in IA-32e mode, 32-bit value is written to registers with bits 63:32 zeroed. Registers not defined when the processor is not in IA-32e mode are written to zero.

Bytes AFH:90H are enhancement to the PEBS record format. Support for this enhanced PEBS record format is indicated by IA32_PERF_CAPABILITIES[11:8] encoding of 0001B.

The value written to bytes 97H:90H is the state of the IA32_PERF_GLOBAL_STATUS register before the PEBS assist occurred. This value is written so software can determine which counters overflowed when this PEBS record was written. Note that this field indicates the overflow status for all counters, regardless of whether they were programmed for PEBS or not.

Programming PEBS Facility

Only a subset of non-architectural performance events in the processor support PEBS. The subset of precise events are listed in Table 21-88. In addition to using IA32_PERFEVTSELx to specify event unit/mask settings and setting the EN_PMCx bit in the IA32_PEBS_ENABLE register for the respective counter, the software must also initialize the DS_BUFFER_MANAGEMENT_AREA data structure in memory to support capturing PEBS records for precise events.

The recording of PEBS records may not operate properly if accesses to the linear addresses in the DS buffer management area or in the PEBS buffer (see below) cause page faults, VM exits, or the setting of accessed or dirty flags in the paging structures (ordinary or EPT). For that reason, system software should establish paging structures (both ordinary and EPT) to prevent such occurrences. Implications of this may be that an operating system should allocate this memory from a non-paged pool and that system software cannot do "lazy" page-table entry propagation for these pages. A virtual-machine monitor may choose to allow use of PEBS by guest software only if EPT maps all guest-physical memory as present and read/write.

NOTE

PEBS events are only valid when the following fields of IA32_PERFEVTSELx are all zero: AnyThread, Edge, Invert, CMask.

The beginning linear address of the DS_BUFFER_MANAGEMENT_AREA data structure must be programmed into the IA32_DS_AREA register. The layout of the DS_BUFFER_MANAGEMENT_AREA is shown in Figure 21-18.

- **PEBS Buffer Base**: This field is programmed with the linear address of the first byte of the PEBS buffer allocated by software. The processor reads this field to determine the base address of the PEBS buffer.
- **PEBS Index**: This field is initially programmed with the same value as the PEBS Buffer Base field, or the beginning linear address of the PEBS buffer. The processor reads this field to determine the location of the next PEBS record to write to. After a PEBS record has been written, the processor also updates this field with the address of the next PEBS record to be written. The figure above illustrates the state of PEBS Index after the first PEBS record is written.
- **PEBS Absolute Maximum**: This field represents the absolute address of the maximum length of the allocated PEBS buffer plus the starting address of the PEBS buffer. The processor will not write any PEBS record beyond the end of PEBS buffer, when **PEBS Index** equals **PEBS Absolute Maximum**. No signaling is generated when PEBS buffer is full. Software must reset the **PEBS Index** field to the beginning of the PEBS buffer address to continue capturing PEBS records.

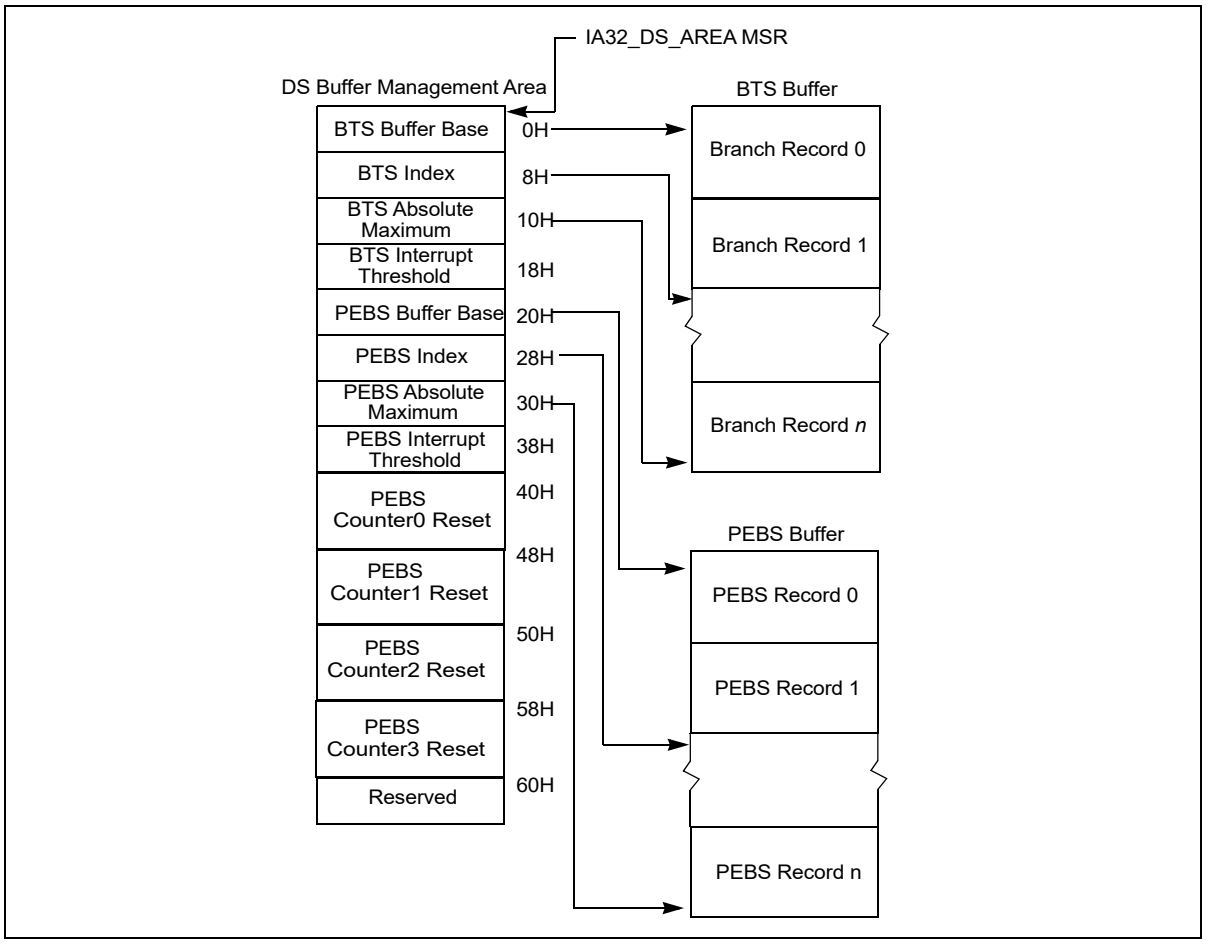

Figure 21-18. PEBS Programming Environment

- **PEBS Interrupt Threshold**: This field specifies the threshold value to trigger a performance interrupt and notify software that the PEBS buffer is nearly full. This field is programmed with the linear address of the first byte of the PEBS record within the PEBS buffer that represents the threshold record. After the processor writes a PEBS record and updates **PEBS Index**, if the **PEBS Index** reaches the threshold value of this field, the processor will generate a performance interrupt. This is the same interrupt that is generated by a performance counter overflow, as programmed in the Performance Monitoring Counters vector in the Local Vector Table of the Local APIC. When a performance interrupt due to PEBS buffer full is generated, the IA32_PERF_-GLOBAL_STATUS.PEBS_Ovf bit will be set.
- **PEBS CounterX Reset**: This field allows software to set up PEBS counter overflow condition to occur at a rate useful for profiling workload, thereby generating multiple PEBS records to facilitate characterizing the profile the execution of test code. After each PEBS record is written, the processor checks each counter to see if it overflowed and was enabled for PEBS (the corresponding bit in IA32_PEBS_ENABLED was set). If these conditions are met, then the reset value for each overflowed counter is loaded from the DS Buffer Management Area. For example, if counter IA32_PMC0 caused a PEBS record to be written, then the value of "PEBS Counter 0 Reset" would be written to counter IA32_PMC0. If a counter is not enabled for PEBS, its value will not be modified by the PEBS assist.

Performance Counter Prioritization

Performance monitoring interrupts are triggered by a counter transitioning from maximum count to zero (assuming IA32_PerfEvtSelX.INT is set). This same transition will cause PEBS hardware to arm, but not trigger. PEBS hardware triggers upon detection of the first PEBS event after the PEBS hardware has been armed (a 0 to 1 transition of the counter). At this point, a PEBS assist will be undertaken by the processor.

Performance counters (fixed and general-purpose) are prioritized in index order. That is, counter IA32_PMC0 takes precedence over all other counters. Counter IA32_PMC1 takes precedence over counters IA32_PMC2 and IA32_PMC3, and so on. This means that if simultaneous overflows or PEBS assists occur, the appropriate action will be taken for the highest priority performance counter. For example, if IA32_PMC1 cause an overflow interrupt and IA32_PMC2 causes an PEBS assist simultaneously, then the overflow interrupt will be serviced first.

The PEBS threshold interrupt is triggered by the PEBS assist, and is by definition prioritized lower than the PEBS assist. Hardware will not generate separate interrupts for each counter that simultaneously overflows. General-purpose performance counters are prioritized over fixed counters.

If a counter is programmed with a precise (PEBS-enabled) event and programmed to generate a counter overflow interrupt, the PEBS assist is serviced before the counter overflow interrupt is serviced. If in addition the PEBS interrupt threshold is met, the

threshold interrupt is generated after the PEBS assist completes, followed by the counter overflow interrupt (two separate interrupts are generated).

Uncore counters may be programmed to interrupt one or more processor cores (see Section 21.3.1.2). It is possible for interrupts posted from the uncore facility to occur coincident with counter overflow interrupts from the processor core. Software must check core and uncore status registers to determine the exact origin of counter overflow interrupts.

21.3.1.1.2 Load Latency Performance Monitoring Facility

The load latency facility provides software a means to characterize the average load latency to different levels of cache/memory hierarchy. This facility requires processor supporting enhanced PEBS record format in the PEBS buffer, see Table 21-4. This field measures the load latency from load's first dispatch of till final data writeback from the memory subsystem. The latency is reported for retired demand load operations and in core cycles (it accounts for re-dispatches).

To use this feature software must assure:

- One of the IA32_PERFEVTSELx MSR is programmed to specify the event unit MEM_INST_RETIRED, and the LATENCY_ABOVE_THRESHOLD event mask must be specified (IA32_PerfEvtSelX[15:0] = 100H). The corresponding counter IA32_PMCx will accumulate event counts for architecturally visible loads which exceed the programmed latency threshold specified separately in a MSR. Stores are ignored when this event is programmed. The CMASK or INV fields of the IA32_PerfEvtSelX register used for counting load latency must be 0. Writing other values will result in undefined behavior.
- The MSR_PEBS_LD_LAT_THRESHOLD MSR is programmed with the desired latency threshold in core clock cycles. Loads with latencies greater than this value are eligible for counting and latency data reporting. The minimum value that may be programmed in this register is 3 (the minimum detectable load latency is 4 core clock cycles).
- The PEBS enable bit in the IA32_PEBS_ENABLE register is set for the corresponding IA32_PMCx counter register. This means that both the PEBS_EN_CTRX and LL_EN_CTRX bits must be set for the counter(s) of interest. For example, to enable load latency on counter IA32_PMC0, the IA32_PEBS_ENABLE register must be programmed with the 64-bit value 00000001_00000001H.

When the load-latency facility is enabled, load operations are randomly selected by hardware and tagged to carry information related to data source locality and latency. Latency and data source information of tagged loads are updated internally.

When a PEBS assist occurs, the last update of latency and data source information are captured by the assist and written as part of the PEBS record. The PEBS sample after value (SAV), specified in PEBS CounterX Reset, operates orthogonally to the tagging mechanism. Loads are randomly tagged to collect latency data. The SAV controls the number of tagged loads with latency information that will be written into the PEBS record field by the PEBS assists. The load latency data written to the PEBS record will be for the last tagged load operation which retired just before the PEBS assist was invoked.

The load-latency information written into a PEBS record (see Table 21-4, bytes AFH:98H) consists of:

- **Data Linear Address**: This is the linear address of the target of the load operation.
- **Latency Value**: This is the elapsed cycles of the tagged load operation between dispatch to GO, measured in processor core clock domain.

- **Data Source:** The encoded value indicates the origin of the data obtained by the load instruction. The encoding is shown in Table 21-5. In the descriptions, local memory refers to system memory physically attached to a processor package, and remote memory refers to system memory physically attached to another processor package.

Table 21-5. Data Source Encoding for Load Latency Record

Encoding	Description
00H	Unknown L3 cache miss.
01H	Minimal latency core cache hit. This request was satisfied by the L1 data cache.
02H	Pending core cache HIT. Outstanding core cache miss to same cache-line address was already underway.
03H	This data request was satisfied by the L2.
04H	L3 HIT. Local or Remote home requests that hit L3 cache in the uncore with no coherency actions required (snooping).
05H	L3 HIT. Local or Remote home requests that hit the L3 cache and were serviced by another processor core with a cross core snoop where no modified copies were found. (clean).
06H	L3 HIT. Local or Remote home requests that hit the L3 cache and were serviced by another processor core with a cross core snoop where no modified copies were found.
07H[1]	Reserved/LLC Snoop HitM. Local or Remote home requests that hit the last level cache and were serviced by another core with a cross core snoop where modified copies were found.
08H	Reserved/L3 MISS. Local homed requests that missed the L3 cache and were serviced by forwarded data following a cross package snoop where no modified copies were found. (Remote home requests are not counted).
09H	Reserved
0AH	L3 MISS. Local home requests that missed the L3 cache and were serviced by local DRAM (go to shared state).
0BH	L3 MISS. Remote home requests that missed the L3 cache and were serviced by remote DRAM (go to shared state).
0CH	L3 MISS. Local home requests that missed the L3 cache and were serviced by local DRAM (go to exclusive state).
0DH	L3 MISS. Remote home requests that missed the L3 cache and were serviced by remote DRAM (go to exclusive state).
0EH	I/O, Request of input/output operation.
0FH	The request was to uncacheable memory.

NOTES:

1. Bit 7 is supported only for processors with a CPUID DisplayFamily_DisplayModel signature of 06_2A, and 06_2E; otherwise it is reserved.

The layout of MSR_PEBS_LD_LAT_THRESHOLD is shown in Figure 21-19.

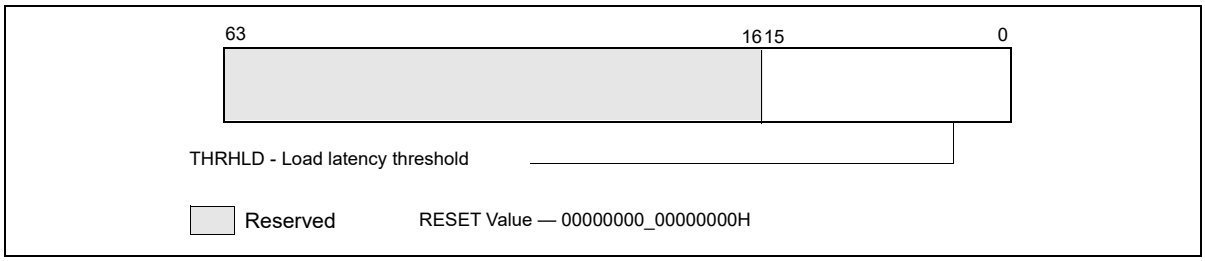

Figure 21-19. Layout of MSR_PEBS_LD_LAT MSR

Bits 15:0 specifies the threshold load latency in core clock cycles. Performance events with latencies greater than this value are counted in IA32_PMCx and their latency information is reported in the PEBS record. Otherwise, they are ignored. The minimum value that may be programmed in this field is 3.

21.3.1.1.3 Off-core Response Performance Monitoring in the Processor Core

Programming a performance event using the off-core response facility can choose any of the four IA32_PERFEVTSELx MSR with specific event codes and predefine mask bit value. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR_OFFCORE_RSP_0. There is only one off-core response configuration MSR. Table 21-6 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32_PMCx.

Table 21-6. Off-Core Response Event Encoding

Event code in IA32_PERFEVTSELx	Mask Value in IA32_PERFEVTSELx	Required Off-core Response MSR
B7H	01H	MSR_OFFCORE_RSP_0 (address 1A6H)

The layout of MSR_OFFCORE_RSP_0 is shown in Figure 21-20. Bits 7:0 specifies the request type of a transaction request to the uncore. Bits 15:8 specifies the response of the uncore subsystem.

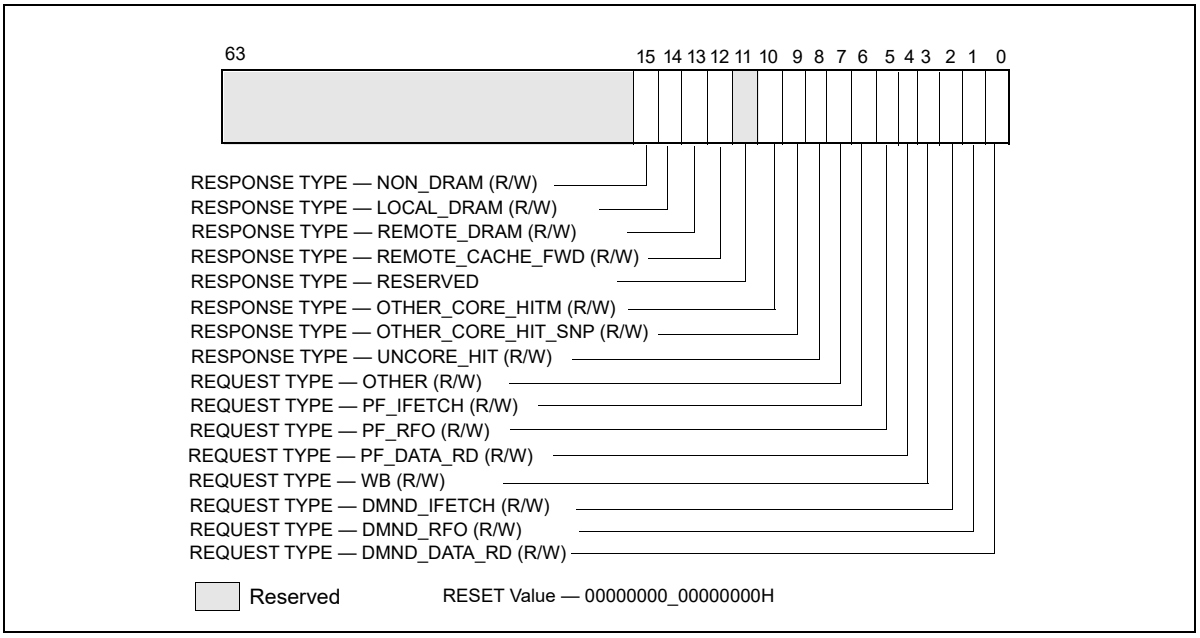

Figure 21-20. Layout of MSR_OFFCORE_RSP_0 and MSR_OFFCORE_RSP_1 to Configure Off-core Response Events

Table 21-7. MSR_OFFCORE_RSP_0 and MSR_OFFCORE_RSP_1 Bit Field Definition

Bit Name	Offset	Description
DMND_DATA_RD	0	Counts the number of demand and DCU prefetch data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count L2 data read prefetches or instruction fetches.
DMND_RFO	1	Counts the number of demand and DCU prefetch reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO.
DMND_IFETCH	2	Counts the number of demand instruction cacheline reads and L1 instruction cacheline prefetches.
WB	3	Counts the number of writeback (modified to exclusive) transactions.
PF_DATA_RD	4	Counts the number of data cacheline reads generated by L2 prefetchers.
PF_RFO	5	Counts the number of RFO requests generated by L2 prefetchers.
PF_IFETCH	6	Counts the number of code reads generated by L2 prefetchers.

Table 21-7. MSR_OFFCORE_RSP_0 and MSR_OFFCORE_RSP_1 Bit Field Definition (Contd.)

Bit Name	Offset	Description
OTHER	7	Counts one of the following transaction types, including L3 invalidate, I/O, full or partial writes, WC or non-temporal stores, CLFLUSH, Fences, lock, unlock, split lock.
UNCORE_HIT	8	L3 Hit: local or remote home requests that hit L3 cache in the uncore with no coherency actions required (snooping).
OTHER_CORE_HIT_SNP	9	L3 Hit: local or remote home requests that hit L3 cache in the uncore and was serviced by another core with a cross core snoop where no modified copies were found (clean).
OTHER_CORE_HITM	10	L3 Hit: local or remote home requests that hit L3 cache in the uncore and was serviced by another core with a cross core snoop where modified copies were found (HITM).
Reserved	11	Reserved
REMOTE_CACHE_FWD	12	L3 Miss: local homed requests that missed the L3 cache and was serviced by forwarded data following a cross package snoop where no modified copies found. (Remote home requests are not counted)
REMOTE_DRAM	13	L3 Miss: remote home requests that missed the L3 cache and were serviced by remote DRAM.
LOCAL_DRAM	14	L3 Miss: local home requests that missed the L3 cache and were serviced by local DRAM.
NON_DRAM	15	Non-DRAM requests that were serviced by IOH.

21.3.1.2 Performance Monitoring Facility in the Uncore

The "uncore" in Nehalem microarchitecture refers to subsystems in the physical processor package that are shared by multiple processor cores. Some of the sub-systems in the uncore include the L3 cache, Intel QuickPath Interconnect link logic, and integrated memory controller. The performance monitoring facilities inside the uncore operates in the same clock domain as the uncore (U-clock domain), which is usually different from the processor core clock domain. The uncore performance monitoring facilities described in this section apply to Intel Xeon processor 5500 series and processors with the following CPUID signatures: 06_1AH, 06_1EH, 06_1FH (see Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4). An overview of the uncore performance monitoring facilities is described separately.

The performance monitoring facilities available in the U-clock domain consist of:

- Eight General-purpose counters (MSR_UNCORE_PerfCntr0 through MSR_UNCORE_PerfCntr7). The counters are 48 bits wide. Each counter is associated with a configuration MSR, MSR_UNCORE_PerfEvtSelx, to specify event code, event mask and other event qualification fields. A set of global uncore performance counter enabling/overflow/status control MSRs are also provided for software.
- Performance monitoring in the uncore provides an address/opcode match MSR that provides event qualification control based on address value or QPI command opcode.
- One fixed-function counter, MSR_UNCORE_FixedCntr0. The fixed-function uncore counter increments at the rate of the U-clock when enabled.

  The frequency of the uncore clock domain can be determined from the uncore clock ratio which is available in the PCI configuration space register at offset C0H under device number 0 and Function 0.

21.3.1.2.1 Uncore Performance Monitoring Management Facility

MSR_UNCORE_PERF_GLOBAL_CTRL provides bit fields to enable/disable general-purpose and fixed-function counters in the uncore. Figure 21-21 shows the layout of MSR_UNCORE_PERF_GLOBAL_CTRL for an uncore that is shared by four processor cores in a physical package.

- EN_PCn (bit n, n = 0, 7): When set, enables counting for the general-purpose uncore counter MSR_UNCORE_PerfCntr n.
- EN_FC0 (bit 32): When set, enables counting for the fixed-function uncore counter MSR_UNCORE_FixedCntr0.
- EN_PMI_COREn (bit n, n = 0, 3 if four cores are present): When set, processor core n is programmed to receive an interrupt signal from any interrupt enabled uncore counter. PMI delivery due to an uncore counter overflow is enabled by setting IA32_DEBUGCTL.Offcore_PMI_EN to 1.

- PMI_FRZ (bit 63): When set, all U-clock uncore counters are disabled when any one of them signals a performance interrupt. Software must explicitly re-enable the counter by setting the enable bits in MSR_UNCORE_PERF_GLOBAL_CTRL upon exit from the ISR.

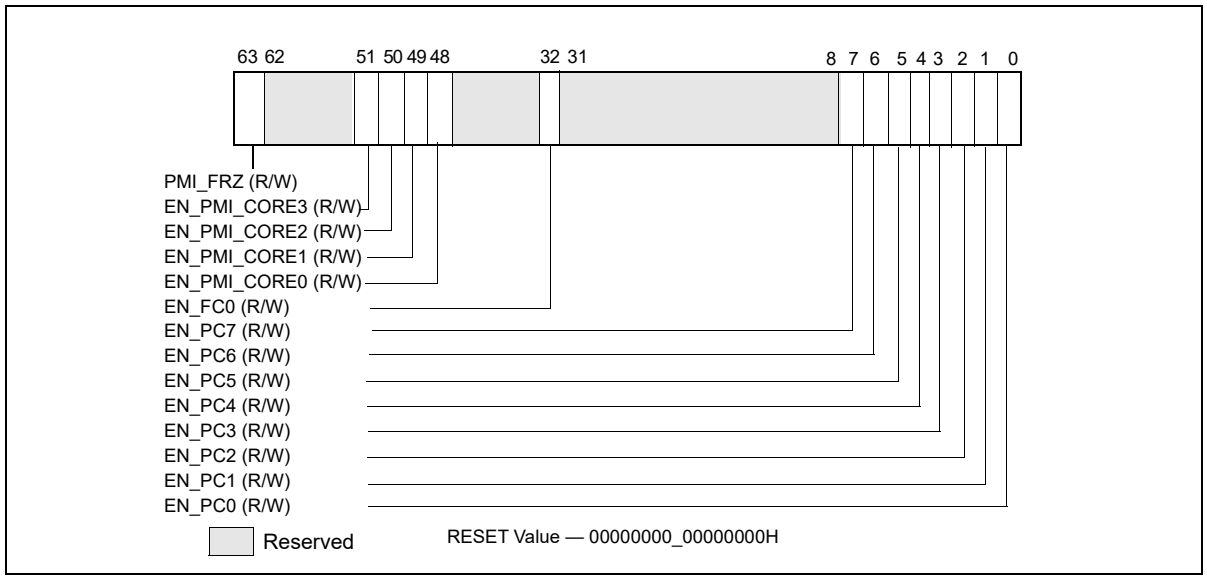

Figure 21-21. Layout of MSR_UNCORE_PERF_GLOBAL_CTRL MSR

MSR_UNCORE_PERF_GLOBAL_STATUS provides overflow status of the U-clock performance counters in the uncore. This is a read-only register. If an overflow status bit is set the corresponding counter has overflowed. The register provides a condition change bit (bit 63) which can be quickly checked by software to determine if a significant change has occurred since the last time the condition change status was cleared. Figure 21-22 shows the layout of MSR_UNCORE_PERF_GLOBAL_STATUS.

- OVF_PCn (bit n, n = 0, 7): When set, indicates general-purpose uncore counter MSR_UNCORE_PerfCntr n has overflowed.
- OVF_FC0 (bit 32): When set, indicates the fixed-function uncore counter MSR_UNCORE_FixedCntr0 has overflowed.
- OVF_PMI (bit 61): When set indicates that an uncore counter overflowed and generated an interrupt request.
- CHG (bit 63): When set indicates that at least one status bit in MSR_UNCORE_PERF_GLOBAL_STATUS register has changed state.

MSR_UNCORE_PERF_GLOBAL_OVF_CTRL allows software to clear the status bits in the UNCORE_PERF_GLOBAL_STATUS register. This is a write-only register, and individual status bits in the global status register are cleared by writing a binary one to the corresponding bit in this register. Writing zero to any bit position in this register has no effect on the uncore PMU hardware.

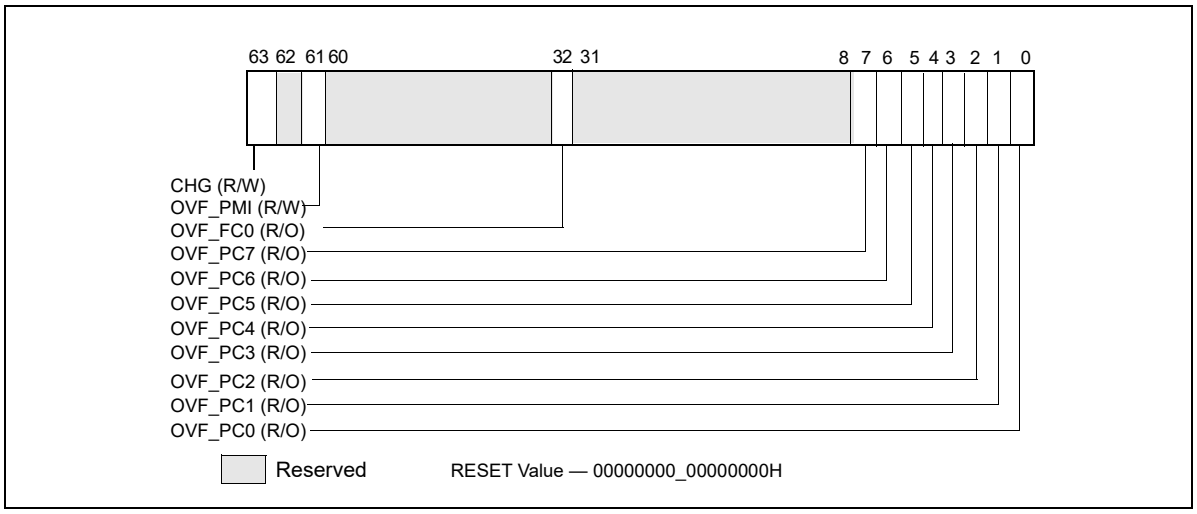

Figure 21-22. Layout of MSR_UNCORE_PERF_GLOBAL_STATUS MSR

Figure 21-23 shows the layout of MSR_UNCORE_PERF_GLOBAL_OVF_CTRL.

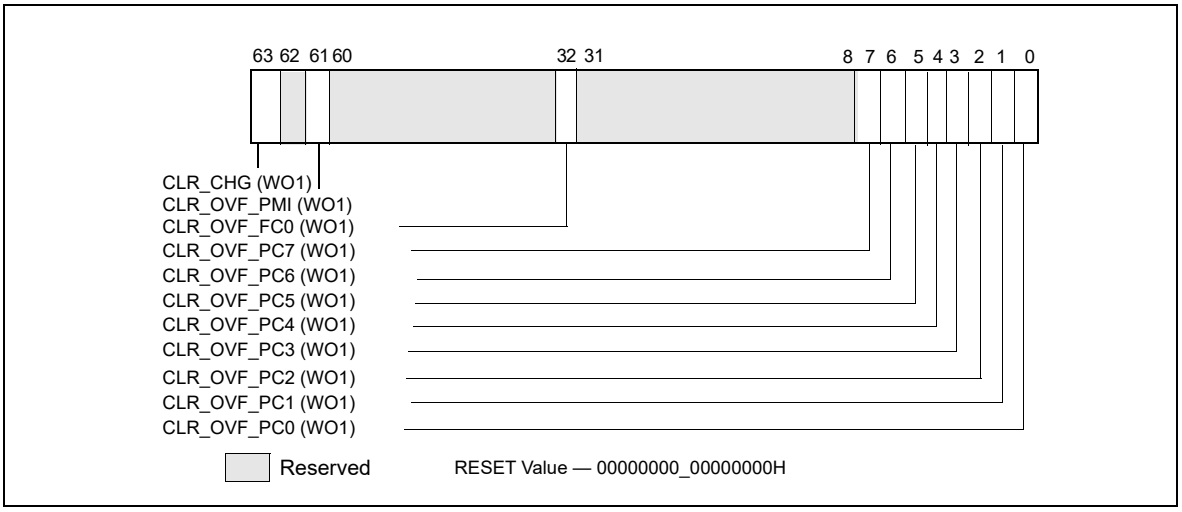

Figure 21-23. Layout of MSR_UNCORE_PERF_GLOBAL_OVF_CTRL MSR

- CLR_OVF_PCn (bit n, n = 0, 7): Set this bit to clear the overflow status for general-purpose uncore counter MSR_UNCORE_PerfCntr n. Writing a value other than 1 is ignored.
- CLR_OVF_FC0 (bit 32): Set this bit to clear the overflow status for the fixed-function uncore counter MSR_UNCORE_FixedCntr0. Writing a value other than 1 is ignored.
- CLR_OVF_PMI (bit 61): Set this bit to clear the OVF_PMI flag in MSR_UNCORE_PERF_GLOBAL_STATUS. Writing a value other than 1 is ignored.
- CLR_CHG (bit 63): Set this bit to clear the CHG flag in MSR_UNCORE_PERF_GLOBAL_STATUS register. Writing a value other than 1 is ignored.

21.3.1.2.2 Uncore Performance Event Configuration Facility

MSR_UNCORE_PerfEvtSel0 through MSR_UNCORE_PerfEvtSel7 are used to select performance event and configure the counting behavior of the respective uncore performance counter. Each uncore PerfEvtSel MSR is paired with an uncore performance counter. Each uncore counter must be locally configured using the corre-

sponding MSR_UNCORE_PerfEvtSelx and counting must be enabled using the respective EN_PCx bit in MSR_UNCORE_PERF_GLOBAL_CTRL. Figure 21-24 shows the layout of MSR_UNCORE_PERFEVTSELx.

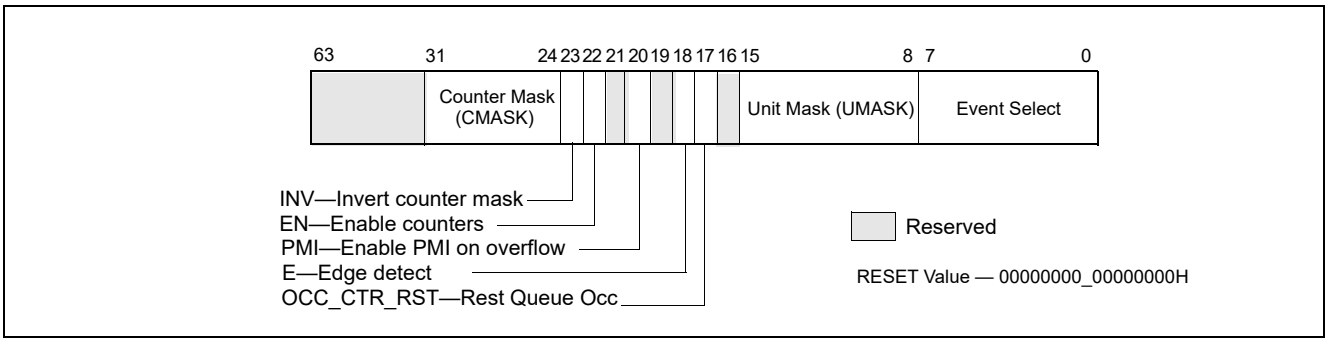

Figure 21-24. Layout of MSR_UNCORE_PERFEVTSELx MSRs

- Event Select (bits 7:0): Selects the event logic unit used to detect uncore events.
- Unit Mask (bits 15:8) : Condition qualifiers for the event selection logic specified in the Event Select field.
- OCC_CTR_RST (bit17): When set causes the queue occupancy counter associated with this event to be cleared (zeroed). Writing a zero to this bit will be ignored. It will always read as a zero.
- Edge Detect (bit 18): When set causes the counter to increment when a deasserted to asserted transition occurs for the conditions that can be expressed by any of the fields in this register.
- PMI (bit 20): When set, the uncore will generate an interrupt request when this counter overflowed. This request will be routed to the logical processors as enabled in the PMI enable bits (EN_PMI_COREx) in the register MSR_UNCORE_PERF_GLOBAL_CTRL.
- EN (bit 22): When clear, this counter is locally disabled. When set, this counter is locally enabled and counting starts when the corresponding EN_PCx bit in MSR_UNCORE_PERF_GLOBAL_CTRL is set.
- INV (bit 23): When clear, the Counter Mask field is interpreted as greater than or equal to. When set, the Counter Mask field is interpreted as less than.
- Counter Mask (bits 31:24): When this field is clear, it has no effect on counting. When set to a value other than zero, the logical processor compares this field to the event counts on each core clock cycle. If INV is clear and the event counts are greater than or equal to this field, the counter is incremented by one. If INV is set and the event counts are less than this field, the counter is incremented by one. Otherwise the counter is not incremented.

Figure 21-25 shows the layout of MSR_UNCORE_FIXED_CTR_CTRL.

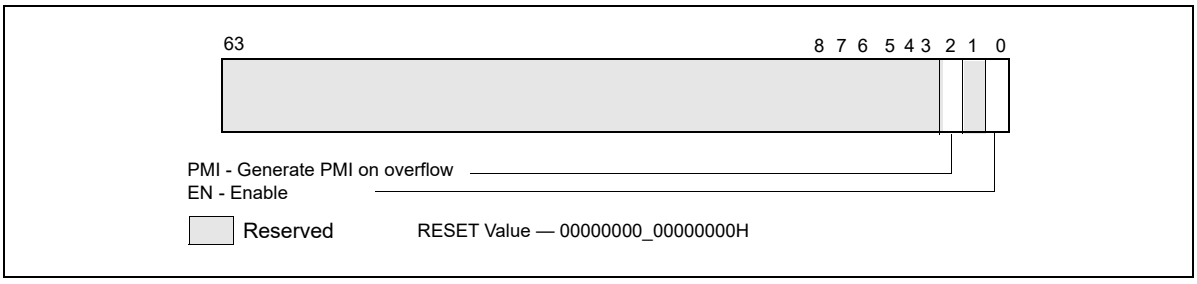

Figure 21-25. Layout of MSR_UNCORE_FIXED_CTR_CTRL MSR

- EN (bit 0): When clear, the uncore fixed-function counter is locally disabled. When set, it is locally enabled and counting starts when the EN_FC0 bit in MSR_UNCORE_PERF_GLOBAL_CTRL is set.
- PMI (bit 2): When set, the uncore will generate an interrupt request when the uncore fixed-function counter overflowed. This request will be routed to the logical processors as enabled in the PMI enable bits (EN_PMI_COREx) in the register MSR_UNCORE_PERF_GLOBAL_CTRL.

Both the general-purpose counters (MSR_UNCORE_PerfCntr) and the fixed-function counter (MSR_UNCORE_-FixedCntr0) are 48 bits wide. They support both counting and interrupt based sampling usages. The event logic unit can filter event counts to specific regions of code or transaction types incoming to the home node logic.

21.3.1.2.3 Uncore Address/Opcode Match MSR

The Event Select field [7:0] of MSR_UNCORE_PERFEVTSELx is used to select different uncore event logic unit. When the event "ADDR_OPCODE_MATCH" is selected in the Event Select field, software can filter uncore performance events according to transaction address and certain transaction responses. The address filter and transaction response filtering requires the use of MSR_UNCORE_ADDR_OPCODE_MATCH register. The layout is shown in Figure 21-26.

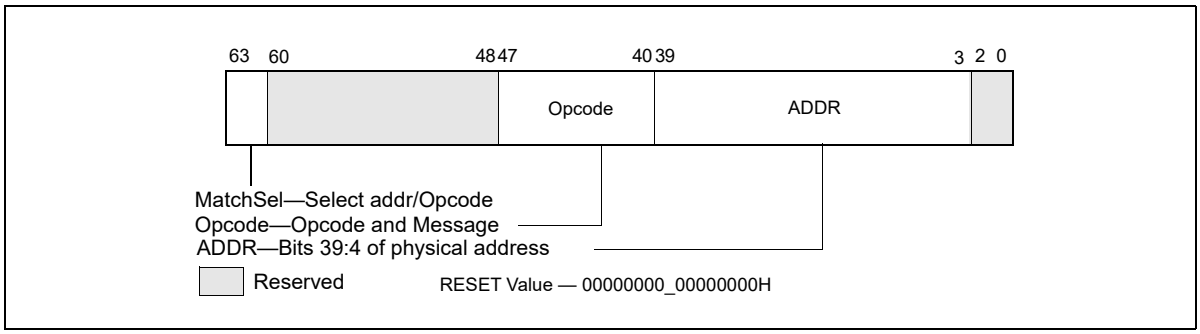

Figure 21-26. Layout of MSR_UNCORE_ADDR_OPCODE_MATCH MSR

- Addr (bits 39:3): The physical address to match if "MatchSel" field is set to select address match. The uncore performance counter will increment if the lowest 40-bit incoming physical address (excluding bits 2:0) for a transaction request matches bits 39:3.
- Opcode (bits 47:40) : Bits 47:40 allow software to filter uncore transactions based on QPI link message class/packed header opcode. These bits are consists two sub-fields:
  - — Bits 43:40 specify the QPI packet header opcode.
  - — Bits 47:44 specify the QPI message classes.

  Table 21-8 lists the encodings supported in the opcode field.

Table 21-8. Opcode Field Encoding for MSR_UNCORE_ADDR_OPCODE_MATCH

Opcode [43:40]	QPI Message Class		
	Home Request [47:44] = 0000B	Snoop Response [47:44] = 0001B	Data Response [47:44] = 1110B
		1	
DMND_IFETCH	2	2	
WB	3	3	
PF_DATA_RD	4	4	
PF_RFO	5	5	
PF_IFETCH	6	6	
OTHER	7	7	
NON_DRAM	15	15	

- MatchSel (bits 63:61): Software specifies the match criteria according to the following encoding:
  - 000B: Disable addr_opcode match hardware.
  - 100B: Count if only the address field matches.
  - 010B: Count if only the opcode field matches.
  - 110B: Count if either opcode field matches or the address field matches.
  - 001B: Count only if both opcode and address field match.
  - Other encoding are reserved.

21.3.1.3 Intel® Xeon® Processor 7500 Series Performance Monitoring Facility

The performance monitoring facility in the processor core of Intel® Xeon® processor 7500 series are the same as those supported in Intel Xeon processor 5500 series. The uncore subsystem in Intel Xeon processor 7500 series are significantly different The uncore performance monitoring facility consist of many distributed units associated with individual logic control units (referred to as boxes) within the uncore subsystem. A high level block diagram of the various box units of the uncore is shown in Figure 21-27.

Uncore PMUs are programmed via MSR interfaces. Each of the distributed uncore PMU units have several general-purpose counters. Each counter requires an associated event select MSR, and may require additional MSRs to configure sub-event conditions. The uncore PMU MSRs associated with each box can be categorized based on its functional scope: per-counter, per-box, or global across the uncore. The number counters available in each box type are different. Each box generally provides a set of MSRs to enable/disable, check status/overflow of multiple counters within each box.

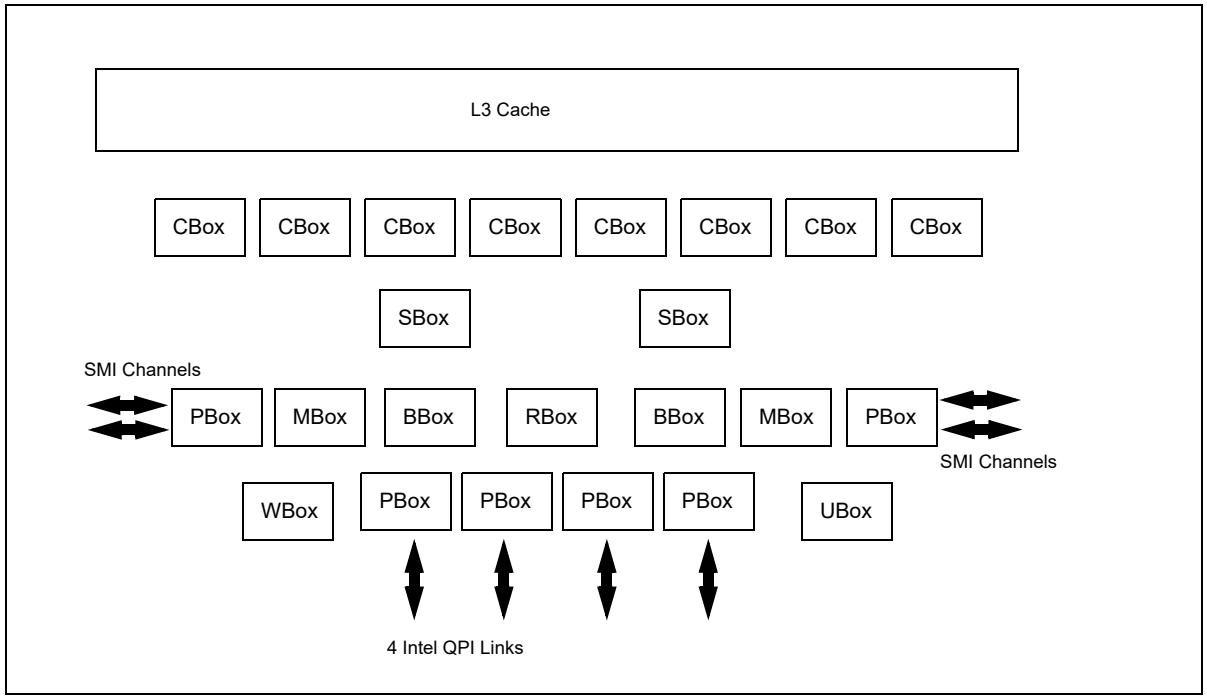

Figure 21-27. Distributed Units of the Uncore of Intel® Xeon® Processor 7500 Series

Table 21-9 summarizes the number MSRs for uncore PMU for each box.

Table 21-9. Uncore PMU MSR Summary

Box	# of Boxes	Counters per Box	Counter Width	General Purpose	Global Enable	Sub-control MSRs
C-Box	8	6	48	Yes	per-box	None
S-Box	2	4	48	Yes	per-box	Match/Mask
B-Box	2	4	48	Yes	per-box	Match/Mask
M-Box	2	6	48	Yes	per-box	Yes
R-Box	1	16 (2 port, 8 per port)	48	Yes	per-box	Yes
W-Box	1	4	48	Yes	per-box	None
		1	48	No	per-box	None
U-Box	1	1	48	Yes	uncore	None

The W-Box provides 4 general-purpose counters, each requiring an event select configuration MSR, similar to the general-purpose counters in other boxes. There is also a fixed-function counter that increments clockticks in the uncore clock domain.

For C,S,B,M,R, and W boxes, each box provides an MSR to enable/disable counting, configuring PMI of multiple counters within the same box, this is somewhat similar the "global control" programming interface, IA32_PERF_-GLOBAL_CTRL, offered in the core PMU. Similarly status information and counter overflow control for multiple counters within the same box are also provided in C,S,B,M,R, and W boxes.

In the U-Box, MSR_U_PMON_GLOBAL_CTL provides overall uncore PMU enable/disable and PMI configuration control. The scope of status information in the U-box is at per-box granularity, in contrast to the per-box status information MSR (in the C,S,B,M,R, and W boxes) providing status information of individual counter overflow. The difference in scope also apply to the overflow control MSR in the U-Box versus those in the other Boxes.

The individual MSRs that provide uncore PMU interfaces are listed in Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4, Table 2-17 under the general naming style of MSR_%box#%_PMON_%scope_function%, where %box#% designates the type of box and zero-based index if there are more the one box of the same type, %scope_function% follows the examples below:

- Multi-counter enabling MSRs: MSR_U_PMON_GLOBAL_CTL, MSR_S0_PMON_BOX_CTL, MSR_C7_PMON_-BOX_CTL, etc.
- Multi-counter status MSRs: MSR_U_PMON_GLOBAL_STATUS, MSR_S0_PMON_BOX_STATUS, MSR_C7_P-MON_BOX_STATUS, etc.
- Multi-counter overflow control MSRs: MSR_U_PMON_GLOBAL_OVF_CTL, MSR_S0_PMON_BOX_OVF_CTL, MSR_C7_PMON_BOX_OVF_CTL, etc.
- Performance counters MSRs: the scope is implicitly per counter, e.g., MSR_U_PMON_CTR, MSR_S0_P-MON_CTR0, MSR_C7_PMON_CTR5, etc.
- Event select MSRs: the scope is implicitly per counter, e.g., MSR_U_PMON_EVNT_SEL, MSR_S0_P-MON_EVNT_SEL0, MSR_C7_PMON_EVNT_SEL5, etc.
- Sub-control MSRs: the scope is implicitly per-box granularity, e.g., MSR_M0_PMON_TIMESTAMP, MSR_R0_P-MON_IPERF0_P1, MSR_S1_PMON_MATCH.

Details of uncore PMU MSR bit field definitions can be found in a separate document "Intel Xeon Processor 7500 Series Uncore Performance Monitoring Guide".

21.3.2 Performance Monitoring for Processors Based on Westmere Microarchitecture

All of the performance monitoring programming interfaces (architectural and non-architectural core PMU facilities, and uncore PMU) described in Section 21.6.3 also apply to processors based on Westmere microarchitecture.

Table 21-6 describes a non-architectural performance monitoring event (event code 0B7H) and associated MSR_OFFCORE_RSP_0 (address 1A6H) in the core PMU. This event and a second functionally equivalent offcore

response event using event code 0BBH and MSR_OFFCORE_RSP_1 (address 1A7H) are supported in processors based on Westmere microarchitecture. The event code and event mask definitions of non-architectural performance monitoring events can be found at: https://perfmon-events.intel.com/.

The load latency facility is the same as described in Section 21.3.1.1.2, but added enhancement to provide more information in the data source encoding field of each load latency record. The additional information relates to STLB_MISS and LOCK, see Table 21-14.

21.3.3 Intel® Xeon® Processor E7 Family Performance Monitoring Facility

The performance monitoring facility in the processor core of the Intel® Xeon® processor E7 family is the same as those supported in the Intel Xeon processor 5600 series[1]. The uncore subsystem in the Intel Xeon processor E7 family is similar to those of the Intel Xeon processor 7500 series. The high level construction of the uncore subsystem is similar to that shown in Figure 21-27, with the additional capability that up to 10 C-Box units are supported.

Table 21-10 summarizes the number MSRs for uncore PMU for each box.

Table 21-10. Uncore PMU MSR Summary for Intel® Xeon® Processor E7 Family

Box	# of Boxes	Counters per Box	Counter Width	General Purpose	Global Enable	Sub-control MSRs
C-Box	10	6	48	Yes	per-box	None
S-Box	2	4	48	Yes	per-box	Match/Mask
B-Box	2	4	48	Yes	per-box	Match/Mask
M-Box	2	6	48	Yes	per-box	Yes
R-Box	1	16 (2 port, 8 per port)	48	Yes	per-box	Yes
W-Box	1	4	48	Yes	per-box	None
		1	48	No	per-box	None
U-Box	1	1	48	Yes	uncore	None

Details of the uncore performance monitoring facility of Intel Xeon Processor E7 family is available in the "Intel® Xeon® Processor E7 Uncore Performance Monitoring Programming Reference Manual".

21.3.4 Performance Monitoring for Processors Based on Sandy Bridge Microarchitecture

Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx processor series, and Intel® Xeon® processor E3-1200 family are based on Sandy Bridge microarchitecture; this section describes the performance monitoring facilities provided in the processor core. The core PMU supports architectural performance monitoring capability with version ID 3 (see Section 21.2.3) and a host of non-architectural monitoring capabilities.

Architectural performance monitoring version 3 capabilities are described in Section 21.2.3.

The core PMU's capability is similar to those described in Section 21.3.1.1 and Section 21.6.3, with some differences and enhancements relative to Westmere microarchitecture summarized in Table 21-11.

1. Exceptions are indicated for event code 0FH in the event list for this processor (https://perfmon-events.intel.com/); and valid bits of data source encoding field of each load latency record is limited to bits 5:4 of Table 21-14.

Table 21-11. Core PMU Comparison

Box	Sandy Bridge Microarchitecture	Westmere Microarchitecture	Comment
# of Fixed counters per thread	3	3	Use CPUID to determine # of counters. See Section 21.2.1.
# of general-purpose counters per core	8	8	Use CPUID to determine # of counters. See Section 21.2.1.
Counter width (R,W)	R:48, W: 32/48	R:48, W:32	See Section 21.2.2.
# of programmable counters per thread	4 or (8 if a core not shared by two threads)	4	Use CPUID to determine # of counters. See Section 21.2.1.
PMI Overhead Mitigation	▪ Freeze_Perfmon_on_PMI with legacy semantics. ▪ Freeze_LBR_on_PMI with legacy semantics for branch profiling. ▪ Freeze_while_SMM.	▪ Freeze_Perfmon_on_PMI with legacy semantics. ▪ Freeze_LBR_on_PMI with legacy semantics for branch profiling. ▪ Freeze_while_SMM.	See Section 19.4.7.
Processor Event Based Sampling (PEBS) Events	See Table 21-13.	See Table 21-88.	IA32_PMC4-IA32_PMC7 do not support PEBS.
PEBS-Load Latency	See Section 21.3.4.4.2; ▪ Data source encoding ▪ STLB miss encoding ▪ Lock transaction encoding	Data source encoding	
PEBS-Precise Store	Section 21.3.4.4.3	No	
PEBS-PDIR	Yes (using precise INST_RETIRED.ALL).	No	
Off-core Response Event	MSR 1A6H and 1A7H, extended request and response types.	MSR 1A6H and 1A7H, limited response types.	Nehalem supports 1A6H only.

21.3.4.1 Global Counter Control Facilities in Sandy Bridge Microarchitecture

The number of general-purpose performance counters visible to a logical processor can vary across Processors based on Sandy Bridge microarchitecture. Software must use CPUID to determine the number performance counters/event select registers (See Section).

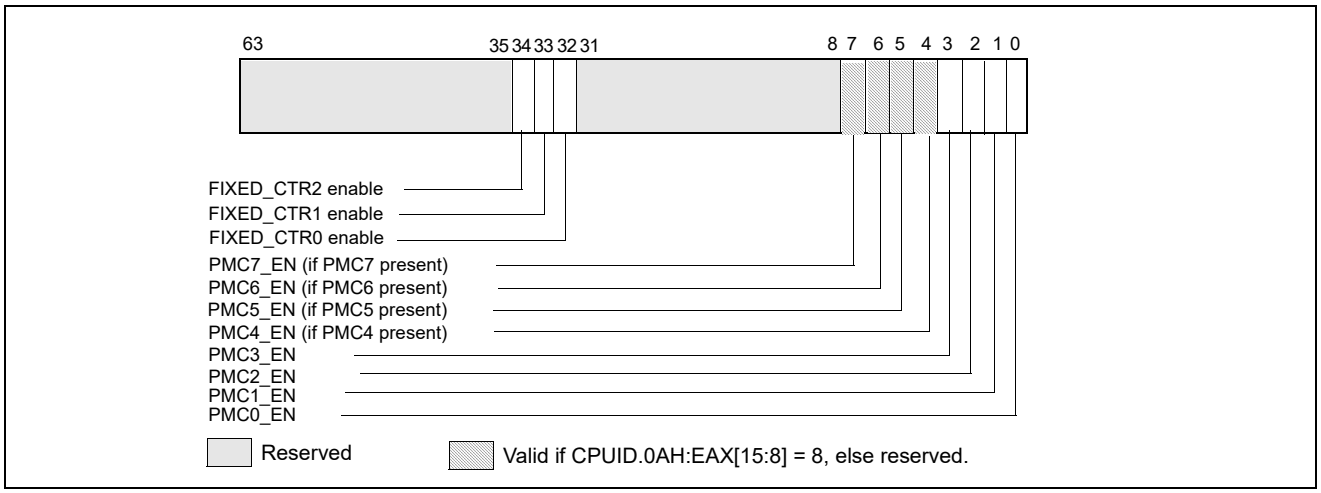

Figure 21-28. IA32_PERF_GLOBAL_CTRL MSR in Sandy Bridge Microarchitecture

Figure 21-46 depicts the layout of IA32_PERF_GLOBAL_CTRL MSR. The enable bits (PMC4_EN, PMC5_EN, PMC6_EN, PMC7_EN) corresponding to IA32_PMC4-IA32_PMC7 are valid only if CPUID.0AH:EAX[15:8] reports a value of '8'. If CPUID.0AH:EAX[15:8] = 4, attempts to set the invalid bits will cause #GP.

Each enable bit in IA32_PERF_GLOBAL_CTRL is AND'ed with the enable bits for all privilege levels in the respective IA32_PERFEVTSELx or IA32_PERF_FIXED_CTR_CTRL MSRs to start/stop the counting of respective counters. Counting is enabled if the AND'ed results is true; counting is disabled when the result is false.
IA32_PERF_GLOBAL_STATUS MSR provides single-bit status used by software to query the overflow condition of each performance counter. IA32_PERF_GLOBAL_STATUS[bit 62] indicates overflow conditions of the DS area data buffer (see Figure 21-29). A value of 1 in each bit of the PMCx_OVF field indicates an overflow condition has occurred in the associated counter.

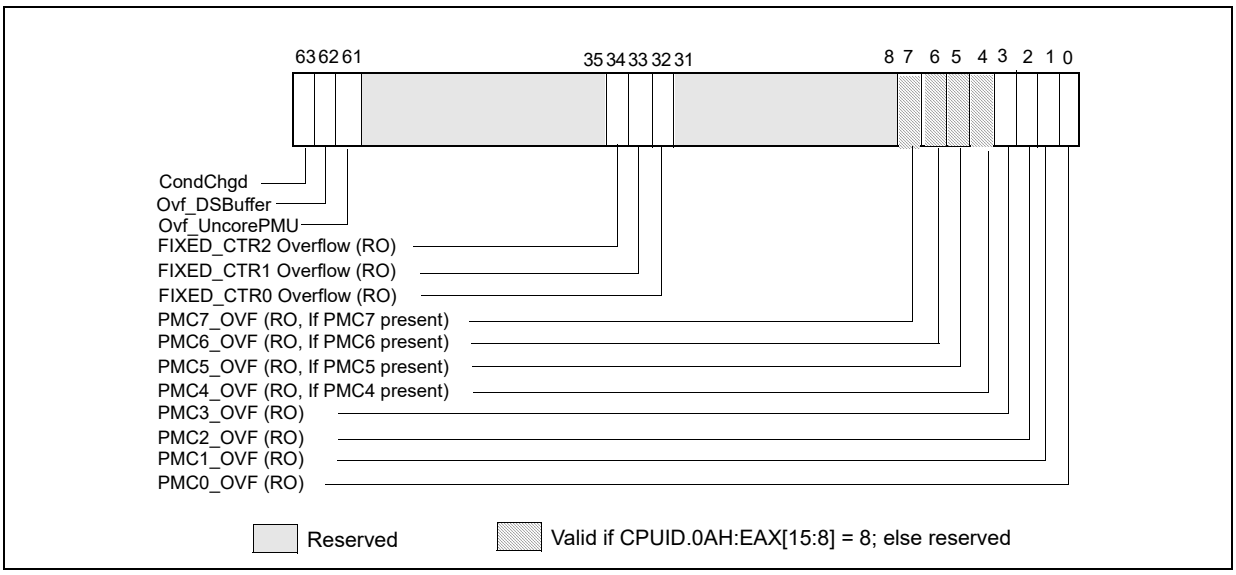

Figure 21-29. IA32_PERF_GLOBAL_STATUS MSR in Sandy Bridge Microarchitecture

When a performance counter is configured for PEBS, an overflow condition in the counter will arm PEBS. On the subsequent event following overflow, the processor will generate a PEBS event. On a PEBS event, the processor will perform bounds checks based on the parameters defined in the DS Save Area (see Section 19.4.9). Upon successful bounds checks, the processor will store the data record in the defined buffer area, clear the counter overflow status, and reload the counter. If the bounds checks fail, the PEBS will be skipped entirely. In the event that the PEBS buffer fills up, the processor will set the OvfBuffer bit in MSR_PERF_GLOBAL_STATUS.

IA32_PERF_GLOBAL_OVF_CTL MSR allows software to clear overflow the indicators for general-purpose or fixed-function counters via a single WRMSR (see Figure 21-30). Clear overflow indications when:

- Setting up new values in the event select and/or UMASK field for counting or interrupt based sampling.
- Reloading counter values to continue sampling.
- Disabling event counting or interrupt based sampling.

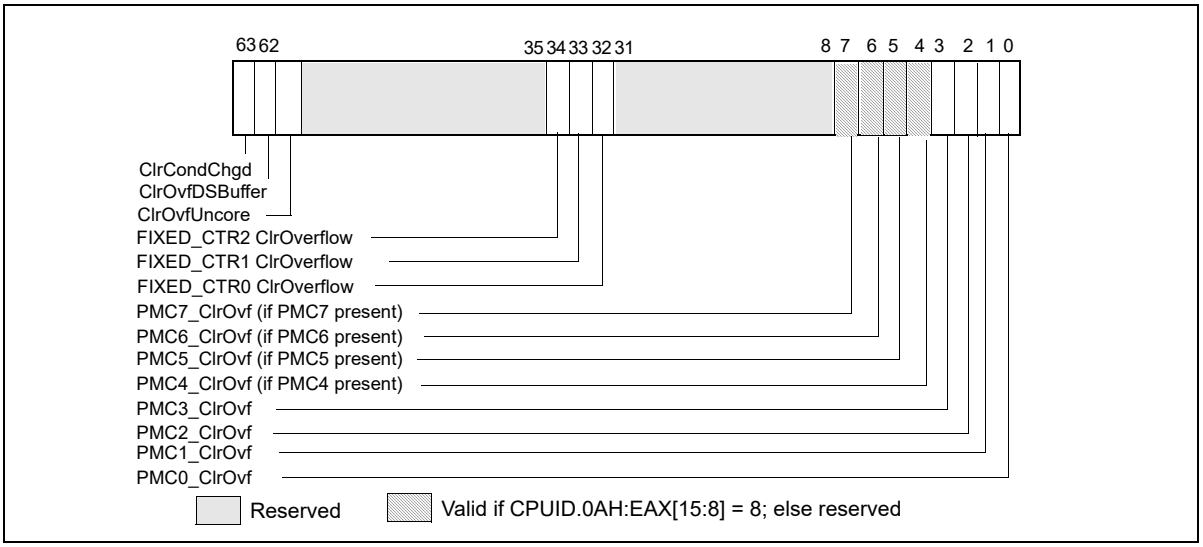

Figure 21-30. IA32_PERF_GLOBAL_OVF_CTRL MSR in Sandy Bridge Microarchitecture

21.3.4.2 Counter Coalescence

In processors based on Sandy Bridge microarchitecture, each processor core implements eight general-purpose counters. CPUID.0AH:EAX[15:8] will report the number of counters visible to software.

If a processor core is shared by two logical processors, each logical processors can access up to four counters (IA32_PMC0-IA32_PMC3). This is the same as in the prior generation for processors based on Nehalem microarchitecture.

If a processor core is not shared by two logical processors, up to eight general-purpose counters are visible. If CPUID.0AH:EAX[15:8] reports 8 counters, then IA32_PMC4-IA32_PMC7 would occupy MSR addresses 0C5H through 0C8H. Each counter is accompanied by an event select MSR (IA32_PERFEVTSEL4-IA32_PERFEVTSEL7).

If CPUID.0AH:EAX[15:8] report 4, access to IA32_PMC4-IA32_PMC7, IA32_PMC4-IA32_PMC7 will cause #GP. Writing 1's to bit position 7:4 of IA32_PERF_GLOBAL_CTRL, IA32_PERF_GLOBAL_STATUS, or IA32_PERF_-GLOBAL_OVF_CTL will also cause #GP.

21.3.4.3 Full Width Writes to Performance Counters

Processors based on Sandy Bridge microarchitecture support full-width writes to the general-purpose counters, IA32_PMCx. Support of full-width writes are enumerated by IA32_PERF_CAPABILITIES.FW_WRITES[13] (see Section 21.2.4).

The default behavior of IA32_PMCx is unchanged, i.e., WRMSR to IA32_PMCx results in a sign-extended 32-bit value of the input EAX written into IA32_PMCx. Full-width writes must issue WRMSR to a dedicated alias MSR address for each IA32_PMCx.

Software must check the presence of full-width write capability and the presence of the alias address IA32_A_PMCx by testing IA32_PERF_CAPABILITIES[13].

21.3.4.4 PEBS Support in Sandy Bridge Microarchitecture

Processors based on Sandy Bridge microarchitecture support PEBS, similar to those offered in prior generation, with several enhanced features. The key components and differences of PEBS facility relative to Westmere microarchitecture is summarized in Table 21-12.

Table 21-12. PEBS Facility Comparison

Box	Sandy Bridge Microarchitecture	Westmere Microarchitecture	Comment
Valid IA32_PMCx	PMC0-PMC3	PMC0-PMC3	No PEBS on PMC4-PMC7.
PEBS Buffer Programming	Section 21.3.1.1.1	Section 21.3.1.1.1	Unchanged
IA32_PEBS_ENABLE Layout	Figure 21-31	Figure 21-17	
PEBS record layout	Physical Layout same as Table 21-4.	Table 21-4	Enhanced fields at offsets 98H, A0H, A8H.
PEBS Events	See Table 21-13.	See Table 21-88.	IA32_PMC4-IA32_PMC7 do not support PEBS.
PEBS-Load Latency	See Table 21-14.	Table 21-5	
PEBS-Precise Store	Yes; see Section 21.3.4.4.3.	No	IA32_PMC3 only
PEBS-PDIR	Yes	No	IA32_PMC1 only
PEBS skid from EventingIP	1 (or 2 if micro+macro fusion)	1	
SAMPLING Restriction	Small SAV(CountDown) value incur higher overhead than prior generation.		

Only IA32_PMC0 through IA32_PMC3 support PEBS.

NOTE

PEBS events are only valid when the following fields of IA32_PERFEVTSELx are all zero: AnyThread, Edge, Invert, CMask.

In a PMU with PDIR capability, PEBS behavior is unpredictable if IA32_PERFEVTSELx or IA32_PMCx is changed for a PEBS-enabled counter while an event is being counted. To avoid this, changes to the programming or value of a PEBS-enabled counter should be performed when the counter is disabled.

In IA32_PEBS_ENABLE MSR, bit 63 is defined as PS_ENABLE: When set, this enables IA32_PMC3 to capture precise store information. Only IA32_PMC3 supports the precise store facility. In typical usage of PEBS, the bit fields in IA32_PEBS_ENABLE are written to when the agent software starts PEBS operation; the enabled bit fields should be modified only when re-programming another PEBS event or cleared when the agent uses the performance counters for non-PEBS operations.

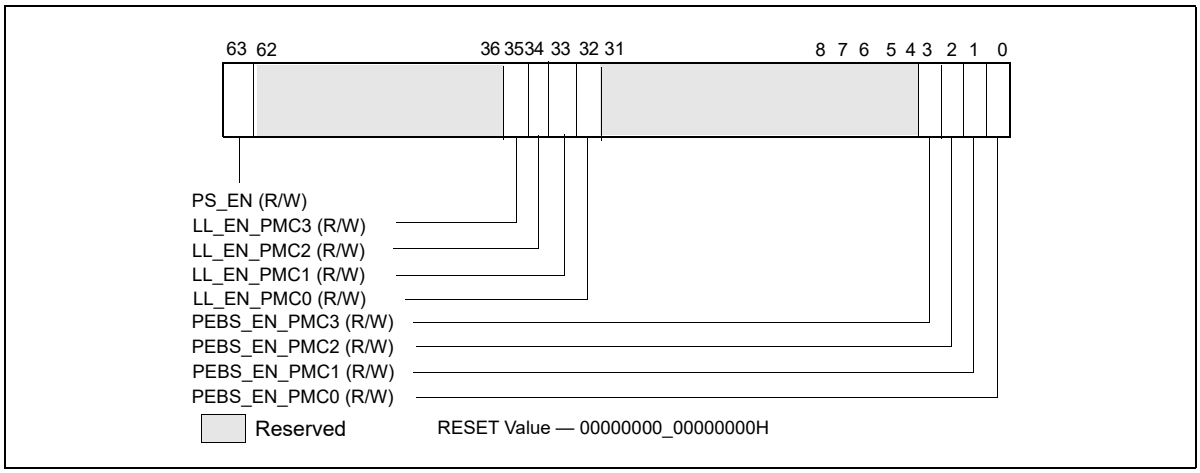

Figure 21-31. Layout of IA32_PEBS_ENABLE MSR

21.3.4.4.1 PEBS Record Format

The layout of PEBS records physically identical to those shown in Table 21-4, but the fields at offsets 98H, A0H, and A8H have been enhanced to support additional PEBS capabilities.

- Load/Store Data Linear Address (Offset 98H): This field will contain the linear address of the source of the load, or linear address of the destination of the store.
- Data Source /Store Status (Offset A0H): When load latency is enabled, this field will contain three piece of information (including an encoded value indicating the source which satisfied the load operation). The source field encodings are detailed in Table 21-5. When precise store is enabled, this field will contain information indicating the status of the store, as detailed in Table 19.
- Latency Value/0 (Offset A8H): When load latency is enabled, this field contains the latency in cycles to service the load. This field is not meaningful when precise store is enabled and will be written to zero in that case. Upon writing the PEBS record, microcode clears the overflow status bits in the IA32_PERF_GLOBAL_STATUS corresponding to those counters that both overflowed and were enabled in the IA32_PEBS_ENABLE register. The status bits of other counters remain unaffected.

The number PEBS events has expanded. The list of PEBS events supported in Sandy Bridge microarchitecture is shown in Table 21-13.

Table 21-13. PEBS Performance Events for Sandy Bridge Microarchitecture

Event Name	Event Select	Sub-event	UMask
INST_RETIRED	C0H	PREC_DIST	01H[1]
UOPS_RETIRED	C2H	All	01H
		Retire_Slots	02H
BR_INST_RETIRED	C4H	Conditional	01H
		Near_Call	02H
		All_branches	04H
		Near_Return	08H
		Near_Taken	20H
BR_MISP_RETIRED	C5H	Conditional	01H
		Near_Call	02H
		All_branches	04H
		Not_Taken	10H
		Taken	20H

Table 21-13. PEBS Performance Events for Sandy Bridge Microarchitecture (Contd.)

Event Name	Event Select	Sub-event	UMask
MEM_UOPS_RETIRED	D0H	STLB_MISS_LOADS	11H
		STLB_MISS_STORE	12H
		LOCK_LOADS	21H
		SPLIT_LOADS	41H
		SPLIT_STORES	42H
		ALL_LOADS	81H
		ALL_STORES	82H
MEM_LOAD_UOPS_RETIRED	D1H	L1_Hit	01H
		L2_Hit	02H
		L3_Hit	04H
		Hit_LFB	40H
MEM_LOAD_UOPS_LLC_HIT_RETIRED	D2H	XSNP_Miss	01H
		XSNP_Hit	02H
		XSNP_Hitm	04H
		XSNP_None	08H

NOTES:

1. Only available on IA32_PMC1.

21.3.4.4.2 Load Latency Performance Monitoring Facility

The load latency facility in Sandy Bridge microarchitecture is similar to that in prior microarchitectures. It provides software a means to characterize the average load latency to different levels of cache/memory hierarchy. This facility requires processor supporting enhanced PEBS record format in the PEBS buffer, see Table 21-4 and Section 21.3.4.4.1. This field measures the load latency from load's first dispatch of till final data writeback from the memory subsystem. The latency is reported for retired demand load operations and in core cycles (it accounts for re-dispatches).

To use this feature software must assure:

- One of the IA32_PERFEVTSELx MSR is programmed to specify the event unit MEM_TRANS_RETIRED, and the LATENCY_ABOVE_THRESHOLD event mask must be specified (IA32_PerfEvtSelX[15:0] = 1CDH). The corresponding counter IA32_PMCx will accumulate event counts for architecturally visible loads which exceed the programmed latency threshold specified separately in a MSR. Stores are ignored when this event is programmed. The CMASK or INV fields of the IA32_PerfEvtSelX register used for counting load latency must be 0. Writing other values will result in undefined behavior.
- The MSR_PEBS_LD_LAT_THRESHOLD MSR is programmed with the desired latency threshold in core clock cycles. Loads with latencies greater than this value are eligible for counting and latency data reporting. The minimum value that may be programmed in this register is 3 (the minimum detectable load latency is 4 core clock cycles).
- The PEBS enable bit in the IA32_PEBS_ENABLE register is set for the corresponding IA32_PMCx counter register. This means that both the PEBS_EN_CTRX and LL_EN_CTRX bits must be set for the counter(s) of interest. For example, to enable load latency on counter IA32_PMC0, the IA32_PEBS_ENABLE register must be programmed with the 64-bit value 00000001.00000001H.
- When Load latency event is enabled, no other PEBS event can be configured with other counters.

When the load-latency facility is enabled, load operations are randomly selected by hardware and tagged to carry information related to data source locality and latency. Latency and data source information of tagged loads are updated internally. The MEM_TRANS_RETIRED event for load latency counts only tagged retired loads. If a load is cancelled it will not be counted and the internal state of the load latency facility will not be updated. In this case the hardware will tag the next available load.

When a PEBS assist occurs, the last update of latency and data source information are captured by the assist and written as part of the PEBS record. The PEBS sample after value (SAV), specified in PEBS CounterX Reset, operates orthogonally to the tagging mechanism. Loads are randomly tagged to collect latency data. The SAV controls the number of tagged loads with latency information that will be written into the PEBS record field by the PEBS assists. The load latency data written to the PEBS record will be for the last tagged load operation which retired just before the PEBS assist was invoked.

The physical layout of the PEBS records is the same as shown in Table 21-4. The specificity of Data Source entry at offset A0H has been enhanced to report three pieces of information.

Table 21-14. Layout of Data Source Field of Load Latency Record

Field	Position	Description
Source	3:0	See Table 21-5
STLB_MISS	4	0: The load did not miss the STLB (hit the DTLB or STLB). 1: The load missed the STLB.
Lock	5	0: The load was not part of a locked transaction. 1: The load was part of a locked transaction.
Reserved	63:6	Reserved

The layout of MSR_PEBS_LD_LAT_THRESHOLD is the same as shown in Figure 21-19.

21.3.4.4.3 Precise Store Facility

Processors based on Sandy Bridge microarchitecture offer a precise store capability that complements the load latency facility. It provides a means to profile store memory references in the system.

Precise stores leverage the PEBS facility and provide additional information about sampled stores. Having precise memory reference events with linear address information for both loads and stores can help programmers improve data structure layout, eliminate remote node references, and identify cache-line conflicts in NUMA systems.

Only IA32_PMC3 can be used to capture precise store information. After enabling this facility, counter overflows will initiate the generation of PEBS records as previously described in PEBS. Upon counter overflow hardware captures the linear address and other status information of the next store that retires. This information is then written to the PEBS record.

To enable the precise store facility, software must complete the following steps. Please note that the precise store facility relies on the PEBS facility, so the PEBS configuration requirements must be completed before attempting to capture precise store information.

- Complete the PEBS configuration steps.
- Program the MEM_TRANS_RETIRED.PRECISE_STORE event in IA32_PERFEVTSEL3. Only counter 3 (IA32_PMC3) supports collection of precise store information.
- Set IA32_PEBS_ENABLE[3] and IA32_PEBS_ENABLE[63]. This enables IA32_PMC3 as a PEBS counter and enables the precise store facility, respectively.

The precise store information written into a PEBS record affects entries at offsets 98H, A0H, and A8H of Table 21-4. The specificity of Data Source entry at offset A0H has been enhanced to report three piece of information.

Table 21-15. Layout of Precise Store Information In PEBS Record

Field	Offset	Description
Store Data Linear Address	98H	The linear address of the destination of the store.
Store Status	A0H	**L1D Hit** (Bit 0): The store hit the data cache closest to the core (lowest latency cache) if this bit is set, otherwise the store missed the data cache. **STLB Miss** (bit 4): The store missed the STLB if set, otherwise the store hit the STLB **Locked Access** (bit 5): The store was part of a locked access if set, otherwise the store was not part of a locked access.
Reserved	A8H	Reserved

21.3.4.4.4 Precise Distribution of Instructions Retired (PDIR)

Upon triggering a PEBS assist, there will be a finite delay between the time the counter overflows and when the microcode starts to carry out its data collection obligations. INST_RETIRED is a very common event that is used to sample where performance bottleneck happened and to help identify its location in instruction address space. Even if the delay is constant in core clock space, it invariably manifest as variable "skids" in instruction address space. This creates a challenge for programmers to profile a workload and pinpoint the location of bottlenecks.

The core PMU in processors based on Sandy Bridge microarchitecture include a facility referred to as precise distribution of Instruction Retired (PDIR).

The PDIR facility mitigates the "skid" problem by providing an early indication of when the INST_RETIRED counter is about to overflow, allowing the machine to more precisely trap on the instruction that actually caused the counter overflow. On processors based on Sandy Bridge microarchitecture, skid is significantly reduced and can be as little as one instruction. On future implementations, PDIR may eliminate skid.

PDIR applies only to the INST_RETIRED.ALL precise event, and processors based on Sandy Bridge microarchitecture must use IA32_PMC1 with PerfEvtSel1 property configured and bit 1 in the IA32_PEBS_ENABLE set to 1. INST_RETIRED.ALL is a non-architectural performance event, it is not supported in prior generation microarchitectures. Additionally, on processors with CPUID DisplayFamily_DisplayModel signatures of 06_2A and 06_2D, the tool that programs PDIR should quiesce the rest of the programmable counters in the core when PDIR is active.

21.3.4.5 Off-core Response Performance Monitoring

The core PMU in processors based on Sandy Bridge microarchitecture provides off-core response facility similar to prior generation. Off-core response can be programmed only with a specific pair of event select and counter MSR, and with specific event codes and predefine mask bit value in a dedicated MSR to specify attributes of the off-core transaction. Two event codes are dedicated for off-core response event programming. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR_OFFCORE_RSP_x. Table 21-16 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32_PMCx.

Table 21-16. Off-Core Response Event Encoding

Counter	Event code	UMask	Required Off-core Response MSR
PMC0-3	B7H	01H	MSR_OFFCORE_RSP_0 (address 1A6H)
PMC0-3	BBH	01H	MSR_OFFCORE_RSP_1 (address 1A7H)

The layout of MSR_OFFCORE_RSP_0 and MSR_OFFCORE_RSP_1 are shown in Figure 21-32 and Figure 21-33. Bits 15:0 specifies the request type of a transaction request to the uncore. Bits 30:16 specifies supplier information, bits 37:31 specifies snoop response information.

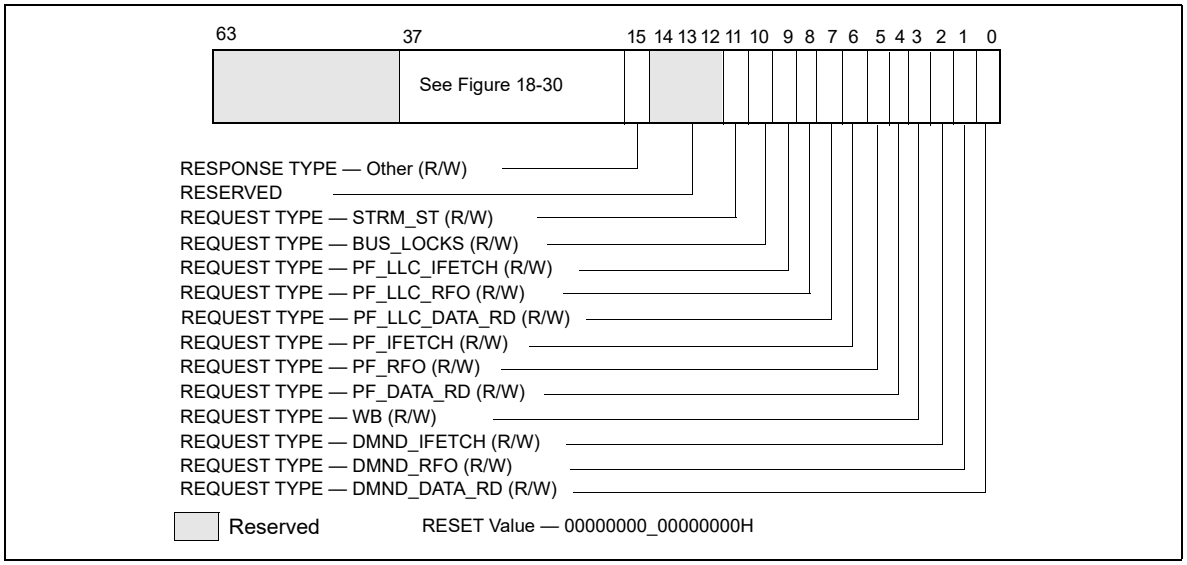

Figure 21-32. Request_Type Fields for MSR_OFFCORE_RSP_x

Table 21-17. MSR_OFFCORE_RSP_x Request_Type Field Definition

Bit Name	Offset	Description
DMND_DATA_RD	0	Counts the number of demand data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count L2 data read prefetches or instruction fetches.
DMND_RFO	1	Counts the number of demand and DCU prefetch reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.
DMND_IFETCH	2	Counts the number of demand instruction cacheline reads and L1 instruction cacheline prefetches.
WB	3	Counts the number of writeback (modified to exclusive) transactions.
PF_DATA_RD	4	Counts the number of data cacheline reads generated by L2 prefetchers.
PF_RFO	5	Counts the number of RFO requests generated by L2 prefetchers.
PF_IFETCH	6	Counts the number of code reads generated by L2 prefetchers.
PF_LLC_DATA_RD	7	L2 prefetcher to L3 for loads.
PF_LLC_RFO	8	RFO requests generated by L2 prefetcher
PF_LLC_IFETCH	9	L2 prefetcher to L3 for instruction fetches.
BUS_LOCKS	10	Bus lock and split lock requests
STRM_ST	11	Streaming store requests
OTHER	15	Any other request that crosses IDI, including I/O.

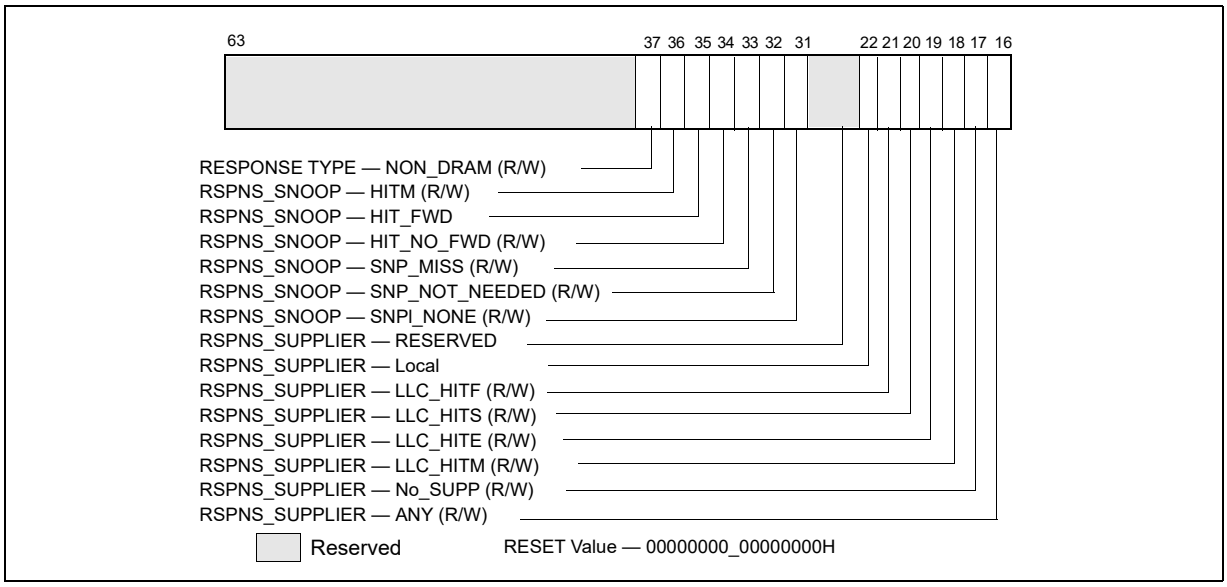

Figure 21-33. Response_Supplier and Snoop Info Fields for MSR_OFFCORE_RSP_x

To properly program this extra register, software must set at least one request type bit and a valid response type pattern. Otherwise, the event count reported will be zero. It is permissible and useful to set multiple request and response type bits in order to obtain various classes of off-core response events. Although MSR_OFFCORE_RSP_x allow an agent software to program numerous combinations that meet the above guideline, not all combinations produce meaningful data.

Table 21-18. MSR_OFFCORE_RSP_x Response Supplier Info Field Definition

Subtype	Bit Name	Offset	Description
Common	Any	16	Catch all value for any response types.
Supplier Info	NO_SUPP	17	No Supplier Information available.
	LLC_HITM	18	M-state initial lookup stat in L3.
	LLC_HITE	19	E-state
	LLC_HITS	20	S-state
	LLC_HITF	21	F-state
	LOCAL	22	Local DRAM Controller.
	Reserved	30:23	Reserved

To specify a complete offcore response filter, software must properly program bits in the request and response type fields. A valid request type must have at least one bit set in the non-reserved bits of 15:0. A valid response type must be a non-zero value of the following expression:

ANY | [(‘OR’ of Supplier Info Bits) & (‘OR’ of Snoop Info Bits)]

If “ANY“ bit is set, the supplier and snoop info bits are ignored.

Table 21-19. MSR_OFFCORE_RSP_x Snoop Info Field Definition

Subtype	Bit Name	Offset	Description
Snoop Info	SNP_NONE	31	No details on snoop-related information.
	SNP_NOT_NEEDED	32	No snoop was needed to satisfy the request.
	SNP_MISS	33	A snoop was needed and it missed all snooped caches: -For LLC Hit, ReslHitI was returned by all cores -For LLC Miss, RspI was returned by all sockets and data was returned from DRAM.
	SNP_NO_FWD	34	A snoop was needed and it hits in at least one snooped cache. Hit denotes a cache-line was valid before snoop effect. This includes: -Snoop Hit w/ Invalidation (LLC Hit, RFO) -Snoop Hit, Left Shared (LLC Hit/Miss, IFetch/Data_RD) -Snoop Hit w/ Invalidation and No Forward (LLC Miss, RFO Hit S) In the LLC Miss case, data is returned from DRAM.
	SNP_FWD	35	A snoop was needed and data was forwarded from a remote socket. This includes: -Snoop Forward Clean, Left Shared (LLC Hit/Miss, IFetch/Data_RD/RFT).
	HITM	36	A snoop was needed and it HitM-ed in local or remote cache. HitM denotes a cache-line was in modified state before effect as a results of snoop. This includes: -Snoop HitM w/ WB (LLC miss, IFetch/Data_RD) -Snoop Forward Modified w/ Invalidation (LLC Hit/Miss, RFO) -Snoop MtoS (LLC Hit, IFetch/Data_RD).
	NON_DRAM	37	Target was non-DRAM system address. This includes MMIO transactions.

21.3.4.6 Uncore Performance Monitoring Facilities in the Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, and Intel® Core™ i3-2xxx Processor Series

The uncore sub-system in Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx processor series provides a unified L3 that can support up to four processor cores. The L3 cache consists multiple slices, each slice interface with a processor via a coherence engine, referred to as a C-Box. Each C-Box provides dedicated facility of MSRs to select uncore performance monitoring events and each C-Box event select MSR is paired with a counter register, similar in style as those described in Section 21.3.1.2.2. The ARB unit in the uncore also provides its local performance counters and event select MSRs. The layout of the event select MSRs in the C-Boxes and the ARB unit are shown in Figure 21-34.

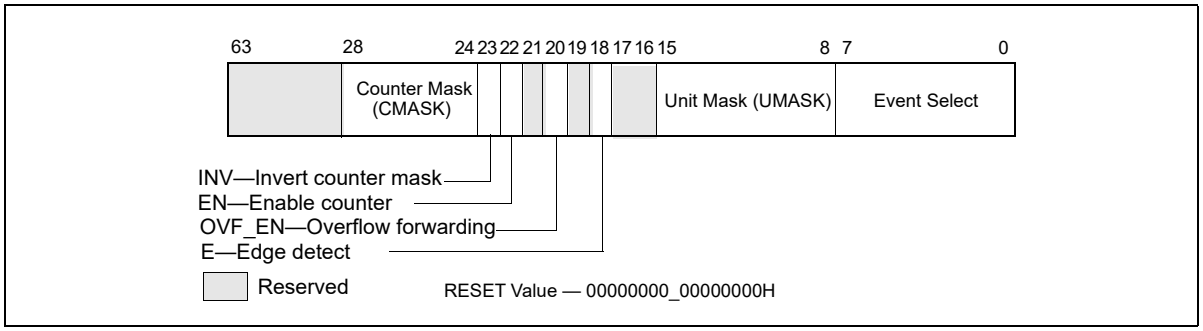

Figure 21-34. Layout of Uncore PERFEVTSEL MSR for a C-Box Unit or the ARB Unit

The bit fields of the uncore event select MSRs for a C-box unit or the ARB unit are summarized below:

- Event_Select (bits 7:0) and UMASK (bits 15:8): Specifies the microarchitectural condition to count in a local uncore PMU counter, see the event list at: https://perfmon-events.intel.com/.
- E (bit 18): Enables edge detection filtering, if 1.
- OVF_EN (bit 20): Enables the overflow indicator from the uncore counter forwarded to MSR_UNC_PERF_-GLOBAL_CTRL, if 1.
- EN (bit 22): Enables the local counter associated with this event select MSR.
- INV (bit 23): Event count increments with non-negative value if 0, with negated value if 1.
- CMASK (bits 28:24): Specifies a positive threshold value to filter raw event count input.

At the uncore domain level, there is a master set of control MSRs that centrally manages all the performance monitoring facility of uncore units. Figure 21-35 shows the layout of the uncore domain global control.

When an uncore counter overflows, a PMI can be routed to a processor core. Bits 3:0 of MSR_UNC_PERF_-GLOBAL_CTRL can be used to select which processor core to handle the uncore PMI. Software must then write to bit 13 of IA32_DEBUGCTL (at address 1D9H) to enable this capability.

- PMI_SEL_Core#: Enables the forwarding of an uncore PMI request to a processor core, if 1. If bit 30 (WakePMI) is '1', a wake request is sent to the respective processor core prior to sending the PMI.
- EN: Enables the fixed uncore counter, the ARB counters, and the CBO counters in the uncore PMU, if 1. This bit is cleared if bit 31 (FREEZE) is set and any enabled uncore counters overflow.
- WakePMI: Controls sending a wake request to any halted processor core before issuing the uncore PMI request. If a processor core was halted and not sent a wake request, the uncore PMI will not be serviced by the processor core.
- FREEZE: Provides the capability to freeze all uncore counters when an overflow condition occurs in a unit counter. When this bit is set, and a counter overflow occurs, the uncore PMU logic will clear the global enable bit (bit 29).

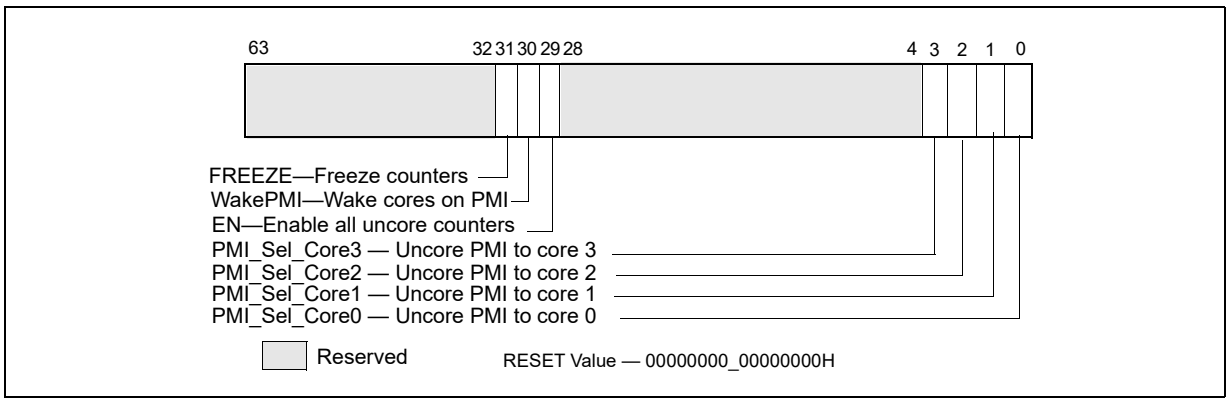

Figure 21-35. Layout of MSR_UNC_PERF_GLOBAL_CTRL MSR for Uncore

Additionally, there is also a fixed counter, counting uncore clockticks, for the uncore domain. Table 21-20 summarizes the number MSRs for uncore PMU for each box.

Table 21-20. Uncore PMU MSR Summary

Box	# of Boxes	Counters per Box	Counter Width	General Purpose	Global Enable	Comment
C-Box	SKU specific	2	44	Yes	Per-box	Up to 4, seeTable 2-21 MSR_UNC_CBO_CONFIG
ARB	1	2	44	Yes	Uncore	

Table 21-20. Uncore PMU MSR Summary (Contd.)

Box	# of Boxes	Counters per Box	Counter Width	General Purpose	Global Enable	Comment
Fixed Counter	N.A.	N.A.	48	No	Uncore	

21.3.4.6.1 Uncore Performance Monitoring Events

There are certain restrictions on the uncore performance counters in each C-Box. Specifically,

- Occupancy events are supported only with counter 0 but not counter 1.
- Other uncore C-Box events can be programmed with either counter 0 or 1.

The C-Box uncore performance events can collect performance characteristics of transactions initiated by processor core. In that respect, they are similar to various sub-events in the OFFCORE_RESPONSE family of performance events in the core PMU. Information such as data supplier locality (LLC HIT/MISS) and snoop responses can be collected via OFFCORE_RESPONSE and qualified on a per-thread basis.

On the other hand, uncore performance event logic cannot associate its counts with the same level of per-thread qualification attributes as the core PMU events can. Therefore, whenever similar event programming capabilities are available from both core PMU and uncore PMU, the recommendation is that utilizing the core PMU events may be less affected by artifacts, complex interactions and other factors.

21.3.4.7 Intel® Xeon® Processor E5 Family Performance Monitoring Facility

The Intel® Xeon® Processor E5 Family (and Intel® Core™ i7-3930K Processor) are based on Sandy Bridge-E microarchitecture. While the processor cores share the same microarchitecture as those of the Intel® Xeon® Processor E3 Family and 2nd generation Intel Core i7-2xxx, Intel Core i5-2xxx, Intel Core i3-2xxx processor series, the uncore subsystems are different. An overview of the uncore performance monitoring facilities of the Intel Xeon processor E5 family (and Intel Core i7-3930K processor) is described in Section 21.3.4.8.

Thus, the performance monitoring facilities in the processor core generally are the same as those described in Section 21.6.3 through Section 21.3.4.5. However, the MSR_OFFCORE_RSP_0/MSR_OFFCORE_RSP_1 Response Supplier Info field shown in Table 21-18 applies to Intel Core Processors with CPUID signature of DisplayFamily_DisplayModel encoding of 06_2AH; Intel Xeon processor with CPUID signature of DisplayFamily_DisplayModel encoding of 06_2DH supports an additional field for remote DRAM controller shown in Table 21-21. Additionally, there are some small differences in the non-architectural performance monitoring events (see event list available at: https://perfmon-events.intel.com/).

Table 21-21. MSR_OFFCORE_RSP_x Supplier Info Field Definitions

Subtype	Bit Name	Offset	Description
Common	Any	16	Catch all value for any response types.
Supplier Info	NO_SUPP	17	No Supplier Information available.
	LLC_HITM	18	M-state initial lookup stat in L3.
	LLC_HITE	19	E-state
	LLC_HITS	20	S-state
	LLC_HITF	21	F-state
	LOCAL	22	Local DRAM Controller.
	Remote	30:23	Remote DRAM Controller (either all 0s or all 1s).

21.3.4.8 Intel® Xeon® Processor E5 Family Uncore Performance Monitoring Facility

The uncore subsystem in the Intel Xeon processor E5-2600 product family has some similarities with those of the Intel Xeon processor E7 family. Within the uncore subsystem, localized performance counter sets are provided at logic control unit scope. For example, each Cbox caching agent has a set of local performance counters, and the power controller unit (PCU) has its own local performance counters. Up to 8 C-Box units are supported in the uncore sub-system.

Table 21-22 summarizes the uncore PMU facilities providing MSR interfaces.

Table 21-22. Uncore PMU MSR Summary for Intel® Xeon® Processor E5 Family

Box	# of Boxes	Counters per Box	Counter Width	General Purpose	Global Enable	Sub-control MSRs
C-Box	8	4	44	Yes	per-box	None
PCU	1	4	48	Yes	per-box	Match/Mask
U-Box	1	2	44	Yes	uncore	None

Details of the uncore performance monitoring facility of Intel Xeon Processor E5 family is available in "Intel® Xeon® Processor E5 Uncore Performance Monitoring Programming Reference Manual". The MSR-based uncore PMU interfaces are listed in Table 2-24.

21.3.5 3rd Generation Intel® Core™ Processor Performance Monitoring Facility

The 3rd generation Intel® Core™ processor family and Intel® Xeon® processor E3-1200v2 product family are based on the Ivy Bridge microarchitecture. The performance monitoring facilities in the processor core generally are the same as those described in Section 21.6.3 through Section 21.3.4.5. The non-architectural performance monitoring events supported by the processor core can be found at: https://perfmon-events.intel.com/.

21.3.5.1 Intel® Xeon® Processor E5 v2 and E7 v2 Family Uncore Performance Monitoring Facility

The uncore subsystem in the Intel Xeon processor E5 v2 and Intel Xeon Processor E7 v2 product families are based on the Ivy Bridge-E microarchitecture. There are some similarities with those of the Intel Xeon processor E5 family based on the Sandy Bridge microarchitecture. Within the uncore subsystem, localized performance counter sets are provided at logic control unit scope.

Details of the uncore performance monitoring facility of Intel Xeon Processor E5 v2 and Intel Xeon Processor E7 v2 families are available in the "Intel® Xeon® Processor E5 v2 and E7 v2 Uncore Performance Monitoring Programming Reference Manual". The MSR-based uncore PMU interfaces are listed in Table 2-28.

21.3.6 4th Generation Intel® Core™ Processor Performance Monitoring Facility

The 4th generation Intel® Core™ processor and Intel® Xeon® processor E3-1200 v3 product family are based on the Haswell microarchitecture. The core PMU supports architectural performance monitoring capability with version ID 3 (see Section 21.2.3) and a host of non-architectural monitoring capabilities.

Architectural performance monitoring version 3 capabilities are described in Section 21.2.3.

The core PMU's capability is similar to those described in Section 21.6.3 through Section 21.3.4.5, with some differences and enhancements summarized in Table 21-23. Additionally, the core PMU provides some enhancement to support performance monitoring when the target workload contains instruction streams using Intel® Transactional Synchronization Extensions (TSX), see Section 21.3.6.5. For details of Intel TSX, see Chapter 16, "Programming with Intel® AVX10," of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1.

Table 21-23. Core PMU Comparison

Box	Haswell Microarchitecture	Sandy Bridge Microarchitecture	Comment
# of Fixed counters per thread	3	3	Use CPUID to determine # of counters. See Section 21.2.1.
# of general-purpose counters per core	8	8	Use CPUID to determine # of counters. See Section 21.2.1.
Counter width (R,W)	R:48, W: 32/48	R:48, W: 32/48	See Section 21.2.2.
# of programmable counters per thread	4 or (8 if a core not shared by two threads)	4 or (8 if a core not shared by two threads)	Use CPUID to determine # of counters. See Section 21.2.1.
PMI Overhead Mitigation	▪ Freeze_Perfmon_on_PMI with legacy semantics. ▪ Freeze_LBR_on_PMI with legacy semantics for branch profiling. ▪ Freeze_while_SMM.	▪ Freeze_Perfmon_on_PMI with legacy semantics. ▪ Freeze_LBR_on_PMI with legacy semantics for branch profiling. ▪ Freeze_while_SMM. Off-core Response Event	MSR 1A6H and 1A7H; extended request and response types.	MSR 1A6H and 1A7H; extended request and response types.	
Intel TSX support for Perfmon	See Section 21.3.6.5.	No	

21.3.6.1 Processor Event Based Sampling (PEBS) Facility

The PEBS facility in the 4th Generation Intel Core processor is similar to those in processors based on Sandy Bridge microarchitecture, with several enhanced features. The key components and differences of PEBS facility relative to Sandy Bridge microarchitecture is summarized in Table 21-24.

Table 21-24. PEBS Facility Comparison

Box	Haswell Microarchitecture	Sandy Bridge Microarchitecture	Comment
Valid IA32_PMCx	PMC0-PMC3	PMC0-PMC3	No PEBS on PMC4-PMC7
PEBS Buffer Programming	Section 21.3.1.1.1	Section 21.3.1.1.1	Unchanged
IA32_PEBS_ENABLE Layout	Figure 21-17	Figure 21-31	
PEBS record layout	Table 21-25; enhanced fields at offsets 98H, A0H, A8H, B0H.	Table 21-4; enhanced fields at offsets 98H, A0H, A8H.	

Table 21-24. PEBS Facility Comparison

Box	Haswell Microarchitecture	Sandy Bridge Microarchitecture	Comment
Precise Events	See Table 21-13.	See Table 21-13.	IA32_PMC4-IA32_PMC7 do not support PEBS.
PEBS-Load Latency	See Table 21-14.	Table 21-14	
PEBS-Precise Store	No, replaced by data address profiling.	Yes; see Section 21.3.4.4.3.	
PEBS-PDIR	Yes	Yes	IA32_PMC1 only.
PEBS skid from EventingIP	1 (or 2 if micro+macro fusion)	1	
SAMPLING Restriction	Small SAV(CountDown) value incur higher overhead than prior generation.		

Only IA32_PMC0 through IA32_PMC3 support PEBS.

NOTE

PEBS events are only valid when the following fields of IA32_PERFEVTSELx are all zero: AnyThread, Edge, Invert, CMask.

In a PMU with PDIR capability, PEBS behavior is unpredictable if IA32_PERFEVTSELx or IA32_PMCx is changed for a PEBS-enabled counter while an event is being counted. To avoid this, changes to the programming or value of a PEBS-enabled counter should be performed when the counter is disabled.

21.3.6.2 PEBS Data Format

The PEBS record format for the 4th Generation Intel Core processor is shown in Table 21-25. The PEBS record format, along with debug/store area storage format, does not change regardless of whether IA-32e mode is active or not. CPUID.01H:ECX.DTES64[bit 2] reports whether the processor's DS storage format support is mode-independent. When set, it uses 64-bit DS storage format.

Table 21-25. PEBS Record Format for 4th Generation Intel Core Processor Family

Byte Offset	Field	Byte Offset	Field
00H	R/EFLAGS	60H	R10
08H	R/EIP	68H	R11
10H	R/EAX	70H	R12
18H	R/EBX	78H	R13
20H	R/ECX	80H	R14
28H	R/EDX	88H	R15
30H	R/ESI	90H	IA32_PERF_GLOBAL_STATUS
38H	R/EDI	98H	Data Linear Address
40H	R/EBP	A0H	Data Source Encoding
48H	R/ESP	A8H	Latency value (core cycles)
50H	R8	B0H	EventingIP
58H	R9	B8H	TX Abort Information (Section 21.3.6.5.1)

The layout of PEBS records are almost identical to those shown in Table 21-4. Offset B0H is a new field that records the eventing IP address of the retired instruction that triggered the PEBS assist.

The PEBS records at offsets 98H, A0H, and ABH record data gathered from three of the PEBS capabilities in prior processor generations: load latency facility (Section 21.3.4.4.2), PDIR (Section 21.3.4.4.4), and the equivalent capability of precise store in prior generation (see Section 21.3.6.3).

In the core PMU of the 4th generation Intel Core processor, load latency facility and PDIR capabilities are unchanged. However, precise store is replaced by an enhanced capability, data address profiling, that is not restricted to store address. Data address profiling also records information in PEBS records at offsets 98H, A0H, and ABH.

21.3.6.3 PEBS Data Address Profiling

The Data Linear Address facility is also abbreviated as DataLA. The facility is a replacement or extension of the precise store facility in previous processor generations. The DataLA facility complements the load latency facility by providing a means to profile load and store memory references in the system, leverages the PEBS facility, and provides additional information about sampled loads and stores. Having precise memory reference events with linear address information for both loads and stores provides information to improve data structure layout, eliminate remote node references, and identify cache-line conflicts in NUMA systems.

The DataLA facility in the 4th generation processor supports the following events configured to use PEBS:

Table 21-26. Precise Events That Supports Data Linear Address Profiling

Event Name	Event Name
MEM_UOPS_RETIRED.STLB_MISS_LOADS	MEM_UOPS_RETIRED.STLB_MISS_STORES
MEM_UOPS_RETIRED.LOCK_LOADS	MEM_UOPS_RETIRED.SPLIT_STORES
MEM_UOPS_RETIRED.SPLIT_LOADS	MEM_UOPS_RETIRED.ALL_STORES
MEM_UOPS_RETIRED.ALL_LOADS	MEM_LOAD_UOPS_LLC_MISS_RETIRED.LOCAL_DRAM
MEM_LOAD_UOPS_RETIRED.L1_HIT	MEM_LOAD_UOPS_RETIRED.L2_HIT
MEM_LOAD_UOPS_RETIRED.L3_HIT	MEM_LOAD_UOPS_RETIRED.L1_MISS
MEM_LOAD_UOPS_RETIRED.L2_MISS	MEM_LOAD_UOPS_RETIRED.L3_MISS
MEM_LOAD_UOPS_RETIRED.HIT_LFB	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_MISS
MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HIT	MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HITM
UOPS_RETIRED.ALL (if load or store is tagged)	MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_NONE

DataLA can use any one of the IA32_PMC0-IA32_PMC3 counters. Counter overflows will initiate the generation of PEBS records. Upon counter overflow, hardware captures the linear address and possible other status information of the retiring memory uop. This information is then written to the PEBS record that is subsequently generated.

To enable the DataLA facility, software must complete the following steps. Please note that the DataLA facility relies on the PEBS facility, so the PEBS configuration requirements must be completed before attempting to capture DataLA information.

- Complete the PEBS configuration steps.
- Program an event listed in Table 21-26 using any one of IA32_PERFEVTSEL0-IA32_PERFEVTSEL3.
- Set the corresponding IA32_PEBS_ENABLE.PEBS_EN_CTRx bit. This enables the corresponding IA32_PMCx as a PEBS counter and enables the DataLA facility.

When the DataLA facility is enabled, the relevant information written into a PEBS record affects entries at offsets 98H, A0H, and A8H, as shown in Table 21-27.

Table 21-27. Layout of Data Linear Address Information In PEBS Record

Field	Offset	Description
Data Linear Address	98H	The linear address of the load or the destination of the store.
Store Status	A0H	▪ **DCU Hit** (Bit 0): The store hit the data cache closest to the core (L1 cache) if this bit is set, otherwise the store missed the data cache. This information is valid only for the following store events: UOPS_RETIRED.ALL (if store is tagged), MEM_UOPS_RETIRED.STLB_MISS_STORES, MEM_UOPS_RETIRED.SPLIT_STORES, MEM_UOPS_RETIRED.ALL_STORES ▪ Other bits are zero, The STLB_MISS, LOCK bit information can be obtained by programming the corresponding store event in Table 21-26.
Reserved	A8H	Always zero.

21.3.6.3.1 EventingIP Record

The PEBS record layout for processors based on Haswell microarchitecture adds a new field at offset 0B0H. This is the eventingIP field that records the IP address of the retired instruction that triggered the PEBS assist. The EIP/RIP field at offset 08H records the IP address of the next instruction to be executed following the PEBS assist.

21.3.6.4 Off-core Response Performance Monitoring

The core PMU facility to collect off-core response events are similar to those described in Section 21.3.4.5. The event codes are listed in Table 21-16. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR_OFFCORE_RSP_x. Software must program MSR_OFFCORE_RSP_x according to:

- Transaction request type encoding (bits 15:0): see Table 21-28.
- Supplier information (bits 30:16): see Table 21-29.
- Snoop response information (bits 37:31): see Table 21-19.

Table 21-28. MSR_OFFCORE_RSP_x Request_Type Definition (Haswell Microarchitecture)

Bit Name	Offset	Description
DMND_DATA_RD	0	Counts the number of demand data reads and page table entry cacheline reads. Does not count L2 data read prefetches or instruction fetches.
DMND_RFO	1	Counts demand read (RFO) and software prefetches (PREFETCHW) for exclusive ownership in anticipation of a write.
DMND_IFETCH	2	Counts the number of demand instruction cacheline reads and L1 instruction cacheline prefetches.
COREWB	3	Counts the number of modified cachelines written back.
PF_DATA_RD	4	Counts the number of data cacheline reads generated by L2 prefetchers.
PF_RFO	5	Counts the number of RFO requests generated by L2 prefetchers.
PF_IFETCH	6	Counts the number of code reads generated by L2 prefetchers.
PF_L3_DATA_RD	7	Counts the number of data cacheline reads generated by L3 prefetchers.
PF_L3_RFO	8	Counts the number of RFO requests generated by L3 prefetchers.
PF_L3_CODE_RD	9	Counts the number of code reads generated by L3 prefetchers.
SPLIT_LOCK_UC_LOCK	10	Counts the number of lock requests that split across two cachelines or are to UC memory.
STRM_ST	11	Counts the number of streaming store requests electronically.
Reserved	14:12	Reserved

Table 21-28. MSR_OFFCORE_RSP_x Request_Type Definition (Haswell Microarchitecture) (Contd.)

Bit Name	Offset	Description
OTHER	15	Any other request that crosses IDI, including I/O.

The supplier information field listed in Table 21-29. The fields vary across products (according to CPUID signatures) and is noted in the description.

Table 21-29. MSR_OFFCORE_RSP_x Supplier Info Field Definition (CPUID Signatures: 06_3CH, 06_46H)

Subtype	Bit Name	Offset	Description
Common	Any	16	Catch all value for any response types.
Supplier Info	NO_SUPP	17	No Supplier Information available.

	L3_MISS_REMOTE_HOP1	28	Hop 1 Remote supplier.
	L3_MISS_REMOTE_HOP2P	29	Hop 2 or more Remote supplier.
	Reserved	30	Reserved

21.3.6.5 Performance Monitoring and Intel® TSX

Chapter 16 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, describes the details of Intel® Transactional Synchronization Extensions (Intel® TSX). This section describes performance monitoring support for Intel TSX.

If a processor supports Intel TSX, the core PMU enhances its IA32_PERFEVTSELx MSR with two additional bit fields for event filtering. Support for Intel TSX is indicated by either (a) CPUID.(EAX=7, ECX=0):RTM[bit 11]=1, or (b) if CPUID.07H.EBX.HLE [bit 4] = 1. The TSX-enhanced layout of IA32_PERFEVTSELx is shown in Figure 21-36. The two additional bit fields are:

- **IN_TX** (bit 32): When set, the counter will only include counts that occurred inside a transactional region, regardless of whether that region was aborted or committed. This bit may only be set if the processor supports HLE or RTM.
- **IN_TXCP** (bit 33): When set, the counter will not include counts that occurred inside of an aborted transactional region. This bit may only be set if the processor supports HLE or RTM. This bit may only be set for IA32_PERFEVTSEL2.

When the IA32_PERFEVTSELx MSR is programmed with both IN_TX=0 and IN_TXCP=0 on a processor that supports Intel TSX, the result in a counter may include detectable conditions associated with a transaction code region for its aborted execution (if any) and completed execution.

In the initial implementation, software may need to take pre-caution when using the IN_TXCP bit. See Table 2-29.

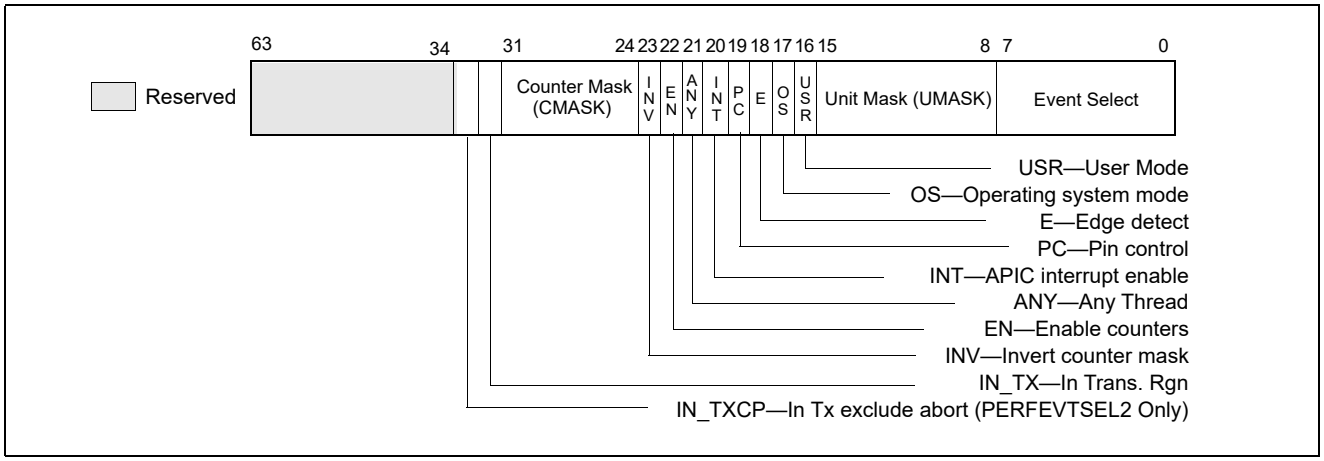

Figure 21-36. Layout of IA32_PERFEVTSELx MSRs Supporting Intel TSX

A common usage of setting IN_TXCP=1 is to capture the number of events that were discarded due to a transactional abort. With IA32_PMC2 configured to count in such a manner, then when a transactional region aborts, the value for that counter is restored to the value it had prior to the aborted transactional region. As a result, any updates performed to the counter during the aborted transactional region are discarded.

On the other hand, setting IN_TX=1 can be used to drill down on the performance characteristics of transactional code regions. When a PMCx is configured with the corresponding IA32_PERFEVTSELx.IN_TX=1, only eventing conditions that occur inside transactional code regions are propagated to the event logic and reflected in the counter result. Eventing conditions specified by IA32_PERFEVTSELx but occurring outside a transactional region are discarded.

Additionally, a number of performance events are solely focused on characterizing the execution of Intel TSX transactional code, they can be found at: https://perfmon-events.intel.com/.

21.3.6.5.1 Intel® TSX and PEBS Support

If a PEBS event would have occurred inside a transactional region, then the transactional region first aborts, and then the PEBS event is processed.

Two of the TSX performance monitoring events also support using the PEBS facility to capture additional information. They are:

- HLE_RETIRED.ABORTED (encoding C8H mask 04H),
- RTM_RETIRED.ABORTED (encoding C9H mask 04H).

A transactional abort (HLE_RETIRED.ABORTED,RTM_RETIRED.ABORTED) can also be programmed to cause PEBS events. In this scenario, a PEBS event is processed following the abort.

Pending a PEBS record inside of a transactional region will cause a transactional abort. If a PEBS record was pended at the time of the abort or on an overflow of the TSX PEBS events listed above, only the following PEBS entries will be valid (enumerated by PEBS entry offset B8H bits[33:32] to indicate an HLE abort or an RTM abort):

- Offset B0H: EventingIP,
- Offset B8H: TX Abort Information

These fields are set for all PEBS events.

- Offset 08H (RIP/EIP) corresponds to the instruction following the outermost XACQUIRE in HLE or the first instruction of the fallback handler of the outermost XBEGIN instruction in RTM. This is useful to identify the aborted transactional region.

In the case of HLE, an aborted transaction will restart execution deterministically at the start of the HLE region. In the case of RTM, an aborted transaction will transfer execution to the RTM fallback handler.

The layout of the TX Abort Information field is given in Table 21-32.

Table 21-32. TX Abort Information Field Definition

Bit Name	Offset	Description
Cycles_Last_TX	31:0	The number of cycles in the last TSX region, regardless of whether that region had aborted or committed.
HLE_Abort	32	If set, the abort information corresponds to an aborted HLE execution
RTM_Abort	33	If set, the abort information corresponds to an aborted RTM execution
Instruction_Abort	34	If set, the abort was associated with the instruction corresponding to the eventing IP (offset 0B0H) within the transactional region.
Non_Instruction_Abort	35	If set, the instruction corresponding to the eventing IP may not necessarily be related to the transactional abort.
Retry	36	If set, retrying the transactional execution may have succeeded.
Data_Conflict	37	If set, another logical processor conflicted with a memory address that was part of the transactional region that aborted.
Capacity Writes	38	If set, the transactional region aborted due to exceeding resources for transactional writes.
Capacity Reads	39	If set, the transactional region aborted due to exceeding resources for transactional reads.
In_Suspend	40	Transaction was aborted while in a suspend region. This is an Intel Xeon processor only feature, available beginning with 4th generation Intel Xeon Scalable Processor Family; otherwise reserved.
Reserved	63:41	Reserved

21.3.6.6 Uncore Performance Monitoring Facilities in the 4th Generation Intel® Core™ Processors

The uncore sub-system in the 4th Generation Intel® Core™ processors provides its own performance monitoring facility. The uncore PMU facility provides dedicated MSRs to select uncore performance monitoring events in a similar manner as those described in Section 21.3.4.6.

The ARB unit and each C-Box provide local pairs of event select MSR and counter register. The layout of the event select MSRs in the C-Boxes are identical as shown in Figure 21-34.

At the uncore domain level, there is a master set of control MSRs that centrally manages all the performance monitoring facility of uncore units. Figure 21-35 shows the layout of the uncore domain global control.

Additionally, there is also a fixed counter, counting uncore clockticks, for the uncore domain. Table 21-20 summarizes the number MSRs for uncore PMU for each box.

Table 21-33. Uncore PMU MSR Summary

Box	# of Boxes	Counters per Box	Counter Width	General Purpose	Global Enable	Comment
C-Box	SKU specific	2	44	Yes	Per-box	Up to 4, seeTable 2-21 MSR_UNC_CBO_CONFIG
ARB	1	2	44	Yes	Uncore	
Fixed Counter	N.A.	N.A.	48	No	Uncore	

The uncore performance events for the C-Box and ARB units can be found at: https://perfmon-events.intel.com/.

21.3.6.7 Intel® Xeon® Processor E5 v3 Family Uncore Performance Monitoring Facility

Details of the uncore performance monitoring facility of Intel Xeon Processor E5 v3 families are available in "Intel® Xeon® Processor E5 v3 Uncore Performance Monitoring Programming Reference Manual". The MSR-based uncore PMU interfaces are listed in Table 2-33.

21.3.7 5th Generation Intel® Core™ Processor and Intel® Core™ M Processor Performance Monitoring Facility

The 5th Generation Intel® Core™ processor and the Intel® Core™ M processor families are based on the Broadwell microarchitecture. The core PMU supports architectural performance monitoring capability with version ID 3 (see Section 21.2.3) and a host of non-architectural monitoring capabilities.

Architectural performance monitoring version 3 capabilities are described in Section 21.2.3.

The core PMU has the same capability as those described in Section 21.3.6. IA32_PERF_GLOBAL_STATUS provide a bit indicator (bit 55) for PMI handler to distinguish PMI due to output buffer overflow condition due to accumulating packet data from Intel Processor Trace.

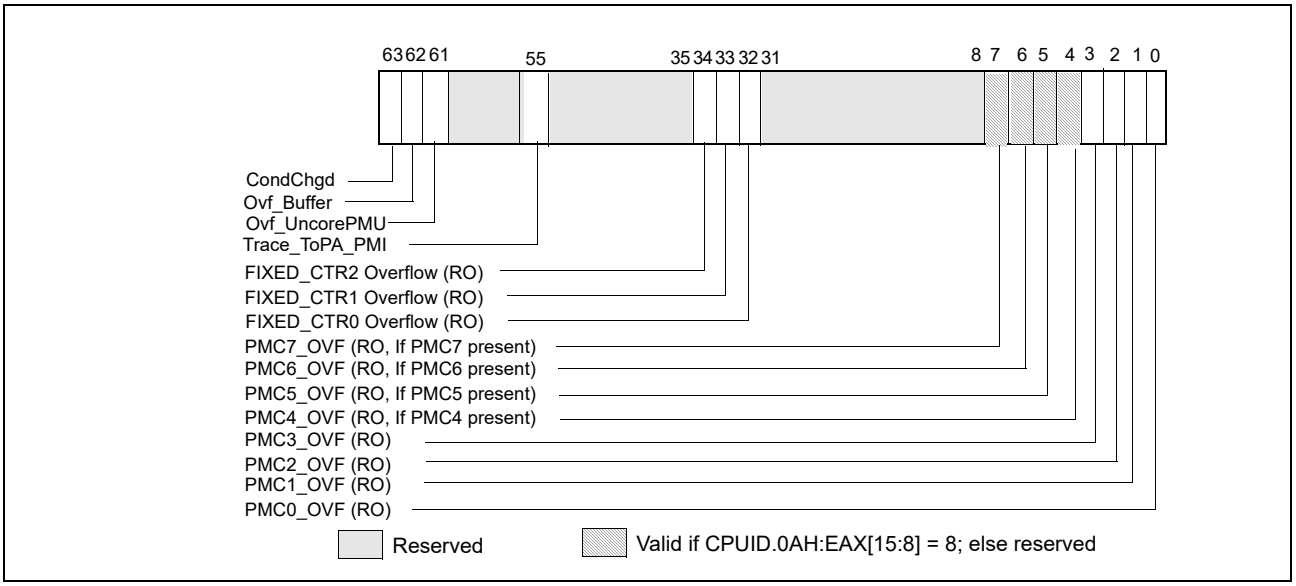

Figure 21-37. IA32_PERF_GLOBAL_STATUS MSR in Broadwell Microarchitecture

Details of Intel Processor Trace is described in Chapter 34, "Intel® Processor Trace." The IA32_PERF_GLOBAL_OVF_CTRL MSR provides a corresponding reset control bit.

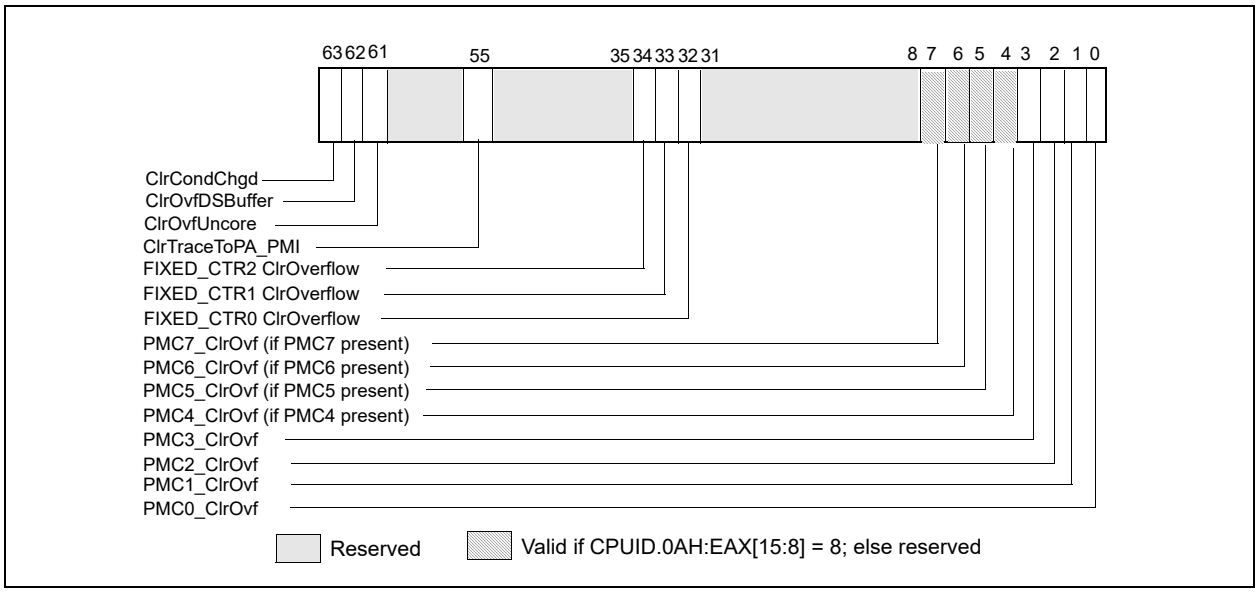

Figure 21-38. IA32_PERF_GLOBAL_OVF_CTRL MSR in Broadwell microarchitecture

The specifics of non-architectural performance events can be found at: https://perfmon-events.intel.com/.

21.3.8 6th Generation, 7th Generation and 8th Generation Intel® Core™ Processor Performance Monitoring Facility

The 6th generation Intel® Core™ processor is based on the Skylake microarchitecture. The 7th generation Intel® Core™ processor is based on the Kaby Lake microarchitecture. The 8th generation Intel® Core™ processors, 9th generation Intel® Core™ processors, and Intel® Xeon® E processors are based on the Coffee Lake microarchitecture. For these microarchitectures, the core PMU supports architectural performance monitoring capability with version ID 4 (see Section 21.2.4) and a host of non-architectural monitoring capabilities.

Architectural performance monitoring version 4 capabilities are described in Section 21.2.4.

The core PMU's capability is similar to those described in Section 21.6.3 through Section 21.3.4.5, with some differences and enhancements summarized in Table 21-34. Additionally, the core PMU provides some enhancement to support performance monitoring when the target workload contains instruction streams using Intel® Transactional Synchronization Extensions (TSX), see Section 21.3.6.5. For details of Intel TSX, see Chapter 16, "Programming with Intel® AVX10," of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1.

Performance monitoring result may be affected by side-band activity on processors that support Intel SGX, details are described in Chapter 40, "Enclave Code Debug and Profiling."

Table 21-34. Core PMU Comparison

21.3.8.1 Processor Event Based Sampling (PEBS) Facility

The PEBS facility in the 6th generation, 7th generation and 8th generation Intel Core processors provides a number enhancement relative to PEBS in processors based on Haswell/Broadwell microarchitectures. The key components and differences of PEBS facility relative to Haswell/Broadwell microarchitecture is summarized in Table 21-35.

Table 21-35. PEBS Facility Comparison

Box	Skylake, Kaby Lake and Coffee Lake Microarchitectures	Haswell and Broadwell Microarchitectures	Comment

PEBS-Load Latency	See Section 21.3.4.4.2.	See Section 21.3.4.4.2.	
Data Address Profiling	Yes	Yes	

Table 21-35. PEBS Facility Comparison (Contd.)

Box	Skylake, Kaby Lake and Coffee Lake Microarchitectures	Haswell and Broadwell Microarchitectures	Comment
FrontEnd event support	FrontEnd_Retried event and MSR_PEBS_FRONTEND.	No	IA32_PMC0-PMC3 only.

Only IA32_PMC0 through IA32_PMC3 support PEBS.

NOTES

Precise events are only valid when the following fields of IA32_PERFEVTSELx are all zero: AnyThread, Edge, Invert, CMask.

In a PMU with PDIR capability, PEBS behavior is unpredictable if IA32_PERFEVTSELx or IA32_PMCx is changed for a PEBS-enabled counter while an event is being counted. To avoid this, changes to the programming or value of a PEBS-enabled counter should be performed when the counter is disabled.

21.3.8.1.1 PEBS Data Format

The PEBS record format for the 6th generation, 7th generation and 8th generation Intel Core processors is reporting with encoding 0011b in IA32_PERF_CAPABILITIES[11:8]. The lay out is shown in Table 21-36. The PEBS record format, along with debug/store area storage format, does not change regardless of whether IA-32e mode is active or not. CPUID.01H:ECX.DTES64[bit 2] reports whether the processor's DS storage format support is mode-independent. When set, it uses 64-bit DS storage format.

Table 21-36. PEBS Record Format for the 6th Generation, 7th Generation, and 8th Generation Intel Core Processor Families

Byte Offset	Field	Byte Offset	Field
00H	R/EFLAGS	68H	R11
08H	R/EIP	70H	R12
10H	R/EAX	78H	R13
18H	R/EBX	80H	R14
20H	R/ECX	88H	R15
28H	R/EDX	90H	Applicable Counter
30H	R/ESI	98H	Data Linear Address
38H	R/EDI	A0H	Data Source Encoding
40H	R/EBP	A8H	Latency value (core cycles)
48H	R/ESP	B0H	EventingIP
50H	R8	B8H	TX Abort Information (Section 21.3.6.5.1)
58H	R9	C0H	TSC
60H	R10		

The layout of PEBS records are largely identical to those shown in Table 21-25.

The PEBS records at offsets 98H, A0H, and ABH record data gathered from three of the PEBS capabilities in prior processor generations: load latency facility (Section 21.3.4.4.2), PDIR (Section 21.3.4.4.4), and data address profiling (Section 21.3.6.3).

In the core PMU of the 6th generation, 7th generation and 8th generation Intel Core processors, load latency facility and PDIR capabilities and data address profiling are unchanged relative to the 4th generation and 5th generation Intel Core processors. Similarly, precise store is replaced by data address profiling.

With format 0010b, a snapshot of the IA32_PERF_GLOBAL_STATUS may be useful to resolve the situations when more than one of IA32_PMICx have been configured to collect PEBS data and two consecutive overflows of the PEBS-enabled counters are sufficiently far apart in time. It is also possible for the image at 90H to indicate multiple PEBS-enabled counters have overflowed. In the latter scenario, software cannot to correlate the PEBS record entry to the multiple overflowed bits.

With PEBS record format encoding 0011b, offset 90H reports the "applicable counter" field, which is a multi-counter PEBS resolution index allowing software to correlate the PEBS record entry with the eventing PEBS overflow when multiple counters are configured to record PEBS records. Additionally, offset C0H captures a snapshot of the TSC that provides a time line annotation for each PEBS record entry.

21.3.8.1.2 PEBS Events

The list of precise events supported for PEBS in the Skylake, Kaby Lake and Coffee Lake microarchitectures is shown in Table 21-37.

Table 21-37. Precise Events for the Skylake, Kaby Lake, and Coffee Lake Microarchitectures

Event Name	Event Select	Sub-event	UMask
INST_RETIRED	C0H	PREC_DIST[1]	01H
		ALL_CYCLES[2]	01H
OTHER_ASSISTS	C1H	ANY	3FH
BR_INST_RETIRED	C4H	CONDITIONAL	01H
		NEAR_CALL	02H
		ALL_BRANCHES	04H
		NEAR_RETURN	08H
		NEAR_TAKEN	20H
		FAR_BRACHES	40H
BR_MISP_RETIRED	C5H	CONDITIONAL	01H
		ALL_BRANCHES	04H
		NEAR_TAKEN	20H
FRONTEND_RETIRED	C6H	<Programmable[3]>	01H
HLE_RETIRED	C8H	ABORTED	04H
RTM_RETIRED	C9H	ABORTED	04H
MEM_INST_RETIRED[2]	D0H	LOCK_LOADS	21H
		SPLIT_LOADS	41H
		SPLIT_STORES	42H
		ALL_LOADS	81H
		ALL_STORES	82H
MEM_LOAD_RETIRED[4]	D1H	L1_HIT	01H
		L2_HIT	02H
		L3_HIT	04H
		L1_MISS	08H
		L2_MISS	10H
		L3_MISS	20H
		HIT_LFB	40H

Table 21-37. Precise Events for the Skylake, Kaby Lake, and Coffee Lake Microarchitectures (Contd.)

Event Name	Event Select	Sub-event	UMask
MEM_LOAD_L3_HIT_RETIRED[2]	D2H	XSNP_MISS	01H
		XSNP_HIT	02H
		XSNP_HITM	04H
		XSNP_NONE	08H

NOTES:

1. Only available on IA32_PMC1.
2. INST_RETIRED.ALL_CYCLES is configured with additional parameters of cmask = 10 and INV = 1
3. Subevents are specified using MSR_PEBS_FRONTEND, see Section 21.3.8.3
4. Instruction with at least one load uop experiencing the condition specified in the UMask.

21.3.8.1.3 Data Address Profiling

The PEBS Data address profiling on the 6th generation, 7th generation and 8th generation Intel Core processors is largely unchanged from the prior generation. When the DataLA facility is enabled, the relevant information written into a PEBS record affects entries at offsets 98H, A0H, and A8H, as shown in Table 21-27.

Table 21-38. Layout of Data Linear Address Information In PEBS Record

Field	Offset	Description
Data Linear Address	98H	The linear address of the load or the destination of the store.
Store Status	A0H	▪ **DCU Hit** (Bit 0): The store hit the data cache closest to the core (L1 cache) if this bit is set, otherwise the store missed the data cache. This information is valid only for the following store events: UOPS_RETIRED.ALL (if store is tagged), MEM_INST_RETIRED.STLB_MISS_STORES, MEM_INST_RETIRED.ALL_STORES, MEM_INST_RETIRED.SPLIT_STORES. ▪ Other bits are zero.
Reserved	A8H	Always zero.

21.3.8.2 Frontend Retired Facility

The Skylake Core PMU has been extended to cover common microarchitectural conditions related to the front end pipeline in addition to providing a generic latency mechanism that can locate fetch bubbles without necessarily attributing them to a particular condition. The facility counts the events if the associated instruction reaches retirement (architecturally committed). Additionally, the user may opt to enable the PEBS facility to obtain precise information on the context of the event, e.g., EventingIP.

The supported frontend microarchitectural conditions require the following interfaces:

- The IA32_PERFEVTSELx MSR must select the FRONTEND_RETIRED event, EventSelect = C6H and UMASK = 01H.
- This event employs a new MSR, MSR_PEBS_FRONTEND, to specify the supported frontend event details, see Table 21-39.
- If precise information is desired, program the PEBS_EN_PMCx field of IA32_PEBS_ENABLE MSR as required.

Note the AnyThread field of IA32_PERFEVTSELx is ignored by the processor for the "FRONTEND_RETIRED" event.

The sub-event encodings supported by MSR_PEBS_FRONTEND.EVTSEL is given in Table 21-39.

Table 21-39. FrontEnd_Retired Sub-Event Encodings Supported by MSR_PEBS_FRONTEND.EVTSEL

Sub-Event Name	EVTSEL	Description
ANY_DSB_MISS	1H	Retired Instructions which experienced any decode stream buffer (DSB) miss.
DSB_MISS	11H	Retired Instructions which experienced a DSB miss that caused a fetch starvation cycle.
L1I_MISS	12H	The fetch of retired Instructions which experienced Instruction L1 Cache true miss[1]. Additional requests to the same cache line as an in-flight L1I cache miss will not be counted.
L2_MISS	13H	The fetch of retired Instructions which experienced L2 Cache true miss. Additional requests to the same cache line as an in-flight MLC cache miss will not be counted.
ITLB_MISS	14H	The fetch of retired Instructions which experienced ITLB true miss. Additional requests to the same cache line as an in-flight ITLB miss will not be counted.
STLB_MISS	15H	The fetch of retired Instructions which experienced STLB true miss. Additional requests to the same cache line as an in-flight STLB miss will not be counted.
IDQ_READ_BUBBLES	6H	An IDQ read bubble is defined as any one of the 4 allocation slots of IDQ that is not filled by the front-end on any cycle where there is no back end stall. Using the threshold and latency fields in MSR_PEBS_FRONTEND allows counting of IDQ read bubbles of various magnitude and duration. Latency controls the number of cycles and Threshold controls the number of allocation slots that contain bubbles. The event counts if and only if a sequence of at least FE_LATENCY consecutive cycles contain at least FE_TRESHOLD number of bubbles each.

NOTES:

1. A true miss is the first miss for a cacheline/page (excluding secondary misses that fall into same cacheline/page).

The layout of MSR_PEBS_FRONTEND is given in Table 21-40.

Table 21-40. MSR_PEBS_FRONTEND Layout

Bit Name	Offset	Description
EVTSEL	7:0	Encodes the sub-event within FrontEnd_Retired that can use PEBS facility, see Table 21-39.
IDQ_Bubble_Length	19:8	Specifies the threshold of continuously elapsed cycles for the specified width of bubbles when counting IDQ_READ_BUBBLES event.
IDQ_Bubble_Width	22:20	Specifies the threshold of simultaneous bubbles when counting IDQ_READ_BUBBLES event.
Reserved	63:23	Reserved

The FRONTEND_RETIRED event is designed to help software developers identify exact instructions that caused front-end issues. There are some instances in which the event will, by design, the under-counting scenarios include the following:

- The event counts only retired (non-speculative) front-end events, i.e., events from just true program execution path are counted.
- The event will count once per cacheline (at most). If a cacheline contains multiple instructions which caused front-end misses, the count will be only 1 for that line.
- If the multibyte sequence of an instruction spans across two cachelines and causes a miss it will be recorded once. If there were additional misses in the second cacheline, they will not be counted separately.
- If a multi-uop instruction exceeds the allocation width of one cycle, the bubbles associated with these uops will be counted once per that instruction.
- If 2 instructions are fused (macro-fusion), and either of them or both cause front-end misses, it will be counted once for the fused instruction.
- If a front-end (miss) event occurs outside instruction boundary (e.g., due to processor handling of architectural event), it may be reported for the next instruction to retire.

21.3.8.3 Off-core Response Performance Monitoring

The core PMU facility to collect off-core response events are similar to those described in Section 21.3.4.5. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR_OFF-CORE_RSP_x. Software must program MSR_OFFCORE_RSP_x according to:

- Transaction request type encoding (bits 15:0): see Table 21-41.
- Supplier information (bits 29:16): see Table 21-42.
- Snoop response information (bits 37:30): see Table 21-43.

Table 21-41. MSR_OFFCORE_RSP_x Request_Type Definition (Skylake, Kaby Lake, and Coffee Lake Microarchitectures)

Bit Name	Offset	Description
DMND_DATA_RD	0	Counts the number of demand data reads and page table entry cacheline reads. Does not count hw or sw prefetches.
DMND_RFO	1	Counts the number of demand reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.
DMND_IFETCH	2	Counts the number of demand instruction cacheline reads and L1 instruction cacheline prefetches.
Reserved	14:3	Reserved
OTHER	15	Counts miscellaneous requests, such as I/O and uncacheable accesses.

Table 21-42 lists the supplier information field that applies to 6th generation, 7th generation and 8th generation Intel Core processors. (6th generation Intel Core processor CPUID signatures: 06_4EH and 06_5EH; 7th generation and 8th generation Intel Core processor CPUID signatures: 06_8EH and 06_9EH).

Table 21-42. MSR_OFFCORE_RSP_x Supplier Info Field Definition (CPUID Signatures: 06_4EH, 06_5EH, 06_8EH, 06_9EH)

Subtype	Bit Name	Offset	Description
Common	Any	16	Catch all value for any response types.
Supplier Info	NO_SUPP	17	No Supplier Information available.
	L3_HITM	18	M-state initial lookup stat in L3.
	L3_HITE	19	E-state
	L3_HITS	20	S-state
	Reserved	21	Reserved
	L4_HIT	22	L4 Cache (if L4 is present in the processor).
	Reserved	25:23	Reserved
	DRAM	26	Local Node
	Reserved	29:27	Reserved
	SPL_HIT	30	L4 cache super line hit (if L4 is present in the processor).

Table 21-43 lists the snoop information field that apply to processors with CPUID signatures 06_4EH, 06_5EH, 06_8EH, 06_9E, and 06_55H.

Table 21-43. MSR_OFFCORE_RSP_x Snoop Info Field Definition (CPUID Signatures: 06_4EH, 06_5EH, 06_8EH, 06_9E, 06_55H)

Subtype	Bit Name	Offset	Description
Snoop Info	SPL_HIT	30	L4 cache super line hit (if L4 is present in the processor).
	SNOOP_NONE	31	No details on snoop-related information.
	SNOOP_NOT_NEEDED	32	No snoop was needed to satisfy the request.
	SNOOP_MISS	33	A snoop was needed and it missed all snooped caches: -For LLC Hit, ReslHitI was returned by all cores. -For LLC Miss, Rspl was returned by all sockets and data was returned from DRAM.
	SNOOP_HIT_NO_FWD	34	A snoop was needed and it hits in at least one snooped cache. Hit denotes a cache-line was valid before snoop effect. This includes: -Snoop Hit w/ Invalidation (LLC Hit, RFO). -Snoop Hit, Left Shared (LLC Hit/Miss, IFetch/Data_RD). -Snoop Hit w/ Invalidation and No Forward (LLC Miss, RFO Hit S). In the LLC Miss case, data is returned from DRAM.
	SNOOP_HIT_WITH_FWD	35	A snoop was needed and data was forwarded from a remote socket. This includes: -Snoop Forward Clean, Left Shared (LLC Hit/Miss, IFetch/Data_RD/RFT).
	SNOOP_HITM	36	A snoop was needed and it HitM-ed in local or remote cache. HitM denotes a cache-line was in modified state before effect as a results of snoop. This includes: -Snoop HitM w/ WB (LLC miss, IFetch/Data_RD). -Snoop Forward Modified w/ Invalidation (LLC Hit/Miss, RFO). -Snoop MtoS (LLC Hit, IFetch/Data_RD).
	SNOOP_NON_DRAM	37	Target was non-DRAM system address. This includes MMIO transactions.

21.3.8.3.1 Off-core Response Performance Monitoring for the Intel® Xeon® Scalable Processor Family

The following tables list the requestor and supplier information fields that apply to the Intel® Xeon® Scalable Processor Family.

- Transaction request type encoding (bits 15:0): see Table 21-44.
- Supplier information (bits 29:16): see Table 21-45.
- Supplier information (bits 29:16) with support for Intel® Optane™ DC Persistent Memory support: see Table 21-46.
- Snoop response information has not been changed and is the same as in (bits 37:30): see Table 21-43.

Table 21-44. MSR_OFFCORE_RSP_x Request_Type Definition (Intel® Xeon® Scalable Processor Family)

Bit Name	Offset	Description
DEMAND_DATA_RD	0	Counts the number of demand data reads and page table entry cacheline reads. Does not count hw or sw prefetches.
DEMAND_RFO	1	Counts the number of demand reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.
DEMAND_CODE_RD	2	Counts the number of demand instruction cacheline reads and L1 instruction cacheline prefetches.
Reserved	3	Reserved.
PF_L2_DATA_RD	4	Counts the number of prefetch data reads into L2.
PF_L2_RFO	5	Counts the number of RFO Requests generated by the MLC prefetches to L2.
Reserved	6	Reserved.
PF_L3_DATA_RD	7	Counts the number of MLC data read prefetches into L3.
PF_L3_RFO	8	Counts the number of RFO requests generated by MLC prefetches to L3.
Reserved	9	Reserved.
PF_L1D_AND_SW	10	Counts data cacheline reads generated by hardware L1 data cache prefetcher or software prefetch requests.
Reserved	14:11	Reserved.
OTHER	15	Counts miscellaneous requests, such as I/O and un-cacheable accesses.

Table 21-45 lists the supplier information field that applies to the Intel Xeon Scalable Processor Family (CPUID signature: 06_55H).

Table 21-45. MSR_OFFCORE_RSP_x Supplier Info Field Definition (CPUID Signature: 06_55H)

Subtype	Bit Name	Offset	Description
Common	Any	16	Catch all value for any response types.
Supplier Info	SUPPLIER_NONE	17	No Supplier Information available.
	L3_HIT_M	18	M-state initial lookup stat in L3.
	L3_HIT_E	19	E-state
	L3_HIT_S	20	S-state
	L3_HIT_F	21	F-state
	Reserved	25:22	Reserved
	L3_MISS_LOCAL_DRAM	26	L3 Miss: local home requests that missed the L3 cache and were serviced by local DRAM.
	L3_MISS_REMOTE_HOP0_DRAM	27	Hop 0 Remote supplier.
	L3_MISS_REMOTE_HOP1_DRAM	28	Hop 1 Remote supplier.
	L3_MISS_REMOTE_HOP2P_DRAM	29	Hop 2 or more Remote supplier.
	Reserved	30	Reserved

Table 21-46 lists the supplier information field that applies to the Intel Xeon Scalable Processor Family (CPUID signature: 06_55H, Steppings 0x5H - 0xFH).

Table 21-46. MSR_OFFCORE_RSP_x Supplier Info Field Definition
(CPUID Signature: 06_55H, Steppings 0x5H - 0xFH)

Subtype	Bit Name	Offset	Description
Common	Any	16	Catch all value for any response types.
Supplier Info	SUPPLIER_NONE	17	No Supplier Information available.
	L3_HIT_M	18	M-state initial lookup stat in L3.
	L3_HIT_E	19	E-state
	L3_HIT_S	20	S-state
	L3_HIT_F	21	F-state
	LOCAL_PMM	22	Local home requests that were serviced by local PMM.
	REMOTE_HOP0_PMM	23	Hop 0 Remote supplier.
	REMOTE_HOP1_PMM	24	Hop 1 Remote supplier.
	REMOTE_HOP2P_PMM	25	Hop 2 or more Remote supplier.
	L3_MISS_LOCAL_DRAM	26	L3 Miss: Local home requests that missed the L3 cache and were serviced by local DRAM.
	L3_MISS_REMOTE_HOP0_DRAM	27	Hop 0 Remote supplier.
	L3_MISS_REMOTE_HOP1_DRAM	28	Hop 1 Remote supplier.
	L3_MISS_REMOTE_HOP2P_DRAM	29	Hop 2 or more Remote supplier.
	Reserved	30	Reserved

21.3.8.4 Uncore Performance Monitoring Facilities on Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Cannon Lake microarchitecture introduces LLC support of up to six processor cores. To support six processor cores and eight LLC slices, existing MSRs have been rearranged and new CBo MSRs have been added. Uncore performance monitoring software drivers from prior generations of Intel Core processors will need to update the MSR addresses. The new MSRs and updated MSR addresses have been added to the Uncore PMU listing in Section 2.17.2, "MSRs Specific to 8th Generation Intel® Core™ i3 Processors," in Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4.

21.3.9 10th Generation Intel® Core™ Processor Performance Monitoring Facility

Some 10th generation Intel® Core™ processors and some 3rd generation Intel® Xeon® Scalable Processor Family are based on Ice Lake microarchitecture. Some 11th generation Intel® Core™ processors are based on the Tiger Lake microarchitecture, and some are based on the Rocket Lake microarchitecture. For these processors, the core PMU supports architectural performance monitoring capability with version Id 5 (see Section 21.2.5) and a host of non-architectural monitoring capabilities.

The core PMU's capability is similar to those described in Section 21.3.1 through Section 21.3.8, with some differences and enhancements summarized in Table 21-47.

Table 21-47. Core PMU Summary of the Ice Lake Microarchitecture

Box	Ice Lake Microarchitecture	Skylake, Kaby Lake and Coffee Lake Microarchitectures	Comment
Architectural Perfmon version	5	4	See Section 21.2.5.
Number of programmable counters per thread	8	4	Use CPUID to determine number of counters. See Section 21.2.1.
PEBS: Basic functionality	Yes	Yes	See Section 21.3.9.1.
PEBS record format encoding	0100b	0011b	See Section 21.6.2.4.2.
Extended PEBS	PEBS is extended to all Fixed and General Purpose counters and to all performance monitoring events.	No	See Section 21.9.1.
Adaptive PEBS	Yes	No	See Section 21.9.2.
Performance Metrics	Yes (4)	No	See Section 21.3.9.3.
PEBS-PDIR	IA32_FIXED0 only (Corresponding counter control MSRs must be enabled.)	IA32_PMC1 only.	

21.3.9.1 Processor Event Based Sampling (PEBS) Facility

The PEBS facility in the 10th generation Intel Core processors provides a number of enhancements relative to PEBS in processors based on the Skylake, Kaby Lake, and Coffee Lake microarchitectures. Enhancement of the PEBS facility with Extended PEBS and Adaptive PEBS features is described in detail in Section 21.9.

The 3rd generation Intel Xeon Scalable Family of processors based on the Ice Lake microarchitecture introduce EPT-friendly PEBS. This allows EPT violations and other VM Exits to be taken on PEBS accesses to the DS Area. See Section 21.9.5 for details.

21.3.9.2 Off-core Response Performance Monitoring

The core PMU facility to collect off-core response events are similar to those described in Section 21.3.4.5. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR_OFFCORE_RSP_x. Software must program MSR_OFFCORE_RSP_x according to:

- Transaction request type encoding (bits 15:0): see Table 18-[N1].
- Response type encoding (bits 16-37) of
  - — Supplier information: see Table [18-N2].
  - — Snoop response information: see Table [18-N3].
- All transactions are tracked at cacheline granularity except some in request type OTHER.

Table 21-48. MSR_OFFCORE_RSP_x Request_Type Definition (Processors Based on Ice Lake Microarchitecture)

Bit Name	Offset	Description
DEMAND_DATA_RD	0	Counts demand data and page table entry reads.
DEMAND_RFO	1	Counts demand read (RFO) and software prefetches (PREFETCHW) for exclusive ownership in anticipation of a write.
DEMAND_CODE_RD	2	Counts demand instruction fetches and instruction prefetches targeting the L1 instruction cache.
Reserved	3	Reserved

Table 21-48. MSR_OFFCORE_RSP_x Request_Type Definition (Processors Based on Ice Lake Microarchitecture)

Bit Name	Offset	Description
HWPF_L2_DATA_RD	4	Counts hardware generated data read prefetches targeting the L2 cache.
HWPF_L2_RFO	5	Counts hardware generated prefetches for exclusive ownership (RFO) targeting the L2 cache.
Reserved	6	Reserved
HWPF_L3	9:7 and 13[1]	Counts hardware generated prefetches of any type targeting the L3 cache.
HWPF_L1D_AND_SWPF	10	Counts hardware generated data read prefetches targeting the L1 data cache and the following software prefetches (PREFETCHNTA, PREFETCHT0/1/2).
STREAMING_WR	11	Counts streaming stores.
Reserved	12	Reserved
Reserved	14	Reserved
OTHER	15	Counts miscellaneous requests, such as I/O and un-cacheable accesses.

NOTES:

1. All bits need to be set to 1 to count this type.

Ice Lake microarchitecture has added a new category of Response subtype, called a Combined Response Info. To count a feature in this type, all the bits specified must be set to 1.

A valid response type must be a non-zero value of the following expression:

Any | ['OR' of Combined Response Info Bits | [('OR' of Supplier Info Bits) & ('OR' of Snoop Info Bits)]]

If "ANY" bit[16] is set, other response type bits [17-39] are ignored.

Table 21-49 lists the supplier information field that applies to processors based on Ice Lake microarchitecture.

Table 21-49. MSR_OFFCORE_RSP_x Supplier Info Field Definition (Processors Based on Ice Lake Microarchitecture)

Subtype	Bit Name	Offset	Description
Common	Any	16	Catch all value for any response types.
Combined Response Info	DRAM	26, 31, 32[1]	Requests that are satisfied by DRAM.
	NON_DRAM	26, 37[1]	Requests that are satisfied by a NON_DRAM system component. This includes MMIO transactions.
	L3_MISS	22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37[1]	Requests that were not supplied by the L3 Cache. The event includes some currently reserved bits in anticipation of future memory designs.
Supplier Info	L3_HIT	18,19, 20[1]	Requests that hit in L3 cache. Depending on the snoop response the L3 cache may have retrieved the cacheline from another core's cache.
Reserved		17, 21:25, 27:29	Reserved.

NOTES:

1. All bits need to be set to 1 to count this type.

Table 21-50 lists the snoop information field that applies to processors based on Ice Lake microarchitecture.

Table 21-50. MSR_OFFCORE_RSP_x Snoop Info Field Definition (Processors Based on Ice Lake Microarchitecture)

Subtype	Bit Name	Offset	Description
Snoop Info	Reserved	30	Reserved.
	SNOOP_NOT_NEEDED	32	No snoop was needed to satisfy the request.
	SNOOP_MISS	33	A snoop was sent and none of the snooped caches contained the cacheline.
	SNOOP_HIT_NO_FWD	34	A snoop was sent and hit in at least one snooped cache. The unmodified cacheline was not forwarded back, because the L3 already has a valid copy.
	Reserved	35	Reserved.
	SNOOP_HITM	36	A snoop was sent and the cacheline was found modified in another core's caches. The modified cacheline was forwarded to the requesting core.

21.3.9.3 Performance Metrics

The Ice Lake core PMU provides built-in support for Top-down Microarchitecture Analysis (TMA) method level 1 metrics. These metrics are always available to cross-validate performance observations, freeing general purpose counters to count other events in high counter utilization scenarios. For more details about the method, refer to Top-Down Analysis Method chapter (Appendix B.1) of the Intel® 64 and IA-32 Architectures Optimization Reference Manual.

A new MSR called MSR_PERF_METRICS reports the metrics directly. Software can check (and/or expose to its guests) the availability of the PERF_METRICS feature using IA32_PERF_CAPABILITIES.PERF_METRICS_AVAILABLE (bit 15). For additional details on this MSR, refer to Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4.

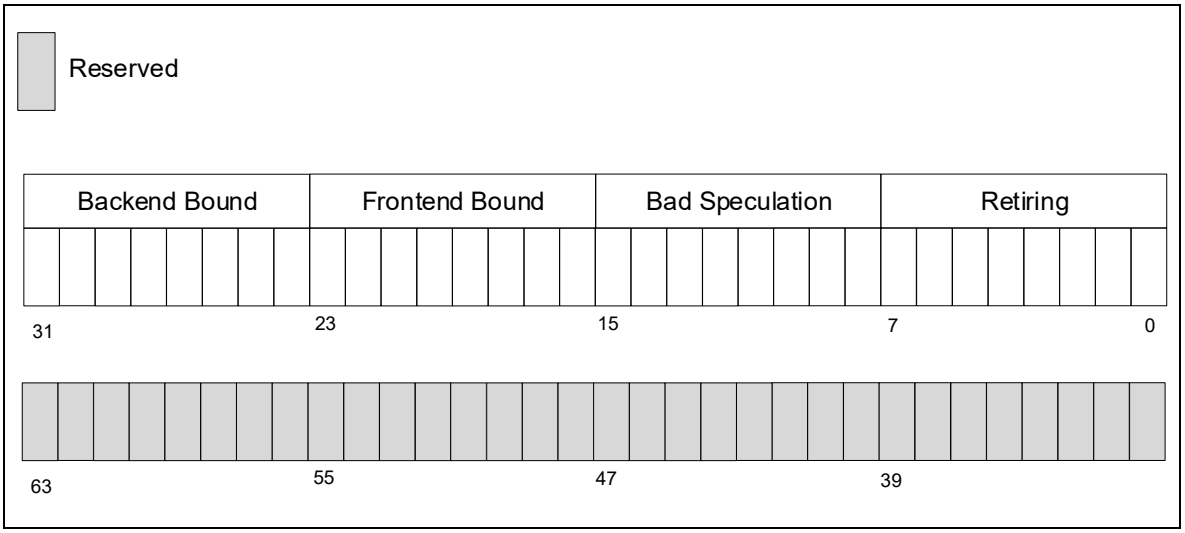

Figure 21-39. MSR_PERF_METRICS Definition

This register exposes the four TMA Level 1 metrics. The lower 32 bits are divided into four 8-bit fields, as shown by the above figure, each of which is an integer fraction of 255.

To support built-in performance metrics, new bits have been added to the following MSRs:

- IA32_PERF_GLOBAL_CTRL. EN_PERF_METRICS[48]: If this bit is set and fixed-function performance-monitoring counter 3 is enabled, built-in performance metrics are enabled.
- IA32_PERF_GLOBAL_STATUS_SET. SET_OVF_PERF_METRICS[48]: If this bit is set, it will set the status bit in the IA32_PERF_GLOBAL_STATUS register for PERF_METRICS.
- IA32_PERF_GLOBAL_STATUS_RESET. RESET_OVF_PERF_METRICS[48]: If this bit is set, it will clear the status bit in the IA32_PERF_GLOBAL_STATUS register for PERF_METRICS.
- IA32_PERF_GLOBAL_STATUS. OVF_PERF_METRICS[48]: If this bit is set, it indicates that a PERF_METRICS-related resource has overflowed and a PMI is triggered[1]. If this bit is clear, no such overflow has occurred.

NOTE

Software has to synchronize, e.g., re-start, fixed-function performance-monitoring counter 3 as well as PERF_METRICS when either bit 35 or 48 in IA32_PERF_GLOBAL_STATUS is set. Otherwise, PERF_METRICS may return undefined values.

The values in MSR_PERF_METRICS are derived from fixed-function performance-monitoring counter 3. Software should start both registers, PERF_METRICS and fixed-function performance-monitoring counter 3, from zero. Additionally, software is recommended to periodically clear both registers in order to maintain accurate measurements for certain scenarios that involve sampling metrics at high rates.

In order to save/restore PERF_METRICS, software should follow these guidelines:

- PERF_METRICS and fixed-function performance-monitoring counter 3 should be saved and restored together.
- To ensure that PERF_METRICS and fixed-function performance-monitoring counter 3 remain synchronized, both should be disabled during both save and restore. Software should enable/disable them atomically, with a single write to IA32_PERF_GLOBAL_CTRL to set/clear both EN_PERF_METRICS[bit 48] and EN_FIXED_CTR3[bit 35].
- On state restore, fixed-function performance-monitoring counter 3 must be restored **before** PERF_METRICS, otherwise undefined results may be observed.

21.3.10 12th and 13th Generation Intel® Core™ Processors, and 4th and 5th Generation Intel® Xeon® Scalable Processor Family Performance Monitoring Facility

The 12th generation Intel® Core™ processor supports Alder Lake performance hybrid architecture. These processors offer a unique combination of Performance and Efficient-cores (P-core and E-core). The P-core is based on Golden Cove microarchitecture and the E-core is based on Gracemont microarchitecture. The 13th generation Intel® Core™ processor supports Raptor Lake performance hybrid architecture, utilizing both Raptor Cove cores and enhanced Gracemont cores. The 4th generation Intel® Xeon® Scalable Processor Family is based on Sapphire Rapids microarchitecture utilizing Golden Cove cores. The 5th generation Intel® Xeon® Scalable Processor Family is based on Sapphire Rapids microarchitecture utilizing Raptor Cove cores. These processors all report architectural performance monitoring version ID = 5 and support non-architectural monitoring capabilities described in this section.

21.3.10.1 P-core Performance Monitoring Unit

The P-core PMU's capability is similar to those described in Section 21.3.1 through Section 21.3.9, with some differences and enhancements summarized in Table 21-51.

1. An overflow of fixed-function performance-monitoring counter 3 should normally happen first if software follows Intel's recommendations.

Table 21-51. Core PMU Summary of the Golden Cove Microarchitecture

Box	Golden Cove Microarchitecture	Ice Lake Microarchitecture	Comment
Architectural Perfmon version	5	5	See Section 21.2.5.
Event-Counter Restrictions	Simplified identification		Counters 4-7 support a subset of events. See Section 21.3.10.1.2.
Performance Metrics	Yes (12)	Yes (4)	See Section 21.3.9.3.
PEBS: Baseline, record format	Yes 0100b	Yes 0100b	See Section 21.3.9.
PEBS: EPT-friendly	Yes	No; debuts in Ice Lake server microarchitecture	See Section 21.6.2.4.2.
PEBS: Precise Distribution	IA32_FIXED0 instruction-granularity PDist on IA32_PMC0	IA32_FIXED0 cycle-granularity No PDist	See Section 21.9.6.
PEBS: Load Latency	Instruction latency Cache latency Access info fields (5)	Instruction latency Access info fields (3)	See Section 21.9.7.
PEBS: Store Latency	Cache latency Access info fields (3)	None	See Section 21.9.8.
PEBS: Intel TSX support	Abort info fields (9)	Abort info fields (8)	See Section 21.3.6.5.1. (Intel Xeon processor only feature.)

21.3.10.1.1 P-core Perf Metrics Extensions

For 12th generation Intel Core processor P-cores, the core PMU supports the built-in metrics that were introduced in the Ice Lake microarchitecture PMU. This core PMU extends the PERF_METRICS MSR to feature TMA method level 2 metrics, as shown in Figure 21-40.

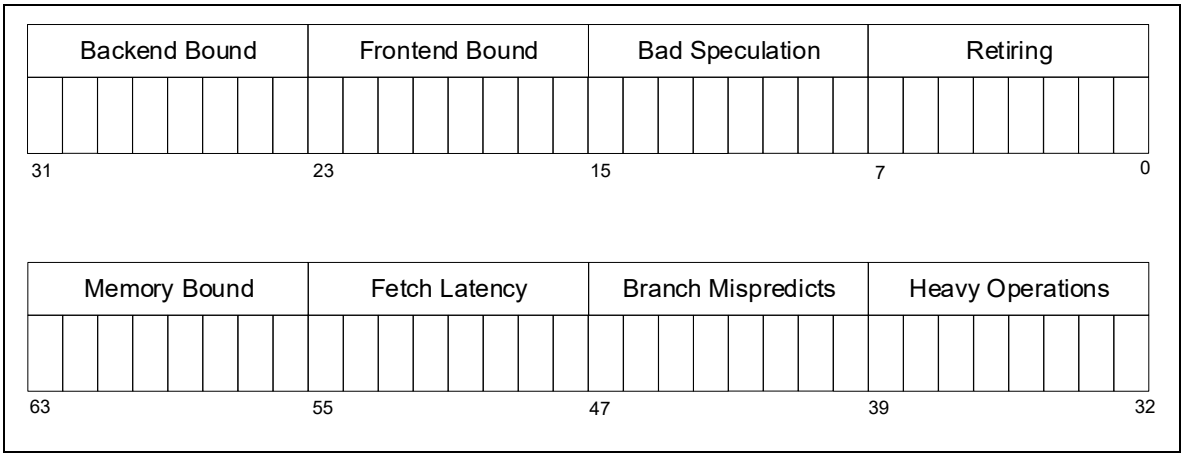

Figure 21-40. PERF_METRICS MSR Definition for 12th Generation Intel® Core™ Processor P-core

The lower half of the register is the TMA level 1 metrics (legacy). The upper half is also divided into four 8-bit fields, each of which is an integer fraction of 255. Additionally, each of the new level 2 metrics in the upper half is a subset of the corresponding level 1 metric in the lower half (that is, its parent node per the TMA hierarchy). This enables software to deduce the other four level 2 metrics by subtracting corresponding metrics as shown in Figure 21-41.

```
Light_Operations = Retiring - Heavy_Operations
Machine_Clears = Bad_Speculation - Branch_Mispredicts
Fetch_Bandwidth = Frontend_Bound - Fetch_Latency
Core_Bound = Backend_Bound - Memory_Bound
```

Figure 21-41. Deducing Implied Level 2 Metrics in the Core PMU for12th Generation Intel® Core™ Processor P-core

The PERF_METRICS MSR and fixed-function performance-monitoring counter 3 of the core PMU feature 12 metrics in total that cover all level 1 and level 2 nodes of the TMA hierarchy.

21.3.10.1.2 P-core Counter Restrictions Simplification

The 12th generation Intel Core processor P-core allows identification of performance monitoring events with counter restrictions based on event encodings. The general rule is: Event Codes < 0x90 are restricted to general-purpose performance-monitoring counters 0-3. Event Codes ≥ 0x90 are likely to have no restrictions. Table 21-52 lists the exceptions to this rule.

Table 21-52. Special Performance Monitoring Events with Counter Restrictions

Event Encoding[1]	Event Name	Counter Restriction
xx3C	CPU_CLK_UNHALTED.*	0-7 (No restriction for all architectural events.)
xx2E	LONGEST_LAT_CACHE.*	
xxDx	MEM_*_RETIRED.*	0-3
01A3, 02A3, 08A3	Some CYCLE_ACTIVITY sub-events	0-3
02CD	MEM_TRANS_RETIRED.STORE_SAMPLE	0
04A4	TOPDOWN.BAD_SPEC_SLOTS	0
08A4	TOPDOWN.BR_MISPREDICT_SLOTS	
xxCE	AMX_OPS_RETIRED	0

NOTES:

1. Linux perf rUUEE syntax, where UU is the Unit Mask field and EE is the Event Select (also known as Event Code) field in the IA32_PERFEVTSELx MSRs.

21.3.10.1.3 P-core Off-core Response Facility

For the 12th generation Intel Core processor P-core, the Off-core Response (OCR) Facility is similar to that described in Section 21.3.9.2.

The following enhancements are introduced for the Request_Type of MSR_OFFCORE_RSP_x:

- WB (bits 3 and 12): Count writeback (modified or non-modified) transactions by core caches.
- HWPF_L1D (bit 10): Counts hardware generated data read prefetches targeting the L1 data cache (only).
- SWPF_READ (bit 14): Counts software generated data read prefetches by the PREFETCHNTA and PREFETCHT0/1/2 instructions.

21.3.10.2 E-core Performance Monitoring Unit

The core PMU capabilities on the 12th generation Intel Core processor E-core are summarized in Table 21-53 below.

Table 21-53. Core PMU Summary of the Gracemont Microarchitecture

Box	Gracemont Microarchitecture	Tremont Microarchitecture	Comment
Number of fixed-function performance-monitoring counters per core	3	3	Use CPUID to enumerate number of counters. See Section 21.2.1.
Number of general-purpose counters per core	6	4	Use CPUID to enumerate number of counters. See Section 21.2.1.
Architectural Performance Monitoring version ID	5	5	See Section 21.2.5.
PEBS record format encoding	0100b	0100b	See Section 21.5.5.
EPT-friendly PEBS support	Yes	No	See Section 21.9.5.
Extended PEBS	Yes	Yes	See Section 21.9.1.
Adaptive PEBS	Yes	Yes	See Section 21.9.2.
Precise distribution (PDist) PEBS	IA32_PMC0 and IA32_FIXED_CTR0	IA32_PMC0 and IA32_FIXED_CTR0	PDist eliminates skid, see Section 21.9.3, Section 21.9.4, and Section 21.9.6.
PEBS Latency	Load and Store Latency	No	See Section 21.3.10.2.1, Section 21.3.10.2.2, Section 21.9.7, and Section 21.9.8.
PEBS Output	DS Save Area or Intel® Processor Trace	DS Save Area or Intel® Processor Trace	See Section 21.5.5.2.1.
Offcore Response	MSR 01A6H and 01A7H, each core has its own register, extended request and response types.	MSR 1A6H and 1A7H, each core has its own register, extended request and response types.	See Section 21.5.5.4.

21.3.10.2.1 E-core PEBS Load Latency

The 12th generation Intel Core processor E-core includes PEBS Load Latency support similar to that described in Section 21.9.7.

When a programmable counter is configured to count MEM_UOPS_RETIRED.LOAD_LATENCY_ABOVE_THRESHOLD (IA32_PERFEVTSELx[15:0] = 0xD005, with CMASK=0 and INV=0), selected load operations whose latency exceeds the threshold provided in MSR_PEBS_LD_LAT_THRESHOLD (MSR 03F6H) will be counted. If a PEBS record is generated on overflow of this counter, the Memory Access Latency and Memory Auxiliary Info data is reported in the Memory Access Info group (Section 21.9.2.2.2). The formats of these fields are shown in Table 21-54 and Table 21-98.

Table 21-54. E-core PEBS Memory Access Info Encoding

Bit(s)	Field	Description
3:0	Data Source	The source of the data; see Table 21-55.
4	Lock	0: The operation was not part of a locked transaction. 1: The operation was part of a locked transaction.
5	STLB_MISS	0: The load did not miss the STLB (hit the DTLB or STLB). 1: The load missed the STLB.

Table 21-54. E-core PEBS Memory Access Info Encoding (Contd.)

Bit(s)	Field	Description
6	ST_FWD_BLK	0: Load did not get a store forward block. 1: Load got a store forward block.
63:7	Reserved	Reserved

For details on E-core PEBS memory access latency encoding, see the Access Latency Field in Table 21-98.

Table 21-55. E-core PEBS Data Source Encodings

Encoding	Description
00H	Unknown Data Source (the processor could not retrieve the origin of this request) and MMIO. Memory mapped I/O hit.
01H	L1 HIT. This request was satisfied by the L1 data cache. (Minimal latency core cache hit.)
02H	FB HIT. Outstanding core cache miss to same cache-line address was already underway. (Pending core cache hit.)
03H	L2 HIT. This request was satisfied by the L2 cache.
04H	L3 HIT. Local or Remote home requests that hit L3 cache in the uncore with no coherency actions required (snooping).
05H	L3 HITE. Local or Remote home requests that hit the L3 cache and were serviced by another processor core with a cross core snoop where no modified copies were found (clean).
06H	L3 HITM. Local or Remote home requests that hit the L3 cache and were serviced by another processor core with a cross core snoop where a modified copy was found.
07H	Reserved.
08H	L3 HITF. Local or Remote home requests that hit the L3 cache and were serviced by another processor core with a cross core snoop where a shared or forwarding copy was found.
09H	Reserved.
0AH	L3 MISS. Local home requests that missed the L3 cache and were serviced by local DRAM (go to shared state).
0BH	Reserved.
0CH	Reserved.
0DH	Reserved.
0EH	I/O. Request of input/output operation.
0FH	The request was to uncacheable memory.

21.3.10.2.2 E-core PEBS Store Latency

The 12th generation Intel Core processor E-core includes PEBS Store Latency support. When a programmable counter is configured to count MEM_UOPS_RETIRED.STORE_LATENCY (IA32_PERFEVTSELx[15:0] = 0xD006, with CMASK=0 and INV=0), all store operations will be counted. If a PEBS record is generated on overflow of this counter, the Memory Access Latency and Memory Auxiliary Info data is reported in the Memory Access Info group (Section 18.9.2.2.2). The formats of these fields are shown in Table 21-54 and Table 21-98.

21.3.10.2.3 E-core Precise Distribution (PDist) Support

The 12th generation Intel Core processor E-core supports PEBS with Precise Distribution (PDist) on IA32_PMC0 and IA32_FIXED_CTR0. All precise events support PDist save for UOPS_RETIRED. See Section 21.9.6 for additional details on PDist.

21.3.10.2.4 E-core Enhanced Off-core Response

Event number 0B7H support off-core response monitoring using an associated configuration MSR, MSR_OFF-CORE_RSP0 (address 1A6H) in conjunction with UMASK value 01H or MSR_OFFCORE_RSP1 (address 1A7H) in

conjunction with UMASK value 02H. There are unique pairs of MSR_OFFCORE_RSPx registers per core. The layout of MSR_OFFCORE_RSP0 and MSR_OFFCORE_RSP1 are organized as follows:

- Bits 15:0 and bits 49:44 specify the request type of a transaction request to the uncore. This is described in Table 21-56.
- Bits 30:16 specify Response Type information or an L2 Hit, and is described in Table 21-79.
- If L2 misses, then bits 37:31 can be used to specify snoop response information and is described in Table 21-80.
- For outstanding requests, bit 38 can enable measurement of average latency of specific type of offcore transaction requests using two programmable counter simultaneously; see Section 21.5.2.3 for details.

Table 21-56. MSR_OFFCORE_RSPx Request Type Definition

Bit Name	Offset	Description
DEMAND_DATA_RD	0	Counts demand data reads.
DEMAND_RFO	1	Counts all demand reads for ownership (RFO) requests and software based prefteches for exclusive ownership (prefetchw).
DEMAND_CODE_RD	2	Counts demand instruction fetches and L1 instruction cache prefetches.
COREWB_M	3	Counts modified write backs from L1 and L2.
HWPF_L2_DATA_RD	4	Counts prefetch (that bring data to L2) data reads.
HWPF_L2_RFO	5	Counts all prefetch (that bring data to L2) RFOs.
HWPF_L2_CODE_RD	6	Counts all prefetch (that bring data to MLC only) code reads.
HWPF_L3_DATA_RD	7	Counts L3 cache hardware prefetch data reads (written to the L3 cache only).
HWPF_L3_RFO	8	Counts L3 cache hardware prefetch RFOs (written to the L3 cache only) .
HWPF_L3_CODE_RD	9	Counts L3 cache hardware prefetch code reads (written to the L3 cache only).
HWPF_L1D_AND_SWPF	10	Counts L1 data cache hardware prefetch requests, read for ownership prefetch requests and software prefetch requests (except prefetchw).
STREAMING_WR	11	Counts all streaming stores.
COREWB_NONM	12	Counts non-modified write backs from L2.
RSVD	14:13	Reserved.
OTHER	15	Counts miscellaneous requests, such as I/O accesses that have any response type.
UC_RD	44	Counts uncached memory reads (PRd, UCRdF).
UC_WR	45	Counts uncached memory writes (WiL).
PARTIAL_STREAMING_WR	46	Counts partial (less than 64 byte) streaming stores (WCiL).
FULL_STREAMING_WR	47	Counts full, 64 byte streaming stores (WCiLF).
L1WB_M	48	Counts modified WriteBacks from L1 that miss the L2.
L2WB_M	49	Counts modified WriteBacks from L2.

21.3.10.3 Unhalted Reference Cycles

The Unhalted Reference Cycles architectural performance monitoring event is enhanced to count at TSC-rate in the 12th generation Intel Core processor P-core when used on a general-purpose PMC. This enhancement makes it consistent with the fixed-function counter 2 and the E-core. As a result, this event is kept enumerated in CPUID leaf 0AH.EBX (unlike prior hybrid parts).

21.3.11 Intel® Series 2 Core™ Ultra Processor Performance Monitoring Facility

The Intel® Series 2 Core™ Ultra processor supports Lunar Lake performance hybrid architecture. This processor offers a combination of Performance and Efficient-cores (P-core and E-core). The P-core is based on Lion Cove microarchitecture and the E-core is based on Skymont microarchitecture. This processor reports architectural performance monitoring version ID = 6 and supports non-architectural monitoring capabilities described in this section.

Architectural performance monitoring version 6 capabilities are described in Section 21.2.6.

21.3.11.1 P-core Performance Monitoring Unit

The core PMU capabilities on the Intel Series 2 Core Ultra processor P-core are similar to those described in Section 21.3.1 through Section 21.3.10, with some differences and enhancements summarized in Table 21-57.

Table 21-57. Core PMU Summary of the Lion Cove Microarchitecture

Box	Lion Cove Microarchitecture	Golden Cove and Redwood Cove Microarchitectures	Comment
Architectural Performance Monitoring version ID	6	5	See Section 21.2.6.
Number of general-purpose counters per core	10	8	Use CPUID to enumerate number of counters. See Section 21.2.1 and Section 21.2.9.
Number of architectural performance-monitoring events	12	8 (Golden Cove) 11 (Redwood Cove)	See Section 21.2.7.
Event-Counter Restrictions	Mostly homogeneous general counters.	Simplified identification of events supported on counters 4-7.	Few counter restrictions may apply; see Section 21.3.1.1.1.
Performance Metrics	12 metrics Metrics clear mode or read-only.	12 metrics Read-only.	See the RDPMC instruction in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B.
PEBS: Baseline	Yes	Yes	See Section 21.8.
PEBS record format encoding	0110b	0101b	See Section 21.9.2.2.
PEBS: Precise Distribution	IA32_FIXED0 instruction-granularity. PDist on IA32_PMC0 and IA32_PMC1.	IA32_FIXED0 instruction-granularity. PDist on IA32_PMC0.	See Section 21.9.6.
PEBS: Data Source field	5-bits	4-bits	See Section 21.9.7.
LBR: Event Logging	Yes	No	See Section 20.1.3.6.
Intel PT: TNT Disable	Yes	No	See Chapter 34 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C.

21.3.11.1.1 P-core Homogeneous General Counters

The Lion Cove PMU enhances general-counters to support most of the performance monitoring events. The remaining events that do have counter restrictions are summarized in next Table 21-58.

Table 21-58. Performance Monitoring Events with Counter Restrictions in Lion Cove PMU

Event Encoding[1]	Event Name	Counter Restriction
xx20	OFFCORE_REQUESTS_OUTSTANDING.*	0-3
0148	L1D_PENDING.*	2
0175	INST_DECODED.DECODERS	2
08A3, 0CA3	CYCLE_ACTIVITY.*_L1D_MISS	2
04A4, 08A4, 10A4	TOPDOWN.BAD_SPEC_SLOTS, TOPDOWN.BR_MISPREDICT_SLOTS, TOPDOWN.MEMORY_BOUND_SLOTS	0
01B1	UOPS_EXECUTED.*	3
xxDx	MEM_INST_RETIRED.*, MEM_LOAD*_RETIRED.*	0-3
02CD	MEM_TRANS_RETIRED.STORE_SAMPLE	0-1

NOTES:

1. Linux perf rUUEE syntax, where UU is the Unit Mask field and EE is the Event Select (also known as Event Code) field in the IA32_PERFEVTSELx MSRs.

21.3.11.2 E-core Performance Monitoring Unit

Skymont microarchitecture performance monitoring capabilities are similar to Crestmont microarchitecture capabilities, with the following extensions:

- Support for fixed counters 4, 5, and 6 (see Section 21.2.9.4)
- Architecturally defined events: TMA L1 and LBR Inserts (see Section 21.2.9.6 and Section 20.1.3.6)
- PEBS Counter Snapshotting (see Section 21.9.10)
- Auto Counter Reload (see Section 21.9.11)

The core PMU capabilities on the Intel Series 2 Core Ultra processor E-core are summarized in Table 21-59.

Table 21-59. Core PMU Summary of the Skymont Microarchitecture

Box	Skymont Microarchitecture	Crestmont Microarchitecture	Comment
Architectural Performance Monitoring version ID	6	5	See Section 21.2.6.
Number of fixed-function performance-monitoring counters per core	6 (0, 1, 2, 4, 5, 6)	3 (0, 1, 2)	Use CPUID to enumerate number of counters. See Section 21.2.1 and Section 21.2.9.4.
Number of general-purpose counters per core	8	8	Use CPUID to enumerate number of counters. See Section 21.2.1.
PEBS record format encoding	0110b	0101b	See Section 21.3.10.
Auto Counter Reload (ACR)	Yes	No	See Section 21.9.11.

21.4 PERFORMANCE MONITORING (INTEL® XEON™ PHI PROCESSORS)

NOTE

This section also applies to the Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series based on Knights Mill microarchitecture.

21.4.1 Intel® Xeon Phi™ Processor 7200/5200/3200 Performance Monitoring

The Intel® Xeon Phi™ processor 7200/5200/3200 series are based on the Knights Landing microarchitecture. The performance monitoring capabilities are distributed between its tiles (pair of processor cores) and untile (connecting many tiles in a physical processor package). Functional details of the tiles and untile of the Knights Landing microarchitecture can be found in Chapter 16 of Intel® 64 and IA-32 Architectures Optimization Reference Manual.

A complete description of the tile and untile PMU programming interfaces for Intel Xeon Phi processors based on the Knights Landing microarchitecture can be found in the Technical Document section at http://www.intel.com/content/www/us/en/processors/xeon/xeon-phi-detail.html.

A tile contains a pair of cores attached to a shared L2 cache and is similar to those found in Intel Atom® processors based on the Silvermont microarchitecture. The processor provides several new capabilities on top of the Silvermont performance monitoring facilities.

The processor supports architectural performance monitoring capability with version ID 3 (see Section 21.2.3) and a host of non-architectural performance monitoring capabilities. The processor provides two general-purpose performance counters (IA32_PMC0, IA32_PMC1) and three fixed-function performance counters (IA32_FIXED_CTR0, IA32_FIXED_CTR1, IA32_FIXED_CTR2).

Non-architectural performance monitoring in the processor also uses the IA32_PERFEVTSELx MSR to configure a set of non-architecture performance monitoring events to be counted by the corresponding general-purpose performance counter.

The bit fields within each IA32_PERFEVTSELx MSR are defined in Figure 21-6 and described in Section and Section 21.2.3. The processor supports AnyThread counting in three architectural performance monitoring events.

21.4.1.1 Enhancements of Performance Monitoring in the Intel® Xeon Phi™ Processor Tile

The Intel® Xeon Phi™ processor tile includes the following enhancements to the Silvermont microarchitecture.

- AnyThread support. This facility is limited to following three architectural events: Instructions Retired, Unhalted Core Cycles, Unhalted Reference Cycles using IA32_FIXED_CTR0-2 and Unhalted Core Cycles, Unhalted Reference Cycles using IA32_PERFEVTSELx.
- PEBS-DLA (Processor Event-Based Sampling-Data Linear Address) fields. The processor provides memory address in addition to the Silvermont PEBS record support on select events. The PEBS recording format as reported by IA32_PERF_CAPABILITIES [11:8] is 2.
- Off-core response counting facility. This facility in the processor core allows software to count certain transaction responses between the processor tile to subsystems outside the tile (untile). Counting off-core response requires additional event qualification configuration facility in conjunction with IA32_PERFEVTSELx. Two off-core response MSRs are provided to use in conjunction with specific event codes that must be specified with IA32_PERFEVTSELx. Two cores do not share the off-core response MSRs. Knights Landing expands off-core response capability to match the processor untile changes.
- Average request latency measurement. The off-core response counting facility can be combined to use two performance counters to count the occurrences and weighted cycles of transaction requests. This facility is updated to match the processor untile changes.

21.4.1.1.1 Processor Event-Based Sampling

The processor supports processor event based sampling (PEBS). PEBS is supported using IA32_PMC0 (see also Section 19.4.9, “BTS and DS Save Area”).

PEBS uses a debug store mechanism to store a set of architectural state information for the processor. The information provides architectural state of the instruction executed after the instruction that caused the event (See Section 21.6.2.4).

The list of PEBS events supported in the processor is shown in the following table.

Table 21-60. PEBS Performance Events for Knights Landing Microarchitecture

Event Name	Event Select	Sub-event	UMask	Data Linear Address Support
BR_INST_RETIRED	C4H	ALL_BRANCHES	00H	No
		JCC	7EH	No
		TAKEN_JCC	FEH	No
		CALL	F9H	No
		REL_CALL	FDH	No
		IND_CALL	FBH	No
		NON_RETURN_IND	EBH	No
		FAR_BRANCH	BFH	No
		RETURN	F7H	No
BR_MISP_RETIRED	C5H	ALL_BRANCHES	00H	No
		JCC	7EH	No
		TAKEN_JCC	FEH	No
		IND_CALL	FBH	No
		NON_RETURN_IND	EBH	No
		RETURN	F7H	No
MEM_UOPS_RETIRED	04H	L2_HIT_LOADS	02H	Yes
		L2_MISS_LOADS	04H	Yes
		DLTB_MISS_LOADS	08H	Yes
RECYCLEQ	03H	LD_BLOCK_ST_FORWARD	01H	Yes
		LD_SPLITS	08H	Yes

The PEBS record format 2 supported by processors based on the Knights Landing microarchitecture is shown in Table 21-61, and each field in the PEBS record is 64 bits long.

Table 21-61. PEBS Record Format for Knights Landing Microarchitecture

Byte Offset	Field	Byte Offset	Field
00H	R/EFLAGS	60H	R10
08H	R/EIP	68H	R11
10H	R/EAX	70H	R12
18H	R/EBX	78H	R13
20H	R/ECX	80H	R14
28H	R/EDX	88H	R15
30H	R/ESI	90H	IA32_PERF_GLOBAL_STATUS
38H	R/EDI	98H	PSDLA
40H	R/EBP	A0H	Reserved
48H	R/ESP	A8H	Reserved
50H	R8	B0H	EventingRIP
58H	R9	B8H	Reserved

21.4.1.1.2 Offcore Response Event

Event number 0B7H support offcore response monitoring using an associated configuration MSR, MSR_OFF-CORE_RSP0 (address 1A6H) in conjunction with UMASK value 01H or MSR_OFFCORE_RSP1 (address 1A7H) in conjunction with UMASK value 02H. Table 21-62 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32_PMCx.

Table 21-62. OffCore Response Event Encoding

Counter	Event code	UMask	Required Off-core Response MSR
PMC0-1	B7H	01H	MSR_OFFCORE_RSP0 (address 1A6H)
PMC0-1	B7H	02H	MSR_OFFCORE_RSP1 (address 1A7H)

Some of the MSR_OFFCORE_RESP [0,1] register bits are not valid in this processor and their use is reserved. The layout of MSR_OFFCORE_RSP0 and MSR_OFFCORE_RSP1 registers are defined in Table 21-63. Bits 15:0 specifies the request type of a transaction request to the uncore. Bits 30:16 specifies supplier information, bits 37:31 specifies snoop response information.

Additionally, MSR_OFFCORE_RSP0 provides bit 38 to enable measurement of average latency of specific type of offcore transaction requests using two programmable counter simultaneously, see Section 21.5.2.3 for details.

Table 21-63. Bit fields of the MSR_OFFCORE_RESP [0, 1] Registers

Main	Sub-field	Bit	Name	Description
Request Type		0	DEMAND_DATA_RD	Demand cacheable data and L1 prefetch data reads.
		1	DEMAND_RFO	Demand cacheable data writes.
		2	DEMAND_CODE_RD	Demand code reads and prefetch code reads.
		3	Reserved	Reserved.
		4	Reserved	Reserved.
		5	PF_L2_RFO	L2 data RFO prefetches (includes PREFETCHW instruction).
		6	PF_L2_CODE_RD	L2 code HW prefetches.
		7	PARTIAL_READS	Partial reads (UC or WC).
		8	PARTIAL_WRITES	Partial writes (UC or WT or WP). Valid only for OFFCORE_RESP_1 event. Should only be used on PMC1. This bit is reserved for OFFCORE_RESP_0 event.
		9	UC_CODE_READS	UC code reads.
		10	BUS_LOCKS	Bus locks and split lock requests.
		11	FULL_STREAMING_STORES	Full streaming stores (WC). Valid only for OFFCORE_RESP_1 event. Should only be used on PMC1. This bit is reserved for OFFCORE_RESP_0 event.
		12	SW_PREFETCH	Software prefetches.
		13	PF_L1_DATA_RD	L1 data HW prefetches.
		14	PARTIAL_STREAMING_STORES	Partial streaming stores (WC). Valid only for OFFCORE_RESP_1 event. Should only be used on PMC1. This bit is reserved for OFFCORE_RESP_0 event.
		15	ANY_REQUEST	Account for any requests.
Response Type	Any	16	ANY_RESPONSE	Account for any response.
	Data Supply from Untile	17	NO_SUPP	No Supplier Details.
		18	Reserved	Reserved.

Table 21-63. Bit fields of the MSR_OFFCORE_RESP [0, 1] Registers (Contd.)

Main	Sub-field	Bit	Name	Description
		19	L2_HIT_OTHER_TILE_NEAR	Other tile L2 hit E Near.
		20	Reserved	Reserved.
		21	MCDRAM_NEAR	MCDRAM Local.
		22	MCDRAM_FAR_OR_L2_HIT_OTHER_TILE_FAR	MCDRAM Far or Other tile L2 hit far.
		23	DRAM_NEAR	DRAM Local.
		24	DRAM_FAR	DRAM Far.
	Data Supply from within same tile	25	L2_HITM_THIS_TILE	M-state.
		26	L2_HITE_THIS_TILE	E-state.
		27	L2_HITS_THIS_TILE	S-state.
		28	L2_HITF_THIS_TILE	F-state.
		29	Reserved	Reserved.
		30	Reserved	Reserved.
	Snoop Info; Only Valid in case of Data Supply from Untile	31	SNOOP_NONE	None of the cores were snooped.
		32	NO_SNOOP_NEEDED	No snoop was needed to satisfy the request.
		33	Reserved	Reserved.
		34	Reserved	Reserved.
		35	HIT_OTHER_TILE_FWD	Snoop request hit in the other tile with data forwarded.
		36	HITM_OTHER_TILE	A snoop was needed and it HitM-ed in other core's L1 cache. HitM denotes a cache-line was in modified state before effect as a result of snoop.
		37	NON_DRAM	Target was non-DRAM system address. This includes MMIO transactions.
Outstanding requests	Weighted cycles	38	OUTSTANDING (Valid only for MSR_OFFCORE_RESP0. Should only be used on PMC0. This bit is reserved for MSR_OFFCORE_RESP1).	If set, counts total number of weighted cycles of any outstanding offcore requests with data response. Valid only for OFFCORE_RESP_0 event. Should only be used on PMC0. This bit is reserved for OFFCORE_RESP_1 event.

21.4.1.1.3 Average Offcore Request Latency Measurement

Measurement of average latency of offcore transaction requests can be enabled using MSR_OFFCORE_RSP0.[bit 38] with the choice of request type specified in MSR_OFFCORE_RSP0.[bit 15:0].

Refer to Section 21.5.2.3, "Average Offcore Request Latency Measurement," for typical usage. Note that MSR_OFFCORE_RESPx registers are not shared between cores in Knights Landing. This allows one core to measure average latency while other core is measuring different offcore response events.

21.5 PERFORMANCE MONITORING (INTEL ATOM® PROCESSORS)

21.5.1 Performance Monitoring (45 nm and 32 nm Intel Atom® Processors)

45 nm and 32 nm Intel Atom processors report architectural performance monitoring versionID = 3 (supporting the aggregate capabilities of versionID 1, 2, and 3; see Section 21.2.3) and a host of non-architectural monitoring capabilities. These 45 nm and 32 nm Intel Atom processors provide two general-purpose performance counters (IA32_PMC0, IA32_PMC1) and three fixed-function performance counters (IA32_FIXED_CTR0, IA32_-FIXED_CTR1, IA32_FIXED_CTR2).

NOTE

The number of counters available to software may vary from the number of physical counters present on the hardware, because an agent running at a higher privilege level (e.g., a VMM) may not expose all counters. CPUID.0AH:EAX[15:8] reports the MSRs available to software; see Section 21.2.1.

Non-architectural performance monitoring in Intel Atom processor family uses the IA32_PERFEVTSELx MSR to configure a set of non-architecture performance monitoring events to be counted by the corresponding general-purpose performance counter. The list of non-architectural performance monitoring events can be found at: https://perfmon-events.intel.com/.

Architectural and non-architectural performance monitoring events in 45 nm and 32 nm Intel Atom processors support thread qualification using bit 21 (AnyThread) of IA32_PERFEVTSELx MSR, i.e., if IA32_PERFEVT-SELx.AnyThread =1, event counts include monitored conditions due to either logical processors in the same processor core.

The bit fields within each IA32_PERFEVTSELx MSR are defined in Figure 21-6 and described in Section and Section 21.2.3.

Valid event mask (Umask) bits can be found at: https://perfmon-events.intel.com/. The UMASK field may contain sub-fields that provide the same qualifying actions like those listed in Table 21-81, Table 21-82, Table 21-83, and Table 21-84. One or more of these sub-fields may apply to specific events on an event-by-event basis. Precise Event Based Monitoring is supported using IA32_PMC0 (see also Section 19.4.9, "BTS and DS Save Area").

21.5.2 Performance Monitoring for Silvermont Microarchitecture

Intel processors based on the Silvermont microarchitecture report architectural performance monitoring versionID = 3 (see Section 21.2.3) and a host of non-architectural monitoring capabilities. Intel processors based on the Silvermont microarchitecture provide two general-purpose performance counters (IA32_PMC0, IA32_PMC1) and three fixed-function performance counters (IA32_FIXED_CTR0, IA32_FIXED_CTR1, IA32_FIXED_CTR2). Intel Atom processors based on the Airmont microarchitecture support the same performance monitoring capabilities as those based on the Silvermont microarchitecture.

Non-architectural performance monitoring in the Silvermont microarchitecture uses the IA32_PERFEVTSELx MSR to configure a set of non-architecture performance monitoring events to be counted by the corresponding general-purpose performance counter. The list of non-architectural performance monitoring events can be found at: https://perfmon-events.intel.com/.

The bit fields (except bit 21) within each IA32_PERFEVTSELx MSR are defined in Figure 21-6 and described in Section and Section 21.2.3. Architectural and non-architectural performance monitoring events in the Silvermont microarchitecture ignore the AnyThread qualification regardless of its setting in IA32_PERFEVTSELx MSR.

21.5.2.1 Enhancements of Performance Monitoring in the Processor Core

The notable enhancements in the monitoring of performance events in the processor core include:

- The width of counter reported by CPUID.0AH:EAX[23:16] is 40 bits.

- Off-core response counting facility. This facility in the processor core allows software to count certain transaction responses between the processor core to sub-systems outside the processor core (uncore). Counting off-core response requires additional event qualification configuration facility in conjunction with IA32_PERFEVTSELx. Two off-core response MSRs are provided to use in conjunction with specific event codes that must be specified with IA32_PERFEVTSELx.
- Average request latency measurement. The off-core response counting facility can be combined to use two performance counters to count the occurrences and weighted cycles of transaction requests.

21.5.2.1.1 Processor Event Based Sampling (PEBS)

In the Silvermont microarchitecture, the PEBS facility can be used with precise events. PEBS is supported using IA32_PMC0 (see also Section 19.4.9).

PEBS uses a debug store mechanism to store a set of architectural state information for the processor. The information provides architectural state of the instruction executed after the instruction that caused the event (See Section 21.6.2.4).

The list of precise events supported in the Silvermont microarchitecture is shown in Table 21-64.

Table 21-64. PEBS Performance Events for the Silvermont Microarchitecture

Event Name	Event Select	Sub-event	UMask
BR_INST_RETIRED	C4H	ALL_BRANCHES	00H
		JCC	7EH
		TAKEN_JCC	FEH
		CALL	F9H
		REL_CALL	FDH
		IND_CALL	FBH
		NON_RETURN_IND	EBH
		FAR_BRANCH	BFH
		RETURN	F7H
BR_MISP_RETIRED	C5H	ALL_BRANCHES	00H
		JCC	7EH
		TAKEN_JCC	FEH
		IND_CALL	FBH
		NON_RETURN_IND	EBH
		RETURN	F7H
MEM_UOPS_RETIRED	04H	L2_HIT_LOADS	02H
		L2_MISS_LOADS	04H
		DLTB_MISS_LOADS	08H
		HITM	20H
REHABQ	03H	LD_BLOCK_ST_FORWARD	01H
		LD_SPLITS	08H

PEBS Record Format The PEBS record format supported by processors based on the Intel Silvermont microarchitecture is shown in Table 21-65, and each field in the PEBS record is 64 bits long.

Table 21-65. PEBS Record Format for the Silvermont Microarchitecture

Byte Offset	Field	Byte Offset	Field
00H	R/EFLAGS	60H	R10
08H	R/EIP	68H	R11
10H	R/EAX	70H	R12
18H	R/EBX	78H	R13
20H	R/ECX	80H	R14
28H	R/EDX	88H	R15
30H	R/ESI	90H	IA32_PERF_GLOBAL_STATUS
38H	R/EDI	98H	Reserved
40H	R/EBP	A0H	Reserved
48H	R/ESP	A8H	Reserved
50H	R8	B0H	EventingRIP
58H	R9	B8H	Reserved

21.5.2.2 Offcore Response Event

Event number 0B7H support offcore response monitoring using an associated configuration MSR, MSR_OFF-CORE_RSP0 (address 1A6H) in conjunction with UMASK value 01H or MSR_OFFCORE_RSP1 (address 1A7H) in conjunction with UMASK value 02H. Table 21-66 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32_PMCx.

In the Silvermont microarchitecture, each MSR_OFFCORE_RSPx is shared by two processor cores.

Table 21-66. OffCore Response Event Encoding

Counter	Event code	UMask	Required Off-core Response MSR
PMC0-1	B7H	01H	MSR_OFFCORE_RSP0 (address 1A6H)
PMC0-1	B7H	02H	MSR_OFFCORE_RSP1 (address 1A7H)

The layout of MSR_OFFCORE_RSP0 and MSR_OFFCORE_RSP1 are shown in Figure 21-42 and Figure 21-43. Bits 15:0 specifies the request type of a transaction request to the uncore. Bits 30:16 specifies supplier information, bits 37:31 specifies snoop response information.

Additionally, MSR_OFFCORE_RSP0 provides bit 38 to enable measurement of average latency of specific type of offcore transaction requests using two programmable counter simultaneously, see Section 21.5.2.3 for details.

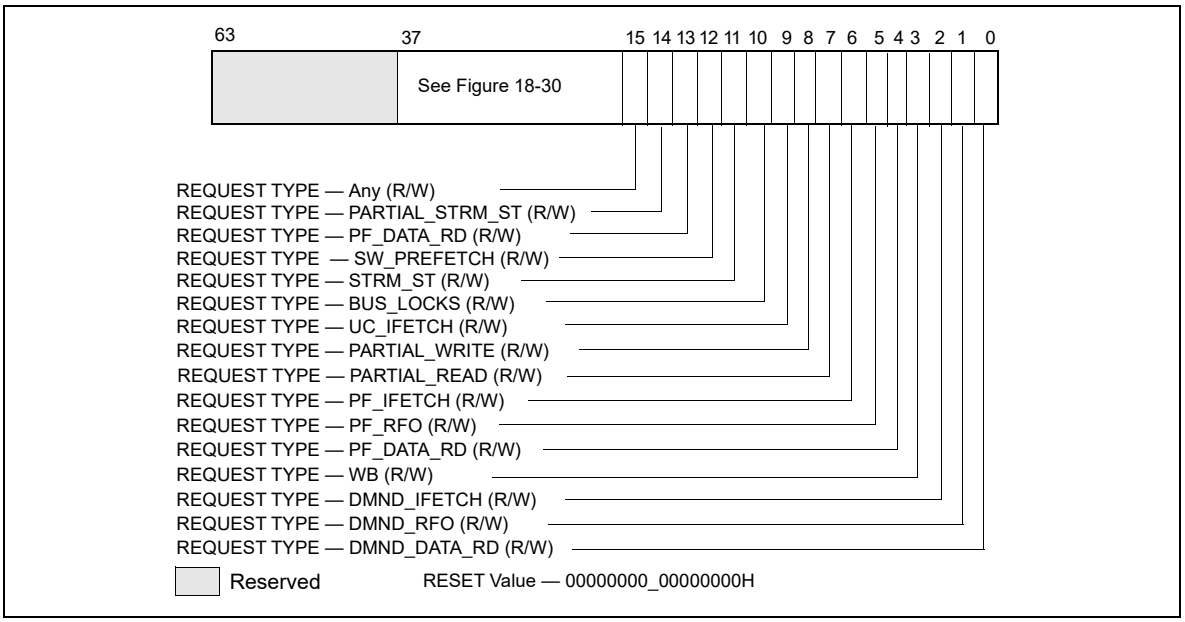

Figure 21-42. Request_Type Fields for MSR_OFFCORE_RSPx

Table 21-67. MSR_OFFCORE_RSPx Request_Type Field Definition

Bit Name	Offset	Description
DMND_DATA_RD	0	Counts the number of demand and DCU prefetch data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count L2 data read prefetches or instruction fetches.
DMND_RFO	1	Counts the number of demand and DCU prefetch reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.
DMND_IFETCH	2	Counts the number of demand instruction cacheline reads and L1 instruction cacheline prefetches.
WB	3	Counts the number of writeback (modified to exclusive) transactions.
PF_DATA_RD	4	Counts the number of data cacheline reads generated by L2 prefetchers.
PF_RFO	5	Counts the number of RFO requests generated by L2 prefetchers.
PF_IFETCH	6	Counts the number of code reads generated by L2 prefetchers.
PARTIAL_READ	7	Counts the number of demand reads of partial cache lines (including UC and WC).
PARTIAL_WRITE	8	Counts the number of demand RFO requests to write to partial cache lines (includes UC, WT, and WP).
UC_IFETCH	9	Counts the number of UC instruction fetches.
BUS_LOCKS	10	Bus lock and split lock requests.
STRM_ST	11	Streaming store requests.
SW_PREFETCH	12	Counts software prefetch requests.
PF_DATA_RD	13	Counts DCU hardware prefetcher data read requests.
PARTIAL_STRM_ST	14	Streaming store requests.
ANY	15	Any request that crosses IDI, including I/O.

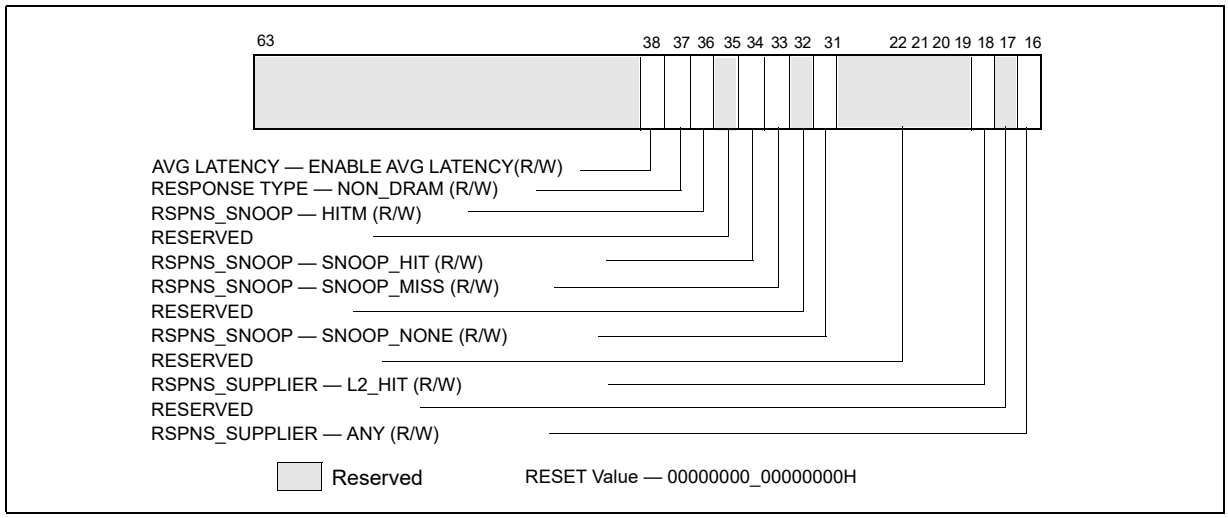

Figure 21-43. Response_Supplier and Snoop Info Fields for MSR_OFFCORE_RSPx

To properly program this extra register, software must set at least one request type bit (Table 21-67) and a valid response type pattern (Table 21-68, Table 21-69). Otherwise, the event count reported will be zero. It is permissible and useful to set multiple request and response type bits in order to obtain various classes of off-core response events. Although MSR_OFFCORE_RSPx allow an agent software to program numerous combinations that meet the above guideline, not all combinations produce meaningful data.

Table 21-68. MSR_OFFCORE_RSP_x Response Supplier Info Field Definition

Subtype	Bit Name	Offset	Description
Common	ANY_RESPONSE	16	Catch all value for any response types.
Supplier Info	Reserved	17	Reserved
	L2_HIT	18	Cache reference hit L2 in either M/E/S states.
	Reserved	30:19	Reserved

To specify a complete offcore response filter, software must properly program bits in the request and response type fields. A valid request type must have at least one bit set in the non-reserved bits of 15:0. A valid response type must be a non-zero value of the following expression:

ANY | [('OR' of Supplier Info Bits) & ('OR' of Snoop Info Bits)]

If "ANY" bit is set, the supplier and snoop info bits are ignored.

Table 21-69. MSR_OFFCORE_RSPx Snoop Info Field Definition

Subtype	Bit Name	Offset	Description
Snoop Info	SNP_NONE	31	No details on snoop-related information.
	Reserved	32	Reserved
	SNOOP_MISS	33	Counts the number of snoop misses when L2 misses.
	SNOOP_HIT	34	Counts the number of snoops hit in the other module where no modified copies were found.
	Reserved	35	Reserved

Table 21-69. MSR_OFFCORE_RSPx Snoop Info Field Definition (Contd.)

Subtype	Bit Name	Offset	Description
	HITM	36	Counts the number of snoops hit in the other module where modified copies were found in other core's L1 cache.
	NON_DRAM	37	Target was non-DRAM system address. This includes MMIO transactions.
	AVG_LATENCY	38	Enable average latency measurement by counting weighted cycles of outstanding offcore requests of the request type specified in bits 15:0 and any response (bits 37:16 cleared to 0). This bit is available in MSR_OFFCORE_RESP0. The weighted cycles is accumulated in the specified programmable counter IA32_PMCx and the occurrence of specified requests are counted in the other programmable counter.

21.5.2.3 Average Offcore Request Latency Measurement

Average latency for offcore transactions can be determined by using both MSR_OFFCORE_RSP registers. Using two performance monitoring counters, program the two OFFCORE_RESPONSE event encodings into the corresponding IA32_PERFEVTSELx MSRs. Count the weighted cycles via MSR_OFFCORE_RSP0 by programming a request type in MSR_OFFCORE_RSP0.[15:0] and setting MSR_OFFCORE_RSP0.OUTSTANDING[38] to 1, white setting the remaining bits to 0. Count the number of requests via MSR_OFFCORE_RSP1 by programming the same request type from MSR_OFFCORE_RSP0 into MSR_OFFCORE_RSP1[bit 15:0], and setting MSR_OFFCORE_RSP1.ANY_RESPONSE[16] = 1, while setting the remaining bits to 0. The average latency can be obtained by dividing the value of the IA32_PMCx register that counted weight cycles by the register that counted requests.

21.5.3 Performance Monitoring for Goldmont Microarchitecture

Intel Atom processors based on the Goldmont microarchitecture report architectural performance monitoring versionID = 4 (see Section 21.2.4) and support non-architectural monitoring capabilities described in this section.

Architectural performance monitoring version 4 capabilities are described in Section 21.2.4.

The bit fields (except bit 21) within each IA32_PERFEVTSELx MSR are defined in Figure 21-6 and described in Section and Section 21.2.3. The Goldmont microarchitecture does not support Hyper-Threading and thus architectural and non-architectural performance monitoring events ignore the AnyThread qualification regardless of its setting in the IA32_PERFEVTSELx MSR. However, Goldmont does not set the AnyThread deprecation bit (CPUID.0AH:EDX[15]).

The core PMU's capability is similar to that of the Silvermont microarchitecture described in Section 21.5.2, with some differences and enhancements summarized in Table 21-70.

Table 21-70. Core PMU Comparison Between the Goldmont and Silvermont Microarchitectures

Box	Goldmont Microarchitecture	Silvermont Microarchitecture	Comment
# of Fixed counters per core	3	3	Use CPUID to determine # of counters. See Section 21.2.1.
# of general-purpose counters per core	4	2	Use CPUID to determine # of counters. See Section 21.2.1.
Counter width (R,W)	R:48, W: 32/48	R:40, W:32	See Section 21.2.2.
Architectural Performance Monitoring version ID	4	3	Use CPUID to determine # of counters. See Section 21.2.1.

Table 21-70. Core PMU Comparison Between the Goldmont and Silvermont Microarchitectures

Box	Goldmont Microarchitecture	Silvermont Microarchitecture	Comment
PMI Overhead Mitigation	▪ Freeze_Perfmon_on_PMI with streamlined semantics. ▪ Freeze_LBR_on_PMI with streamlined semantics for branch profiling.	▪ Freeze_Perfmon_on_PMI with legacy semantics. ▪ Freeze_LBR_on_PMI with legacy semantics for branch profiling.	See Section 19.4.7. Legacy semantics not supported with version 4 or higher.
Counter and Buffer Overflow Status Management	▪ Query via IA32_PERF_GLOBAL_STATUS ▪ Reset via IA32_PERF_GLOBAL_STATUS_RESET ▪ Set via IA32_PERF_GLOBAL_STATUS_SET	▪ Query via IA32_PERF_GLOBAL_STATUS ▪ Reset via IA32_PERF_GLOBAL_OVF_CTRL	See Section 21.2.4.
IA32_PERF_GLOBAL_STATUS Indicators of Overflow/Overhead/Interference	▪ Individual counter overflow ▪ PEBS buffer overflow ▪ ToPA buffer overflow ▪ CTR_Frz, LBR_Frz	▪ Individual counter overflow ▪ PEBS buffer overflow	See Section 21.2.4.
Enable control in IA32_PERF_GLOBAL_STATUS	▪ CTR_Frz, ▪ LBR_Frz	No	See Section 21.2.4.1.
Perfmon Counter In-Use Indicator	Query IA32_PERF_GLOBAL_INUSE	No	See Section 21.2.4.3.
Processor Event Based Sampling (PEBS) Events	General-Purpose Counter 0 only. Supports all events (precise and non-precise). Precise events are listed in Table 21-71.	See Section 21.5.2.1.1. General-Purpose Counter 0 only. Only supports precise events (see Table 21-64).	IA32_PMC0 only.
PEBS record format encoding	0011b	0010b	
Reduce skid PEBS	IA32_PMC0 only	No	
Data Address Profiling	Yes	No	
PEBS record layout	Table 21-72; enhanced fields at offsets 90H- 98H; and TSC record field at C0H.	Table 21-65.	
PEBS EventingIP	Yes	Yes	
Off-core Response Event	MSR 1A6H and 1A7H, each core has its own register.	MSR 1A6H and 1A7H, shared by a pair of cores.	Nehalem supports 1A6H only.

21.5.3.1 Processor Event Based Sampling (PEBS)

Processor event based sampling (PEBS) on the Goldmont microarchitecture is enhanced over prior generations with respect to sampling support of precise events and non-precise events. In the Goldmont microarchitecture, PEBS is supported using IA32_PMC0 for all events (see Section 19.4.9).

PEBS uses a debug store mechanism to store a set of architectural state information for the processor at the time the sample was generated.

Precise events work the same way on Goldmont microarchitecture as on the Silvermont microarchitecture. The record will be generated after an instruction that causes the event when the counter is already overflowed and will capture the architectural state at this point (see Section 21.6.2.4 and Section 19.4.9). The eventingIP in the record will indicate the instruction that caused the event. The list of precise events supported in the Goldmont microarchitecture is shown in Table 21-71.

In the Goldmont microarchitecture, the PEBS facility also supports the use of non-precise events to record processor state information into PEBS records with the same format as with precise events.

However, a non-precise event may not be attributable to a particular retired instruction or the time of instruction execution. When the counter overflows, a PEBS record will be generated at the next opportunity. Consider the event ICACHE.HIT. When the counter overflows, the processor is fetching future instructions. The PEBS record will be generated at the next opportunity and capture the state at the processor's current retirement point. It is likely that the instruction fetch that caused the event to increment was beyond that current retirement point. Other examples of non-precise events are CPU_CLK_UNHALTED.CORE_P and HARDWARE_INTERRUPTS.RECEIVED. CPU_CLK_UNHALTED.CORE_P will increment each cycle that the processor is awake. When the counter over-flows, there may be many instructions in various stages of execution. Additionally, zero, one or multiple instructions may be retired the cycle that the counter overflows. HARDWARE_INTERRUPTS.RECEIVED increments independent of any instructions being executed. For all non-precise events, the PEBS record will be generated at the next opportunity, after the counter has overflowed. The PEBS facility thus allows for identification of the instructions which were executing when the event overflowed.

After generating a record for a non-precise event, the PEBS facility reloads the counter and resumes execution, just as is done for precise events. Unlike interrupt-based sampling, which requires an interrupt service routine to collect the sample and reload the counter, the PEBS facility can collect samples even when interrupts are masked and without using NMI. Since a PEBS record is generated immediately when a counter for a non-precise event is enabled, it may also be generated after an overflow is set by an MSR write to IA32_PERF_GLOBAL_STATUS_SET.

Table 21-71. Precise Events Supported by the Goldmont Microarchitecture

Event Name	Event Select	Sub-event	UMask
LD_BLOCKS	03H	DATA_UNKNOWN	01H
		STORE_FORWARD	02H
		4K_ALIAS	04H
		UTLB_MISS	08H
		ALL_BLOCK	10H
MISALIGN_MEM_REF	13H	LOAD_PAGE_SPLIT	02H
		STORE_PAGE_SPLIT	04H
INST_RETIRED	C0H	ANY	00H
UOPS_RETITRED	C2H	ANY	00H
		LD_SPLITSMS	01H
BR_INST_RETIRED	C4H	ALL_BRANCHES	00H
		JCC	7EH
		TAKEN_JCC	FEH
		CALL	F9H
		REL_CALL	FDH
		IND_CALL	FBH
		NON_RETURN_IND	EBH
		FAR_BRANCH	BFH
		RETURN	F7H
BR_MISP_RETIRED	C5H	ALL_BRANCHES	00H
		JCC	7EH
		TAKEN_JCC	FEH
		IND_CALL	FBH
		NON_RETURN_IND	EBH
		RETURN	F7H

Table 21-71. Precise Events Supported by the Goldmont Microarchitecture (Contd.)

Event Name	Event Select	Sub-event	UMask
MEM_UOPS_RETIRED	D0H	ALL_LOADS	81H
		ALL_STORES	82H
		ALL	83H
		DLTB_MISS_LOADS	11H
		DLTB_MISS_STORES	12H
		DLTB_MISS	13H
MEM_LOAD_UOPS_RETIRED	D1H	L1_HIT	01H
		L2_HIT	02H
		L1_MISS	08H
		L2_MISS	10H
		HITM	20H
		WCB_HIT	40H
		DRAM_HIT	80H

The PEBS record format supported by processors based on the Goldmont microarchitecture is shown in Table 21-72, and each field in the PEBS record is 64 bits long.

Table 21-72. PEBS Record Format for the Goldmont Microarchitecture

Byte Offset	Field	Byte Offset	Field
00H	R/EFLAGS	68H	R11
08H	R/EIP	70H	R12
10H	R/EAX	78H	R13
18H	R/EBX	80H	R14
20H	R/ECX	88H	R15
28H	R/EDX	90H	Applicable Counters
30H	R/ESI	98H	Data Linear Address
38H	R/EDI	A0H	Reserved
40H	R/EBP	A8H	Reserved
48H	R/ESP	B0H	EventingRIP
50H	R8	B8H	Reserved
58H	R9	C0H	TSC
60H	R10		

On Goldmont microarchitecture, all 64 bits of architectural registers are written into the PEBS record regardless of processor mode.

With PEBS record format encoding 0011b, offset 90H reports the “Applicable Counter” field, which indicates which counters actually requested generating a PEBS record. This allows software to correlate the PEBS record entry properly with the instruction that caused the event even when multiple counters are configured to record PEBS records and multiple bits are set in the field. Additionally, offset C0H captures a snapshot of the TSC that provides a time line annotation for each PEBS record entry.

21.5.3.1.1 PEBS Data Linear Address Profiling

Goldmont supports the Data Linear Address field introduced in Haswell. It does not support the Data Source Encoding or Latency Value fields that are also part of Data Address Profiling; those fields are present in the record but are reserved.

For Goldmont microarchitecture, the Data Linear Address field will record the linear address of memory accesses in the previous instruction (e.g., the one that triggered a precise event that caused the PEBS record to be generated). Goldmont microarchitecture may record a Data Linear Address for the instruction that caused the event even for events not related to memory accesses. This may differ from other microarchitectures.

21.5.3.1.2 Reduced Skid PEBS

Processors based on Goldmont Plus microarchitecture support the Reduced Skid PEBS feature described in Section 21.9.4 on the IA32_PMC0 counter. Although Extended PEBS adds support for generating PEBS records for precise events on additional general-purpose and fixed-function performance counters, those counters do not support the Reduced Skid PEBS feature.

21.5.3.1.3 Enhancements to IA32_PERF_GLOBAL_STATUS.OvfDSBuffer[62]

In addition to IA32_PERF_GLOBAL_STATUS.OvfDSBuffer[62] being set when PEBS_Index reaches the PEBS_Interrupt_Theshold, the bit is also set when PEBS_Index is out of bounds. That is, the bit will be set when PEBS_Index < PEBS_Buffer_Base or PEBS_Index > PEBS_Absolute_Maximum. Note that when an out of bound condition is encountered, the overflow bits in IA32_PERF_GLOBAL_STATUS will be cleared according to Applicable Counters, however the IA32_PMCx values will not be reloaded with the Reset values stored in the DS_AREA.

21.5.3.2 Offcore Response Event

Event number 0B7H support offcore response monitoring using an associated configuration MSR, MSR_OFFCORE_RSP0 (address 1A6H) in conjunction with UMASK value 01H or MSR_OFFCORE_RSP1 (address 1A7H) in conjunction with UMASK value 02H. Table 21-66 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32_PMCx.

The Goldmont microarchitecture provides unique pairs of MSR_OFFCORE_RSPx registers per core.

The layout of MSR_OFFCORE_RSP0 and MSR_OFFCORE_RSP1 are organized as follows:

- Bits 15:0 specifies the request type of a transaction request to the uncore. This is described in Table 21-73.
- Bits 30:16 specifies common supplier information or an L2 Hit, and is described in Table 21-68.
- If L2 misses, then Bits 37:31 can be used to specify snoop response information and is described in Table 21-74.
- For outstanding requests, bit 38 can enable measurement of average latency of specific type of offcore transaction requests using two programmable counter simultaneously; see Section 21.5.2.3 for details.

Table 21-73. MSR_OFFCORE_RSPx Request_Type Field Definition

Bit Name	Offset	Description
DEMAND_DATA_RD	0	Counts cacheline read requests due to demand reads (excludes prefetches).
DEMAND_RFO	1	Counts cacheline read for ownership (RFO) requests due to demand writes (excludes prefetches).
DEMAND_CODE_RD	2	Counts demand instruction cacheline and I-side prefetch requests that miss the instruction cache.
COREWB	3	Counts writeback transactions caused by L1 or L2 cache evictions.
PF_L2_DATA_RD	4	Counts data cacheline reads generated by hardware L2 cache prefetcher.
PF_L2_RFO	5	Counts reads for ownership (RFO) requests generated by L2 prefetcher.
Reserved	6	Reserved.

Table 21-73. MSR_OFFCORE_RSPx Request_Type Field Definition (Contd.)

Bit Name	Offset	Description
PARTIAL_READS	7	Counts demand data partial reads, including data in uncacheable (UC) or uncacheable (WC) write combining memory types.
PARTIAL_WRITES	8	Counts partial writes, including uncacheable (UC), write through (WT) and write protected (WP) memory type writes.
UC_CODE_READS	9	Counts code reads in uncacheable (UC) memory region.
BUS_LOCKS	10	Counts bus lock and split lock requests.
FULL_STREAMING_STORES	11	Counts full cacheline writes due to streaming stores.
SW_PREFETCH	12	Counts cacheline requests due to software prefetch instructions.
PF_L1_DATA_RD	13	Counts data cacheline reads generated by hardware L1 data cache prefetcher.
PARTIAL_STREAMING_STORES	14	Counts partial cacheline writes due to streaming stores.
ANY_REQUEST	15	Counts requests to the uncore subsystem.

To properly program this extra register, software must set at least one request type bit (Table 21-67) and a valid response type pattern (either Table 21-68 or Table 21-74). Otherwise, the event count reported will be zero. It is permissible and useful to set multiple request and response type bits in order to obtain various classes of off-core response events. Although MSR_OFFCORE_RSPx allow an agent software to program numerous combinations that meet the above guideline, not all combinations produce meaningful data.

Table 21-74. MSR_OFFCORE_RSPx For L2 Miss and Outstanding Requests

Subtype	Bit Name	Offset	Description
L2_MISS (Snoop Info)	Reserved	32:31	Reserved
	L2_MISS.SNOOP_MISS_OR_NO_SNOOP_NEEDED	33	A true miss to this module, for which a snoop request missed the other module or no snoop was performed/needed.
	L2_MISS.HIT_OTHER_CORE_NO_FWD	34	A snoop hit in the other processor module, but no data forwarding is required.
	Reserved	35	Reserved
	L2_MISS.HITM_OTHER_CORE	36	Counts the number of snoops hit in the other module or other core's L1 where modified copies were found.
	L2_MISS.NON_DRAM	37	Target was a non-DRAM system address. This includes MMIO transactions.
Outstanding requests[1]	OUTSTANDING	38	Counts weighted cycles of outstanding offcore requests of the request type specified in bits 15:0, from the time the XQ receives the request and any response is received. Bits 37:16 must be set to 0. This bit is only available in MSR_OFFCORE_RESP0.

NOTES:

1. See Section 21.5.2.3, "Average Offcore Request Latency Measurement," for details on how to use this bit to extract average latency.

To specify a complete offcore response filter, software must properly program bits in the request and response type fields. A valid request type must have at least one bit set in the non-reserved bits of 15:0. A valid response type must be a non-zero value of the following expression:

Any_Response Bit | L2 Hit | 'OR' of Snoop Info Bits | Outstanding Bit

21.5.3.3 Average Offcore Request Latency Measurement

In Goldmont microarchitecture, measurement of average latency of offcore transaction requests is the same as described in Section 21.5.2.3.

21.5.4 Performance Monitoring for Goldmont Plus Microarchitecture

Intel Atom processors based on the Goldmont Plus microarchitecture report architectural performance monitoring versionID = 4 and support non-architectural monitoring capabilities described in this section.

Architectural performance monitoring version 4 capabilities are described in Section 21.2.4.

Goldmont Plus performance monitoring capabilities are similar to Goldmont capabilities. The differences are in specific events and in which counters support PEBS. Goldmont Plus introduces the ability for fixed performance monitoring counters to generate PEBS records.

Goldmont Plus will set the AnyThread deprecation CPUID bit (CPUID.0AH:EDX[15]) to indicate that the Any-Thread bits in IA32_PERFEVTSELx and IA32_FIXED_CTR_CTRL have no effect.

The core PMU's capability is similar to that of the Goldmont microarchitecture described in Section 21.6.3, with some differences and enhancements summarized in Table 21-75.

Table 21-75. Core PMU Comparison Between the Goldmont Plus and Goldmont Microarchitectures

Box	Goldmont Plus Microarchitecture	Goldmont Microarchitecture	Comment
# of Fixed counters per core	3	3	Use CPUID to determine # of counters. See Section 21.2.1.
# of general-purpose counters per core	4	4	Use CPUID to determine # of counters. See Section 21.2.1.
Counter width (R,W)	R:48, W: 32/48	R:48, W: 32/48	No change.
Architectural Performance Monitoring version ID	4	4	No change.
Processor Event Based Sampling (PEBS) Events	All General-Purpose and Fixed counters. Each General-Purpose counter supports all events (precise and non-precise).	General-Purpose Counter 0 only. Supports all events (precise and non-precise). Precise events are listed in Table 21-71.	Goldmont Plus supports PEBS on all counters.
PEBS record format encoding	0011b	0011b	No change.

21.5.4.1 Extended PEBS

The PEBS facility in Goldmont Plus microarchitecture provides a number of enhancements relative to PEBS in processors from previous generations. Enhancement of PEBS facility with the Extended PEBS feature are described in detail in section 18.9.

21.5.5 Performance Monitoring for Tremont Microarchitecture

Intel Atom processors based on the Tremont microarchitecture report architectural performance monitoring versionID = 5 and support non-architectural monitoring capabilities described in this section.

Architectural performance monitoring version 5 capabilities are described in Section 21.2.5.

Tremont performance monitoring capabilities are similar to Goldmont Plus capabilities, with the following extensions:

- Support for Adaptive PEBS.
- Support for PEBS output to Intel® Processor Trace.
- Precise Distribution support on Fixed Counter0.
- Compatibility enhancements to off-core response MSRs, MSR_OFFCORE_RSPx.

The differences and enhancements between Tremont microarchitecture and Goldmont Plus microarchitecture are summarized in Table 21-76.

Table 21-76. Core PMU Comparison Between the Tremont and Goldmont Plus Microarchitectures

Box	Tremont Microarchitecture	Goldmont Plus Microarchitecture	Comment
# of fixed counters per core	3	3	Use CPUID to determine # of counters. See Section 21.2.1.
# of general-purpose counters per core	4	4	Use CPUID to determine # of counters. See Section 21.2.1.
Counter width (R,W)	R:48, W: 32/48	R:48, W: 32/48	No change. See Section 21.2.2.
Architectural Performance Monitoring version ID	5	4	
PEBS record format encoding	0100b	0011b	See Section 21.6.2.4.2.
Reduce skid PEBS	IA32_PMC0 and IA32_FIXED_CTR0	IA32_PMC0 only	
Extended PEBS	Yes	Yes	See Section 21.5.4.1.
Adaptive PEBS	Yes	No	See Section 21.9.2.
PEBS output	DS Save Area or Intel® Processor Trace	DS Save Area only	See Section 21.5.5.2.1.
PEBS record layout	See Section 21.9.2.3 for output to DS, Section 21.5.5.2.2 for output to Intel PT.	Table 21-72; enhanced fields at offsets 90H- 98H; and TSC record field at C0H.	
Off-core Response Event	MSR 1A6H and 1A7H, each core has its own register, extended request and response types.	MSR 1A6H and 1A7H, each core has its own register.	

21.5.5.1 Adaptive PEBS

The PEBS record format and configuration interface has changed versus Goldmont Plus, as the Tremont microarchitecture includes support for the configurable Adaptive PEBS records; see Section 21.9.2.

21.5.5.2 PEBS output to Intel® Processor Trace

Intel Atom processors based on the Tremont microarchitecture introduce the following Precise Event-Based Sampling (PEBS) extensions:

- A mechanism to direct PEBS output into the Intel® Processor Trace (Intel® PT) output stream. In this scenario, the PEBS record is written in packetized form, in order to co-exist with other Intel PT trace data.
- New Performance Monitoring counter reload MSRs, which are used by PEBS in place of the counter reload values stored in the DS Management area when PEBS output is directed into the Intel PT output stream.

Processors that indicate support for Intel PT by setting CPUID.07H.0.EBX[25]=1, and set the new IA32_PERF_CAPABILITIES.PEBS_OUTPUT_PT_AVAIL[16] bit, support these extensions.

21.5.5.2.1 PEBS Configuration

PEBS output to Intel Processor Trace includes support for two new fields in IA32_PEBS_ENABLE.

Table 21-77. New Fields in IA32_PEBS_ENABLE

Field	Description
PMI_AFTER_EACH_RECORD[60]	Pend a PerfMon Interrupt (PMI) after each PEBS event.
PEBS_OUTPUT[62:61]	Specifies PEBS output destination. Encodings: 00B: DS Save Area. Matches legacy PEBS behavior, output location defined by IA32_DS_AREA. 01B: Intel PT trace output. 10B: Reserved. 11B: Reserved.

When PEBS_OUTPUT is set to 01B, the DS Management Area is not used and need not be configured. Instead, the output mechanism is configured through IA32_RTIT_CTL and other Intel PT MSRs, while counter reload values are configured in the MSR_RELOAD_PMCx MSRs. Details on configuring Intel PT can be found in Section 34.2.7.

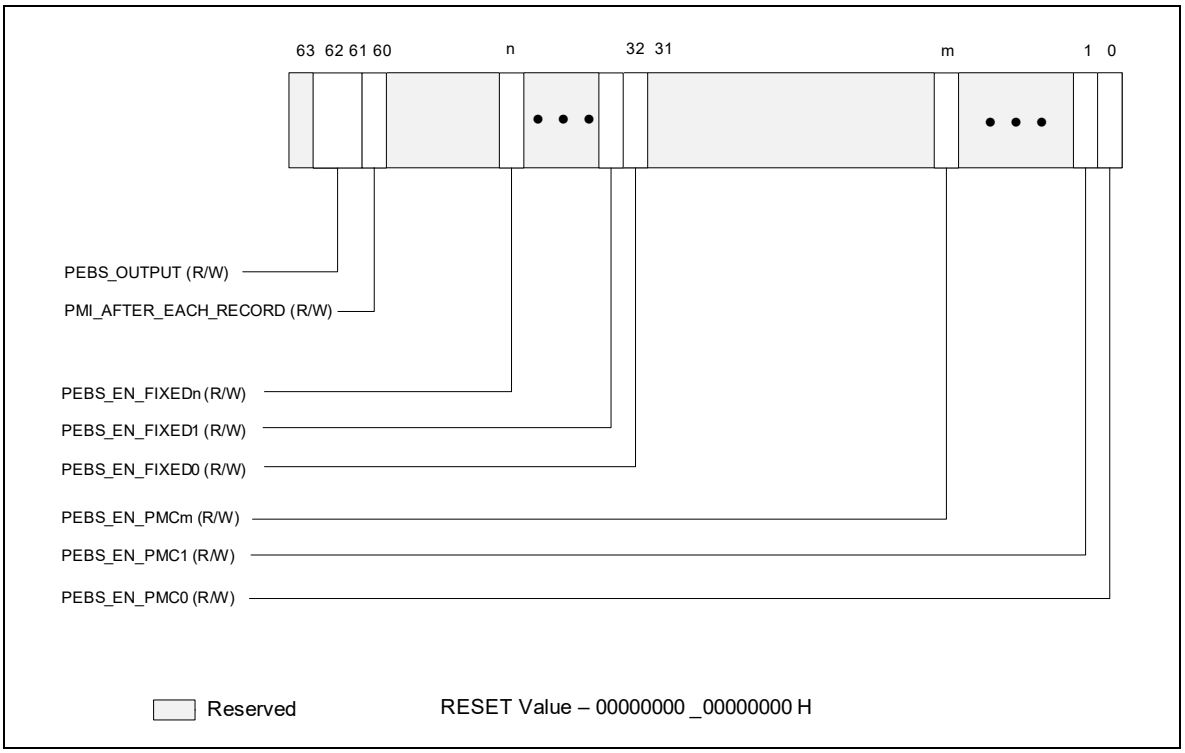

Figure 21-44. IA32_PEBS_ENABLE MSR with PEBS Output to Intel® Processor Trace

21.5.5.2.2 PEBS Record Format in Intel® Processor Trace

The format of the PEBS record changes when output to Intel PT, as the PEBS state is packetized. Each PEBS grouping is emitted as a Block Begin (BBP) and following Block Item (BIP) packets. A PEBS grouping ends when either a new PEBS grouping begins (indicated by a BBP packet) or a Block End (BEP) packet is encountered. See Section 34.4.1.1 for details of these Intel PT packets.

Because the packet headers describe the state held in the packet payload, PEBS state ordering is not fixed. PEBS state groupings may be emitted in any order, and the PEBS state elements within those groupings may be emitted in any order. Further, there is no packet that provides indication of "Record Format" or "Record Size".

If Intel PT tracing is not enabled (IA32_RTIT_STATUS.TriggerEn=0), any PEBS records triggered will be dropped. PEBS packets do not depend on ContextEn or FilterEn in IA32_RTIT_STATUS, any filtering of PEBS must be enabled from within the PerfMon configuration. Counter reload will occur in all scenarios where PEBS is triggered, regardless of TriggerEn.

The PEBS threshold mechanism for generating PerfMon Interrupts (PMIs) is not available in this mode. However, there exist other means to generate PMIs based on PEBS output. When the Intel PT ToPA output mechanism is chosen, a PMI can optionally be pended when a ToPA region is filled; see Section 34.2.7.2 for details. Further, software can opt to generate a PMI on each PEBS record by setting the new IA32_PEBS_ENABLE.PMI_AFTER_EACH_RECORD[60] bit.

The IA32_PERF_GLOBAL_STATUS.OvfDSBuffer bit will not be set in this mode.

21.5.5.2.3 PEBS Counter Reload

When PEBS output is directed into Intel PT (IA32_PEBS_ENABLE.PEBS_OUTPUT = 01B), new MSR_RELOAD_PMCx MSRs are used by the PEBS routine to reload PerfMon counters. The value from the associated reload MSR will be loaded to the appropriate counter on each PEBS event.

21.5.5.3 Precise Distribution Support on Fixed Counter 0

The Tremont microarchitecture supports the PDIR (Precise Distribution of Retired Instructions) facility, as described in Section 21.3.4.4.4, on Fixed Counter 0. Fixed Counter 0 counts the INST_RETIRED.ALL event. PEBS skid for Fixed Counter 0 will be precisely one instruction.

This is in addition to the reduced skid PEBS behavior on IA32_PMC0; see Section 21.5.3.1.2.

21.5.5.4 Compatibility Enhancements to Offcore Response MSRs

The Off-core Response facility is similar to that described in Section 21.5.3.2.

The layout of MSR_OFFCORE_RSP0 and MSR_OFFCORE_RSP1 are organized as shown below. RequestType bits are defined in Table 21-78, ResponseType bits in Table 21-79, and SnoopInfo bits in Table 21-80.

Table 21-78. MSR_OFFCORE_RSPx Request Type Definition

Bit Name	Offset	Description
DEMAND_DATA_RD	0	Counts demand data reads.
DEMAND_RFO	1	Counts all demand reads for ownership (RFO) requests and software based prefetches for exclusive ownership (prefetchw).
DEMAND_CODE_RD	2	Counts demand instruction fetches and L1 instruction cache prefetches.
COREWB_M	3	Counts modified write backs from L1 and L2.
HWPF_L2_DATA_RD	4	Counts prefetch (that bring data to L2) data reads.
HWPF_L2_RFO	5	Counts all prefetch (that bring data to L2) RFOs.
HWPF_L2_CODE_RD	6	Counts all prefetch (that bring data to L2 only) code reads.
Reserved	9:7	Reserved.
HWPF_L1D_AND_SWPF	10	Counts L1 data cache hardware prefetch requests, read for ownership prefetch requests and software prefetch requests (except prefetchw).
STREAMING_WR	11	Counts all streaming stores.
COREWB_NONM	12	Counts non-modified write backs from L2.
Reserved	14:13	Reserved.
OTHER	15	Counts miscellaneous requests, such as I/O accesses that have any response type.
UC_RD	44	Counts uncached memory reads (PRd, UCRdF).
UC_WR	45	Counts uncached memory writes (WiL).
PARTIAL_STREAMING_WR	46	Counts partial (less than 64 byte) streaming stores (WCiL).
FULL_STREAMING_WR	47	Counts full, 64 byte streaming stores (WCiLF).

Table 21-78. MSR_OFFCORE_RSPx Request Type Definition (Contd.)

Bit Name	Offset	Description
L1WB_M	48	Counts modified WriteBacks from L1 that miss the L2.
L2WB_M	49	Counts modified WriteBacks from L2.

Table 21-79. MSR_OFFCORE_RSPx Response Type Definition

Bit Name	Offset	Description
ANY_RESPONSE	16	Catch all value for any response types.
L3_HIT_M	18	LLC/L3 Hit - M-state.
L3_HIT_E	19	LLC/L3 Hit - E-state.
L3_HIT_S	20	LLC/L3 Hit - S-state.
L3_HIT_F	21	LLC/L3 Hit - I-state.
LOCAL_DRAM	26	LLC/L3 Miss, DRAM Hit.
OUTSTANDING	63	Average latency of outstanding requests with the other counter counting number of occurrences; can also can be used to count occupancy.

Table 21-80. MSR_OFFCORE_RSPx Snoop Info Definition

Bit Name	Offset	Description
SNOOP_NONE	31	None of the cores were snooped. ▪ LLC miss and Dram data returned directly to the core.
SNOOP_NOT_NEEDED	32	No snoop needed to satisfy the request. ▪ LLC hit and CV bit(s) (core valid) was not set. ▪ LLC miss and Dram data returned directly to the core.
SNOOP_MISS	33	A snoop was sent but missed. ▪ LLC hit and CV bit(s) was set but snoop missed (silent data drop in core), data returned from LLC. ▪ LLC miss and Dram data returned directly to the core.
SNOOP_HIT_NO_FWD	34	A snoop was sent but no data forward. ▪ LLC hit and CV bit(s) was set but no data forward from the core, data returned from LLC. ▪ LLC miss and Dram data returned directly to the core.
SNOOP_HIT_WITH_FWD	35	A snoop was sent and non-modified data was forward. ▪ LLC hit and CV bit(s) was set, non-modified data was forward from core.
SNOOP_HITM	36	A snoop was sent and modified data was forward. ▪ LLC hit E or M and the CV bit(s) was set, modified data was forward from core.
NON_DRAM_BIT	37	Target was non-DRAM system address, MMIO access. ▪ LLC miss and Non-Dram data returned.

The Off-core Response capability behaves as follows:

- To specify a complete offcore response filter, software must properly program at least one RequestType and one ResponseType. A valid request type must have at least one bit set in the non-reserved bits of 15:0 or 49:44. A valid response type must be a non-zero value of one the following expressions:
    - Read requests:

      Any_Response Bit | (‘OR’ of Supplier Info Bits) ‘AND’ (‘OR’ of Snoop Info Bits) | Outstanding Bit
    - Write requests:

      Any_Response Bit | (‘OR’ of Supplier Info Bits) | Outstanding Bit
- When the ANY_RESPONSE bit in the ResponseType is set, all other response type bits will be ignored.
- True Demand Cacheable Loads include neither L1 Prefetches nor Software Prefetches.
- Bits 15:0 and Bits 49:44 specifies the request type of a transaction request to the uncore. This is described in Table 21-78.
- Bits 30:16 specifies common supplier information.
- “Outstanding Requests” (bit 63) is only available on MSR_OFFCORE_RSP0; a #GP fault will occur if software attempts to write a 1 to this bit in MSR_OFFCORE_RSP1. It is mutually exclusive with any ResponseType. Software must guarantee that all other ResponseType bits are set to 0 when the “Outstanding Requests” bit is set.
- “Outstanding Requests” bit 63 can enable measurement of the average latency of a specific type of off-core transaction; two programmable counters must be used simultaneously and the RequestType programming for MSR_OFFCORE_RSP0 and MSR_OFFCORE_RSP1 must be the same when using this Average Latency feature. See Section 21.5.2.3 for further details.

21.6 PERFORMANCE MONITORING (LEGACY INTEL PROCESSORS)

21.6.1 Performance Monitoring (Intel® Core™ Solo and Intel® Core™ Duo Processors)

In Intel Core Solo and Intel Core Duo processors, non-architectural performance monitoring events are programmed using the same facilities (see Figure 21-1) used for architectural performance events.

Non-architectural performance events use event select values that are model-specific. Event mask (Umask) values are also specific to event logic units. Some microarchitectural conditions detectable by a Umask value may have specificity related to processor topology (see Section 10.6, “Detecting Hardware Multi-Threading Support and Topology,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A). As a result, the unit mask field (for example, IA32_PERFEVTSELx[bits 15:8]) may contain sub-fields that specify topology information of processor cores.

The sub-field layout within the Umask field may support two-bit encoding that qualifies the relationship between a microarchitectural condition and the originating core. This data is shown in Table 21-81. The two-bit encoding for core-specificity is only supported for a subset of Umask values (see: https://perfmon-events.intel.com/) and for Intel Core Duo processors. Such events are referred to as core-specific events.

Table 21-81. Core Specificity Encoding within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit 15:14 Encoding	**Description**
11B	All cores
10B	Reserved
01B	This core
00B	Reserved

Some microarchitectural conditions allow detection specificity only at the boundary of physical processors. Some bus events belong to this category, providing specificity between the originating physical processor (a bus agent) versus other agents on the bus. Sub-field encoding for agent specificity is shown in Table 21-82.

Table 21-82. Agent Specificity Encoding within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit 13 Encoding	**Description**
0	This agent
1	Include all agents

Some microarchitectural conditions are detectable only from the originating core. In such cases, unit mask does not support core-specificity or agent-specificity encodings. These are referred to as core-only conditions.

Some microarchitectural conditions allow detection specificity that includes or excludes the action of hardware prefetches. A two-bit encoding may be supported to qualify hardware prefetch actions. Typically, this applies only to some L2 or bus events. The sub-field encoding for hardware prefetch qualification is shown in Table 21-83.

Table 21-83. HW Prefetch Qualification Encoding within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit 13:12 Encoding	**Description**
11B	All inclusive
10B	Reserved
01B	Hardware prefetch only
00B	Exclude hardware prefetch

Some performance events may (a) support none of the three event-specific qualification encodings (b) may support core-specificity and agent specificity simultaneously (c) or may support core-specificity and hardware prefetch qualification simultaneously. Agent-specificity and hardware prefetch qualification are mutually exclusive.

In addition, some L2 events permit qualifications that distinguish cache coherent states. The sub-field definition for cache coherency state qualification is shown in Table 21-84. If no bits in the MESI qualification sub-field are set for an event that requires setting MESI qualification bits, the event count will not increment.

Table 21-84. MESI Qualification Definitions within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit Position 11:8	**Description**
Bit 11	Counts modified state
Bit 10	Counts exclusive state
Bit 9	Counts shared state
Bit 8	Counts Invalid state

21.6.2 Performance Monitoring (Processors Based on Intel® Core™ Microarchitecture)

In addition to architectural performance monitoring, processors based on the Intel Core microarchitecture support non-architectural performance monitoring events.

Architectural performance events can be collected using general-purpose performance counters. Non-architectural performance events can be collected using general-purpose performance counters (coupled with two IA32_PERFE-VTSELx MSRs for detailed event configurations), or fixed-function performance counters (see Section 21.6.2.1). IA32_PERFEVTSELx MSRs are architectural; their layout is shown in Figure 21-1. Starting with Intel Core 2

processor T 7700, fixed-function performance counters and associated counter control and status MSR becomes part of architectural performance monitoring version 2 facilities (see also Section 21.2.2).

Non-architectural performance events in processors based on Intel Core microarchitecture use event select values that are model-specific. Valid event mask (Umask) bits can be found at: https://perfmon-events.intel.com/. The UMASK field may contain sub-fields identical to those listed in Table 21-81, Table 21-82, Table 21-83, and Table 21-84. One or more of these sub-fields may apply to specific events on an event-by-event basis.

In addition, the UMASK filed may also contain a sub-field that allows detection specificity related to snoop responses. Bits of the snoop response qualification sub-field are defined in Table 21-85.

Table 21-85. Bus Snoop Qualification Definitions within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit Position 11:8	**Description**
Bit 11	HITM response
Bit 10	Reserved
Bit 9	HIT response
Bit 8	CLEAN response

There are also non-architectural events that support qualification of different types of snoop operation. The corresponding bit field for snoop type qualification are listed in Table 21-86.

Table 21-86. Snoop Type Qualification Definitions within a Non-Architectural Umask

IA32_PERFEVTSELx MSRs	
Bit Position 9:8	**Description**
Bit 9	CMP2I snoops
Bit 8	CMP2S snoops

No more than one sub-field of MESI, snoop response, and snoop type qualification sub-fields can be supported in a performance event.

NOTE

Software must write known values to the performance counters prior to enabling the counters. The content of general-purpose counters and fixed-function counters are undefined after INIT or RESET.

21.6.2.1 Fixed-function Performance Counters

Processors based on Intel Core microarchitecture provide three fixed-function performance counters. Bits beyond the width of the fixed counter are reserved and must be written as zeros. Model-specific fixed-function performance counters on processors that support Architectural Perfmon version 1 are 40 bits wide.

Each of the fixed-function counter is dedicated to count a pre-defined performance monitoring events. See Table 21-1 for details of the PMC addresses and what these events count.

Programming the fixed-function performance counters does not involve any of the IA32_PERFEVTSELx MSRs, and does not require specifying any event masks. Instead, the MSR IA32_FIXED_CTR_CTRL provides multiple sets of 4-bit fields; each 4-bit field controls the operation of a fixed-function performance counter (PMC). See Figures 21-45. Two sub-fields are defined for each control. See Figure 21-45; bit fields are:

- **Enable field (low 2 bits in each 4-bit control) —** When bit 0 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment when the target condition associated with the architecture performance event occurs at ring 0.

When bit 1 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment when the target condition associated with the architecture performance event occurs at ring greater than 0.

Writing 0 to both bits stops the performance counter. Writing 11B causes the counter to increment irrespective of privilege levels.

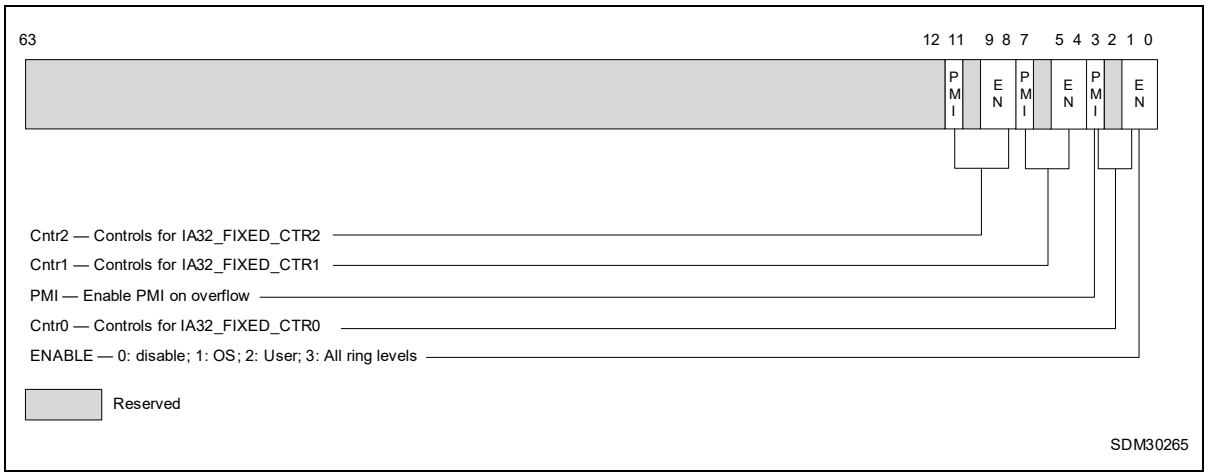

Figure 21-45. Layout of IA32_FIXED_CTR_CTRL MSR

- **PMI field (fourth bit in each 4-bit control)** — When set, the logical processor generates an exception through its local APIC on overflow condition of the respective fixed-function counter.

21.6.2.2 Global Counter Control Facilities

Processors based on Intel Core microarchitecture provides simplified performance counter control that simplifies the most frequent operations in programming performance events, i.e., enabling/disabling event counting and checking the status of counter overflows. This is done by the following three MSRs:

- MSR_PERF_GLOBAL_CTRL enables/disables event counting for all or any combination of fixed-function PMCs (IA32_FIXED_CTRx) or general-purpose PMCs via a single WRMSR.
- MSR_PERF_GLOBAL_STATUS allows software to query counter overflow conditions on any combination of fixed-function PMCs (IA32_FIXED_CTRx) or general-purpose PMCs via a single RDMSR.
- MSR_PERF_GLOBAL_OVF_CTRL allows software to clear counter overflow conditions on any combination of fixed-function PMCs (IA32_FIXED_CTRx) or general-purpose PMCs via a single WRMSR.

MSR_PERF_GLOBAL_CTRL MSR provides single-bit controls to enable counting in each performance counter (see Figure 21-46). Each enable bit in MSR_PERF_GLOBAL_CTRL is AND'ed with the enable bits for all privilege levels in the respective IA32_PERFEVTSELx or IA32_FIXED_CTR_CTRL MSRs to start/stop the counting of respective counters. Counting is enabled if the AND'ed results is true; counting is disabled when the result is false.

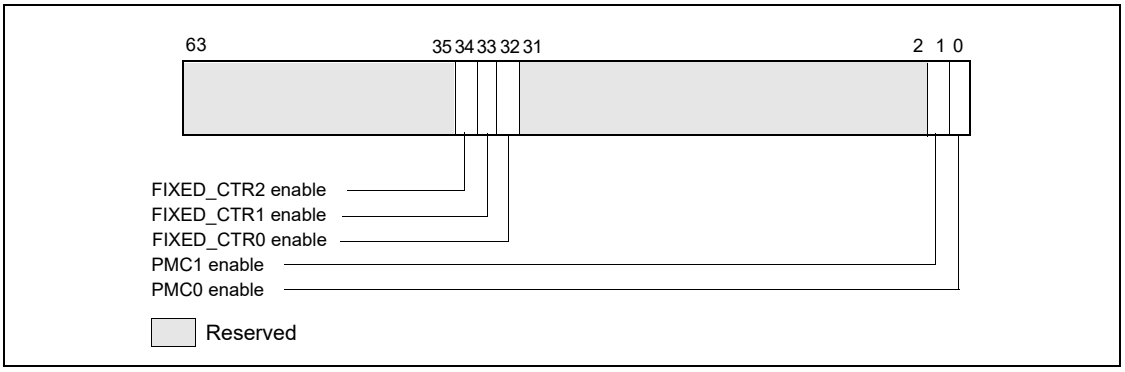

Figure 21-46. Layout of MSR_PERF_GLOBAL_CTRL MSR

MSR_PERF_GLOBAL_STATUS MSR provides single-bit status used by software to query the overflow condition of each performance counter. MSR_PERF_GLOBAL_STATUS[bit 62] indicates overflow conditions of the DS area data buffer. MSR_PERF_GLOBAL_STATUS[bit 63] provides a CondChgd bit to indicate changes to the state of performance monitoring hardware (see Figure 21-47). A value of 1 in bits 34:32, 1, 0 indicates an overflow condition has occurred in the associated counter.

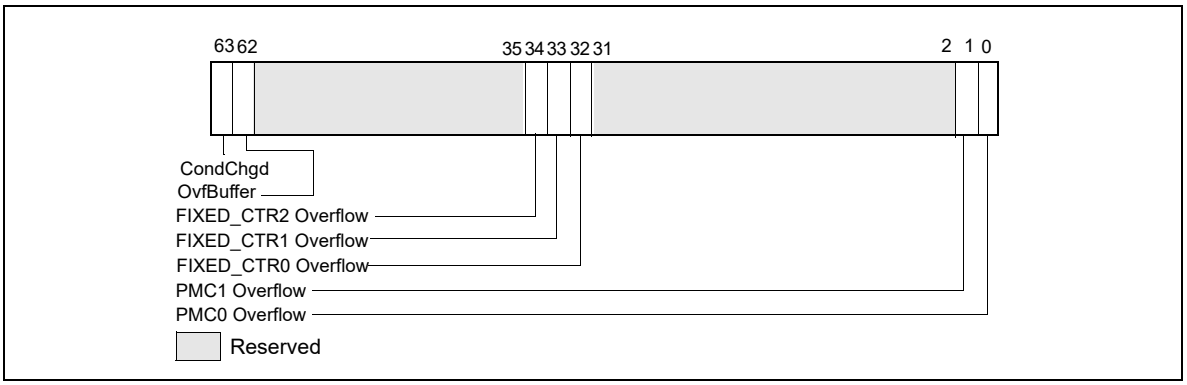

Figure 21-47. Layout of MSR_PERF_GLOBAL_STATUS MSR

When a performance counter is configured for PEBS, an overflow condition in the counter will arm PEBS. On the subsequent event following overflow, the processor will generate a PEBS event. On a PEBS event, the processor will perform bounds checks based on the parameters defined in the DS Save Area (see Section 19.4.9). Upon successful bounds checks, the processor will store the data record in the defined buffer area, clear the counter overflow status, and reload the counter. If the bounds checks fail, the PEBS will be skipped entirely. In the event that the PEBS buffer fills up, the processor will set the OvfBuffer bit in MSR_PERF_GLOBAL_STATUS.

MSR_PERF_GLOBAL_OVF_CTL MSR allows software to clear overflow the indicators for general-purpose or fixed-function counters via a single WRMSR (see Figure 21-48). Clear overflow indications when:

- Setting up new values in the event select and/or UMASK field for counting or interrupt-based event sampling.
- Reloading counter values to continue collecting next sample.
- Disabling event counting or interrupt-based event sampling.

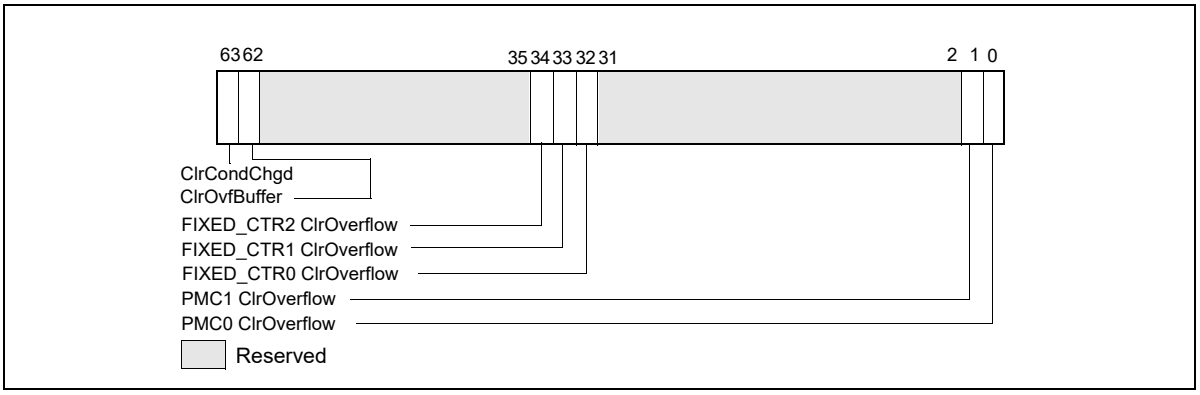

Figure 21-48. Layout of MSR_PERF_GLOBAL_OVF_CTRL MSR

21.6.2.3 At-Retirement Events

Many non-architectural performance events are impacted by the speculative nature of out-of-order execution. A subset of non-architectural performance events on processors based on Intel Core microarchitecture are enhanced with a tagging mechanism (similar to that found in Intel NetBurst® microarchitecture) that exclude contributions that arise from speculative execution. The at-retirement events available in processors based on Intel Core microarchitecture does not require special MSR programming control (see Section 21.6.3.6, "At-Retirement Counting"), but is limited to IA32_PMC0. See Table 21-87 for a list of events available to processors based on Intel Core microarchitecture.

Table 21-87. At-Retirement Performance Events for Intel Core Microarchitecture

Event Name	UMask	Event Select
ITLB_MISS_RETIRED	00H	C9H
MEM_LOAD_RETIRED.L1D_MISS	01H	CBH
MEM_LOAD_RETIRED.L1D_LINE_MISS	02H	CBH
MEM_LOAD_RETIRED.L2_MISS	04H	CBH
MEM_LOAD_RETIRED.L2_LINE_MISS	08H	CBH
MEM_LOAD_RETIRED.DTLB_MISS	10H	CBH

21.6.2.4 Processor Event Based Sampling (PEBS)

Processors based on Intel Core microarchitecture also support processor event based sampling (PEBS). This feature was introduced by processors based on Intel NetBurst microarchitecture.

PEBS uses a debug store mechanism and a performance monitoring interrupt to store a set of architectural state information for the processor. The information provides architectural state of the instruction executed after the instruction that caused the event (See Section 21.6.2.4.2 and Section 19.4.9).

In cases where the same instruction causes BTS and PEBS to be activated, PEBS is processed before BTS are processed. The PMI request is held until the processor completes processing of PEBS and BTS.

For processors based on Intel Core microarchitecture, precise events that can be used with PEBS are listed in Table 21-88. The procedure for detecting availability of PEBS is the same as described in Section 21.6.3.8.1.

Table 21-88. PEBS Performance Events for Intel Core Microarchitecture

Event Name	UMask	Event Select
INSTR_RETIRED.ANY_P	00H	C0H
X87_OPS_RETIRED.ANY	FEH	C1H
BR_INST_RETIRED.MISPRED	00H	C5H
SIMD_INST_RETIRED.ANY	1FH	C7H
MEM_LOAD_RETIRED.L1D_MISS	01H	CBH
MEM_LOAD_RETIRED.L1D_LINE_MISS	02H	CBH
MEM_LOAD_RETIRED.L2_MISS	04H	CBH
MEM_LOAD_RETIRED.L2_LINE_MISS	08H	CBH
MEM_LOAD_RETIRED.DTLB_MISS	10H	CBH

21.6.2.4.1 Setting up the PEBS Buffer

For processors based on Intel Core microarchitecture, PEBS is available using IA32_PMC0 only. Use the following procedure to set up the processor and IA32_PMC0 counter for PEBS:

1. Set up the precise event buffering facilities. Place values in the precise event buffer base, precise event index, precise event absolute maximum, precise event interrupt threshold, and precise event counter reset fields of the DS buffer management area. In processors based on Intel Core microarchitecture, PEBS records consist of 64-bit address entries. See Figure 19-8 to set up the precise event records buffer in memory.
2. Enable PEBS. Set the Enable PEBS on PMC0 flag (bit 0) in IA32_PEBS_ENABLE MSR.
3. Set up the IA32_PMC0 performance counter and IA32_PERFEVTSEL0 for an event listed in Table 21-88.

21.6.2.4.2 PEBS Record Format

The PEBS record format may be extended across different processor implementations. The IA32_PERF_CAPABILITES MSR defines a mechanism for software to handle the evolution of PEBS record format in processors that support architectural performance monitoring with version ID equals 2 or higher. The bit fields of IA32_PERF_CAPABILITES are defined in Table 2-2 of Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4. The relevant bit fields that governs PEBS are:

- PEBSTrap [bit 6]: When set, PEBS recording is trap-like. After the PEBS-enabled counter has overflowed, PEBS record is recorded for the next PEBS-able event at the completion of the sampled instruction causing the PEBS event. When clear, PEBS recording is fault-like. The PEBS record is recorded before the sampled instruction causing the PEBS event.
- PEBSSaveArchRegs [bit 7]: When set, PEBS will save architectural register and state information according to the encoded value of the PEBSRecordFormat field. When clear, only the return instruction pointer and flags are recorded. On processors based on Intel Core microarchitecture, this bit is always 1.
- PEBSRecordFormat [bits 11:8]: Valid encodings are:
  - 0000B: Only general-purpose registers, instruction pointer and RFLAGS registers are saved in each PEBS record (See Section 21.6.3.8).
  - 0001B: PEBS record includes additional information of IA32_PERF_GLOBAL_STATUS and load latency data. (See Section 21.3.1.1.1).
  - 0010B: PEBS record includes additional information of IA32_PERF_GLOBAL_STATUS, load latency data, and TSX tuning information. (See Section 21.3.6.2).
  - 0011B: PEBS record includes additional information of load latency data, TSX tuning information, TSC data, and the applicable counter field replaces IA32_PERF_GLOBAL_STATUS at offset 90H. (See Section 21.3.8.1.1).
  - 0100B: PEBS record contents are defined by elections in MSR_PEBS_DATA_CFG. (See Section 21.9.2.3). The PEBS Configuration Buffer is defined as shown in Figure 21-66 with Counter Reset fields allocation for 8 general-purpose counters followed by 4 fixed-function counters.

— 0101B: PEBS record contents are defined by elections in MSR_PEBS_DATA_CFG. (See Section 21.9.2.3). The PEBS Configuration Buffer is defined as shown in Figure 21-66 with Counter Reset fields allocation for 32 general-purpose counters followed by 16 fixed-function counters.

— 0110B: PEBS record contents are defined by elections in MSR_PEBS_DATA_CFG (see Figure 21-73 in Section 21.9.2.3) that is compatible with the previous MSR_PEBS_DATA_CFG (see Figure 21-72 in Section 21.9.2.3). The PEBS Config Buffer is defined as shown in Figure 21-72 with a Counter Reset fields allocation for 32 general-purpose counters followed by 16 fixed-function counters.

21.6.2.4.3 Writing a PEBS Interrupt Service Routine

The PEBS facilities share the same interrupt vector and interrupt service routine (called the DS ISR) with the Interrupt-based event sampling and BTS facilities. To handle PEBS interrupts, PEBS handler code must be included in the DS ISR. See Section 19.4.9.1, "64 Bit Format of the DS Save Area," for guidelines when writing the DS ISR.

The service routine can query MSR_PERF_GLOBAL_STATUS to determine which counter(s) caused of overflow condition. The service routine should clear overflow indicator by writing to MSR_PERF_GLOBAL_OVF_CTL.

A comparison of the sequence of requirements to program PEBS for processors based on Intel Core and Intel NetBurst microarchitectures is listed in Table 21-89.

Table 21-89. Requirements to Program PEBS

	For Processors based on Intel Core microarchitecture	For Processors based on Intel NetBurst microarchitecture
Verify PEBS support of processor/OS.	▪ IA32_MISC_ENABLE.EMON_AVAILABE (bit 7) is set. ▪ IA32_MISC_ENABLE.PEBS_UNAVAILABE (bit 12) is clear.	
Ensure counters are in disabled.	On initial set up or changing event configurations, write MSR_PERF_GLOBAL_CTRL MSR (38FH) with 0. On subsequent entries: ▪ Clear all counters if "Counter Freeze on PMI" is not enabled. ▪ If IA32_DebugCTL.Freeze is enabled, counters are automatically disabled. Counters MUST be stopped before writing.[1]	Optional
Disable PEBS.	Clear ENABLE PMC0 bit in IA32_PEBS_ENABLE MSR (3F1H).	Optional
Check overflow conditions.	Check MSR_PERF_GLOBAL_STATUS MSR (38EH) handle any overflow conditions.	Check OVF flag of each CCCR for overflow condition
Clear overflow status.	Clear MSR_PERF_GLOBAL_STATUS MSR (38EH) using IA32_PERF_GLOBAL_OVF_CTRL MSR (390H).	Clear OVF flag of each CCCR.
Write "sample-after" values.	Configure the counter(s) with the sample after value.	
Configure specific counter configuration MSR.	▪ Set local enable bit 22 - 1. ▪ Do NOT set local counter PMI/INT bit, bit 20 - 0. ▪ Event programmed must be PEBS capable.	▪ Set appropriate OVF_PMI bits - 1. ▪ Only CCCR for MSR_IQ_COUNTER4 support PEBS.
Allocate buffer for PEBS states.	Allocate a buffer in memory for the precise information.	
Program the IA32_DS_AREA MSR.	Program the IA32_DS_AREA MSR.	
Configure the PEBS buffer management records.	Configure the PEBS buffer management records in the DS buffer management area.	
Configure/Enable PEBS.	Set Enable PMC0 bit in IA32_PEBS_ENABLE MSR (3F1H).	Configure MSR_PEBS_ENABLE, MSR_PEBS_MATRIX_VERT, and MSR_PEBS_MATRIX_HORZ as needed.
Enable counters.	Set Enable bits in MSR_PERF_GLOBAL_CTRL MSR (38FH).	Set each CCCR enable bit 12 - 1.

NOTES:

1. Counters read while enabled are not guaranteed to be precise with event counts that occur in timing proximity to the RDMSR.

21.6.2.4.4 Re-configuring PEBS Facilities

When software needs to reconfigure PEBS facilities, it should allow a quiescent period between stopping the prior event counting and setting up a new PEBS event. The quiescent period is to allow any latent residual PEBS records to complete its capture at their previously specified buffer address (provided by IA32_DS_AREA).

21.6.3 Performance Monitoring (Processors Based on Intel NetBurst® Microarchitecture)

The performance monitoring mechanism provided in processors based on Intel NetBurst microarchitecture is different from that provided in the P6 family and Pentium processors. While the general concept of selecting, filtering, counting, and reading performance events through the WRMSR, RDMSR, and RDPMC instructions is unchanged, the setup mechanism and MSR layouts are incompatible with the P6 family and Pentium processor mechanisms. Also, the RDPMC instruction has been extended to support faster reading of counters and to read all performance counters available in processors based on Intel NetBurst microarchitecture.

The event monitoring mechanism consists of the following facilities:

- The IA32_MISC_ENABLE MSR, which indicates the availability in an Intel 64 or IA-32 processor of the performance monitoring and processor event-based sampling (PEBS) facilities.
- Event selection control (ESCR) MSRs for selecting events to be monitored with specific performance counters. The number available differs by family and model (43 to 45).
- 18 performance counter MSRs for counting events.
- 18 counter configuration control (CCCR) MSRs, with one CCCR associated with each performance counter. CCCRs sets up an associated performance counter for a specific method of counting.
- A debug store (DS) save area in memory for storing PEBS records.
- The IA32_DS_AREA MSR, which establishes the location of the DS save area.
- The debug store (DS) feature flag (bit 21) returned by the CPUID instruction, which indicates the availability of the DS mechanism.
- The MSR_PEBS_ENABLE MSR, which enables the PEBS facilities and replay tagging used in at-retirement event counting.
- A set of predefined events and event metrics that simplify the setting up of the performance counters to count specific events.

Table 21-90 lists the performance counters and their associated CCCRs, along with the ESCRs that select events to be counted for each performance counter. Predefined event metrics and events can be found at: https://perfmon-events.intel.com/.

NOTES:

1. MSR_IQ_ESCR0 and MSR_IQ_ESCR1 are available only on early processor builds (family 0FH, models 01H-02H). These MSRs are not available on later versions.

The types of events that can be counted with these performance monitoring facilities are divided into two classes: non-retirement events and at-retirement events.

- Non-retirement events are events that occur any time during instruction execution (such as bus transactions or cache transactions).
- At-retirement events are events that are counted at the retirement stage of instruction execution, which allows finer granularity in counting events and capturing machine state.

  The at-retirement counting mechanism includes facilities for tagging μops that have encountered a particular performance event during instruction execution. Tagging allows events to be sorted between those that occurred on an execution path that resulted in architectural state being committed at retirement as well as events that occurred on an execution path where the results were eventually cancelled and never committed to architectural state (such as, the execution of a mispredicted branch).

The Pentium 4 and Intel Xeon processor performance monitoring facilities support the three usage models described below. The first two models can be used to count both non-retirement and at-retirement events; the third model is used to count a subset of at-retirement events:

- **Event counting —** A performance counter is configured to count one or more types of events. While the counter is counting, software reads the counter at selected intervals to determine the number of events that have been counted between the intervals.
- **Interrupt-based event sampling —** A performance counter is configured to count one or more types of events and to generate an interrupt when it overflows. To trigger an overflow, the counter is preset to a modulus value that will cause the counter to overflow after a specific number of events have been counted.

  When the counter overflows, the processor generates a performance monitoring interrupt (PMI). The interrupt service routine for the PMI then records the return instruction pointer (RIP), resets the modulus, and restarts the counter. Code performance can be analyzed by examining the distribution of RIPs with a tool like the VTune™ Performance Analyzer.
- **Processor event-based sampling (PEBS) —** In PEBS, the processor writes a record of the architectural state of the processor to a memory buffer after the counter overflows. The records of architectural state provide additional information for use in performance tuning. Processor-based event sampling can be used to count only a subset of at-retirement events. PEBS captures more precise processor state information compared to interrupt based event sampling, because the latter need to use the interrupt service routine to re-construct the architectural states of processor.

The following sections describe the MSRs and data structures used for performance monitoring in the Pentium 4 and Intel Xeon processors.

21.6.3.1 ESCR MSRs

The 45 ESCR MSRs (see Table 21-90) allow software to select specific events to be countered. Each ESCR is usually associated with a pair of performance counters (see Table 21-90) and each performance counter has several ESCRs associated with it (allowing the events counted to be selected from a variety of events).

Figure 21-49 shows the layout of an ESCR MSR. The functions of the flags and fields are:

- **USR flag, bit 2 —** When set, events are counted when the processor is operating at a current privilege level (CPL) of 1, 2, or 3. These privilege levels are generally used by application code and unprotected operating system code.
- **OS flag, bit 3 —** When set, events are counted when the processor is operating at CPL of 0. This privilege level is generally reserved for protected operating system code. (When both the OS and USR flags are set, events are counted at all privilege levels.)

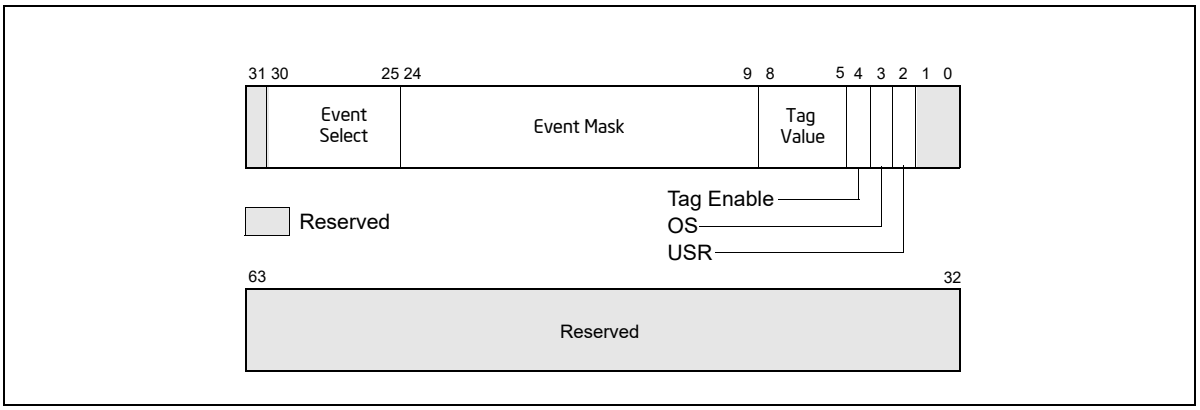

Figure 21-49. Event Selection Control Register (ESCR) for Pentium 4 and Intel® Xeon® Processors without Intel HT Technology Support

- **Tag enable, bit 4 —** When set, enables tagging of μops to assist in at-retirement event counting; when clear, disables tagging. See Section 21.6.3.6, "At-Retirement Counting."

- **Tag value field, bits 5 through 8 —** Selects a tag value to associate with a μop to assist in at-retirement event counting.
- **Event mask field, bits 9 through 24 —** Selects events to be counted from the event class selected with the event select field.
- **Event select field, bits 25 through 30) —** Selects a class of events to be counted. The events within this class that are counted are selected with the event mask field.

When setting up an ESCR, the event select field is used to select a specific class of events to count, such as retired branches. The event mask field is then used to select one or more of the specific events within the class to be counted. For example, when counting retired branches, four different events can be counted: branch not taken predicted, branch not taken mispredicted, branch taken predicted, and branch taken mispredicted. The OS and USR flags allow counts to be enabled for events that occur when operating system code and/or application code are being executed. If neither the OS nor USR flag is set, no events will be counted.

The ESCRs are initialized to all 0s on reset. The flags and fields of an ESCR are configured by writing to the ESCR using the WRMSR instruction. Table 21-90 gives the addresses of the ESCR MSRs.

Writing to an ESCR MSR does not enable counting with its associated performance counter; it only selects the event or events to be counted. The CCCR for the selected performance counter must also be configured. Configuration of the CCCR includes selecting the ESCR and enabling the counter.

21.6.3.2 Performance Counters

The performance counters in conjunction with the counter configuration control registers (CCCRs) are used for filtering and counting the events selected by the ESCRs. Processors based on Intel NetBurst microarchitecture provide 18 performance counters organized into 9 pairs. A pair of performance counters is associated with a particular subset of events and ESCR's (see Table 21-90). The counter pairs are partitioned into four groups:

- The BPU group, includes two performance counter pairs:
  - MSR_BPU_COUNTER0 and MSR_BPU_COUNTER1.
  - MSR_BPU_COUNTER2 and MSR_BPU_COUNTER3.
- The MS group, includes two performance counter pairs:
  - MSR_MS_COUNTER0 and MSR_MS_COUNTER1.
  - MSR_MS_COUNTER2 and MSR_MS_COUNTER3.
- The FLAME group, includes two performance counter pairs:
  - MSR_FLAME_COUNTER0 and MSR_FLAME_COUNTER1.
  - MSR_FLAME_COUNTER2 and MSR_FLAME_COUNTER3.
- The IQ group, includes three performance counter pairs:
  - MSR_IQ_COUNTER0 and MSR_IQ_COUNTER1.
  - MSR_IQ_COUNTER2 and MSR_IQ_COUNTER3.
  - MSR_IQ_COUNTER4 and MSR_IQ_COUNTER5.

The MSR_IQ_COUNTER4 counter in the IQ group provides support for the PEBS.

Alternate counters in each group can be cascaded: the first counter in one pair can start the first counter in the second pair and vice versa. A similar cascading is possible for the second counters in each pair. For example, within the BPU group of counters, MSR_BPU_COUNTER0 can start MSR_BPU_COUNTER2 and vice versa, and MSR_BPU_COUNTER1 can start MSR_BPU_COUNTER3 and vice versa (see Section 21.6.3.5.6, "Cascading Counters"). The cascade flag in the CCCR register for the performance counter enables the cascading of counters.

Each performance counter is 40-bits wide (see Figure 21-50). The RDPMC instruction is intended to allow reading of either the full counter-width (40-bits) or, if ECX[31] is set to 1, the low 32-bits of the counter. Reading the low 32-bits is faster than reading the full counter width and is appropriate in situations where the count is small enough to be contained in 32 bits. In such cases, counter bits 31:0 are written to EAX, while 0 is written to EDX.

The RDPMC instruction can be used by programs or procedures running at any privilege level and in virtual-8086 mode to read these counters. The PCE flag in control register CR4 (bit 8) allows the use of this instruction to be restricted to only programs and procedures running at privilege level 0.

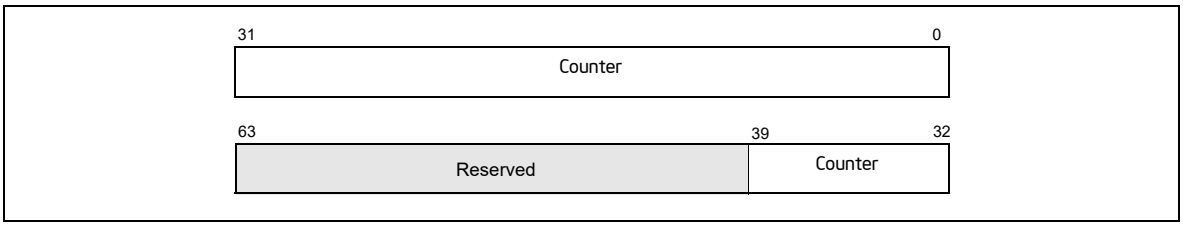

Figure 21-50. Performance Counter (Pentium 4 and Intel® Xeon® Processors)

The RDPMC instruction is not serializing or ordered with other instructions. Thus, it does not necessarily wait until all previous instructions have been executed before reading the counter. Similarly, subsequent instructions may begin execution before the RDPMC instruction operation is performed.

Only the operating system, executing at privilege level 0, can directly manipulate the performance counters, using the RDMSR and WRMSR instructions. A secure operating system would clear the PCE flag during system initialization to disable direct user access to the performance-monitoring counters, but provide a user-accessible programming interface that emulates the RDPMC instruction.

Some uses of the performance counters require the counters to be preset before counting begins (that is, before the counter is enabled). This can be accomplished by writing to the counter using the WRMSR instruction. To set a counter to a specified number of counts before overflow, enter a 2s complement negative integer in the counter. The counter will then count from the preset value up to -1 and overflow. Writing to a performance counter in a Pentium 4 or Intel Xeon processor with the WRMSR instruction causes all 40 bits of the counter to be written.

21.6.3.3 CCCR MSRs

Each of the 18 performance counters has one CCCR MSR associated with it (see Table 21-90). The CCCRs control the filtering and counting of events as well as interrupt generation. Figure 21-51 shows the layout of an CCCR MSR. The functions of the flags and fields are as follows:

- **Enable flag, bit 12 —** When set, enables counting; when clear, the counter is disabled. This flag is cleared on reset.
- **ESCR select field, bits 13 through 15 —** Identifies the ESCR to be used to select events to be counted with the counter associated with the CCCR.
- **Compare flag, bit 18 —** When set, enables filtering of the event count; when clear, disables filtering. The filtering method is selected with the threshold, complement, and edge flags.
- **Complement flag, bit 19 —** Selects how the incoming event count is compared with the threshold value. When set, event counts that are less than or equal to the threshold value result in a single count being delivered to the performance counter; when clear, counts greater than the threshold value result in a count being delivered to the performance counter (see Section 21.6.3.5.2, "Filtering Events"). The complement flag is not active unless the compare flag is set.
- **Threshold field, bits 20 through 23 —** Selects the threshold value to be used for comparisons. The processor examines this field only when the compare flag is set, and uses the complement flag setting to determine the type of threshold comparison to be made. The useful range of values that can be entered in this field depend on the type of event being counted (see Section 21.6.3.5.2, "Filtering Events").
- **Edge flag, bit 24 —** When set, enables rising edge (false-to-true) edge detection of the threshold comparison output for filtering event counts; when clear, rising edge detection is disabled. This flag is active only when the compare flag is set.

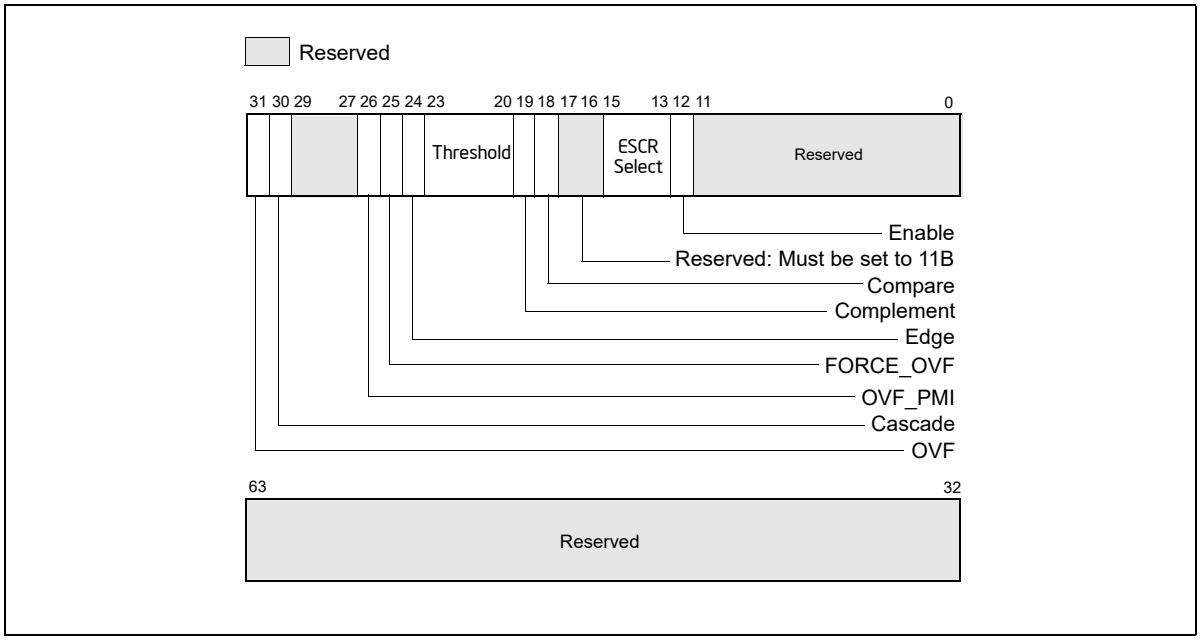

Figure 21-51. Counter Configuration Control Register (CCCR)

- **FORCE_OVF flag, bit 25 —** When set, forces a counter overflow on every counter increment; when clear, overflow only occurs when the counter actually overflows.
- **OVF_PMI flag, bit 26 —** When set, causes a performance monitor interrupt (PMI) to be generated when the counter overflows occurs; when clear, disables PMI generation. Note that the PMI is generated on the next event count after the counter has overflowed.
- **Cascade flag, bit 30 —** When set, enables counting on one counter of a counter pair when its alternate counter in the other the counter pair in the same counter group overflows (see Section 21.6.3.2, "Performance Counters," for further details); when clear, disables cascading of counters.
- **OVF flag, bit 31 —** Indicates that the counter has overflowed when set. This flag is a sticky flag that must be explicitly cleared by software.

The CCCRs are initialized to all 0s on reset.

The events that an enabled performance counter actually counts are selected and filtered by the following flags and fields in the ESCR and CCCR registers and in the qualification order given:

1. The event select and event mask fields in the ESCR select a class of events to be counted and one or more event types within the class, respectively.
2. The OS and USR flags in the ESCR selected the privilege levels at which events will be counted.
3. The ESCR select field of the CCCR selects the ESCR. Since each counter has several ESCRs associated with it, one ESCR must be chosen to select the classes of events that may be counted.
4. The compare and complement flags and the threshold field of the CCCR select an optional threshold to be used in qualifying an event count.
5. The edge flag in the CCCR allows events to be counted only on rising-edge transitions.

The qualification order in the above list implies that the filtered output of one "stage" forms the input for the next. For instance, events filtered using the privilege level flags can be further qualified by the compare and complement flags and the threshold field, and an event that matched the threshold criteria, can be further qualified by edge detection.

The uses of the flags and fields in the CCCRs are discussed in greater detail in Section 21.6.3.5, "Programming the Performance Counters for Non-Retirement Events."

21.6.3.4 Debug Store (DS) Mechanism

The debug store (DS) mechanism was introduced with processors based on Intel NetBurst microarchitecture to allow various types of information to be collected in memory-resident buffers for use in debugging and tuning programs. The DS mechanism can be used to collect two types of information: branch records and processor event-based sampling (PEBS) records. The availability of the DS mechanism in a processor is indicated with the DS feature flag (bit 21) returned by the CPUID instruction.

See Section 19.4.5, "Branch Trace Store (BTS)," and Section 21.6.3.8, "Processor Event-Based Sampling (PEBS)," for a description of these facilities. Records collected with the DS mechanism are saved in the DS save area. See Section 19.4.9, "BTS and DS Save Area."

21.6.3.5 Programming the Performance Counters for Non-Retirement Events

The basic steps to program a performance counter and to count events include the following:

1. Select the event or events to be counted.
2. For each event, select an ESCR that supports the event.
3. Match the CCCR Select value and ESCR name to a value listed in Table 21-90; select a CCCR and performance counter.
4. Set up an ESCR for the specific event or events to be counted and the privilege levels at which they are to be counted.
5. Set up the CCCR for the performance counter by selecting the ESCR and the desired event filters.
6. Set up the CCCR for optional cascading of event counts, so that when the selected counter overflows its alternate counter starts.
7. Set up the CCCR to generate an optional performance monitor interrupt (PMI) when the counter overflows. If PMI generation is enabled, the local APIC must be set up to deliver the interrupt to the processor and a handler for the interrupt must be in place.
8. Enable the counter to begin counting.

21.6.3.5.1 Selecting Events to Count

There is a set of at-retirement events for processors based on Intel NetBurst microarchitecture. For each event, setup information is provided. Table 21-91 gives an example of one of the events.

Table 21-91. Event Example

Event Name	Event Parameters	Parameter Value	Description
branch_retired			Counts the retirement of a branch. Specify one or more mask bits to select any combination of branch taken, not-taken, predicted, and mispredicted.
	ESCR restrictions	MSR_CRU_ESCR2 MSR_CRU_ESCR3	See Table 15-3 for the addresses of the ESCR MSRs.
	Counter numbers per ESCR	ESCR2: 12, 13, 16 ESCR3: 14, 15, 17	The counter numbers associated with each ESCR are provided. The performance counters and corresponding CCCRs can be obtained from Table 15-3.
	ESCR Event Select	06H	ESCR[31:25]
	ESCR Event Mask	 Bit 0: MMNP 1: MMNM 2: MMTP 3: MMTM	ESCR[24:9] Branch Not-taken Predicted Branch Not-taken Mispredicted Branch Taken Predicted Branch Taken Mispredicted
	CCCR Select	05H	CCCR[15:13]

Table 21-91. Event Example (Contd.)

Event Name	Event Parameters	Parameter Value	Description
	Event Specific Notes		P6: EMON_BR_INST_RETIRED
	Can Support PEBS	No	
	Requires Additional MSRs for Tagging	No	

Event Parameters are described below.

- **ESCR restrictions —** Lists the ESCRs that can be used to program the event. Typically only one ESCR is needed to count an event.
- **Counter numbers per ESCR —** Lists which performance counters are associated with each ESCR. Table 21-90 gives the name of the counter and CCCR for each counter number. Typically only one counter is needed to count the event.
- **ESCR event select —** Gives the value to be placed in the event select field of the ESCR to select the event.
- **ESCR event mask —** Gives the value to be placed in the Event Mask field of the ESCR to select sub-events to be counted. The parameter value column defines the documented bits with relative bit position offset starting from 0, where the absolute bit position of relative offset 0 is bit 9 of the ESCR. All undocumented bits are reserved and should be set to 0.
- **CCCR select —** Gives the value to be placed in the ESCR select field of the CCCR associated with the counter to select the ESCR to be used to define the event. This value is not the address of the ESCR; it is the number of the ESCR from the Number column in Table 21-90.
- **Event specific notes —** Gives additional information about the event, such as the name of the same or a similar event defined for the P6 family processors.
- **Can support PEBS —** Indicates if PEBS is supported for the event (only supplied for at-retirement events).
- **Requires additional MSR for tagging —** Indicates which if any additional MSRs must be programmed to count the events (only supplied for the at-retirement events).

NOTE

The performance-monitoring events found at https://perfmon-events.intel.com/ are intended to be used as guides for performance tuning. The counter values reported are not guaranteed to be absolutely accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

The following procedure shows how to set up a performance counter for basic counting; that is, the counter is set up to count a specified event indefinitely, wrapping around whenever it reaches its maximum count. This procedure is continued through the following four sections.

An event to be counted can be selected as follows:

1. Select the event to be counted.
2. Select the ESCR to be used to select events to be counted from the ESCRs field.
3. Select the number of the counter to be used to count the event from the Counter Numbers Per ESCR field.
4. Determine the name of the counter and the CCCR associated with the counter, and determine the MSR addresses of the counter, CCCR, and ESCR from Table 21-90.
5. Use the WRMSR instruction to write the ESCR Event Select and ESCR Event Mask values into the appropriate fields in the ESCR. At the same time set or clear the USR and OS flags in the ESCR as desired.
6. Use the WRMSR instruction to write the CCCR Select value into the appropriate field in the CCCR.

NOTE

Typically all the fields and flags of the CCCR will be written with one WRMSR instruction; however, in this procedure, several WRMSR writes are used to more clearly demonstrate the uses of the various CCCR fields and flags.

This setup procedure is continued in the next section, Section 21.6.3.5.2, "Filtering Events."

21.6.3.5.2 Filtering Events

Each counter receives up to 4 input lines from the processor hardware from which it is counting events. The counter treats these inputs as binary inputs (input 0 has a value of 1, input 1 has a value of 2, input 3 has a value of 4, and input 3 has a value of 8). When a counter is enabled, it adds this binary input value to the counter value on each clock cycle. For each clock cycle, the value added to the counter can then range from 0 (no event) to 15.

For many events, only the 0 input line is active, so the counter is merely counting the clock cycles during which the 0 input is asserted. However, for some events two or more input lines are used. Here, the counters threshold setting can be used to filter events. The compare, complement, threshold, and edge fields control the filtering of counter increments by input value.

If the compare flag is set, then a "greater than" or a "less than or equal to" comparison of the input value vs. a threshold value can be made. The complement flag selects "less than or equal to" (flag set) or "greater than" (flag clear). The threshold field selects a threshold value of from 0 to 15. For example, if the complement flag is cleared and the threshold field is set to 6, than any input value of 7 or greater on the 4 inputs to the counter will cause the counter to be incremented by 1, and any value less than 7 will cause an increment of 0 (or no increment) of the counter. Conversely, if the complement flag is set, any value from 0 to 6 will increment the counter and any value from 7 to 15 will not increment the counter. Note that when a threshold condition has been satisfied, the input to the counter is always 1, not the input value that is presented to the threshold filter.

The edge flag provides further filtering of the counter inputs when a threshold comparison is being made. The edge flag is only active when the compare flag is set. When the edge flag is set, the resulting output from the threshold filter (a value of 0 or 1) is used as an input to the edge filter. Each clock cycle, the edge filter examines the last and current input values and sends a count to the counter only when it detects a "rising edge" event; that is, a false-to-true transition. Figure 21-52 illustrates rising edge filtering.

The following procedure shows how to configure a CCCR to filter events using the threshold filter and the edge filter. This procedure is a continuation of the setup procedure introduced in Section 21.6.3.5.1, "Selecting Events to Count."

7. (Optional) To set up the counter for threshold filtering, use the WRMSR instruction to write values in the CCCR compare and complement flags and the threshold field:
   - Set the compare flag.
   - Set or clear the complement flag for less than or equal to or greater than comparisons, respectively.
   - Enter a value from 0 to 15 in the threshold field.
8. (Optional) Select rising edge filtering by setting the CCCR edge flag.

This setup procedure is continued in the next section, Section 21.6.3.5.3, "Starting Event Counting."

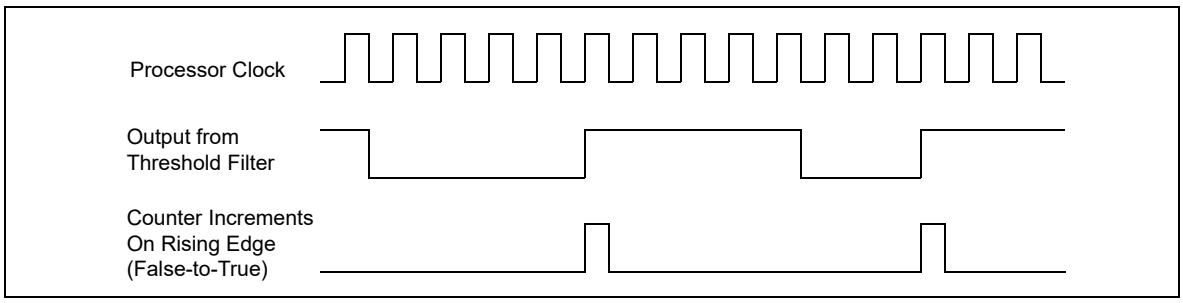

Figure 21-52. Effects of Edge Filtering

21.6.3.5.3 Starting Event Counting

Event counting by a performance counter can be initiated in either of two ways. The typical way is to set the enable flag in the counter's CCCR. Following the instruction to set the enable flag, event counting begins and continues until it is stopped (see Section 21.6.3.5.5, "Halting Event Counting").

The following procedural step shows how to start event counting. This step is a continuation of the setup procedure introduced in Section 21.6.3.5.2, "Filtering Events."

9. To start event counting, use the WRMSR instruction to set the CCCR enable flag for the performance counter.

This setup procedure is continued in the next section, Section 21.6.3.5.4, "Reading a Performance Counter's Count."

The second way that a counter can be started by using the cascade feature. Here, the overflow of one counter automatically starts its alternate counter (see Section 21.6.3.5.6, "Cascading Counters").

21.6.3.5.4 Reading a Performance Counter's Count

Performance counters can be read using either the RDPMC or RDMSR instructions. The enhanced functions of the RDPMC instruction (including fast read) are described in Section 21.6.3.2, "Performance Counters." These instructions can be used to read a performance counter while it is counting or when it is stopped.

The following procedural step shows how to read the event counter. This step is a continuation of the setup procedure introduced in Section 21.6.3.5.3, "Starting Event Counting."

10. To read a performance counters current event count, execute the RDPMC instruction with the counter number obtained from Table 21-90 used as an operand.

This setup procedure is continued in the next section, Section 21.6.3.5.5, "Halting Event Counting."

21.6.3.5.5 Halting Event Counting

After a performance counter has been started (enabled), it continues counting indefinitely. If the counter overflows (goes one count past its maximum count), it wraps around and continues counting. When the counter wraps around, it sets its OVF flag to indicate that the counter has overflowed. The OVF flag is a sticky flag that indicates that the counter has overflowed at least once since the OVF bit was last cleared.

To halt counting, the CCCR enable flag for the counter must be cleared.

The following procedural step shows how to stop event counting. This step is a continuation of the setup procedure introduced in Section 21.6.3.5.4, "Reading a Performance Counter's Count."

11. To stop event counting, execute a WRMSR instruction to clear the CCCR enable flag for the performance counter.

To halt a cascaded counter (a counter that was started when its alternate counter overflowed), either clear the Cascade flag in the cascaded counter's CCCR MSR or clear the OVF flag in the alternate counter's CCCR MSR.

21.6.3.5.6 Cascading Counters

As described in Section 21.6.3.2, "Performance Counters," eighteen performance counters are implemented in pairs. Nine pairs of counters and associated CCCRs are further organized as four blocks: BPU, MS, FLAME, and IQ (see Table 21-90). The first three blocks contain two pairs each. The IQ block contains three pairs of counters (12 through 17) with associated CCCRs (MSR_IQ_CCCR0 through MSR_IQ_CCCR5).

The first 8 counter pairs (0 through 15) can be programmed using ESCRs to detect performance monitoring events. Pairs of ESCRs in each of the four blocks allow many different types of events to be counted. The cascade flag in the CCCR MSR allows nested monitoring of events to be performed by cascading one counter to a second counter located in another pair in the same block (see Figure 21-51 for the location of the flag).

Counters 0 and 1 form the first pair in the BPU block. Either counter 0 or 1 can be programmed to detect an event via MSR_MO B_ESCR0. Counters 0 and 2 can be cascaded in any order, as can counters 1 and 3. It's possible to set up 4 counters in the same block to cascade on two pairs of independent events. The pairing described also applies to subsequent blocks. Since the IQ PUB has two extra counters, cascading operates somewhat differently if 16 and 17 are involved. In the IQ block, counter 16 can only be cascaded from counter 14 (not from 12); counter 14

cannot be cascaded from counter 16 using the CCCR cascade bit mechanism. Similar restrictions apply to counter 17.

Example 21-1. Counting Events

Assume a scenario where counter X is set up to count 200 occurrences of event A; then counter Y is set up to count 400 occurrences of event B. Each counter is set up to count a specific event and overflow to the next counter. In the above example, counter X is preset for a count of -200 and counter Y for a count of -400; this setup causes the counters to overflow on the 200th and 400th counts respectively.

Continuing this scenario, counter X is set up to count indefinitely and wraparound on overflow. This is described in the basic performance counter setup procedure that begins in Section 21.6.3.5.1, "Selecting Events to Count." Counter Y is set up with the cascade flag in its associated CCCR MSR set to 1 and its enable flag set to 0.

To begin the nested counting, the enable bit for the counter X is set. Once enabled, counter X counts until it overflows. At this point, counter Y is automatically enabled and begins counting. Thus counter X overflows after 200 occurrences of event A. Counter Y then starts, counting 400 occurrences of event B before overflowing. When performance counters are cascaded, the counter Y would typically be set up to generate an interrupt on overflow. This is described in Section 21.6.3.5.8, "Generating an Interrupt on Overflow."

The cascading counters mechanism can be used to count a single event. The counting begins on one counter then continues on the second counter after the first counter overflows. This technique doubles the number of event counts that can be recorded, since the contents of the two counters can be added together.

21.6.3.5.7 EXTENDED CASCADING

Extended cascading is a model-specific feature in the Intel NetBurst microarchitecture with CPUID DisplayFamily_DisplayModel 0F_02, 0F_03, 0F_04, 0F_06. This feature uses bit 11 in CCCRs associated with the IQ block. See Table 21-92.

Table 21-92. CCR Names and Bit Positions

CCCR Name:Bit Position	Bit Name	Description
MSR_IQ_CCCR1|2:11	Reserved	
MSR_IQ_CCCR0:11	CASCNT4INTO0	Allow counter 4 to cascade into counter 0
MSR_IQ_CCCR3:11	CASCNT5INTO3	Allow counter 5 to cascade into counter 3
MSR_IQ_CCCR4:11	CASCNT5INTO4	Allow counter 5 to cascade into counter 4
MSR_IQ_CCCR5:11	CASCNT4INTO5	Allow counter 4 to cascade into counter 5

The extended cascading feature can be adapted to the Interrupt based sampling usage model for performance monitoring. However, it is known that performance counters do not generate PMI in cascade mode or extended cascade mode due to an erratum. This erratum applies to processors with CPUID DisplayFamily_DisplayModel signature of 0F_02. For processors with CPUID DisplayFamily_DisplayModel signature of 0F_00 and 0F_01, the erratum applies to processors with stepping encoding greater than 09H.

Counters 16 and 17 in the IQ block are frequently used in processor event-based sampling or at-retirement counting of events indicating a stalled condition in the pipeline. Neither counter 16 or 17 can initiate the cascading of counter pairs using the cascade bit in a CCCR.

Extended cascading permits performance monitoring tools to use counters 16 and 17 to initiate cascading of two counters in the IQ block. Extended cascading from counter 16 and 17 is conceptually similar to cascading other counters, but instead of using CASCADE bit of a CCCR, one of the four CASCNTxINTOy bits is used.

Example 21-2. Scenario for Extended Cascading

A usage scenario for extended cascading is to sample instructions retired on logical processor 1 after the first 4096 instructions retired on logical processor 0. A procedure to program extended cascading in this scenario is outlined below:

1. Write the value 0 to counter 12.
2. Write the value 04000603H to MSR_CRU_ESCR0 (corresponding to selecting the NBOGNTAG and NBOGTAG event masks with qualification restricted to logical processor 1).
3. Write the value 04038800H to MSR_IQ_CCCR0. This enables CASCNT4INTO0 and OVF_PMI. An ISR can sample on instruction addresses in this case (do not set ENABLE, or CASCADE).
4. Write the value FFFFF000H into counter 16.1.
5. Write the value 0400060CH to MSR_CRU_ESCR2 (corresponding to selecting the NBOGNTAG and NBOGTAG event masks with qualification restricted to logical processor 0).
6. Write the value 00039000H to MSR_IQ_CCCR4 (set ENABLE bit, but not OVF_PMI).

Another use for cascading is to locate stalled execution in a multithreaded application. Assume MOB replays in thread B cause thread A to stall. Getting a sample of the stalled execution in this scenario could be accomplished by:

1. Set up counter B to count MOB replays on thread B.
2. Set up counter A to count resource stalls on thread A; set its force overflow bit and the appropriate CASCNTx-INTOy bit.
3. Use the performance monitoring interrupt to capture the program execution data of the stalled thread.

21.6.3.5.8 Generating an Interrupt on Overflow

Any performance counter can be configured to generate a performance monitor interrupt (PMI) if the counter overflows. The PMI interrupt service routine can then collect information about the state of the processor or program when overflow occurred. This information can then be used with a tool like the Intel® VTune™ Performance Analyzer to analyze and tune program performance.

To enable an interrupt on counter overflow, the OVR_PMI flag in the counter's associated CCCR MSR must be set. When overflow occurs, a PMI is generated through the local APIC. (Here, the performance counter entry in the local vector table [LVT] is set up to deliver the interrupt generated by the PMI to the processor.)

The PMI service routine can use the OVF flag to determine which counter overflowed when multiple counters have been configured to generate PMIs. Also, note that these processors mask PMIs upon receiving an interrupt. Clear this condition before leaving the interrupt handler.

When generating interrupts on overflow, the performance counter being used should be preset to value that will cause an overflow after a specified number of events are counted plus 1. The simplest way to select the preset value is to write a negative number into the counter, as described in Section 21.6.3.5.6, "Cascading Counters." Here, however, if an interrupt is to be generated after 100 event counts, the counter should be preset to minus 100 plus 1 (-100 + 1), or -99. The counter will then overflow after it counts 99 events and generate an interrupt on the next (100th) event counted. The difference of 1 for this count enables the interrupt to be generated immediately after the selected event count has been reached, instead of waiting for the overflow to be propagation through the counter.

Because of latency in the microarchitecture between the generation of events and the generation of interrupts on overflow, it is sometimes difficult to generate an interrupt close to an event that caused it. In these situations, the FORCE_OVF flag in the CCCR can be used to improve reporting. Setting this flag causes the counter to overflow on every counter increment, which in turn triggers an interrupt after every counter increment.

21.6.3.5.9 Counter Usage Guideline

There are some instances where the user must take care to configure counting logic properly, so that it is not powered down. To use any ESCR, even when it is being used just for tagging, (any) one of the counters that the particular ESCR (or its paired ESCR) can be connected to should be enabled. If this is not done, 0 counts may result. Likewise, to use any counter, there must be some event selected in a corresponding ESCR (other than no_event, which generally has a select value of 0).

21.6.3.6 At-Retirement Counting

At-retirement counting provides a means counting only events that represent work committed to architectural state and ignoring work that was performed speculatively and later discarded.

One example of this speculative activity is branch prediction. When a branch misprediction occurs, the results of instructions that were decoded and executed down the mispredicted path are canceled. If a performance counter was set up to count all executed instructions, the count would include instructions whose results were canceled as well as those whose results committed to architectural state.

To provide finer granularity in event counting in these situations, the performance monitoring facilities provided in the Pentium 4 and Intel Xeon processors provide a mechanism for tagging events and then counting only those tagged events that represent committed results. This mechanism is called "at-retirement counting."

There are predefined at-retirement events and event metrics that can be used to for tagging events when using at retirement counting. The following terminology is used in describing at-retirement counting:

- **Bogus, non-bogus, retire —** In at-retirement event descriptions, the term "bogus" refers to instructions or μops that must be canceled because they are on a path taken from a mispredicted branch. The terms "retired" and "non-bogus" refer to instructions or μops along the path that results in committed architectural state changes as required by the program being executed. Thus instructions and μops are either bogus or non-bogus, but not both. Several of the Pentium 4 and Intel Xeon processors' performance monitoring events (such as, Instruction_Retired and Uops_Retired) can count instructions or μops that are retired based on the characterization of bogus" versus non-bogus.
- **Tagging —** Tagging is a means of marking μops that have encountered a particular performance event so they can be counted at retirement. During the course of execution, the same event can happen more than once per μop and a direct count of the event would not provide an indication of how many μops encountered that event.

  The tagging mechanisms allow a μop to be tagged once during its lifetime and thus counted once at retirement. The retired suffix is used for performance metrics that increment a count once per μop, rather than once per event. For example, a μop may encounter a cache miss more than once during its life time, but a "Miss Retired" metric (that counts the number of retired μops that encountered a cache miss) will increment only once for that μop. A "Miss Retired" metric would be useful for characterizing the performance of the cache hierarchy for a particular instruction sequence. Details of various performance metrics and how these can be constructed using the Pentium 4 and Intel Xeon processors performance events are provided in the Intel® 64 and IA-32 Architectures Optimization Reference Manual (see Section 1.4, "Related Literature").
- **Replay —** To maximize performance for the common case, the Intel NetBurst microarchitecture aggressively schedules μops for execution before all the conditions for correct execution are guaranteed to be satisfied. In the event that all of these conditions are not satisfied, μops must be reissued. The mechanism that the Pentium 4 and Intel Xeon processors use for this reissuing of μops is called replay. Some examples of replay causes are cache misses, dependence violations, and unforeseen resource constraints. In normal operation, some number of replays is common and unavoidable. An excessive number of replays is an indication of a performance problem.
- **Assist —** When the hardware needs the assistance of microcode to deal with some event, the machine takes an assist. One example of this is an underflow condition in the input operands of a floating-point operation. The hardware must internally modify the format of the operands in order to perform the computation. Assists clear the entire machine of μops before they begin and are costly.

21.6.3.6.1 Using At-Retirement Counting

Processors based on Intel NetBurst microarchitecture allow counting both events and μops that encountered a specified event. For a subset of the at-retirement events, a μop may be tagged when it encounters that event. The tagging mechanisms can be used in Interrupt-based event sampling, and a subset of these mechanisms can be used in PEBS. There are four independent tagging mechanisms, and each mechanism uses a different event to count μops tagged with that mechanism:

- **Front-end tagging —** This mechanism pertains to the tagging of μops that encountered front-end events (for example, trace cache and instruction counts) and are counted with the Front_end_event event.
- **Execution tagging —** This mechanism pertains to the tagging of μops that encountered execution events (for example, instruction types) and are counted with the Execution_Event event.

- **Replay tagging —** This mechanism pertains to tagging of μops whose retirement is replayed (for example, a cache miss) and are counted with the Replay_event event. Branch mispredictions are also tagged with this mechanism.
- **No tags —** This mechanism does not use tags. It uses the Instr_retired and the Uops_ retired events.

Each tagging mechanism is independent from all others; that is, a μop that has been tagged using one mechanism will not be detected with another mechanism's tagged-μop detector. For example, if μops are tagged using the front-end tagging mechanisms, the Replay_event will not count those as tagged μops unless they are also tagged using the replay tagging mechanism. However, execution tags allow up to four different types of μops to be counted at retirement through execution tagging.

The independence of tagging mechanisms does not hold when using PEBS. When using PEBS, only one tagging mechanism should be used at a time.

Certain kinds of μops that cannot be tagged, including I/O, uncacheable and locked accesses, returns, and far transfers.

There are performance monitoring events that support at-retirement counting: specifically the Front_end_event, Execution_event, Replay_event, Inst_retired, and Uops_retired events. The following sections describe the tagging mechanisms for using these events to tag μop and count tagged μops.

21.6.3.6.2 Tagging Mechanism for Front_end_event

The Front_end_event counts μops that have been tagged as encountering any of the following events:

- **μop decode events —** Tagging μops for μop decode events requires specifying bits in the ESCR associated with the performance-monitoring event, Uop_type.
- **Trace cache events —** Tagging μops for trace cache events may require specifying certain bits in the MSR_TC_PRECISE_EVENT MSR.

The MSRs that are supported by the front-end tagging mechanism must be set and one or both of the NBOGUS and BOGUS bits in the Front_end_event event mask must be set to count events. None of the events currently supported requires the use of the MSR_TC_PRECISE_EVENT MSR.

21.6.3.6.3 Tagging Mechanism For Execution_event

The execution tagging mechanism differs from other tagging mechanisms in how it causes tagging. One *upstream* ESCR is used to specify an event to detect and to specify a tag value (bits 5 through 8) to identify that event. A second *downstream* ESCR is used to detect μops that have been tagged with that tag value identifier using Execution_event for the event selection.

The upstream ESCR that counts the event must have its tag enable flag (bit 4) set and must have an appropriate tag value mask entered in its tag value field. The 4-bit tag value mask specifies which of tag bits should be set for a particular μop. The value selected for the tag value should coincide with the event mask selected in the downstream ESCR. For example, if a tag value of 1 is set, then the event mask of NBOGUS0 should be enabled, correspondingly in the downstream ESCR. The downstream ESCR detects and counts tagged μops. The normal (not tag value) mask bits in the downstream ESCR specify which tag bits to count. If any one of the tag bits selected by the mask is set, the related counter is incremented by one. The tag enable and tag value bits are irrelevant for the downstream ESCR used to select the Execution_event.

The four separate tag bits allow the user to simultaneously but distinctly count up to four execution events at retirement. (This applies for interrupt-based event sampling. There are additional restrictions for PEBS as noted in Section 21.6.3.8.3, "Setting Up the PEBS Buffer.") It is also possible to detect or count combinations of events by setting multiple tag value bits in the upstream ESCR or multiple mask bits in the downstream ESCR. For example, use a tag value of 3H in the upstream ESCR and use NBOGUS0/NBOGUS1 in the downstream ESCR event mask.

21.6.3.7 Tagging Mechanism for Replay_event

The replay mechanism enables tagging of μops for a subset of all replays before retirement. Use of the replay mechanism requires selecting the type of μop that may experience the replay in the MSR_PEBS_MATRIX_VERT MSR and selecting the type of event in the MSR_PEBS_ENABLE MSR. Replay tagging must also be enabled with the UOP_Tag flag (bit 24) in the MSR_PEBS_ENABLE MSR.

The replay tags defined in Table A-5 also enable Processor Event-Based Sampling (PEBS, see Section 19.4.9). Each of these replay tags can also be used in normal sampling by not setting Bit 24 nor Bit 25 in IA_32_PEBS_ENABLE_MSR. Each of these metrics requires that the Replay_Event be used to count the tagged μops.

21.6.3.8 Processor Event-Based Sampling (PEBS)

The debug store (DS) mechanism in processors based on Intel NetBurst microarchitecture allow two types of information to be collected for use in debugging and tuning programs: PEBS records and BTS records. See Section 19.4.5, "Branch Trace Store (BTS)," for a description of the BTS mechanism.

PEBS permits the saving of precise architectural information associated with one or more performance events in the precise event records buffer, which is part of the DS save area (see Section 19.4.9, "BTS and DS Save Area"). To use this mechanism, a counter is configured to overflow after it has counted a preset number of events. After the counter overflows, the processor copies the current state of the general-purpose and EFLAGS registers and instruction pointer into a record in the precise event records buffer. The processor then resets the count in the performance counter and restarts the counter. When the precise event records buffer is nearly full, an interrupt is generated, allowing the precise event records to be saved. A circular buffer is not supported for precise event records.

PEBS is supported only for a subset of the at-retirement events: Execution_event, Front_end_event, and Replay_event. Also, PEBS can only be carried out using the one performance counter, the MSR_IQ_COUNTER4 MSR.

In processors based on Intel Core microarchitecture, a similar PEBS mechanism is also supported using IA32_PMC0 and IA32_PERFEVTSEL0 MSRs (See Section 21.6.2.4).

21.6.3.8.1 Detection of the Availability of the PEBS Facilities

The DS feature flag (bit 21) returned by the CPUID instruction indicates (when set) the availability of the DS mechanism in the processor, which supports the PEBS (and BTS) facilities. When this bit is set, the following PEBS facilities are available:

- The PEBS_UNAVAILABLE flag in the IA32_MISC_ENABLE MSR indicates (when clear) the availability of the PEBS facilities, including the MSR_PEBS_ENABLE MSR.
- The enable PEBS flag (bit 24) in the MSR_PEBS_ENABLE MSR allows PEBS to be enabled (set) or disabled (clear).
- The IA32_DS_AREA MSR can be programmed to point to the DS save area.

21.6.3.8.2 Setting Up the DS Save Area

Section 19.4.9.2, "Setting Up the DS Save Area," describes how to set up and enable the DS save area. This procedure is common for PEBS and BTS.

21.6.3.8.3 Setting Up the PEBS Buffer

Only the MSR_IQ_COUNTER4 performance counter can be used for PEBS. Use the following procedure to set up the processor and this counter for PEBS:

1. Set up the precise event buffering facilities. Place values in the precise event buffer base, precise event index, precise event absolute maximum, and precise event interrupt threshold, and precise event counter reset fields of the DS buffer management area (see Figure 19-5) to set up the precise event records buffer in memory.
2. Enable PEBS. Set the Enable PEBS flag (bit 24) in MSR_PEBS_ENABLE MSR.
3. Set up the MSR_IQ_COUNTER4 performance counter and its associated CCCR and one or more ESCRs for PEBS.

21.6.3.8.4 Writing a PEBS Interrupt Service Routine

The PEBS facilities share the same interrupt vector and interrupt service routine (called the DS ISR) with the non-precise event-based sampling and BTS facilities. To handle PEBS interrupts, PEBS handler code must be included in the DS ISR. See Section 19.4.9.5, "Writing the DS Interrupt Service Routine," for guidelines for writing the DS ISR.

21.6.3.8.5 Other DS Mechanism Implications

The DS mechanism is not available in the SMM. It is disabled on transition to the SMM mode. Similarly the DS mechanism is disabled on the generation of a machine check exception and is cleared on processor RESET and INIT.

The DS mechanism is available in real address mode.

21.6.3.9 Operating System Implications

The DS mechanism can be used by the operating system as a debugging extension to facilitate failure analysis. When using this facility, a 25 to 30 times slowdown can be expected due to the effects of the trace store occurring on every taken branch.

Depending upon intended usage, the instruction pointers that are part of the branch records or the PEBS records need to have an association with the corresponding process. One solution requires the ability for the DS specific operating system module to be chained to the context switch. A separate buffer can then be maintained for each process of interest and the MSR pointing to the configuration area saved and setup appropriately on each context switch.

If the BTS facility has been enabled, then it must be disabled and state stored on transition of the system to a sleep state in which processor context is lost. The state must be restored on return from the sleep state.

It is required that an interrupt gate be used for the DS interrupt as opposed to a trap gate to prevent the generation of an endless interrupt loop.

Pages that contain buffers must have mappings to the same physical address for all processes/logical processors, such that any change to CR3 will not change DS addresses. If this requirement cannot be satisfied (that is, the feature is enabled on a per thread/process basis), then the operating system must ensure that the feature is enabled/disabled appropriately in the context switch code.

21.6.4 Performance Monitoring and Intel® Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture

The performance monitoring capability of processors based on Intel NetBurst microarchitecture and supporting Intel Hyper-Threading Technology is similar to that described in Section 21.6.3. However, the capability is extended so that:

- Performance counters can be programmed to select events qualified by logical processor IDs.
- Performance monitoring interrupts can be directed to a specific logical processor within the physical processor.

The sections below describe performance counters, event qualification by logical processor ID, and special purpose bits in ESCRs/CCCRs. They also describe MSR_PEBS_ENABLE, MSR_PEBS_MATRIX_VERT, and MSR_TC_PRECISE_EVENT.

21.6.4.1 ESCR MSRs

Figure 21-53 shows the layout of an ESCR MSR in processors supporting Intel Hyper-Threading Technology.

The functions of the flags and fields are as follows:

- **T1_USR flag, bit 0 —** When set, events are counted when thread 1 (logical processor 1) is executing at a current privilege level (CPL) of 1, 2, or 3. These privilege levels are generally used by application code and unprotected operating system code.

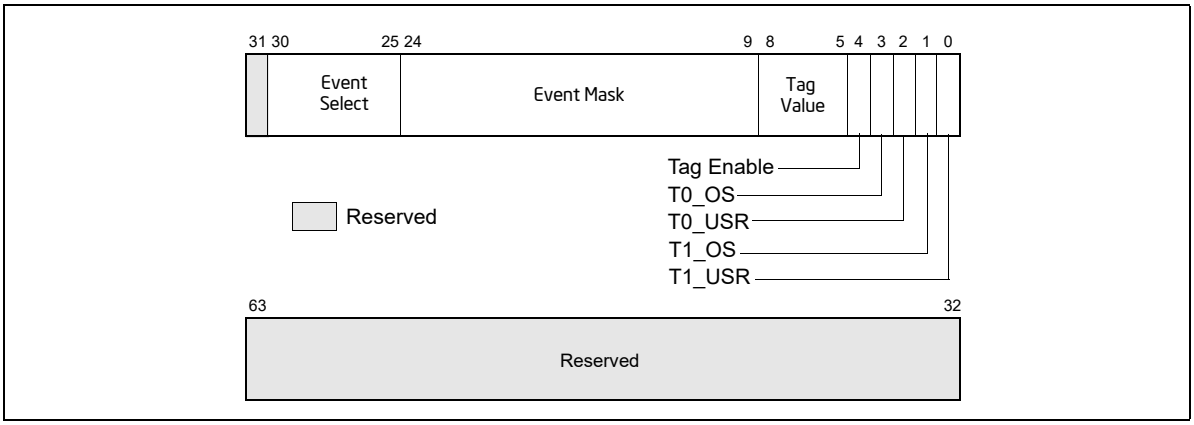

Figure 21-53. Event Selection Control Register (ESCR) for the Pentium 4 Processor, Intel® Xeon® Processor, and Intel® Xeon® Processor MP Supporting Hyper-Threading Technology

- **T1_OS flag, bit 1 —** When set, events are counted when thread 1 (logical processor 1) is executing at CPL of 0. This privilege level is generally reserved for protected operating system code. (When both the T1_OS and T1_USR flags are set, thread 1 events are counted at all privilege levels.)
- **T0_USR flag, bit 2 —** When set, events are counted when thread 0 (logical processor 0) is executing at a CPL of 1, 2, or 3.
- **T0_OS flag, bit 3 —** When set, events are counted when thread 0 (logical processor 0) is executing at CPL of 0. (When both the T0_OS and T0_USR flags are set, thread 0 events are counted at all privilege levels.)
- **Tag enable, bit 4 —** When set, enables tagging of μops to assist in at-retirement event counting; when clear, disables tagging. See Section 21.6.3.6, "At-Retirement Counting."
- **Tag value field, bits 5 through 8 —** Selects a tag value to associate with a μop to assist in at-retirement event counting.
- **Event mask field, bits 9 through 24 —** Selects events to be counted from the event class selected with the event select field.
- **Event select field, bits 25 through 30) —** Selects a class of events to be counted. The events within this class that are counted are selected with the event mask field.

The T0_OS and T0_USR flags and the T1_OS and T1_USR flags allow event counting and sampling to be specified for a specific logical processor (0 or 1) within an Intel Xeon processor MP (See also: Section 10.4.5, "Identifying Logical Processors in an MP System," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A).

Not all performance monitoring events can be detected within an Intel Xeon processor MP on a per logical processor basis (see Section 21.6.4.4, "Performance Monitoring Events"). Some sub-events (specified by an event mask bits) are counted or sampled without regard to which logical processor is associated with the detected event.

21.6.4.2 CCCR MSRs

Figure 21-54 shows the layout of a CCCR MSR in processors supporting Intel Hyper-Threading Technology. The functions of the flags and fields are as follows:

- **Enable flag, bit 12 —** When set, enables counting; when clear, the counter is disabled. This flag is cleared on reset
- **ESCR select field, bits 13 through 15 —** Identifies the ESCR to be used to select events to be counted with the counter associated with the CCCR.
- **Active thread field, bits 16 and 17 —** Enables counting depending on which logical processors are active (executing a thread). This field enables filtering of events based on the state (active or inactive) of the logical processors. The encodings of this field are as follows:

  00 — None. Count only when neither logical processor is active.

01 — Single. Count only when one logical processor is active (either 0 or 1).

10 — Both. Count only when both logical processors are active.

11 — Any. Count when either logical processor is active.

A halted logical processor or a logical processor in the "wait for SIPI" state is considered inactive.

- **Compare flag, bit 18 —** When set, enables filtering of the event count; when clear, disables filtering. The filtering method is selected with the threshold, complement, and edge flags.

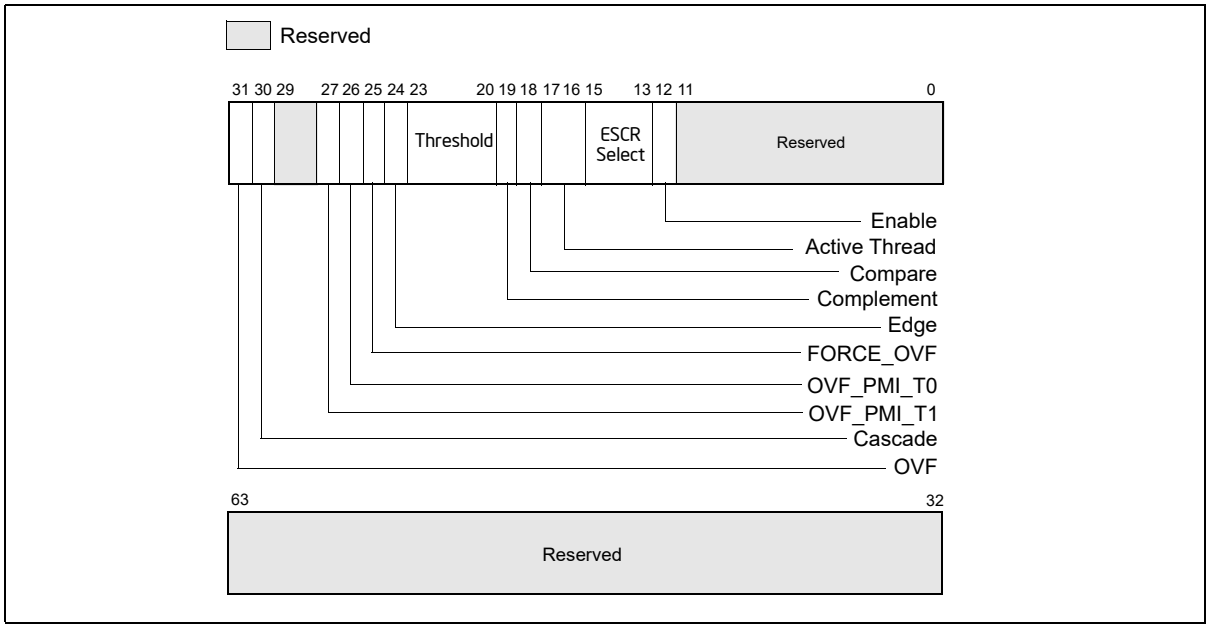

Figure 21-54. Counter Configuration Control Register (CCCR)

- **Complement flag, bit 19 —** Selects how the incoming event count is compared with the threshold value. When set, event counts that are less than or equal to the threshold value result in a single count being delivered to the performance counter; when clear, counts greater than the threshold value result in a count being delivered to the performance counter (see Section 21.6.3.5.2, "Filtering Events"). The compare flag is not active unless the compare flag is set.
- **Threshold field, bits 20 through 23 —** Selects the threshold value to be used for comparisons. The processor examines this field only when the compare flag is set, and uses the complement flag setting to determine the type of threshold comparison to be made. The useful range of values that can be entered in this field depend on the type of event being counted (see Section 21.6.3.5.2, "Filtering Events").
- **Edge flag, bit 24 —** When set, enables rising edge (false-to-true) edge detection of the threshold comparison output for filtering event counts; when clear, rising edge detection is disabled. This flag is active only when the compare flag is set.
- **FORCE_OVF flag, bit 25 —** When set, forces a counter overflow on every counter increment; when clear, overflow only occurs when the counter actually overflows.
- **OVF_PMI_T0 flag, bit 26 —** When set, causes a performance monitor interrupt (PMI) to be sent to logical processor 0 when the counter overflows occurs; when clear, disables PMI generation for logical processor 0. Note that the PMI is generate on the next event count after the counter has overflowed.
- **OVF_PMI_T1 flag, bit 27 —** When set, causes a performance monitor interrupt (PMI) to be sent to logical processor 1 when the counter overflows occurs; when clear, disables PMI generation for logical processor 1. Note that the PMI is generate on the next event count after the counter has overflowed.
- **Cascade flag, bit 30 —** When set, enables counting on one counter of a counter pair when its alternate counter in the other the counter pair in the same counter group overflows (see Section 21.6.3.2, "Performance Counters," for further details); when clear, disables cascading of counters.

- **OVF flag, bit 31 —** Indicates that the counter has overflowed when set. This flag is a sticky flag that must be explicitly cleared by software.

21.6.4.3 IA32_PEBS_ENABLE MSR

In a processor supporting Intel Hyper-Threading Technology and based on the Intel NetBurst microarchitecture, PEBS is enabled and qualified with two bits in the MSR_PEBS_ENABLE MSR: bit 25 (ENABLE_PEBS_MY_THR) and 26 (ENABLE_PEBS_OTH_THR) respectively. These bits do not explicitly identify a specific logical processor by logic processor ID(T0 or T1); instead, they allow a software agent to enable PEBS for subsequent threads of execution on the same logical processor on which the agent is running ("my thread") or for the other logical processor in the physical package on which the agent is not running ("other thread").

PEBS is supported for only a subset of the at-retirement events: Execution_event, Front_end_event, and Replay_event. Also, PEBS can be carried out only with two performance counters: MSR_IQ_CCCR4 (MSR address 370H) for logical processor 0 and MSR_IQ_CCCR5 (MSR address 371H) for logical processor 1.

Performance monitoring tools should use a processor affinity mask to bind the kernel mode components that need to modify the ENABLE_PEBS_MY_THR and ENABLE_PEBS_OTH_THR bits in the MSR_PEBS_ENABLE MSR to a specific logical processor. This is to prevent these kernel mode components from migrating between different logical processors due to OS scheduling.

21.6.4.4 Performance Monitoring Events

When Intel Hyper-Threading Technology is active, many performance monitoring events can be can be qualified by the logical processor ID, which corresponds to bit 0 of the initial APIC ID. This allows for counting an event in any or all of the logical processors. However, not all the events have this logic processor specificity, or thread specificity.

Here, each event falls into one of two categories:

- **Thread specific (TS) —** The event can be qualified as occurring on a specific logical processor.
- **Thread independent (TI) —** The event cannot be qualified as being associated with a specific logical processor.

If for example, a TS event occurred in logical processor T0, the counting of the event (as shown in Table 21-93) depends only on the setting of the T0_USR and T0_OS flags in the ESCR being used to set up the event counter. The T1_USR and T1_OS flags have no effect on the count.

Table 21-93. Effect of Logical Processor and CPL Qualification for Logical-Processor-Specific (TS) Events

	T1_OS/T1_USR = 00	T1_OS/T1_USR = 01	T1_OS/T1_USR = 11	T1_OS/T1_USR = 10
T0_OS/T0_USR = 00	Zero count	Counts while T1 in USR	Counts while T1 in OS or USR	Counts while T1 in OS
T0_OS/T0_USR = 01	Counts while T0 in USR	Counts while T0 in USR or T1 in USR	Counts while (a) T0 in USR or (b) T1 in OS or (c) T1 in USR	Counts while (a) T0 in OS or (b) T1 in OS
T0_OS/T0_USR = 11	Counts while T0 in OS or USR	Counts while (a) T0 in OS or (b) T0 in USR or (c) T1 in USR	Counts irrespective of CPL, T0, T1	Counts while (a) T0 in OS or (b) or T0 in USR or (c) T1 in OS
T0_OS/T0_USR = 10	Counts T0 in OS	Counts T0 in OS or T1 in USR	Counts while (a)T0 in Os or (b) T1 in OS or (c) T1 in USR	Counts while (a) T0 in OS or (b) T1 in OS

When a bit in the event mask field is TI, the effect of specifying bit-0-3 of the associated ESCR are described in Table 15-6. For events that are marked as TI, the effect of selectively specifying T0_USR, T0_OS, T1_USR, T1_OS bits is shown in Table 21-94.

Table 21-94. Effect of Logical Processor and CPL Qualification for Non-logical-Processor-specific (TI) Events

	T1_OS/T1_USR = 00	T1_OS/T1_USR = 01	T1_OS/T1_USR = 11	T1_OS/T1_USR = 10
T0_OS/T0_USR = 00	Zero count	Counts while (a) T0 in USR or (b) T1 in USR	Counts irrespective of CPL, T0, T1	Counts while (a) T0 in OS or (b) T1 in OS
T0_OS/T0_USR = 01	Counts while (a) T0 in USR or (b) T1 in USR	Counts while (a) T0 in USR or (b) T1 in USR	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1
T0_OS/T0_USR = 11	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1
T0_OS/T0_USR = 0	Counts while (a) T0 in OS or (b) T1 in OS	Counts irrespective of CPL, T0, T1	Counts irrespective of CPL, T0, T1	Counts while (a) T0 in OS or (b) T1 in OS

21.6.4.5 Counting Clocks on systems with Intel® Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture

21.6.4.5.1 Non-Halted Clockticks

Use the following procedure to program ESCRs and CCCRs to obtain non-halted clockticks on processors based on Intel NetBurst microarchitecture:

1. Select an ESCR for the global_power_events and specify the RUNNING sub-event mask and the desired T0_OS/T0_USR/T1_OS/T1_USR bits for the targeted processor.
2. Select an appropriate counter.
3. Enable counting in the CCCR for that counter by setting the enable bit.

21.6.4.5.2 Non-Sleep Clockticks

Performance monitoring counters can be configured to count clockticks whenever the performance monitoring hardware is not powered-down. To count Non-sleep Clockticks with a performance-monitoring counter, do the following:

1. Select one of the 18 counters.
2. Select any of the ESCRs whose events the selected counter can count. Set its event select to anything other than "no_event"; the counter may be disabled if this is not done.
3. Turn threshold comparison on in the CCCR by setting the compare bit to "1".
4. Set the threshold to "15" and the complement to "1" in the CCCR. Since no event can exceed this threshold, the threshold condition is met every cycle and the counter counts every cycle. Note that this overrides any qualification (e.g., by CPL) specified in the ESCR.
5. Enable counting in the CCCR for the counter by setting the enable bit.

In most cases, the counts produced by the non-halted and non-sleep metrics are equivalent if the physical package supports one logical processor and is not placed in a power-saving state. Operating systems may execute an HLT instruction and place a physical processor in a power-saving state.

On processors that support Intel Hyper-Threading Technology (Intel HT Technology), each physical package can support two or more logical processors. Current implementation of Intel HT Technology provides two logical processors for each physical processor. While both logical processors can execute two threads simultaneously, one logical processor may halt to allow the other logical processor to execute without sharing execution resources between two logical processors.

Non-halted Clockticks can be set up to count the number of processor clock cycles for each logical processor whenever the logical processor is not halted (the count may include some portion of the clock cycles for that logical processor to complete a transition to a halted state). Physical processors that support Intel HT Technology enter into a power-saving state if all logical processors halt.

The Non-sleep Clockticks mechanism uses a filtering mechanism in CCCRs. The mechanism will continue to increment as long as one logical processor is not halted or in a power-saving state. Applications may cause a processor to enter into a power-saving state by using an OS service that transfers control to an OS's idle loop. The idle loop then may place the processor into a power-saving state after an implementation-dependent period if there is no work for the processor.

21.6.5 Performance Monitoring and Dual-Core Technology

The performance monitoring capability of dual-core processors duplicates the microarchitectural resources of a single-core processor implementation. Each processor core has dedicated performance monitoring resources.

In the case of Pentium D processor, each logical processor is associated with dedicated resources for performance monitoring. In the case of Pentium processor Extreme edition, each processor core has dedicated resources, but two logical processors in the same core share performance monitoring resources (see Section 21.6.4, "Performance Monitoring and Intel® Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture").

21.6.6 Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache

The 64-bit Intel Xeon processor MP with up to 8-MByte L3 cache has a CPUID signature of family [0FH], model [03H or 04H]. Performance monitoring capabilities available to Pentium 4 and Intel Xeon processors with the same values (see Section 21.1 and Section 21.6.4) apply to the 64-bit Intel Xeon processor MP with an L3 cache.

The level 3 cache is connected between the system bus and IOQ through additional control logic. See Figure 21-55.

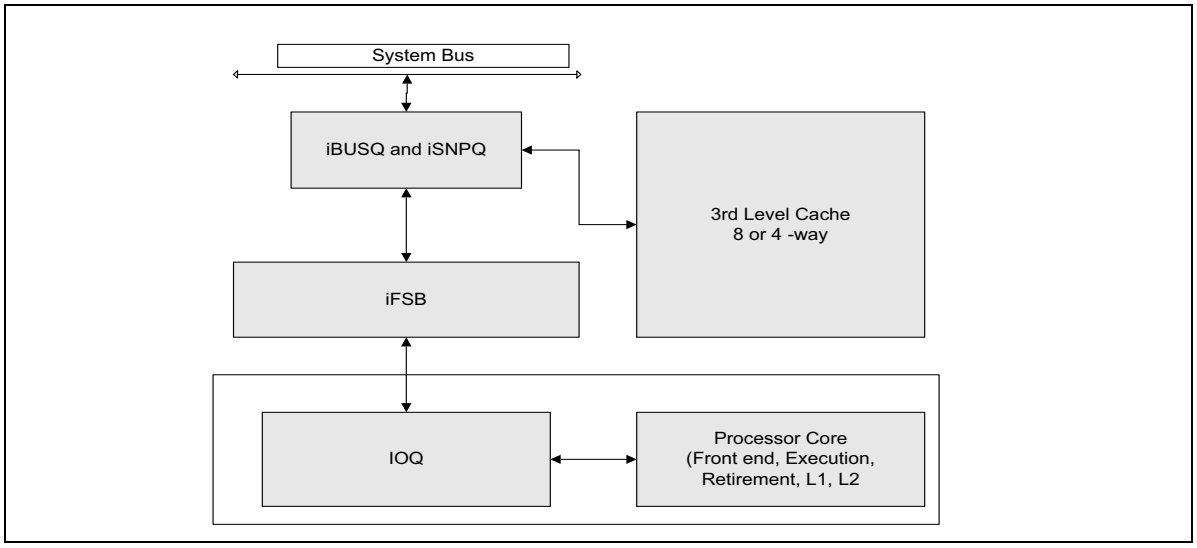

Figure 21-55. Block Diagram of 64-bit Intel® Xeon® Processor MP with 8-MByte L3

Additional performance monitoring capabilities and facilities unique to 64-bit Intel Xeon processor MP with an L3 cache are described in this section. The facility for monitoring events consists of a set of dedicated model-specific registers (MSRs), each dedicated to a specific event. Programming of these MSRs requires using RDMSR/WRMSR instructions with 64-bit values.

The lower 32-bits of the MSRs at addresses 107CC through 107D3 are treated as 32 bit performance counter registers. These performance counters can be accessed using RDPMC instruction with the index starting from 18 through 25. The EDX register returns zero when reading these 8 PMCs.

The performance monitoring capabilities consist of four events. These are:

- **IBUSQ event —** This event detects the occurrence of micro-architectural conditions related to the iBUSQ unit. It provides two MSRs: MSR_IFSB_IBUSQ0 and MSR_IFSB_IBUSQ1. Configure sub-event qualification and enable/disable functions using the high 32 bits of these MSRs. The low 32 bits act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the upper 32 bits. See Figure 21-56.

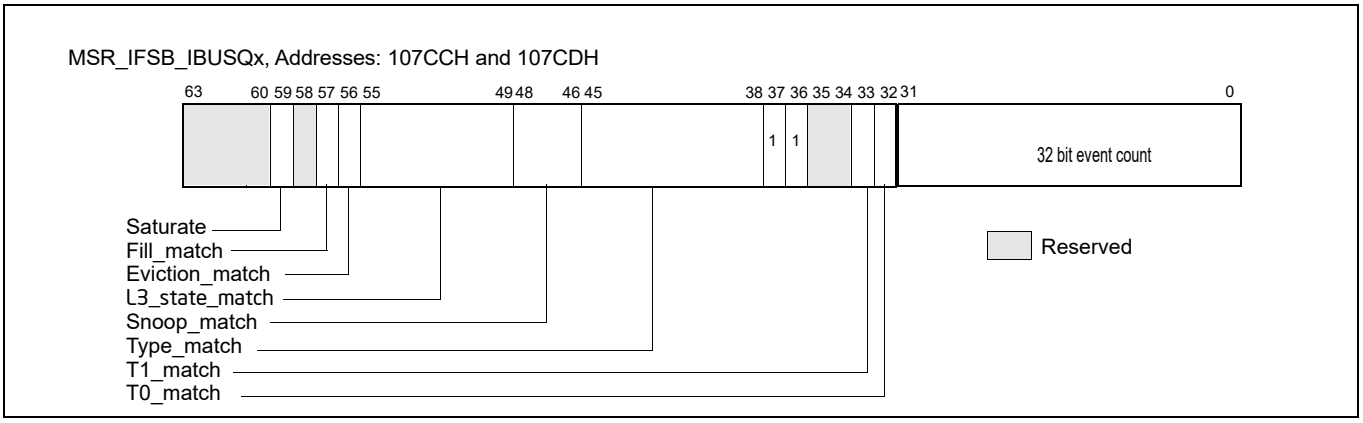

Figure 21-56. MSR_IFSB_IBUSQx, Addresses: 107CCH and 107CDH

- **ISNPQ event —** This event detects the occurrence of microarchitectural conditions related to the iSNPQ unit. It provides two MSRs: MSR_IFSB_ISNPQ0 and MSR_IFSB_ISNPQ1. Configure sub-event qualifications and enable/disable functions using the high 32 bits of the MSRs. The low 32-bits act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the upper 32-bits. See Figure 21-57.

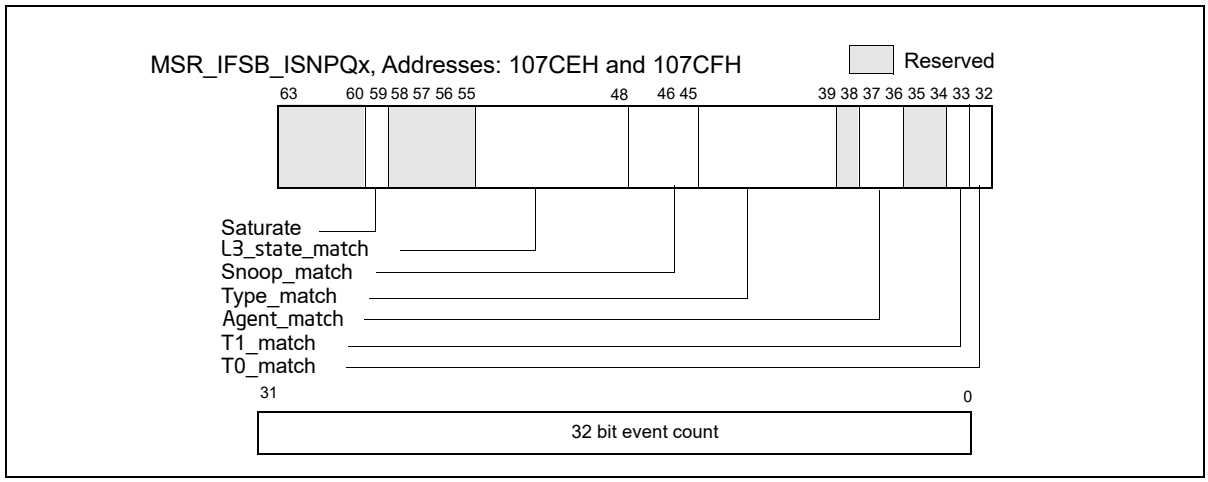

Figure 21-57. MSR_IFSB_ISNPQx, Addresses: 107CEH and 107CFH

- **EFSB event —** This event can detect the occurrence of micro-architectural conditions related to the iFSB unit or system bus. It provides two MSRs: MSR_EFSB_DRDY0 and MSR_EFSB_DRDY1. Configure sub-event qualifications and enable/disable functions using the high 32 bits of the 64-bit MSR. The low 32-bit act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the qualification bits in the upper 32-bits of the MSR. See Figure 21-58.

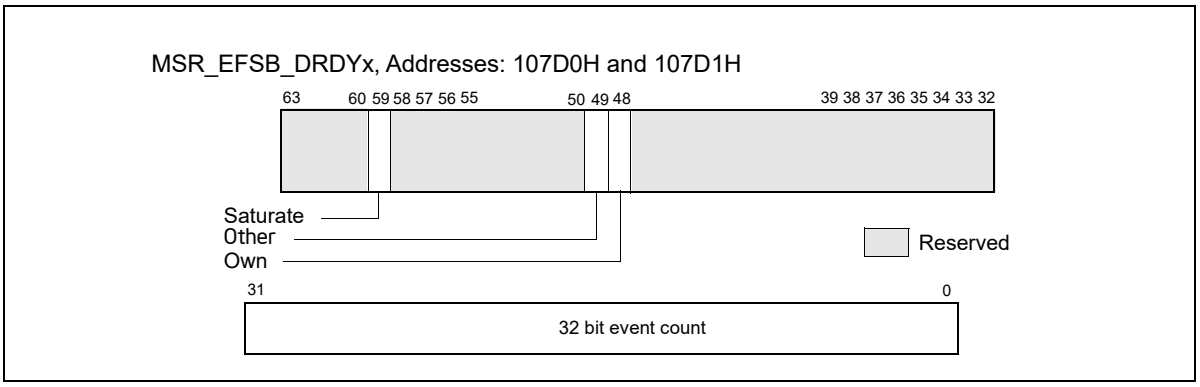

Figure 21-58. MSR_EFSB_DRDYx, Addresses: 107D0H and 107D1H

- **IBUSQ Latency event —** This event accumulates weighted cycle counts for latency measurement of transactions in the iBUSQ unit. The count is enabled by setting MSR_IFSB_CTRL6[bit 26] to 1; the count freezes after software sets MSR_IFSB_CTRL6[bit 26] to 0. MSR_IFSB_CNTR7 acts as a 64-bit event counter for this event. See Figure 21-59.

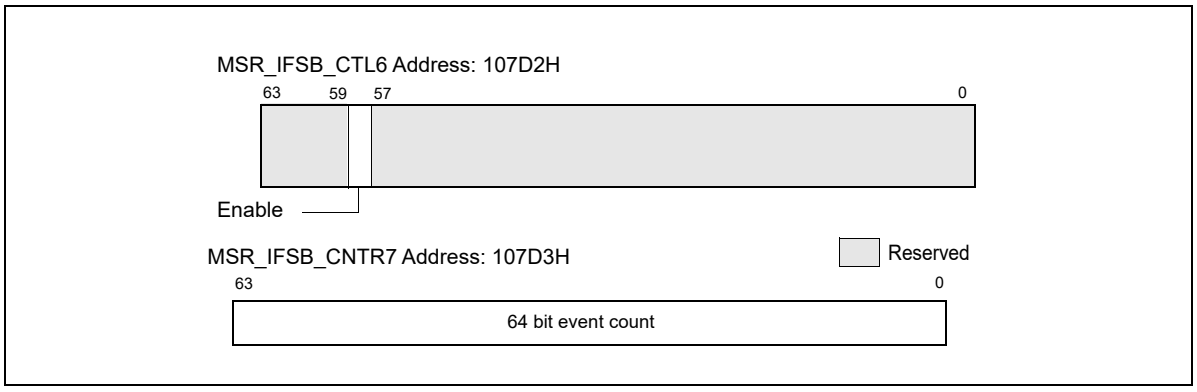

Figure 21-59. MSR_IFSB_CTL6, Address: 107D2H; MSR_IFSB_CNTR7, Address: 107D3H

21.6.7 Performance Monitoring on L3 and Caching Bus Controller Sub-Systems

The Intel Xeon processor 7400 series and Dual-Core Intel Xeon processor 7100 series employ a distinct L3/caching bus controller sub-system. These sub-system have a unique set of performance monitoring capability and programming interfaces that are largely common between these two processor families.

Intel Xeon processor 7400 series are based on 45 nm enhanced Intel Core microarchitecture. The CPUID signature is indicated by DisplayFamily_DisplayModel value of 06_1DH (see the CPUID instruction in Chapter 3, "Instruction Set Reference, A-L," of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A). Intel Xeon processor 7400 series have six processor cores that share an L3 cache.

Dual-Core Intel Xeon processor 7100 series are based on Intel NetBurst microarchitecture, have a CPUID signature of family [0FH], model [06H] and a unified L3 cache shared between two cores. Each core in an Intel Xeon processor 7100 series supports Intel Hyper-Threading Technology, providing two logical processors per core.

Both Intel Xeon processor 7400 series and Intel Xeon processor 7100 series support multi-processor configurations using system bus interfaces. In Intel Xeon processor 7400 series, the L3/caching bus controller sub-system provides three Simple Direct Interface (SDI) to service transactions originated the XQ-replacement SDI logic in each dual-core modules. In Intel Xeon processor 7100 series, the IOQ logic in each processor core is replaced with a Simple Direct Interface (SDI) logic. The L3 cache is connected between the system bus and the SDI through additional control logic. See Figure 21-60 for the block configuration of six processor cores and the L3/Caching bus

controller sub-system in Intel Xeon processor 7400 series. Figure 21-60 shows the block configuration of two processor cores (four logical processors) and the L3/Caching bus controller sub-system in Intel Xeon processor 7100 series.

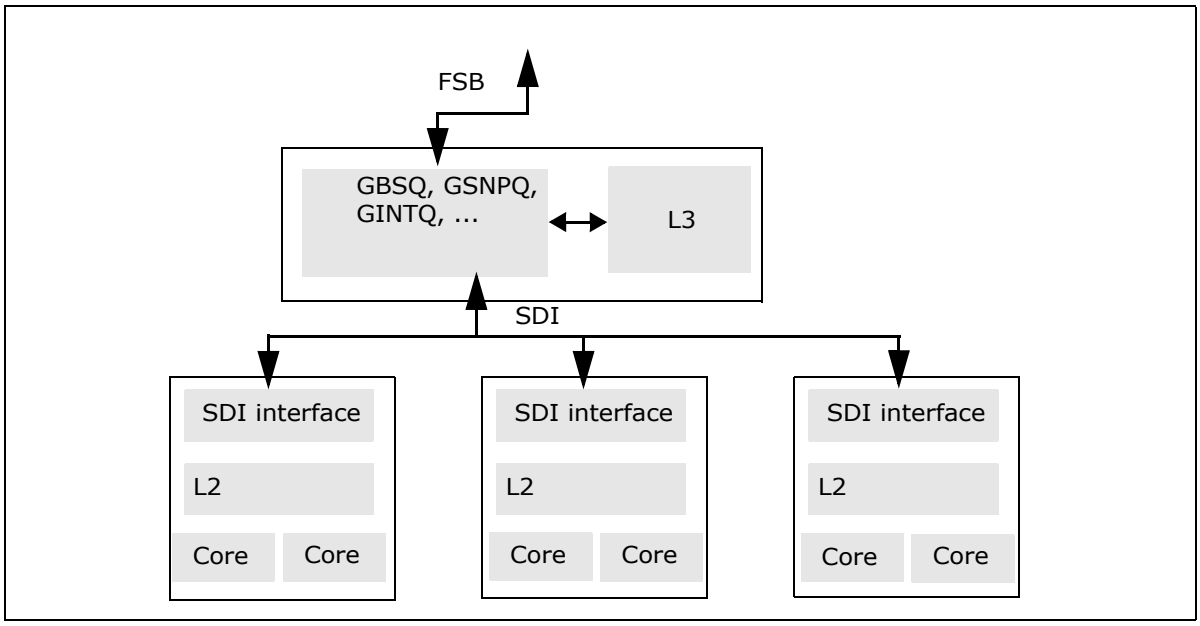

Figure 21-60. Block Diagram of the Intel® Xeon® Processor 7400 Series

Almost all of the performance monitoring capabilities available to processor cores with the same CPUID signatures (see Section 21.1 and Section 21.6.4) apply to Intel Xeon processor 7100 series. The MSRs used by performance monitoring interface are shared between two logical processors in the same processor core.

The performance monitoring capabilities available to processor with DisplayFamily_DisplayModel signature 06_17H also apply to Intel Xeon processor 7400 series. Each processor core provides its own set of MSRs for performance monitoring interface.

The IOQ_allocation and IOQ_active_entries events are not supported in Intel Xeon processor 7100 series and 7400 series. Additional performance monitoring capabilities applicable to the L3/caching bus controller sub-system are described in this section.

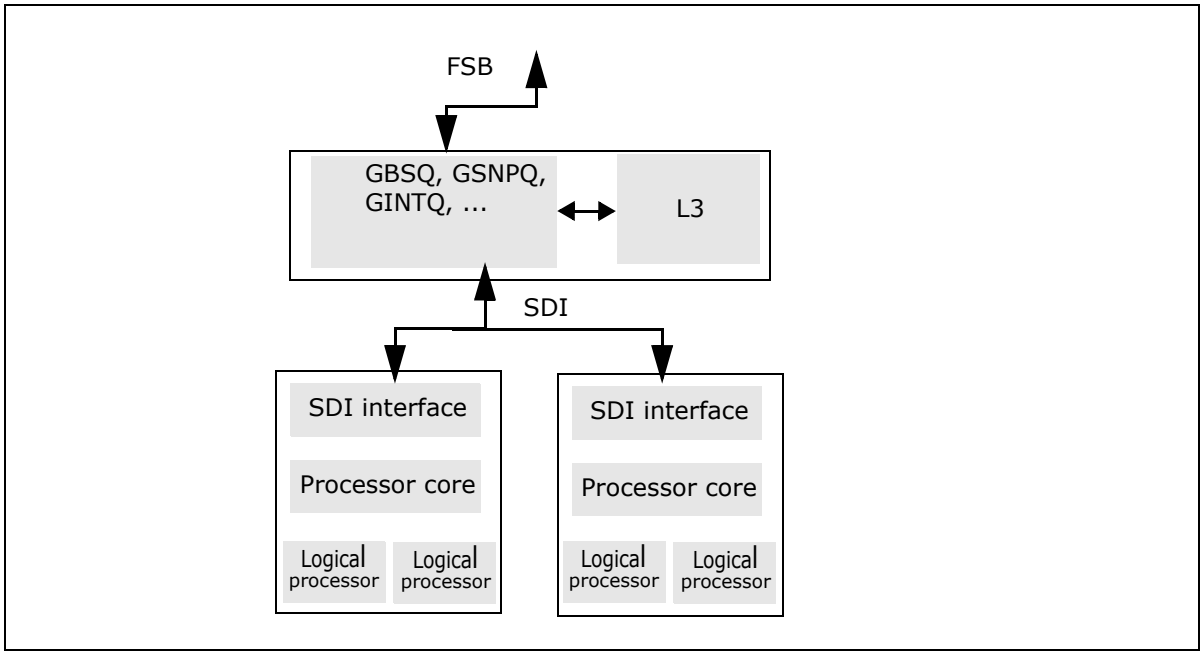

Figure 21-61. Block Diagram of the Intel® Xeon® Processor 7100 Series

21.6.7.1 Overview of Performance Monitoring with L3/Caching Bus Controller

The facility for monitoring events consists of a set of dedicated model-specific registers (MSRs). There are eight event select/counting MSRs that are dedicated to counting events associated with specified microarchitectural conditions. Programming of these MSRs requires using RDMSR/WRMSR instructions with 64-bit values. In addition, an MSR MSR_EMON_L3_GL_CTL provides simplified interface to control freezing, resetting, re-enabling operation of any combination of these event select/counting MSRs.

The eight MSRs dedicated to count occurrences of specific conditions are further divided to count three sub-classes of microarchitectural conditions:

- Two MSRs (MSR_EMON_L3_CTR_CTL0 and MSR_EMON_L3_CTR_CTL1) are dedicated to counting GBSQ events. Up to two GBSQ events can be programmed and counted simultaneously.
- Two MSRs (MSR_EMON_L3_CTR_CTL2 and MSR_EMON_L3_CTR_CTL3) are dedicated to counting GSNPQ events. Up to two GBSQ events can be programmed and counted simultaneously.
- Four MSRs (MSR_EMON_L3_CTR_CTL4, MSR_EMON_L3_CTR_CTL5, MSR_EMON_L3_CTR_CTL6, and MSR_EMON_L3_CTR_CTL7) are dedicated to counting external bus operations.

The bit fields in each of eight MSRs share the following common characteristics:

- Bits 63:32 is the event control field that includes an event mask and other bit fields that control counter operation. The event mask field specifies details of the microarchitectural condition, and its definition differs across GBSQ, GSNPQ, FSB.
- Bits 31:0 is the event count field. If the specified condition is met during each relevant clock domain of the event logic, the matched condition signals the counter logic to increment the associated event count field. The lower 32-bits of these 8 MSRs at addresses 107CC through 107D3 are treated as 32 bit performance counter registers.

In Dual-Core Intel Xeon processor 7100 series, the uncore performance counters can be accessed using RDPMC instruction with the index starting from 18 through 25. The EDX register returns zero when reading these 8 PMCs.

In Intel Xeon processor 7400 series, RDPMC with ECX between 2 and 9 can be used to access the eight uncore performance counter/control registers.

21.6.7.2 GBSQ Event Interface

The layout of MSR_EMON_L3_CTR_CTL0 and MSR_EMON_L3_CTR_CTL1 is given in Figure 21-62. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) consists of the following eight attributes:

- Agent_Select (bits 35:32): The definition of this field differs slightly between Intel Xeon processor 7100 and 7400.

  For Intel Xeon processor 7100 series, each bit specifies a logical processor in the physical package. The lower two bits corresponds to two logical processors in the first processor core, the upper two bits corresponds to two logical processors in the second processor core. 0FH encoding matches transactions from any logical processor.

  For Intel Xeon processor 7400 series, each bit of [34:32] specifies the SDI logic of a dual-core module as the originator of the transaction. A value of 0111B in bits [35:32] specifies transaction from any processor core.

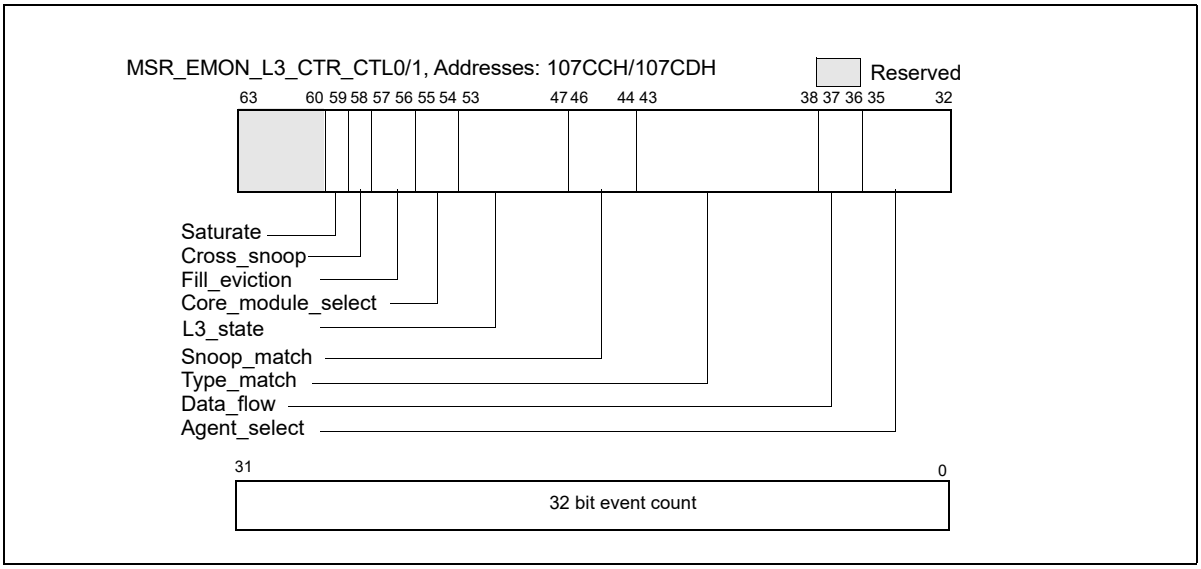

Figure 21-62. MSR_EMON_L3_CTR_CTL0/1, Addresses: 107CCH/107CDH

- Data_Flow (bits 37:36): Bit 36 specifies demand transactions, bit 37 specifies prefetch transactions.
- Type_Match (bits 43:38): Specifies transaction types. If all six bits are set, event count will include all transaction types.
- Snoop_Match: (bits 46:44): The three bits specify (in ascending bit position) clean snoop result, HIT snoop result, and HITM snoop results respectively.
- L3_State (bits 53:47): Each bit specifies an L2 coherency state.
- Core_Module_Select (bits 55:54): The valid encodings for L3 lookup differ slightly between Intel Xeon processor 7100 and 7400.

  For Intel Xeon processor 7100 series,

  — 00B: Match transactions from any core in the physical package

  — 01B: Match transactions from this core only

  — 10B: Match transactions from the other core in the physical package

  — 11B: Match transaction from both cores in the physical package

  For Intel Xeon processor 7400 series,

  — 00B: Match transactions from any dual-core module in the physical package

  — 01B: Match transactions from this dual-core module only

  — 10B: Match transactions from either one of the other two dual-core modules in the physical package

  - 11B: Match transaction from more than one dual-core modules in the physical package
- Fill_Eviction (bits 57:56): The valid encodings are
  - 00B: Match any transactions
  - 01B: Match transactions that fill L3
  - 10B: Match transactions that fill L3 without an eviction
  - 11B: Match transaction fill L3 with an eviction
- Cross_Snoop (bit 58): The encodings are
  - 0B: Match any transactions
  - 1B: Match cross snoop transactions

For each counting clock domain, if all eight attributes match, event logic signals to increment the event count field.

21.6.7.3 GSNPQ Event Interface

The layout of MSR_EMON_L3_CTR_CTL2 and MSR_EMON_L3_CTR_CTL3 is given in Figure 21-63. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) consists of the following six attributes:

- Agent_Select (bits 37:32): The definition of this field differs slightly between Intel Xeon processor 7100 and 7400.
- For Intel Xeon processor 7100 series, each of the lowest 4 bits specifies a logical processor in the physical package. The lowest two bits corresponds to two logical processors in the first processor core, the next two bits corresponds to two logical processors in the second processor core. Bit 36 specifies other symmetric agent transactions. Bit 37 specifies central agent transactions. 3FH encoding matches transactions from any logical processor.

  For Intel Xeon processor 7400 series, each of the lowest 3 bits specifies a dual-core module in the physical package. Bit 37 specifies central agent transactions.
- Type_Match (bits 43:38): Specifies transaction types. If all six bits are set, event count will include any transaction types.
- Snoop_Match: (bits 46:44): The three bits specify (in ascending bit position) clean snoop result, HIT snoop result, and HITM snoop results respectively.
- L2_State (bits 53:47): Each bit specifies an L3 coherency state.
- Core_Module_Select (bits 56:54): Bit 56 enables Core_Module_Select matching. If bit 56 is clear, Core_Module_Select encoding is ignored. The valid encodings for the lower two bits (bit 55, 54) differ slightly between Intel Xeon processor 7100 and 7400.

  For Intel Xeon processor 7100 series, if bit 56 is set, the valid encodings for the lower two bits (bit 55, 54) are
  - 00B: Match transactions from only one core (irrespective which core) in the physical package
  - 01B: Match transactions from this core and not the other core
  - 10B: Match transactions from the other core in the physical package, but not this core
  - 11B: Match transaction from both cores in the physical package

  For Intel Xeon processor 7400 series, if bit 56 is set, the valid encodings for the lower two bits (bit 55, 54) are
  - 00B: Match transactions from only one dual-core module (irrespective which module) in the physical package.
  - 01B: Match transactions from one or more dual-core modules.
  - 10B: Match transactions from two or more dual-core modules.
  - 11B: Match transaction from all three dual-core modules in the physical package.
- Block_Snoop (bit 57): specifies blocked snoop.

For each counting clock domain, if all six attributes match, event logic signals to increment the event count field.

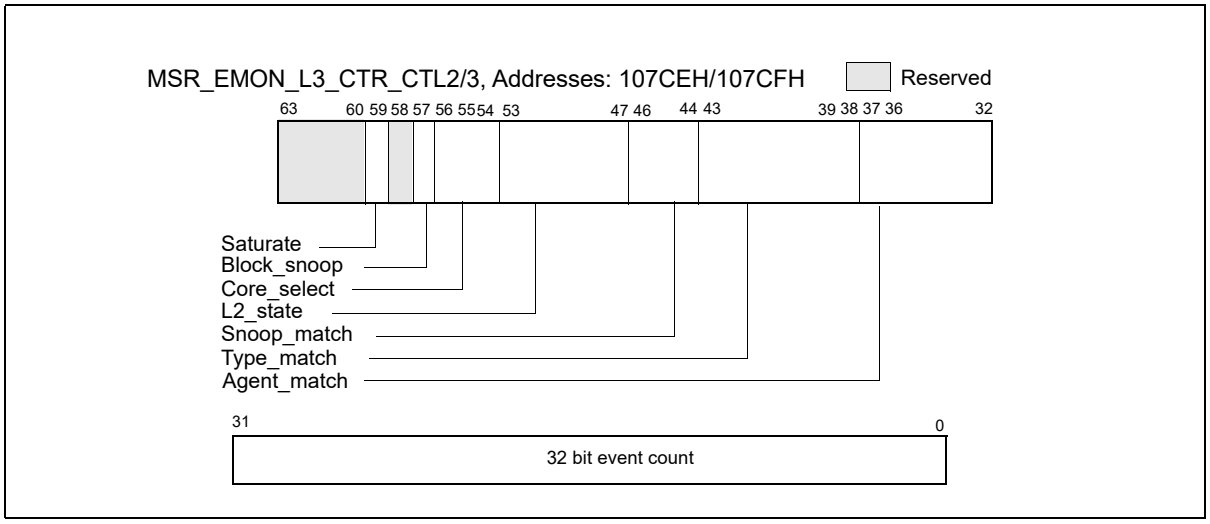

Figure 21-63. MSR_EMON_L3_CTR_CTL2/3, Addresses: 107CEH/107CFH

21.6.7.4 FSB Event Interface

The layout of MSR_EMON_L3_CTR_CTL4 through MSR_EMON_L3_CTR_CTL7 is given in Figure 21-64. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) is organized as follows:

- Bit 58: must set to 1.
- FSB_Submask (bits 57:32): Specifies FSB-specific sub-event mask.

The FSB sub-event mask defines a set of independent attributes. The event logic signals to increment the associated event count field if one of the attribute matches. Some of the sub-event mask bit counts durations. A duration event increments at most once per cycle.

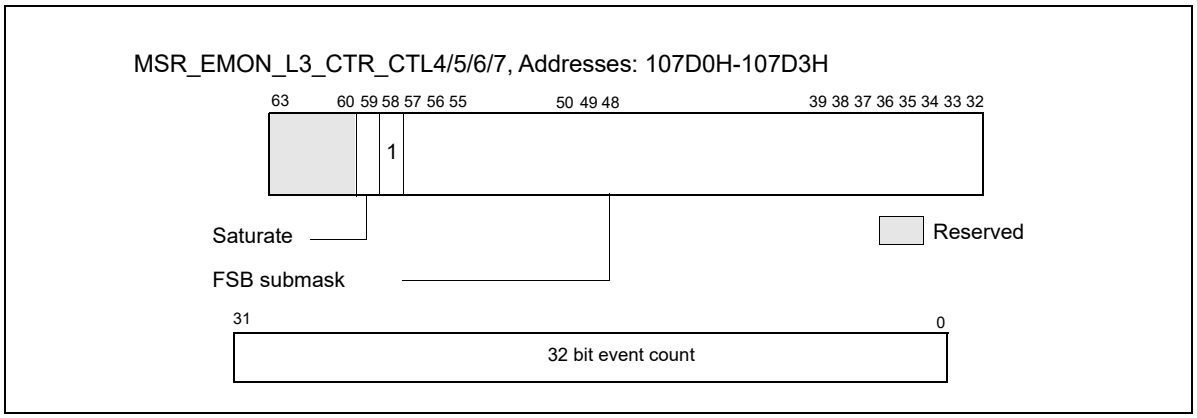

Figure 21-64. MSR_EMON_L3_CTR_CTL4/5/6/7, Addresses: 107D0H-107D3H

21.6.7.4.1 FSB Sub-Event Mask Interface

- FSB_type (bit 37:32): Specifies different FSB transaction types originated from this physical package.
- FSB_L_clear (bit 38): Count clean snoop results from any source for transaction originated from this physical package.
- FSB_L_hit (bit 39): Count HIT snoop results from any source for transaction originated from this physical package.

- FSB_L_hitm (bit 40): Count HITM snoop results from any source for transaction originated from this physical package.
- FSB_L_defer (bit 41): Count DEFER responses to this processor's transactions.
- FSB_L_retry (bit 42): Count RETRY responses to this processor's transactions.
- FSB_L_snoop_stall (bit 43): Count snoop stalls to this processor's transactions.
- FSB_DBSY (bit 44): Count DBSY assertions by this processor (without a concurrent DRDY).
- FSB_DRDY (bit 45): Count DRDY assertions by this processor.
- FSB_BNR (bit 46): Count BNR assertions by this processor.
- FSB_IOQ_empty (bit 47): Counts each bus clocks when the IOQ is empty.
- FSB_IOQ_full (bit 48): Counts each bus clocks when the IOQ is full.
- FSB_IOQ_active (bit 49): Counts each bus clocks when there is at least one entry in the IOQ.
- FSB_WW_data (bit 50): Counts back-to-back write transaction's data phase.
- FSB_WW_issue (bit 51): Counts back-to-back write transaction request pairs issued by this processor.
- FSB_WR_issue (bit 52): Counts back-to-back write-read transaction request pairs issued by this processor.
- FSB_RW_issue (bit 53): Counts back-to-back read-write transaction request pairs issued by this processor.
- FSB_other_DBSY (bit 54): Count DBSY assertions by another agent (without a concurrent DRDY).
- FSB_other_DRDY (bit 55): Count DRDY assertions by another agent.
- FSB_other_snoop_stall (bit 56): Count snoop stalls on the FSB due to another agent.
- FSB_other_BNR (bit 57): Count BNR assertions from another agent.

21.6.7.5 Common Event Control Interface

The MSR_EMON_L3_GL_CTL MSR provides simplified access to query overflow status of the GBSQ, GSNPQ, FSB event counters. It also provides control bit fields to freeze, unfreeze, or reset those counters. The following bit fields are supported:

- GL_freeze_cmd (bit 0): Freeze the event counters specified by the GL_event_select field.
- GL_unfreeze_cmd (bit 1): Unfreeze the event counters specified by the GL_event_select field.
- GL_reset_cmd (bit 2): Clear the event count field of the event counters specified by the GL_event_select field. The event select field is not affected.
- GL_event_select (bit 23:16): Selects one or more event counters to subject to specified command operations indicated by bits 2:0. Bit 16 corresponds to MSR_EMON_L3_CTR_CTL0, bit 23 corresponds to MSR_EMON_L3_CTR_CTL7.
- GL_event_status (bit 55:48): Indicates the overflow status of each event counters. Bit 48 corresponds to MSR_EMON_L3_CTR_CTL0, bit 55 corresponds to MSR_EMON_L3_CTR_CTL7.

In the event control field (bits 63:32) of each MSR, if the saturate control (bit 59, see Figure 21-62 for example) is set, the event logic forces the value FFFF_FFFFH into the event count field instead of incrementing it.

21.6.8 Performance Monitoring (P6 Family Processor)

The P6 family processors provide two 40-bit performance counters, allowing two types of events to be monitored simultaneously. These can either count events or measure duration. When counting events, a counter increments each time a specified event takes place or a specified number of events takes place. When measuring duration, it counts the number of processor clocks that occur while a specified condition is true. The counters can count events or measure durations that occur at any privilege level.

NOTE

The performance-monitoring events found at https://perfmon-events.intel.com/ are intended to be used as guides for performance tuning. Counter values reported are not guaranteed to be accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

The performance-monitoring counters are supported by four MSRs: the performance event select MSRs (PerfEvtSel0 and PerfEvtSel1) and the performance counter MSRs (PerfCtr0 and PerfCtr1). These registers can be read from and written to using the RDMSR and WRMSR instructions, respectively. They can be accessed using these instructions only when operating at privilege level 0. The PerfCtr0 and PerfCtr1 MSRs can be read from any privilege level using the RDPMC (read performance-monitoring counters) instruction.

NOTE

The PerfEvtSel0, PerfEvtSel1, PerfCtr0, and PerfCtr1 MSRs and the events listed for P6 family processors are model-specific for P6 family processors. They are not guaranteed to be available in other IA-32 processors.

21.6.8.1 PerfEvtSel0 and PerfEvtSel1 MSRs

The PerfEvtSel0 and PerfEvtSel1 MSRs control the operation of the performance-monitoring counters, with one register used to set up each counter. They specify the events to be counted, how they should be counted, and the privilege levels at which counting should take place. Figure 21-65 shows the flags and fields in these MSRs.

The functions of the flags and fields in the PerfEvtSel0 and PerfEvtSel1 MSRs are as follows:

- **Event select field (bits 0 through 7) —** Selects the event logic unit to detect certain microarchitectural conditions.
- **Unit mask (UMASK) field (bits 8 through 15) —** Further qualifies the event logic unit selected in the event select field to detect a specific microarchitectural condition. For example, for some cache events, the mask is used as a MESI-protocol qualifier of cache states.

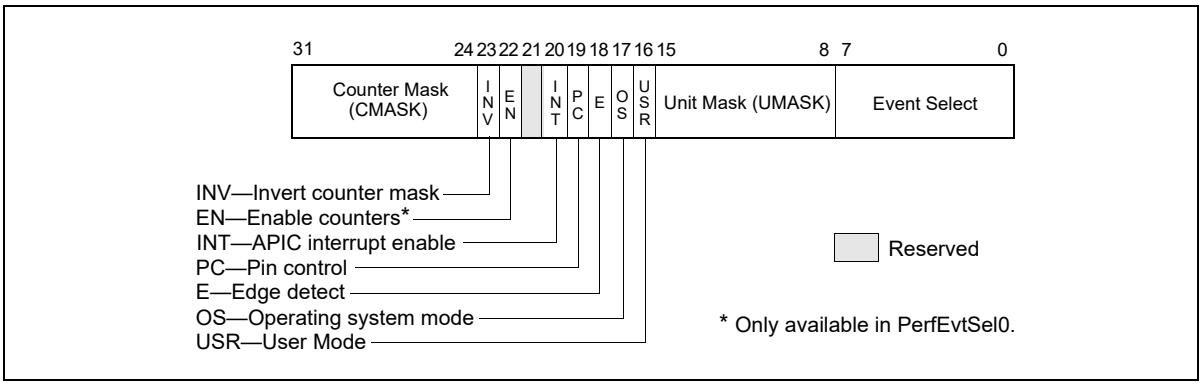

Figure 21-65. PerfEvtSel0 and PerfEvtSel1 MSRs

- **USR (user mode) flag (bit 16) —** Specifies that events are counted only when the processor is operating at privilege levels 1, 2 or 3. This flag can be used in conjunction with the OS flag.
- **OS (operating system mode) flag (bit 17) —** Specifies that events are counted only when the processor is operating at privilege level 0. This flag can be used in conjunction with the USR flag.
- **E (edge detect) flag (bit 18) —** Enables (when set) edge detection of events. The processor counts the number of deasserted to asserted transitions of any condition that can be expressed by the other fields. The mechanism is limited in that it does not permit back-to-back assertions to be distinguished. This mechanism allows software to measure not only the fraction of time spent in a particular state, but also the average length of time spent in such a state (for example, the time spent waiting for an interrupt to be serviced).

- **PC (pin control) flag (bit 19) —** When set, the processor toggles the PM*i* pins and increments the counter when performance-monitoring events occur; when clear, the processor toggles the PM*i* pins when the counter overflows. The toggling of a pin is defined as assertion of the pin for a single bus clock followed by deassertion.
- **INT (APIC interrupt enable) flag (bit 20) —** When set, the processor generates an exception through its local APIC on counter overflow.
- **EN (Enable Counters) Flag (bit 22) —** This flag is only present in the PerfEvtSel0 MSR. When set, performance counting is enabled in both performance-monitoring counters; when clear, both counters are disabled.
- **INV (invert) flag (bit 23) —** When set, inverts the counter-mask (CMASK) comparison, so that both greater than or equal to and less than comparisons can be made (0: greater than or equal; 1: less than). Note if counter-mask is programmed to zero, INV flag is ignored.
- **Counter mask (CMASK) field (bits 24 through 31) —** When nonzero, the processor compares this mask to the number of events counted during a single cycle. If the event count is greater than or equal to this mask, the counter is incremented by one. Otherwise the counter is not incremented. This mask can be used to count events only if multiple occurrences happen per clock (for example, two or more instructions retired per clock). If the counter-mask field is 0, then the counter is incremented each cycle by the number of events that occurred that cycle.

21.6.8.2 PerfCtr0 and PerfCtr1 MSRs

The performance-counter MSRs (PerfCtr0 and PerfCtr1) contain the event or duration counts for the selected events being counted. The RDPMC instruction can be used by programs or procedures running at any privilege level and in virtual-8086 mode to read these counters. The PCE flag in control register CR4 (bit 8) allows the use of this instruction to be restricted to only programs and procedures running at privilege level 0.

The RDPMC instruction is not serializing or ordered with other instructions. Thus, it does not necessarily wait until all previous instructions have been executed before reading the counter. Similarly, subsequent instructions may begin execution before the RDPMC instruction operation is performed.

Only the operating system, executing at privilege level 0, can directly manipulate the performance counters, using the RDMSR and WRMSR instructions. A secure operating system would clear the PCE flag during system initialization to disable direct user access to the performance-monitoring counters, but provide a user-accessible programming interface that emulates the RDPMC instruction.

The WRMSR instruction cannot arbitrarily write to the performance-monitoring counter MSRs (PerfCtr0 and PerfCtr1). Instead, the lower-order 32 bits of each MSR may be written with any value, and the high-order 8 bits are sign-extended according to the value of bit 31. This operation allows writing both positive and negative values to the performance counters.

21.6.8.3 Starting and Stopping the Performance-Monitoring Counters

The performance-monitoring counters are started by writing valid setup information in the PerfEvtSel0 and/or PerfEvtSel1 MSRs and setting the enable counters flag in the PerfEvtSel0 MSR. If the setup is valid, the counters begin counting following the execution of a WRMSR instruction that sets the enable counter flag. The counters can be stopped by clearing the enable counters flag or by clearing all the bits in the PerfEvtSel0 and PerfEvtSel1 MSRs. Counter 1 alone can be stopped by clearing the PerfEvtSel1 MSR.

21.6.8.4 Event and Time-Stamp Monitoring Software

To use the performance-monitoring counters and time-stamp counter, the operating system needs to provide an event-monitoring device driver. This driver should include procedures for handling the following operations:

- Feature checking.
- Initialize and start counters.
- Stop counters.
- Read the event counters.
- Read the time-stamp counter.

The event monitor feature determination procedure must check whether the current processor supports the performance-monitoring counters and time-stamp counter. This procedure compares the family and model of the processor returned by the CPUID instruction with those of processors known to support performance monitoring. (The Pentium and P6 family processors support performance counters.) The procedure also checks the MSR and TSC flags returned to register EDX by the CPUID instruction to determine if the MSRs and the RDTSC instruction are supported.

The initialize and start counters procedure sets the PerfEvtSel0 and/or PerfEvtSel1 MSRs for the events to be counted and the method used to count them and initializes the counter MSRs (PerfCtr0 and PerfCtr1) to starting counts. The stop counters procedure stops the performance counters (see Section 21.6.8.3, "Starting and Stopping the Performance-Monitoring Counters").

The read counters procedure reads the values in the PerfCtr0 and PerfCtr1 MSRs, and a read time-stamp counter procedure reads the time-stamp counter. These procedures would be provided in lieu of enabling the RDTSC and RDPMC instructions that allow application code to read the counters.

21.6.8.5 Monitoring Counter Overflow

The P6 family processors provide the option of generating a local APIC interrupt when a performance-monitoring counter overflows. This mechanism is enabled by setting the interrupt enable flag in either the PerfEvtSel0 or the PerfEvtSel1 MSR. The primary use of this option is for statistical performance sampling.

To use this option, the operating system should do the following things on the processor for which performance events are required to be monitored:

- Provide an interrupt vector for handling the counter-overflow interrupt.
- Initialize the APIC PERF local vector entry to enable handling of performance-monitor counter overflow events.
- Provide an entry in the IDT that points to a stub exception handler that returns without executing any instructions.
- Provide an event monitor driver that provides the actual interrupt handler and modifies the reserved IDT entry to point to its interrupt routine.

When interrupted by a counter overflow, the interrupt handler needs to perform the following actions:

- Save the instruction pointer (EIP register), code-segment selector, TSS segment selector, counter values and other relevant information at the time of the interrupt.
- Reset the counter to its initial setting and return from the interrupt.

An event monitor application utility or another application program can read the information collected for analysis of the performance of the profiled application.

21.6.9 Performance Monitoring (Pentium Processors)

The Pentium processor provides two 40-bit performance counters, which can be used to count events or measure duration. The counters are supported by three MSRs: the control and event select MSR (CESR) and the performance counter MSRs (CTR0 and CTR1). These can be read from and written to using the RDMSR and WRMSR instructions, respectively. They can be accessed using these instructions only when operating at privilege level 0.

Each counter has an associated external pin (PM0/BP0 and PM1/BP1), which can be used to indicate the state of the counter to external hardware.

NOTES

The CESR, CTR0, and CTR1 MSRs and the events listed for Pentium processors are model-specific for the Pentium processor.

The performance-monitoring events found at https://perfmon-events.intel.com/ are intended to be used as guides for performance tuning. Counter values reported are not guaranteed to be accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

21.6.9.1 Control and Event Select Register (CESR)

The 32-bit control and event select MSR (CESR) controls the operation of performance-monitoring counters CTR0 and CTR1 and the associated pins (see Figure 21-66). To control each counter, the CESR register contains a 6-bit event select field (ES0 and ES1), a pin control flag (PC0 and PC1), and a 3-bit counter control field (CC0 and CC1). The functions of these fields are as follows:

- **ES0 and ES1 (event select) fields (bits 0-5, bits 16-21) —** Selects (by entering an event code in the field) up to two events to be monitored.

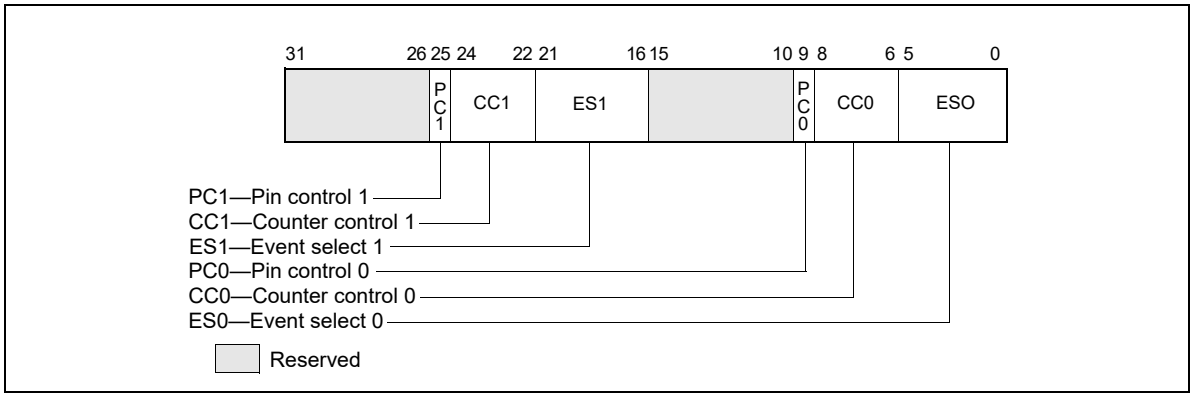

Figure 21-66. CESR MSR (Pentium Processor Only)

- **CC0 and CC1 (counter control) fields (bits 6-8, bits 22-24) —** Controls the operation of the counter. Control codes are as follows:

  000 — Count nothing (counter disabled).

  001 — Count the selected event while CPL is 0, 1, or 2.

  010 — Count the selected event while CPL is 3.

  011 — Count the selected event regardless of CPL.

  100 — Count nothing (counter disabled).

  101 — Count clocks (duration) while CPL is 0, 1, or 2.

  110 — Count clocks (duration) while CPL is 3.

  111 — Count clocks (duration) regardless of CPL.

  The highest order bit selects between counting events and counting clocks (duration); the middle bit enables counting when the CPL is 3; and the low-order bit enables counting when the CPL is 0, 1, or 2.

- **PC0 and PC1 (pin control) flags (bits 9, 25) —** Selects the function of the external performance-monitoring counter pin (PM0/BP0 and PM1/BP1). Setting one of these flags to 1 causes the processor to assert its associated pin when the counter has overflowed; setting the flag to 0 causes the pin to be asserted when the counter has been incremented. These flags permit the pins to be individually programmed to indicate the overflow or incremented condition. The external signaling of the event on the pins will lag the internal event by a few clocks as the signals are latched and buffered.

While a counter need not be stopped to sample its contents, it must be stopped and cleared or preset before switching to a new event. It is not possible to set one counter separately. If only one event needs to be changed, the CESR register must be read, the appropriate bits modified, and all bits must then be written back to CESR. At reset, all bits in the CESR register are cleared.

21.6.9.2 Use of the Performance-Monitoring Pins

When performance-monitor pins PM0/BP0 and/or PM1/BP1 are configured to indicate when the performance-monitor counter has incremented and an "occurrence event" is being counted, the associated pin is asserted (high) each time the event occurs. When a "duration event" is being counted, the associated PM pin is asserted for the

entire duration of the event. When the performance-monitor pins are configured to indicate when the counter has overflowed, the associated PM pin is asserted when the counter has overflowed.

When the PM0/BP0 and/or PM1/BP1 pins are configured to signal that a counter has incremented, it should be noted that although the counters may increment by 1 or 2 in a single clock, the pins can only indicate that the event occurred. Moreover, since the internal clock frequency may be higher than the external clock frequency, a single external clock may correspond to multiple internal clocks.

A "count up to" function may be provided when the event pin is programmed to signal an overflow of the counter. Because the counters are 40 bits, a carry out of bit 39 indicates an overflow. A counter may be preset to a specific value less then $2^{40} - 1$. After the counter has been enabled and the prescribed number of events has transpired, the counter will overflow.

Approximately 5 clocks later, the overflow is indicated externally and appropriate action, such as signaling an interrupt, may then be taken.

The PM0/BP0 and PM1/BP1 pins also serve to indicate breakpoint matches during in-circuit emulation, during which time the counter increment or overflow function of these pins is not available. After RESET, the PM0/BP0 and PM1/BP1 pins are configured for performance monitoring, however a hardware debugger may reconfigure these pins to indicate breakpoint matches.

21.6.9.3 Events Counted

Events that performance-monitoring counters can be set to count and record (using CTR0 and CTR1) are divided in two categories: occurrence and duration:

- **Occurrence events** — Counts are incremented each time an event takes place. If PM0/BP0 or PM1/BP1 pins are used to indicate when a counter increments, the pins are asserted each clock counters increment. But if an event happens twice in one clock, the counter increments by 2 (the pins are asserted only once).
- **Duration events** — Counters increment the total number of clocks that the condition is true. When used to indicate when counters increment, PM0/BP0 and/or PM1/BP1 pins are asserted for the duration.

21.7 COUNTING CLOCKS

The count of cycles, also known as clockticks, forms the basis for measuring how long a program takes to execute. Clockticks are also used as part of efficiency ratios like cycles per instruction (CPI). Processor clocks may stop ticking under circumstances like the following:

- The processor is halted when there is nothing for the CPU to do. For example, the processor may halt to save power while the computer is servicing an I/O request. When Intel Hyper-Threading Technology is enabled, both logical processors must be halted for performance-monitoring counters to be powered down.
- The processor is asleep as a result of being halted or because of a power-management scheme. There are different levels of sleep. In the some deep sleep levels, the time-stamp counter stops counting.

In addition, processor core clocks may undergo transitions at different ratios relative to the processor's bus clock frequency. Some of the situations that can cause processor core clock to undergo frequency transitions include:

- TM2 transitions.
- Enhanced Intel SpeedStep Technology transitions (P-state transitions).

For Intel processors that support TM2, the processor core clocks may operate at a frequency that differs from the Processor Base frequency (as indicated by processor frequency information reported by CPUID instruction). See Section 21.7.2 for more detail.

Due to the above considerations there are several important clocks referenced in this manual:

- **Base Clock —** The frequency of this clock is the frequency of the processor when the processor is not in turbo mode, and not being throttled via Intel SpeedStep.
- **Maximum Clock —** This is the maximum frequency of the processor when turbo mode is at the highest point.
- **Bus Clock —** These clockticks increment at a fixed frequency and help coordinate the bus on some systems.

- **Core Crystal Clock —** This is a clock that runs at fixed frequency; it coordinates the clocks on all packages across the system.
- **Non-halted Clockticks —** Measures clock cycles in which the specified logical processor is not halted and is not in any power-saving state. When Intel Hyper-Threading Technology is enabled, ticks can be measured on a per-logical-processor basis. There are also performance events on dual-core processors that measure clockticks per logical processor when the processor is not halted.
- **Non-sleep Clockticks —** Measures clock cycles in which the specified physical processor is not in a sleep mode or in a power-saving state. These ticks cannot be measured on a logical-processor basis.
- **Time-stamp Counter —** See Section 19.17, "Time-Stamp Counter."
- **Reference Clockticks —** TM2 or Enhanced Intel SpeedStep technology are two examples of processor features that can cause processor core clockticks to represent non-uniform tick intervals due to change of bus ratios. Performance events that counts clockticks of a constant reference frequency was introduced Intel Core Duo and Intel Core Solo processors. The mechanism is further enhanced on processors based on Intel Core microarchitecture.

Some processor models permit clock cycles to be measured when the physical processor is not in deep sleep (by using the time-stamp counter and the RDTSC instruction). Note that such ticks cannot be measured on a per-logical-processor basis. See Section 19.17, "Time-Stamp Counter," for detail on processor capabilities.

The first two methods use performance counters and can be set up to cause an interrupt upon overflow (for sampling). They may also be useful where it is easier for a tool to read a performance counter than to use a time stamp counter (the timestamp counter is accessed using the RDTSC instruction).

For applications with a significant amount of I/O, there are two ratios of interest:

- **Non-halted CPI —** Non-halted clockticks/instructions retired measures the CPI for phases where the CPU was being used. This ratio can be measured on a logical-processor basis when Intel Hyper-Threading Technology is enabled.
- **Nominal CPI —** Time-stamp counter ticks/instructions retired measures the CPI over the duration of a program, including those periods when the machine halts while waiting for I/O.

21.7.1 Non-Halted Reference Clockticks

Software can use UnHalted Reference Cycles on either a general purpose performance counter using event mask 0x3C and UMASK 0x01 or on fixed function performance counter 2 to count at a constant rate. These events count at a consistent rate irrespective of P-state, TM2, or frequency transitions that may occur to the processor. The UnHalted Reference Cycles event may count differently on the general purpose event and fixed counter.

21.7.2 Cycle Counting and Opportunistic Processor Operation

As a result of the state transitions due to opportunistic processor performance operation (see Chapter 16, "Power and Thermal Management"), a logical processor or a processor core can operate at frequency different from the Processor Base frequency.

The following items are expected to hold true irrespective of when opportunistic processor operation causes state transitions:

- The time stamp counter operates at a fixed-rate frequency of the processor.
- The IA32_MPERF counter increments at a fixed frequency irrespective of any transitions caused by opportunistic processor operation.
- The IA32_FIXED_CTR2 counter increments at the same TSC frequency irrespective of any transitions caused by opportunistic processor operation.
- The Local APIC timer operation is unaffected by opportunistic processor operation.
- The TSC, IA32_MPERF, and IA32_FIXED_CTR2 operate at close to the maximum non-turbo frequency, which is equal to the product of scalable bus frequency and maximum non-turbo ratio.

21.7.3 Determining the Processor Base Frequency

For Intel processors in which the nominal core crystal clock frequency is enumerated in CPUID.15H.ECX and the core crystal clock ratio is encoded in CPUID.15H (see Table 3-17 "Information Returned by CPUID Instruction"), the nominal TSC frequency can be determined by using the following equation:

Nominal TSC frequency = (CPUID.15H.ECX[31:0] * CPUID.15H.EBX[31:0]) ÷ CPUID.15H.EAX[31:0]

For Intel processors in which CPUID.15H.EBX[31:0] ÷ CPUID.0x15.EAX[31:0] is enumerated but CPUID.15H.ECX is not enumerated, Table 21-95 can be used to look up the nominal core crystal clock frequency.

Table 21-95. Nominal Core Crystal Clock Frequency

Processor Families/Processor Number Series[1]	Nominal Core Crystal Clock Frequency
Intel® Xeon® Scalable Processor Family with CPUID signature 06_55H.	25 MHz
6th and 7th generation Intel® Core™ processors and Intel® Xeon® W Processor Family.	24 MHz
Next Generation Intel Atom® processors based on Goldmont Microarchitecture with CPUID signature 06_5CH (does not include Intel Xeon processors).	19.2 MHz

NOTES:

1. For any processor in which CPUID.15H is enumerated and MSR_PLATFORM_INFO[15:8] (which gives the scalable bus frequency) is available, a more accurate frequency can be obtained by using CPUID.15H.

21.7.3.1 For Intel® Processors Based on Sandy Bridge, Ivy Bridge, Haswell, and Broadwell Microarchitectures

The scalable bus frequency is encoded in the bit field MSR_PLATFORM_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by a bus speed of 100 MHz.

21.7.3.2 For Intel® Processors Based on Nehalem Microarchitecture

The scalable bus frequency is encoded in the bit field MSR_PLATFORM_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by a bus speed of 133.33 MHz.

21.7.3.3 For Intel Atom® Processors Based on Silvermont Microarchitecture (Including Intel Processors Based on Airmont Microarchitecture)

The scalable bus frequency is encoded in the bit field MSR_PLATFORM_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by the scalable bus frequency. The scalable bus frequency is encoded in the bit field MSR_FSB_FREQ[2:0] for Intel Atom processors based on the Silvermont microarchitecture, and in bit field MSR_FSB_FREQ[3:0] for processors based on the Airmont microarchitecture; see Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4.

21.7.3.4 For Intel® Core™ 2 Processor Family and for Intel® Xeon® Processors Based on Intel Core Microarchitecture

For processors based on Intel Core microarchitecture, the scalable bus frequency is encoded in the bit field MSR_FSB_FREQ[2:0] at (0CDH), see Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4. The maximum resolved bus ratio can be read from the following bit field:

- If XE operation is disabled, the maximum resolved bus ratio can be read in MSR_PLATFORM_ID[12:8]. It corresponds to the Processor Base frequency.

- IF XE operation is enabled, the maximum resolved bus ratio is given in MSR_PERF_STATUS[44:40], it corresponds to the maximum XE operation frequency configured by BIOS.

XE operation of an Intel 64 processor is implementation specific. XE operation can be enabled only by BIOS. If MSR_PERF_STATUS[31] is set, XE operation is enabled. The MSR_PERF_STATUS[31] field is read-only.

21.8 IA32_PERF_CAPABILITIES MSR ENUMERATION

The layout of IA32_PERF_CAPABILITIES MSR is shown in Figure 21-67; it provides enumeration of a variety of interfaces:

- IA32_PERF_CAPABILITIES.LBR_FMT[bits 5:0]: encodes the LBR format, details are described in Section 19.4.8.1.
- IA32_PERF_CAPABILITIES.PEBSTrap[6]: Trap/Fault-like indicator of PEBS recording assist; see Section 21.6.2.4.2.
- IA32_PERF_CAPABILITIES.PEBSArchRegs[7]: Indicator of PEBS assist save architectural registers; see Section 21.6.2.4.2.
- IA32_PERF_CAPABILITIES.PEBS_FMT[bits 11:8]: Specifies the encoding of the layout of PEBS records; see Section 21.6.2.4.2.
- IA32_PERF_CAPABILITIES.FREEZE_WHILE_SMM[12]: Indicates IA32_DEBUGCTL.FREEZE_WHILE_SMM is supported if 1. See Section 21.8.1.
- IA32_PERF_CAPABILITIES.FULL_WRITE[13]: Indicates the processor supports IA32_A_PMCx interface for updating bits 32 and above of IA32_PMCx; see Section 21.2.8.
- IA32_PERF_CAPABILITIES.PEBS_BASELINE [bit 14]: If set, the following is true:
  - The IA32_PEBS_ENABLE MSR (address 3F1H) exists and all architecturally enumerated fixed and general-purpose counters have corresponding bits in IA32_PEBS_ENABLE that enable generation of PEBS records. The general-purpose counter bits start at bit IA32_PEBS_ENABLE[0], and the fixed counter bits start at bit IA32_PEBS_ENABLE[32].
  - The format of the PEBS record is enumerated by IA32_PERF_CAPABILITIES.PEBS_FMT; see Section 21.6.2.4.2.
  - Extended PEBS is supported. All counters support the PEBS facility, and all events (both precise and non-precise) can generate PEBS records when PEBS is enabled for that counter. Note that not all events may be available on all counters.
  - Adaptive PEBS is supported. The PEBS_DATA_CFG MSR (address 3F2H) and adaptive record enable bits (IA32_PERFEVTSELx.Adaptive_Record and IA32_FIXED_CTR_CTRL.FCx_Adaptive_Record) are supported. The definition of the PEBS_DATA_CFG MSR, including which bits are supported and how they affect the record, is enumerated by IA32_PERF_CAPABILITIES.PEBS_FMT. See Section 21.9.2.3.
  - NOTE: Software is recommended to feature PEBS Baseline when the following is true: IA32_PERF_CAPABILITIES.PEBS_BASELINE[14] && IA32_PERF_CAPABILITIES.PEBS_FMT[11:8] ≥ 4.
- IA32_PERF_CAPABILITIES.PERF_METRICS_AVAILABLE[15]: If set, indicates that the architecture provides built in support for TMA L1 metrics through the PERF_METRICS MSR. See Section 21.3.9.3.
- IA32_PERF_CAPABILITIES.PEBS_OUTPUT_PT_AVAIL[16]: If set on parts that enumerate support for Intel PT (CPUID.0x7.0.EBX[25]=1), setting IA32_PEBS_ENABLE.PEBS_OUTPUT to 01B will result in PEBS output being written into the Intel PT trace stream. See Section 21.5.5.2.
- IA32_PERF_CAPABILITIES.PEBS_TIMING_INFO[17]: If set, indicates that the processor supports the Timed PEBS capability. See Section 21.9.9.
- IA32_PERF_CAPABILITIES.RDPMC_METRICS_CLEAR[19]: If set, indicates that the processor supports RDPMC Metrics Clear Mode.

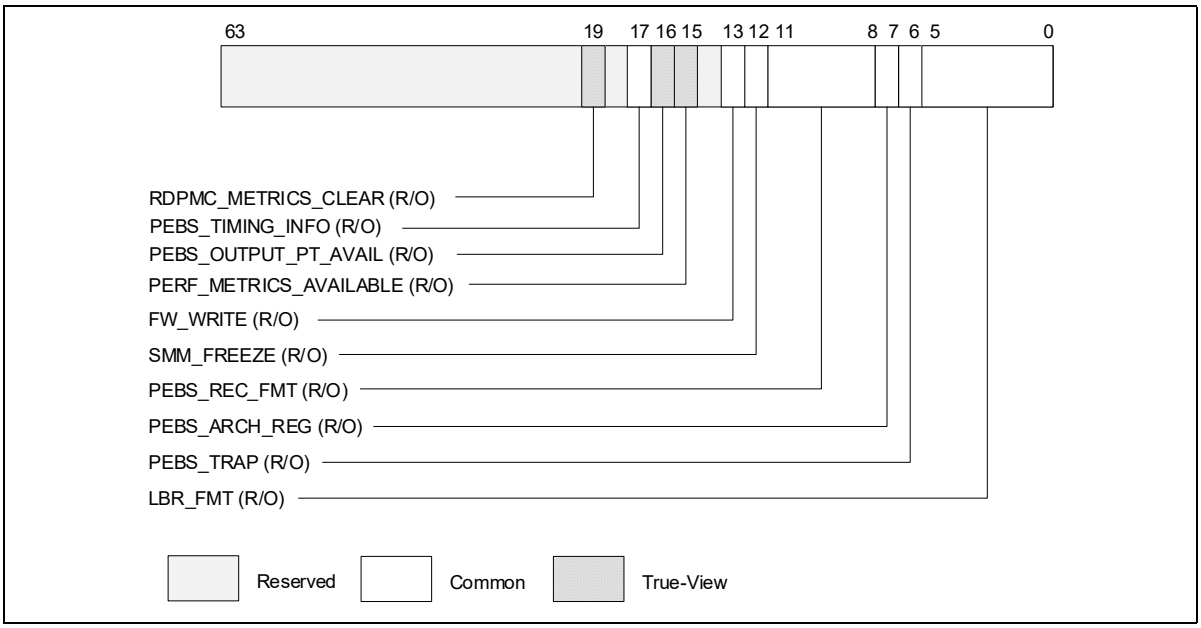

Figure 21-67. Layout of IA32_PERF_CAPABILITIES MSR

21.8.1 Filtering of SMM Handler Overhead

When performance monitoring facilities and/or branch profiling facilities (see Section 19.5, "Last Branch, Interrupt, and Exception Recording (Intel® Core™ 2 Duo and Intel Atom® Processors)") are enabled, these facilities capture event counts, branch records and branch trace messages occurring in a logical processor. The occurrence of interrupts, instruction streams due to various interrupt handlers all contribute to the results recorded by these facilities.

If CPUID.01H:ECX.PDCM[bit 15] is 1, the processor supports the IA32_PERF_CAPABILITIES MSR. If IA32_PERF_-CAPABILITIES.FREEZE_WHILE_SMM[Bit 12] is 1, the processor supports the ability for system software using performance monitoring and/or branch profiling facilities to filter out the effects of servicing system management interrupts.

If the FREEZE_WHILE_SMM capability is enabled on a logical processor and after an SMI is delivered, the processor will clear all the enable bits of IA32_PERF_GLOBAL_CTRL, save a copy of the content of IA32_DEBUGCTL and disable LBR, BTF, TR, and BTS fields of IA32_DEBUGCTL before transferring control to the SMI handler.

The enable bits of IA32_PERF_GLOBAL_CTRL will be set to 1, the saved copy of IA32_DEBUGCTL prior to SMI delivery will be restored , after the SMI handler issues RSM to complete its servicing.

It is the responsibility of the SMM code to ensure the state of the performance monitoring and branch profiling facilities are preserved upon entry or until prior to exiting the SMM. If any of this state is modified due to actions by the SMM code, the SMM code is required to restore such state to the values present at entry to the SMM handler.

System software is allowed to set IA32_DEBUGCTL.FREEZE_WHILE_SMM[bit 14] to 1 only supported as indicated by IA32_PERF_CAPABILITIES.FREEZE_WHILE_SMM[Bit 12] reporting 1.

21.9 PEBS FACILITY

21.9.1 Extended PEBS

The Extended PEBS feature supports Processor Event Based Sampling (PEBS) on all counters, both fixed function and general purpose; and all performance monitoring events, both precise and non-precise. PEBS can be enabled for the general purpose counters using PEBS_EN_PMCi bits of IA32_PEBS_ENABLE (i = 0, 1,..m). PEBS can be enabled for 'i' fixed function counters using the PEBS_EN_FIXEDi bits of IA32_PEBS_ENABLE (i = 0, 1, ...n).

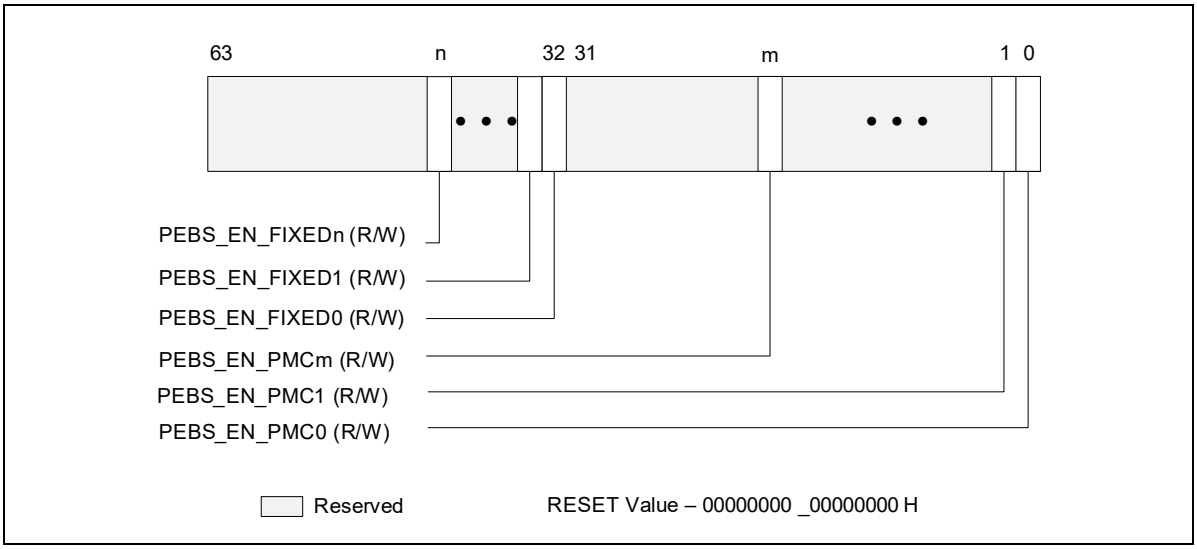

Figure 21-68. Layout of IA32_PEBS_ENABLE MSR

A PEBS record due to a precise event will be generated after an instruction that causes the event when the counter has already overflowed. A PEBS record due to a non-precise event will occur at the next opportunity after the counter has overflowed, including immediately after an overflow is set by an MSR write.

Currently, IA32_FIXED_CTR0 counts instructions retired and is a precise event. IA32_FIXED_CTR1, IA32_-FIXED_CTR2 … IA32_FIXED_CTRm count as non-precise events.

The Applicable Counter field in the Basic Info Group of the PEBS record indicates which counters caused the PEBS record to be generated. It is in the same format as the enable bits for each counter in IA32_PEBS_ENABLE. As an example, an Applicable Counter field with bits 2 and 32 set would indicate that both general purpose counter 2 and fixed function counter 0 generated the PEBS record.

To properly use PEBS for the additional counters, software will need to set up the counter reset values in PEBS portion of the DS_BUFFER_MANAGEMENT_AREA data structure that is indicated by the IA32_DS_AREA register. The layout of the DS_BUFFER_MANAGEMENT_AREA is shown in Figure 21-69. When a counter generates a PEBS records, the appropriate counter reset values will be loaded into that counter. In the above example where general purpose counter 2 and fixed function counter 0 generated the PEBS record, general purpose counter 2 would be reloaded with the value contained in PEBS GP Counter 2 Reset (offset 50H) and fixed function counter 0 would be reloaded with the value contained in PEBS Fixed Counter 0 Reset (offset 80H).

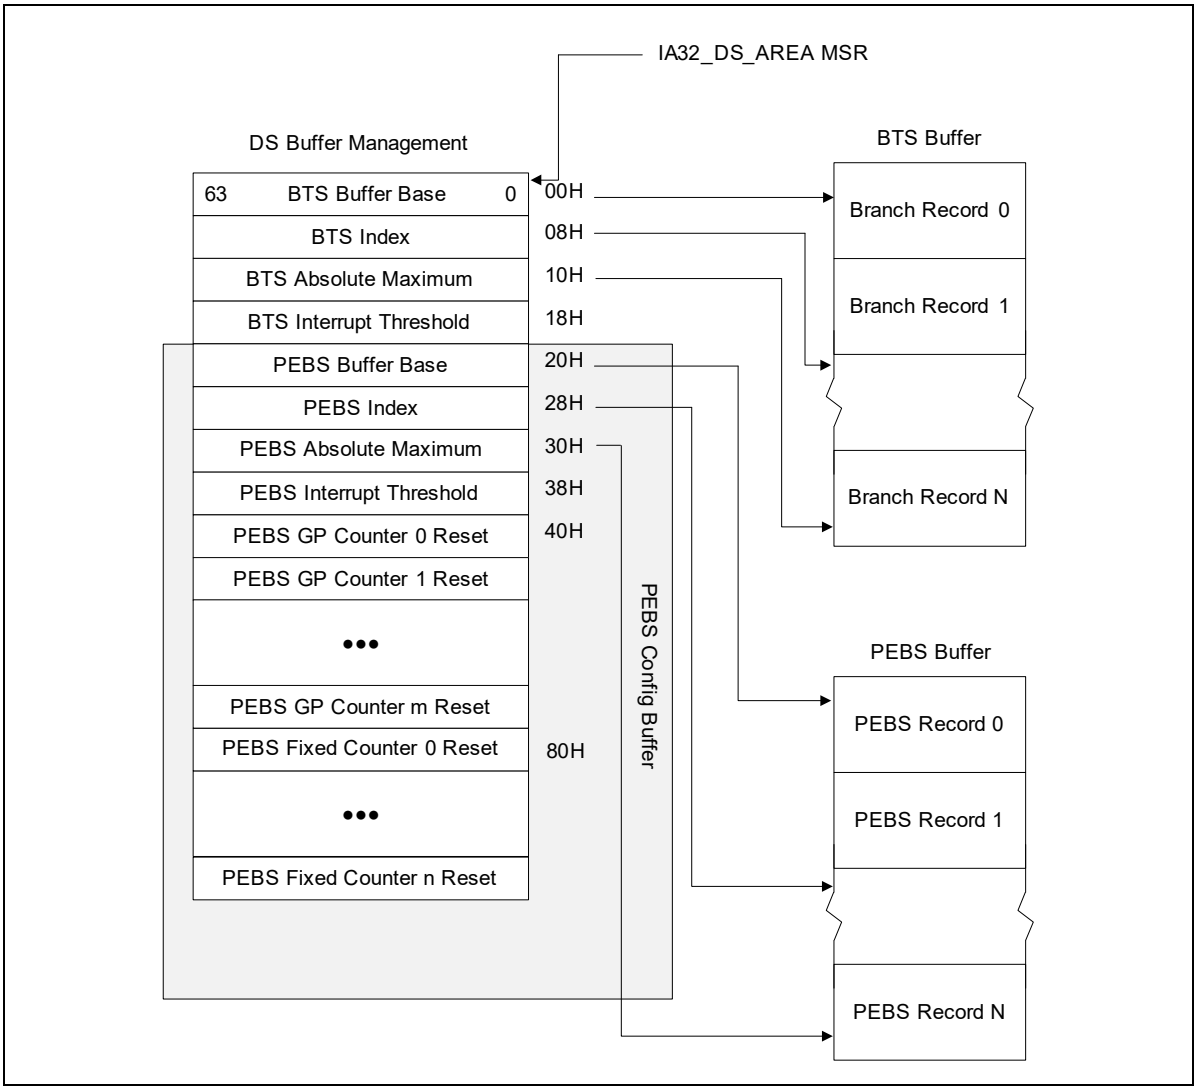

Figure 21-69. PEBS Programming Environment

Extended PEBS support debuts on Intel Atom® processors based on the Goldmont Plus microarchitecture and future Intel® Core™ processors based on the Ice Lake microarchitecture.

21.9.2 Adaptive PEBS

The PEBS facility has been enhanced to collect the following CPU state in addition to GPRs, EventingIP, TSC, and memory access related information collected by legacy PEBS:

- XMM registers
- LBR records (TO/FROM/INFO)
- Counters Snapshotting

The PEBS record is restructured where fields are grouped into Basic group, Memory group, GPR group, XMM group, LBR group, and Counters group. A new register MSR_PEBS_DATA_CFG provides software the capability to select data groups of interest and thus reduce the record size in memory and record generation latency. Hence, a PEBS record's size and layout vary based on the selected groups. The MSR also allows software to select LBR depth for branch data records.

By default, the PEBS record will only contain the Basic group. Optionally, each counter can be configured to generate a PEBS records with the groups specified in MSR_PEBS_DATA_CFG.

Details and examples for the Adaptive PEBS capability follow below.

21.9.2.1 Adaptive_Record Counter Control

IA32_PERFEVTSELx.Adaptive_Record[34]: If this bit is set and IA32_PEBS_ENABLE.PEBS_EN_PMCx is set for the corresponding GP counter, an overflow of PMCx results in generation of an adaptive PEBS record with state information based on the selections made in MSR_PEBS_DATA_CFG. If this bit is not set, a basic record is generated.

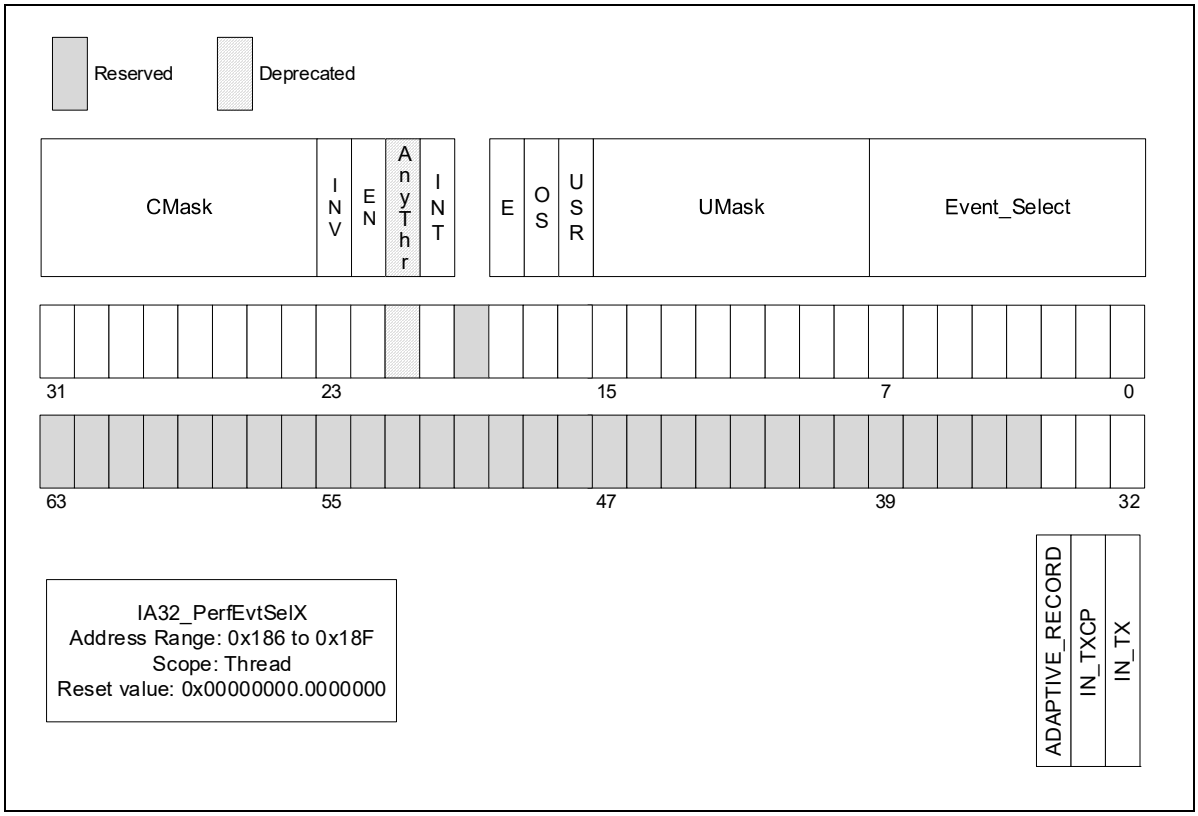

Figure 21-70. Layout of IA32_PerfEvtSelX MSR Supporting Adaptive PEBS

IA32_FIXED_CTR_CTRL.FCx_Adaptive_Record: If this bit is set and IA32_PEBS_ENABLE.PEBS_EN_FIXEDx is set for the corresponding Fixed counter, an overflow of FixedCtrx results in generation of an adaptive PEBS record with state information based on the selections made in MSR_PEBS_DATA_CFG. If this bit is not set, a basic record is generated.

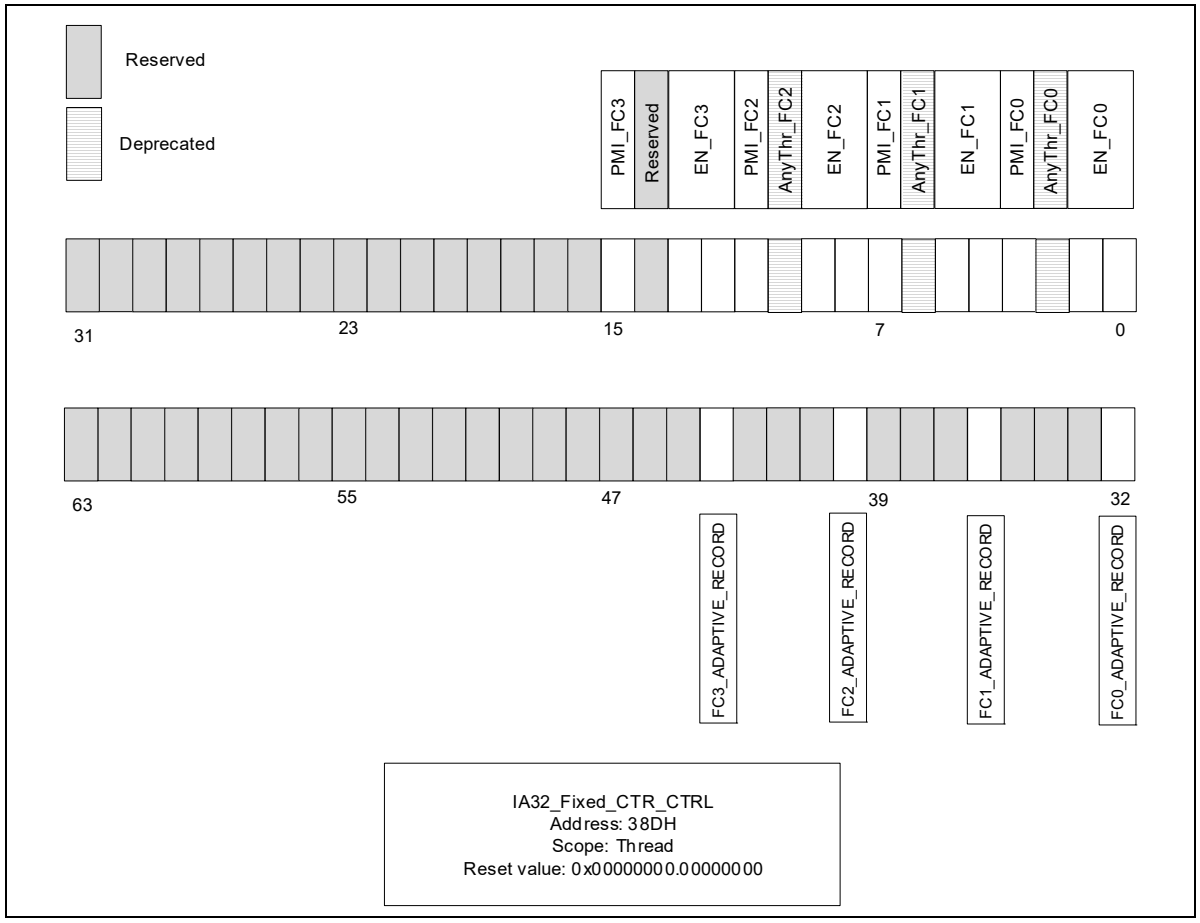

Figure 21-71. Layout of IA32_FIXED_CTR_CTRL MSR Supporting Adaptive PEBS

21.9.2.2 PEBS Record Format

The data fields in the PEBS record are aggregated into five groups which are described in the sub-sections below. Processors that support Adaptive PEBS implement a new MSR called MSR_PEBS_DATA_CFG which allows software to select the data groups to be captured. The data groups are not placed at fixed locations in the PEBS record, but are positioned immediately after one another, thus making the record format/size variable based on the groups selected.

21.9.2.2.1 Basic Info

The Basic group contains essential information for software to parse a record along with several critical fields. It is always collected.

Table 21-96. Basic Info Group

Field Name	Bit Width	Description
Record Format	[47:0]	This field indicates which data groups are included in the record. The field is zero if none of the counters that triggered the current PEBS record have their Adaptive_Record bit set. Otherwise it contains the value of MSR_PEBS_DATA_CFG.
	[63:48]	This field provides the size of the current record in bytes. Selected groups are packed back-to-back in the record without gaps or padding for unselected groups.

Table 21-96. Basic Info Group (Contd.)

Instruction Pointer	[63:0]	This field reports the Eventing Instruction Pointer (EventingIP) of the retired instruction that triggered the PEBS record generation. Note that this field is different than R/EIP which records the instruction pointer of the next instruction to be executed after record generation. The legacy R/EIP field has been removed.
Applicable Counters	[63:0]	The Applicable Counters field indicates which counters triggered the generation of the PEBS record, linking the record to specific events. This allows software to correlate the PEBS record entry properly with the instruction that caused the event, even when multiple counters are configured to generate PEBS records and multiple bits are set in the field.
TSC	[63:0]	This field provides the time stamp counter value when the PEBS record was generated.

21.9.2.2.2 Memory Access Info

This group contains the legacy PEBS memory-related fields; see Section 21.3.1.1.2.

Table 21-97. Memory Access Info Group

Field Name	Bit Width	Description
Memory Access Address	[63:0]	This field contains the linear address of the source of the load, or linear address of the destination (target) of the store. This value is written as a 64-bit address in canonical form.
Memory Auxiliary Info	[63:0]	When a MEM_TRANS_RETIRED.* event is configured in a General Purpose counter, this field contains an encoded value indicating the memory hierarchy source which satisfied the load. These encodings are detailed in Table 21-5 and Table 21-14. If the PEBS assist was triggered for a store uop, this field will contain information indicating the status of the store, as detailed in Table 21-15.
Memory Access Latency[1]	[63:0]	When a MEM_TRANS_RETIRED.* event is configured in a General Purpose counter, this field contains the latency to service the load in core clock cycles.
TSX Auxiliary Info	[31:0]	This field contains the number of cycles in the last TSX region, regardless of whether that region had aborted or committed.
	[63:32]	This field contains the abort details. Refer to Section 21.3.6.5.1.

NOTES:

1. In certain conditions, high latencies in fields under "Memory Access Latency" may be observed even when the Data Src of the "Memory Auxiliary Info" field indicates a close source.

Beginning with 12th generation Intel Core processors, the memory access information group has been updated. New fields added are shaded gray in Table 21-98.

Table 21-98. Updated Memory Access Info Group

Field Name	Sub-field Name	Bits	Description
Access Address (offset 0H)	DLA	[63:0]	This field reports the data linear address (DLA) of the memory access in canonical form. A zero value indicates the processor could not retrieve the address of the particular access.
Access Info (offset 8H)	Data Src	[3:0]	An encoded value indicating the memory hierarchy source which satisfied the access. These encodings are detailed in Table 21-5. A zero value indicates the processor could not retrieve the data source of the particular access.
	STLB-miss	[4]	A value of 1 indicates the access has missed the Second-level TLB (STLB).
	Is-Lock	[5]	A value of 1 indicates the access was part of a locked (atomic) memory transaction.
	Data-Blk	[6]	A value of 1 indicates the load was blocked since its data could not be forwarded from a preceding store.
	Address-Blk	[7]	A value of 1 indicates the load was blocked due to potential address conflict with a preceding store.
Access Latency (offset 10H)	Instruction Latency	[15:0]	Measured instruction latency in core cycles. For loads, the latency starts by the dispatch of the load operation for execution and lasts until completion of the instruction it belongs to. This field includes the entire latency including time for data-dependency resolution or TLB lookups.
	Cache Latency	[47:32]	Measured cache access latency in core cycles. For loads, the latency starts by the actual cache access until the data is returned by the memory subsystem. For stores, the latency starts when the demand write accesses the L1 data-cache and lasts until the cacheline write is completed in the memory subsystem. This field does not include non-data-cache latency such as memory ordering checks or TLB lookups.
TSX (offset 18H)	Transaction Latency	[31:0]	This field contains the number of cycles in the last TSX region, regardless of whether that region had aborted or committed.
	Abort Info	[63:32]	This field contains the abort details. Refer to Section 21.3.6.5.1.

To determine which fields are supported for certain performance monitoring events, consult the Memory Info attribute in the event lists at https://download.01.org/perfmon/.

NOTE

There may be additional block reasons, even if Data-Blk and Address-Blk are both clear, e.g., non-optimal instruction latency.

On P-core, the new Data-Blk and Address-Blk bits require the event LD_BLOCKS.STORE_FORWARD (r8203) to be configured in a programmable counter.

21.9.2.2.3 GPRs

This group is captured when the GPR bit is enabled in MSR_PEBS_DATA_CFG. GPRs are always 64 bits wide. If they are selected for non 64-bit mode, the upper 32-bit of the legacy RAX - RDI and all contents of R8-15 GPRs will be filled with 0s. In 64bit mode, the full 64 bit value of each register is written.

The order differs from legacy. The table below shows the order of the GPRs in Ice Lake microarchitecture.

Table 21-99. GPRs in Ice Lake Microarchitecture

Field Name	Bit Width
RFLAGS	[63:0]
RIP	[63:0]
RAX	[63:0]
RCX*	[63:0]
RDX*	[63:0]
RBX*	[63:0]
RSP*	[63:0]
RBP*	[63:0]
RSI*	[63:0]
RDI*	[63:0]
R8	[63:0]
…	…
R15	[63:0]

The machine state reported in the PEBS record is the committed machine state immediately after the instruction that triggers PEBS completes.

For instance, consider the following instruction sequence:

MOV eax, [eax]; triggers PEBS record generation

NOP

If the mov instruction triggers PEBS record generation, the EventingIP field in the PEBS record will report the address of the mov, and the value of EAX in the PEBS record will show the value read from memory, not the target address of the read operation. And the value of RIP will contain the linear address of the nop.

21.9.2.2.4 XMMs

This group is captured when the XMM bit is enabled in MSR_PEBS_DATA_CFG and SSE is enabled. If SSE is not enabled, the fields will contain zeroes. XMM8-XMM15 will also contain zeroes if not in 64-bit mode.

Table 21-100. XMMs

Field Name	Bit Width
XMM0	[127:0]
…	…
XMM15	[127:0]

21.9.2.2.5 LBRs

To capture LBR data in the PEBS record, the LBR bit in MSR_PEBS_DATA_CFG must be enabled. The number of LBR entries included in the record can be configured in the LBR_entries field of MSR_PEBS_DATA_CFG.

Table 21-101. LBRs

Field Name	Bit Width	Description
LBR[].FROM	[63:0]	Branch from address.
LBR[].TO	[63:0]	Branch to address.
LBR[].INFO	[63:0]	Other LBR information, like timing. This field is described in more detail in Section 19.12.1, "MSR_LBR_INFO_x MSR."

LBR entries are recorded into the record starting at LBR[TOS] and proceeding to LBR[TOS-1] and following. Note that LBR index is modulo the number of LBRs supporting on the processor.

21.9.2.3 MSR_PEBS_DATA_CFG

Bits in MSR_PEBS_DATA_CFG can be set to include data field blocks/groups into adaptive records. The Basic Info group is always included in the record. Additionally, the number of LBR entries included in the record is configurable.

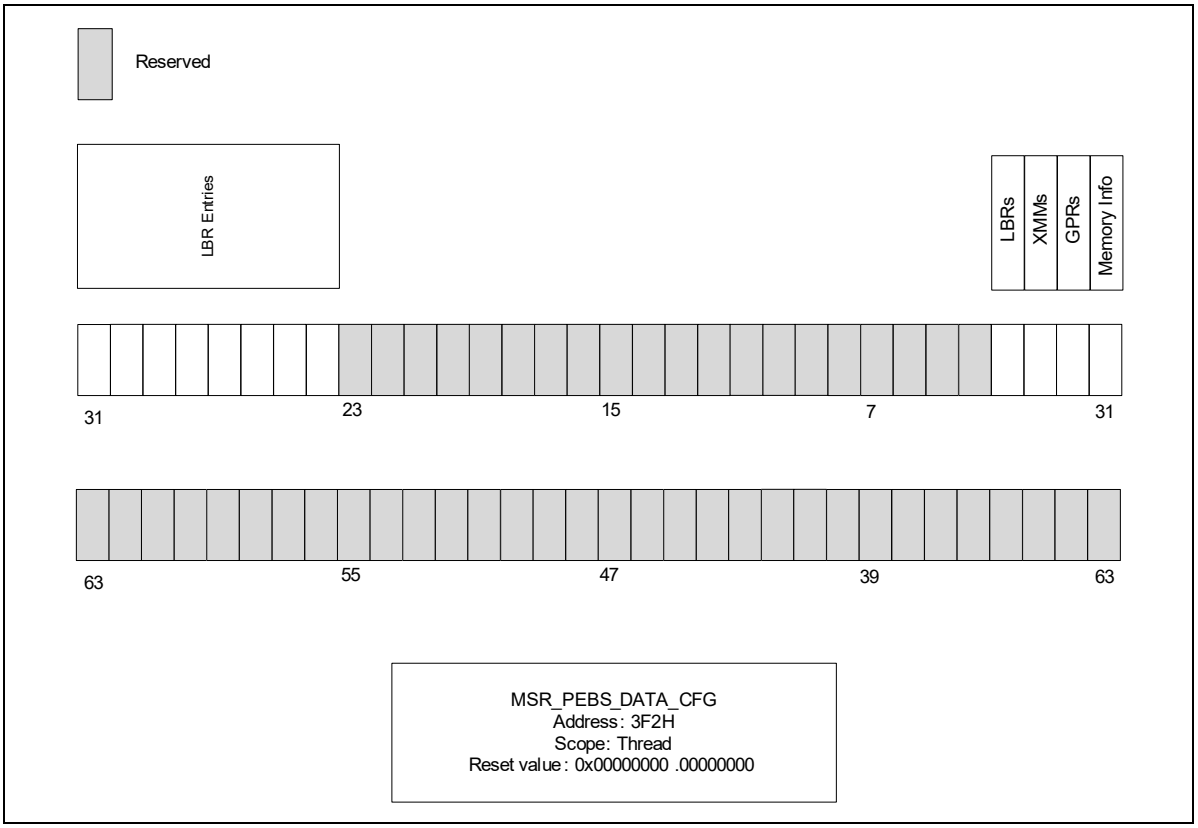

Figure 21-72. Legacy MSR_PEBS_DATA_CFG

Beginning with the Intel Series 2 Core Ultra processor, which counters are included in the Counters group is configurable. See Figure 21-73.

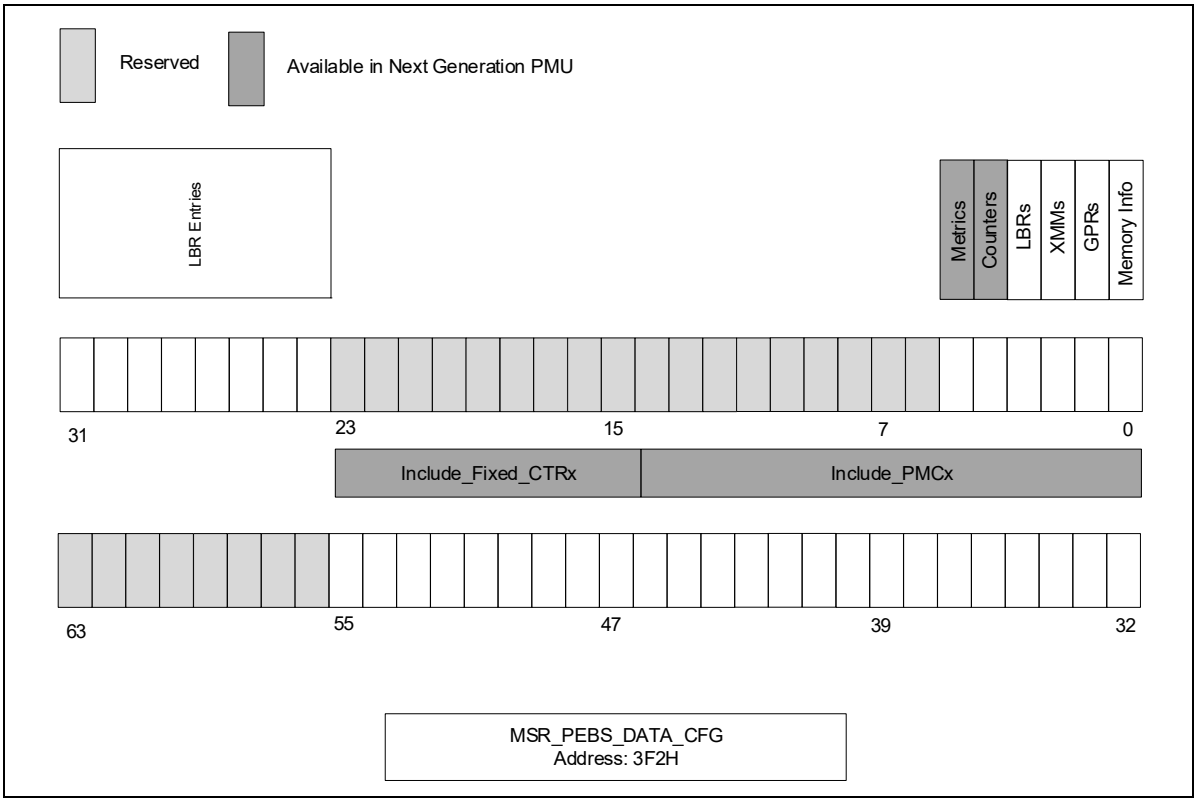

Figure 21-73. MSR_PEBS_DATA_CFG in PEBS_FMT=6

Table 21-102. MSR_PEBS_CFG Programming[1]

Bit Name	Bit Index	Access	Description	Availability
Memory Info	0	R/W	Setting this bit will capture memory information such as the linear address, data source and latency of the memory access in the PEBS record.	PEBS_FMT=4 and later
GPRs	1	R/W	Setting this bit will capture the contents of the General Purpose registers in the PEBS record.	PEBS_FMT=4 and later
XMMs	2	R/W	Setting this bit will capture the contents of the XMM registers in the PEBS record.	PEBS_FMT=4 and later
LBRs	3	R/W	Setting this bit will capture LBR TO, FROM, and INFO in the PEBS record.	PEBS_FMT=4 and later
Counters	4	R/W	Setting this bit will allow recording of the IA32_PMCx MSRs and the IA32_FIXED_CTRx counters. The Include_PMCx and Include_Fixed_CTRx bits are also set.	PEBS_FMT=6[2]
Metrics	5	R/W	Setting this bit will allow recording and clearing of the MSR_PERF_METRICS register (when the Include_Fixed_CTR3 bit is also set).	PEBS_FMT=6[2] && PERF_METRICS_AVAILABLE =1
Reserved[3]	23:6	NA	Reserved.	

Table 21-102. MSR_PEBS_CFG Programming[1] (Contd.)

LBR Entries	31:24	R/W	Set the field to the desired number of entries minus 1. For example, if the LBR_entries field is 0, a single entry will be included in the record. To include 32 LBR entries, set the LBR_entries field to 31 (0x1F). To ensure all PEBS records are 16-byte aligned, it is recommended to select an even number of LBR entries (programmed into LBR_entries as an odd number).	PEBS_FMT=4 and later
Include_PMCx	47:32	R/W	A bit mask of the general-purpose counters that are allowed to be captured into the PEBS record. Note that only bits that match reporting of CPUID.(EAX=23H, ECX=01H):EAX are writable.	PEBS_FMT=6[2]
Include_FIXED_CTRx	55:48	R/W	A bit mask of the fixed-function counters that are allowed to be captured into the PEBS record. Note that only bits that match reporting of CPUID.(EAX=23H, ECX=01H):EBX are writable.	PEBS_FMT=6[2]
Reserved	63:56	NA	Reserved.	

NOTES:

1. A write to the MSR will be ignored when IA32_MISC_ENABLE.PERFMON_AVAILABLE is zero (default).
2. These fields are available starting with the IA32_PERF_CAPABILITIES.PEBS_FMT of 6 in addition to a subset of processors with a CPUID signature value of DisplayFamily_DisplayModel 06_C5H or 06_C6H (though they report IA32_PERF_CAPABILITIES.PEBS_FMT as 5).
3. Writing to the reserved bits will cause a GP fault.

21.9.2.3.6 Counters and Metrics Group

To capture the counters group, either the COUNTERS bit or the METRICS bit must be enabled in MSR_PEBS_DATA_CFG. The group allows recording of the IA32_PMCx MSRs, IA32_FIXED_CTRx MSRs, and the Performance Metrics.

The counters group first captures a 128-bit header with the bit vector of the counters that are captured later. The format of the counters header and the payload is shown in Table 21-103.

The group is available starting with IA32_PERF_CAPABILITIES.PEBS_FMT of 6. Additionally, the group is available in a subset of processors with a CPUID signature value of DisplayFamily_DisplayModel 06_C5H or 06_C6H (though they report IA32_PERF_CAPABILITIES.PEBS_FMT as 5).

Table 21-103. Counters Group

Field Name	Sub-Field Name	Bit Width	Description
Counters Group Header	PMC BitVector	[31:0]	Bit vector of IA32_PMCx MSRs. IA32_PMCx is recorded if bit x is set.
	FIXED_CTR BitVector	[31:0]	Bit vector of IA32_FIXED_CTRx MSRs. IA32_FIXED_CTRx is recorded if bit x is set.
	Metrics BitVector	[31:0]	Bit vector of the performance metrics counters.
	Reserved	[31:0]	Reserved.

Table 21-103. Counters Group (Contd.)

Field Name	Sub-Field Name	Bit Width	Description
Counters/Metrics Values	PMCx	[63:0]	PMCx will be captured if PMC BitVector x is set.
	...		
	FIXED CTRx	[63:0]	FIXED_CTRx will be captured if FIXED_CTRx BitVector x is set.
	...		
	Metrics Base	[63:0]	The performance metrics base, mapped to IA32_FIXED_CTR3, if Metrics BitVector bit 0 is set.
	Metrics Data	[63:0]	MSR_PERF_METRICS, if Metrics BitVector bit 1 is set.

IA32_PMCx will be captured if both Counters and MSR_PEBS_DATA_CFG bit 32 + x are set. In this case, the PMC BitVector field bit x will be set too.

IA32_FIXED_CTRx will be captured if both Counters and MSR_PEBS_DATA_CFG bit 48 + x are set. In this case, the FIXED_CTR BitVector field bit x will be set too.

The performance metrics will be recorded if both Metrics and MSR_PEBS_DATA_CFG bit 51 (the bit used for IA32_FIXED_CTR3) are set. The Metrics record will have two 64-bit fields, MSR_PERF_METRICS and the PERF_METRICS_BASE that is derived from IA32_FIXED_CTR3. In this case, the Metrics BitVector will be 3. Note that MSR_PERF_METRICS and the IA32_FIXED_CTR3 MSR will be cleared after they are recorded.

Size of the group can be calculated in bytes by: 16 + popcount(BitVectors[127:0]) * 8.

21.9.2.4 PEBS Record Examples

The following example shows the layout of the PEBS record when all data groups are selected (all valid bits in MSR_PEBS_DATA_CFG are set) and maximum number of LBRs are selected. There are no gaps in the PEBS record when a subset of the groups are selected, thus keeping the layout compact. Implementations that do not support some features will have to pad zeroes in the corresponding fields.

Table 21-104. PEBS Record Example 1

Offset	Group Name	Field Name	Legacy Name (If Different)
0x0	Basic Info	Record Format	New
		Record Size	New
0x8		Instruction Pointer	EventingRIP

21.9.3 Precise Distribution of Instructions Retired (PDIR) Facility

Precise Distribution of Instructions Retired Facility is available via PEBS on some microarchitectures. Refer to Section 21.3.4.4.4. Counters that support PDIR also vary. See the processor specific sections for availability.

21.9.4 Reduced Skid PEBS

For precise events, upon triggering a PEBS assist, there will be a finite delay between the time the counter overflows and when the microcode starts to carry out its data collection obligations. The Reduced Skid mechanism mitigates the "skid" problem by providing an early indication of when the counter is about to overflow, allowing the machine to more precisely trap on the instruction that actually caused the counter overflow thus greatly reducing skid.

This mechanism is a superset of the PDIR mechanism available in the Sandy Bridge microarchitecture. See Section 21.3.4.4.4

In the Goldmont microarchitecture, the mechanism applies to all precise events including, INST_RETIRED, except for UOPS_RETIRED. However, the Reduced Skid mechanism is disabled for any counter when the INV, ANY, E, or CMASK fields are set.

With Reduced Skid PEBS, the skid is precisely one event occurrence. Hence if counting INST_RETIRED, PEBS will indicate the instruction that follows that which caused the counter to overflow.

For the Reduced Skid mechanism to operate correctly, the performance monitoring counters should not be reconfigured or modified when they are running with PEBS enabled. The counters need to be disabled (e.g., via IA32_PERF_GLOBAL_CTRL MSR) before changes to the configuration (e.g., what event is specified in IA32_PERFEVTSELx or whether PEBS is enabled for that counter via IA32_PEBS_ENABLE) or counter value (MSR write to IA32_PMCx and IA32_A_PMCx).

21.9.5 EPT-Friendly PEBS

The 3rd generation Intel Xeon Scalable Family of processors based on Ice Lake microarchitecture (and later processors) and the 12th generation Intel Core processor (and later processors) support VMX guest use of PEBS when the DS Area (including the PEBS Buffer and DS Management Area) is allocated from a paged pool of EPT pages. In such a configuration PEBS DS Area accesses may result in VM exits (e.g., EPT violations due to "lazy" EPT page-table entry propagation), and in such cases the PEBS record will not be lost but instead will "skid" to after the subsequent VM Entry back to the guest. For precise events the guest will observe that the record skid by one event occurrence, while for non-precise events the record will skid by one instruction.

21.9.6 PDist: Precise Distribution

PDist eliminates any skid or shadowing effects from PEBS. With PDist, the PEBS record will be generated precisely upon completion of the instruction or operation that causes the counter to overflow (there is no "wait for next occurrence" by default).

PDist is supported by selected counters, and is only supported when those counters are programmed to count select precise events[1]. The legacy PEBS behavior applies to counters that do not support PDist, unless specified otherwise. PDist requires that the INV, ANY, E, EQ, and CMASK fields are cleared. Which counters support PDist, and which events are supported for PDist, is model-specific. Further, the counter reload value must not be less than 256 for PDist to operate.

For the PDist mechanism to operate correctly, the performance monitoring counters should not be reconfigured or modified when they are running with PEBS enabled. The counters need to be disabled (e.g., via IA32_PERF_GLOBAL_CTRL MSR) before changes to the configuration (e.g., what event is specified in IA32_PERFEVTSELx or IA32_FIXED_CTR_CTRL or whether PEBS is enabled for that counter via IA32_PEBS_ENABLE) or counter value (MSR write to IA32_PMCx and IA32_A_PMCx or IA32_FIXED_CTRx).

21.9.7 Load Latency Facility

The load latency facility provides software a means to characterize the latencies of memory load operations to different levels of cache/memory hierarchy. This facility requires a processor supporting the enhanced PEBS record format in the PEBS buffer.

Beginning with 12th generation Intel Core processors, the load latency facility supports all fields in Table 21-98, "Updated Memory Access Info Group," in addition to the Memory Access Address field:

- The **Instruction Latency** field measures the load latency from the load's first dispatch until final data writeback from the memory subsystem. The latency is reported for retired demand load operations and in core cycles (it accounts for re-dispatches and data dependencies).
- The **Cache Latency** field measures the subset of cache access latency in core cycles. It starts from the actual cache access until the data is returned by the memory subsystem The latency is reported for retired demand load operations in core cycles (it does not account for memory ordering blocks).
- The **Data Source** field is an encoded value indicates the origin of the data obtained by the load instruction. The encoding is shown in Table 21-106. In the descriptions, local memory refers to system memory physically

1. To determine whether an event is precise or supports PDist, consult the relevant attribute in the event lists at https://download.01.org/perfmon/.

attached to a processor package, and remote memory refers to system memory or cache physically attached to another processor package (in a server product).

- Through the **Access Info** field, load latency features binary indications on certain blocks that the load operation may have encountered. Refer to STLB-miss, Is-Lock, Data-Blk and Address-Blk fields in Table 21-98.

NOTE

For loads triggered by software prefetch instructions, the cache related fields including Data Source and Cache Latency, report values as if the load was an L1 cache hit (the prefetch completes without waiting for data return, for performance reasons).

Table 21-106. Data Source Encoding for Memory Accesses (Ice Lake and Later Microarchitectures)

Encoding [3:0]	Description
00H	Unknown Data Source (the processor could not retrieve the origin of this request).
01H	L1 HIT. This request was satisfied by the L1 data cache. (Minimal latency core cache hit.)
02H	FB HIT. This request was merged into an outstanding cache miss to same cache-line address.
03H	L2 HIT. This request was satisfied by the L2 cache.
04H	L3 HIT. This request was satisfied by the L3 cache with no coherency actions performed (snooping).
05H	XCORE MISS. This request was satisfied by the L3 cache but involved a coherency check in some sibling core(s).
06H	XCORE HIT. This request was satisfied by the L3 cache but involved a coherency check that hit a non-modified copy in a sibling core.
07H	XCORE FWD. This request was satisfied by a sibling core where either a modified (cross-core HITM) or a non-modified (cross-core FWD) cache-line copy was found.
08H	Local Far Memory. This request has missed the L3 cache and was serviced by local far memory.
09H	Remote Far Memory. This request has missed the L3 cache and was serviced by remote far memory.
0AH	Local Near Memory. This request has missed the L3 cache and was serviced by local near memory.
0BH	Remote Near Memory. This request has missed the L3 cache and was serviced by remote near memory.
0CH	Remote FWD. This request has missed the L3 cache and a non-modified cache-line copy was forwarded from a remote cache.
0DH	Remote HITM. This request has missed the L3 cache and a modified cache-line was forwarded from a remote cache.
0EH	I/O. Request of input/output operation.
0FH	UC. The request was to uncacheable memory.

Table 21-107. Data Source Encoding for Memory Accesses (Lion Cove and Next Generation Microarchitectures)

Encoding [4:0]	Description
00H	Unknown Data Source (the processor could not retrieve the origin of this request).
01H or 02H	L1 HIT. This request was satisfied by the L1 data cache. (Minimal latency core cache hit.)
03H	FB merge. L1 mishandling buffer.
05H	L2 HIT. This request was satisfied by the L2 cache.
06H	XQ merge. L2 mishandling buffer.
08H	L3 HIT. This request was satisfied by the L3 cache.
0CH	L3 Hit, x-core forward.
0DH	L3 Hit, x-core modified.
0FH	L3 Miss, x-core modified.

Table 21-107. Data Source Encoding for Memory Accesses (Lion Cove and Next Generation Microarchitectures)

Encoding [4:0]	Description
10H	L3 Miss, MSC Hit (memory-side cache).
11H	L3 Miss, memory.

To use this feature, software must complete the following steps:

- Complete the PEBS configuration steps.
- Set the Memory Info bit in the PEBS_DATA_CFG MSR.
- One of the relevant IA32_PERFEVTSELx MSRs is programmed to specify the event unit MEM_TRANS_RETIRED.LOAD_LATENCY (IA32_PerfEvtSelX[15:0] = 1CDH). The corresponding counter, IA32_PMCx, will accumulate event counts for architecturally visible loads which exceed the programmed latency threshold specified separately in an MSR. Stores are ignored when this event is programmed. The CMASK or INV fields of the IA32_PerfEvtSelX register used for counting load latency must be 0. Writing other values will result in undefined behavior.
- The MSR_PEBS_LD_LAT_THRESHOLD MSR is programmed with the desired latency threshold in core clock cycles. Loads with instruction latency greater than this value are eligible for counting and PEBS data reporting. The minimum value that may be programmed in this register is 1.
- The PEBS enable bit in the IA32_PEBS_ENABLE register is set for the corresponding IA32_PMCx counter register.

Refer to Section 21.3.4.4.2 for further implementation details of Load Latency.

21.9.8 Store Latency Facility

Store latency support is available on the 12th generation Intel Core processor. Store latency is a PEBS extension that provides a means to profile store memory accesses in the system. It complements the load latency facility.

Store latency leverages the PEBS facility where it can provide additional information about sampled stores. The additional information includes the data address, memory auxiliary information, and the cache latency of the store access. Normal stores (those preceded with a read-for-ownership) as well as streaming stores are supported by the store latency facility.

Memory store operations typically do not limit performance since they update the memory with no operation that directly depends on them. Thus, data out of this facility should be carefully used once stores are suspected as a performance limiter; for example, once the TMA node of Backend_Bound.Memory_Bound.Store_Bound is flagged[1].

To enable the store latency facility, software must complete the following steps:

- Complete the PEBS configuration steps.
- Set the Memory Info bit in the PEBS_DATA_CFG MSR.
- Program the MEM_TRANS_RETIRED.STORE_SAMPLE event on general-purpose performance-monitoring counter 0 (IA32_PERFEVTSEL0[15:0] = 2CDH).
- Setup the PEBS buffer to hold at least two records, setting both 'PEBS Absolute Maximum' and 'PEBS Interrupt Threshold', should any other counter be used by PEBS (that is whenever IA32_PEBS_ENABLE[x] ≠ 0 for x ≠ 0).
- Set IA32_PEBS_ENABLE[0].

The store latency information is written into a PEBS record as shown in Table 21-49.

The store latency relies on the PEBS facility, so the PEBS configuration must be completed first. Unlike load latency, there is no option to filter on a subset of stores that exceed a certain threshold.

1. For more details about the method, refer to Section B.1, "Top-Down Analysis Method" of the Intel® 64 and IA-32 Architectures Optimization Reference Manual.

21.9.9 Timed Processor Event Based Sampling

Timed Processor Event Based Sampling (Timed PEBS) enables recording of time in every PEBS record. It extends all PEBS records with timing information in a new "Retire Latency" field that is placed in the Basic Info group of the PEBS record as shown in Table 21-108.

Table 21-108. PEBS Basic Info Group

Offset	Field Name	Bits
0x0	Record Format	[31:0]
	Retire Latency	[47:32]
	Record Size	[63:48]
0x08	Instruction Pointer	[63:0]
0x10	Applicable Counters	[63:0]
0x18	TSC	[63:0]

The Retire Latency field reports the number of Unhalted Core Cycles between the retirement of the current instruction (as indicated by the Instruction Pointer field of the PEBS record) and the retirement of the prior instruction. All ones are reported when the number exceeds 16 bits.

Processors that support this enhancement set a new bit: IA32_PERF_CAPABILITIES.PEBS_TIMING_INFO[bit 17].

NOTE

Timed PEBS is not supported when PEBS is programmed on fixed-function counter 0. The Retire Latency field of such record is undefined.

21.9.10 Counters Snapshotting

Counters Snapshotting extends Adaptive PEBS with the PEBS Counters and Metrics group. This extension enables software to capture general-purpose counters, fixed-function counters, and performance metrics in the PEBS record. For additional details, see Section 21.9.2.3.6, "Counters and Metrics Group."

21.9.11 Auto Counter Reload

Auto Counter Reload (ACR) provides a means for software to specify that, for each supported counter, the hardware should automatically reload the counter to a specified initial value upon overflow of chosen counters. This mechanism enables software to sample based on the relative rate of two (or more) events, such that a sample (PMI or PEBS) is taken only if the rate of one event exceeds some threshold relative to the rate of another event. Taking a PMI or PEBS only when the relative rate of performance-monitoring events crosses a threshold can have significantly less performance overhead than other techniques (e.g., taking a PMI every 1000 instructions in order to check the number of mispredicts since the last PMI).

21.9.11.1 Discovery and Interface

CPUID.(EAX=23H, ECX=02H):EAX indicates general-purpose counters [n:0] that can be reloaded.
CPUID.(EAX=23H, ECX=02H):EBX indicates fixed-function counters [m:0] that can be reloaded.
CPUID.(EAX=23H, ECX=02H):ECX indicates general-purpose counters [n:0] that can cause a reload of reloadable counters. CPUID.(EAX=23H, ECX=02H):EDX indicates fixed-function counters [m:0] that can cause a reload of reloadable counters. If a counter can be reloaded, its associated reload configuration MSR (*_CFG_B) and its reload value MSR (*_CFG_C) are supported.

See Chapter 2 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4, for details about the following MSRs: IA32_PMC_GPn_CFG_B, IA32_PMC_GPn_CFG_C, IA32_PMC_FXm_CFG_B, and IA32_PMC_FXm_CFG_C.

21.9.11.2 Configuration and Behavior

For a given counter IA32_PMC_GPn_CTR, bit fields in the IA32_PMC_GPn_CFG_B MSR indicate which counter(s) can cause a reload of that counter:

- If GP counter 'n' is configured to do a reload when GP counter 'x' overflows (IA32_PMC_GPn_CFG_B.PMC[x] = 1), then that GP counter 'n' will be written with its reload value (in IA32_PMC_GPn_CFG_C[31:0]) when counter 'x' (IA32_PMC_GPx_CTR) overflows.
- If GP counter 'n' is configured to do a reload when fixed-function counter 'x' overflows (IA32_PMC_GPn_CFG_B.FIXED_CTR[x] = 1), then that GP counter 'n' will be written with its reload value (in IA32_PMC_GPn_CFG_C[31:0]) when fixed-function counter 'x' (IA32_PMC_FXx_CTR) overflows.

ACR will not reload IA32_PMC_GPn_CTR if counters are frozen (IA32_PERF_GLOBAL_STATUS.COUNTERS_FROZEN = 1) or if IA32_PMC_GPn_CTR has already overflowed (IA32_PERF_GLOBAL_STATUS.PMCn_OVF = 1). If a PMI or PEBS is taken due to a counter overflow, the PMI ISR or PEBS record can record the unmodified counter value before reloading the counter. In race conditions, where IA32_PMC_GPn_CTR overflows in the same cycle as a counter configured to reload the IA32_PMC_GPn_CTR on overflow, IA32_PMC_GPn_CTR will not be reloaded, and IA32_PERF_GLOBAL_STATUS.PMCn_OVF will be set.

For counters that reload themselves (i.e., IA32_PMC_GPn_CFG_B.PMCn = 1), the overflow bit (IA32_PERF_GLOBAL_STATUS.PMCn_OVF) will never be set. Instead, upon overflow, the counter will be immediately reloaded; thus, it is never in an overflowed state. There is an exception associated with PEBS; see Section 21.9.11.2.2.

The behavior is similar for reloading of fixed-function counters. For IA32_PMC_FXm_CTR, the reload value is stored in IA32_PMC_FXm_CFG_C[31:0], and which counters cause reload of IA32_PMC_FXm_CTR is configured in IA32_PMC_FXm_CFG_B.

21.9.11.2.1 Reload Precision

ACR reload is not guaranteed to be precise; in some cases, a small number of events may be lost during the time between counter overflow and counter reload. However, when the reload happens, hardware will reload all configured counters simultaneously.

21.9.11.2.2 PEBS Interaction

If a counter is configured to reload other counters with ACR and to take PEBS on overflow, the counter reload actions will be taken only after the PEBS record has been written. This ensures that any counter values captured in the PEBS record reflect the value before the reload occurs. Because the reload actions are taken after the PEBS records are written, reloaded counter value will not account for the events which occurred during the process of writing the PEBS record.

For a counter configured to reload itself and to take PEBS on overflow, the overflow bit associated with the counter (in IA32_PERF_GLOBAL_STATUS) will be set from the time the counter overflows to the time the PEBS record is written. This is required to ensure the PEBS record is not lost due to a VM exit taken during record generation. Once the record is written, the overflow bit will be cleared, and the counter reloaded.

21.9.11.2.3 Precise Distribution (PDIST) Interaction

Precise distribution of PEBS events (PDIR) is not supported when such a counter is reloaded by ACR. For details on PDIST, see Section 21.9.6.

21. Updates to Chapter 26, Volume 3C

Change bars and violet text show changes to Chapter 26 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C:* System Programming Guide, Part 3.

Changes to this chapter:

- Added a new VM-execution control for the MSR-list instructions.
- Minor updates and corrections as necessary.

CHAPTER 26
VIRTUAL MACHINE CONTROL STRUCTURES

26.1 OVERVIEW

A logical processor uses **virtual-machine control data structures** (**VMCSs**) while it is in VMX operation. These manage transitions into and out of VMX non-root operation (VM entries and VM exits) as well as processor behavior in VMX non-root operation. This structure is manipulated by the new instructions VMCLEAR, VMPTRLD, VMREAD, and VMWRITE.

A VMM can use a different VMCS for each virtual machine that it supports. For a virtual machine with multiple logical processors (virtual processors), the VMM can use a different VMCS for each virtual processor.

A logical processor associates a region in memory with each VMCS. This region is called the **VMCS region**.[1] Software references a specific VMCS using the 64-bit physical address of the region (a **VMCS pointer**). VMCS pointers must be aligned on a 4-KByte boundary (bits 11:0 must be zero). These pointers must not set bits beyond the processor's physical-address width.[2,3]

A logical processor may maintain a number of VMCSs that are **active**. The processor may optimize VMX operation by maintaining the state of an active VMCS in memory, on the processor, or both. At any given time, at most one of the active VMCSs is the **current** VMCS. (This document frequently uses the term "the VMCS" to refer to the current VMCS.) The VMLAUNCH, VMREAD, VMRESUME, and VMWRITE instructions operate only on the current VMCS.

The following items describe how a logical processor determines which VMCSs are active and which is current:

- The memory operand of the VMPTRLD instruction is the address of a VMCS. After execution of the instruction, that VMCS is both active and current on the logical processor. Any other VMCS that had been active remains so, but no other VMCS is current.
- The VMCS link pointer field in the current VMCS (see Section 26.4.2) is itself the address of a VMCS. If VM entry is performed successfully with the 1-setting of the "VMCS shadowing" VM-execution control, the VMCS referenced by the VMCS link pointer field becomes active on the logical processor. The identity of the current VMCS does not change.
- The memory operand of the VMCLEAR instruction is also the address of a VMCS. After execution of the instruction, that VMCS is neither active nor current on the logical processor. If the VMCS had been current on the logical processor, the logical processor no longer has a current VMCS.

The VMPTRST instruction stores the address of the logical processor's current VMCS into a specified memory location (it stores the value FFFFFFFF_FFFFFFFFH if there is no current VMCS).

The **launch state** of a VMCS determines which VM-entry instruction should be used with that VMCS: the VMLAUNCH instruction requires a VMCS whose launch state is "clear"; the VMRESUME instruction requires a VMCS whose launch state is "launched". A logical processor maintains a VMCS's launch state in the corresponding VMCS region. The following items describe how a logical processor manages the launch state of a VMCS:

- If the launch state of the current VMCS is "clear", successful execution of the VMLAUNCH instruction changes the launch state to "launched".
- The memory operand of the VMCLEAR instruction is the address of a VMCS. After execution of the instruction, the launch state of that VMCS is "clear".
- There are no other ways to modify the launch state of a VMCS (it cannot be modified using VMWRITE) and there is no direct way to discover it (it cannot be read using VMREAD).

---

1. The amount of memory required for a VMCS region is at most 4 KBytes. The exact size is implementation specific and can be determined by consulting the VMX capability MSR IA32_VMX_BASIC to determine the size of the VMCS region (see Appendix A.1).
2. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
3. If IA32_VMX_BASIC[48] is read as 1, these pointers must not set any bits in the range 63:32; see Appendix A.1.

Figure 26-1 illustrates the different states of a VMCS. It uses "X" to refer to the VMCS and "Y" to refer to any other VMCS. Thus: "VMPTRLD X" always makes X current and active; "VMPTRLD Y" always makes X not current (because it makes Y current); VMLAUNCH makes the launch state of X "launched" if X was current and its launch state was "clear"; and VMCLEAR X always makes X inactive and not current and makes its launch state "clear".

The figure does not illustrate operations that do not modify the VMCS state relative to these parameters (e.g., execution of VMPTRLD X when X is already current). Note that VMCLEAR X makes X "inactive, not current, and clear," even if X's current state is not defined (e.g., even if X has not yet been initialized). See Section 26.11.3.

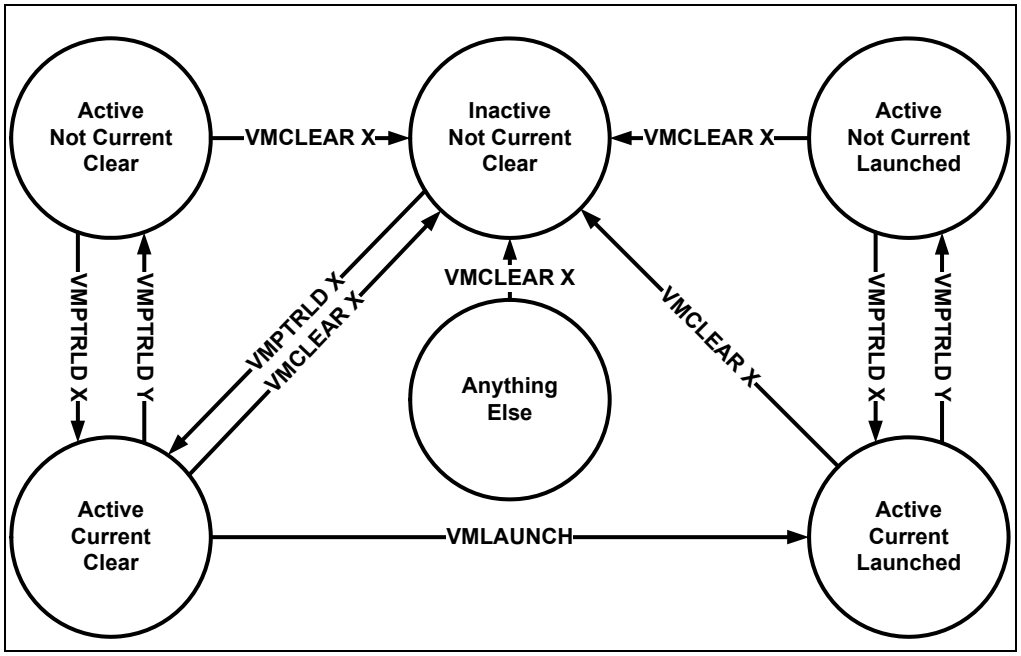

Figure 26-1. States of VMCS X

Because a shadow VMCS (see Section 26.10) cannot be used for VM entry, the launch state of a shadow VMCS is not meaningful. Figure 26-1 does not illustrate all the ways in which a shadow VMCS may be made active.

26.2 FORMAT OF THE VMCS REGION

A VMCS region comprises up to 4-KBytes.[1] The format of a VMCS region is given in Table 26-1.

Table 26-1. Format of the VMCS Region

Byte Offset	Contents
0	Bits 30:0: VMCS revision identifier Bit 31: shadow-VMCS indicator (see Section 26.10)
4	VMX-abort indicator
8	VMCS data (implementation-specific format)

1. The exact size is implementation specific and can be determined by consulting the VMX capability MSR IA32_VMX_BASIC to determine the size of the VMCS region (see Appendix A.1).

The first 4 bytes of the VMCS region contain the **VMCS revision identifier** at bits 30:0.[1] Processors that maintain VMCS data in different formats (see below) use different VMCS revision identifiers. These identifiers enable software to avoid using a VMCS region formatted for one processor on a processor that uses a different format.[2] Bit 31 of this 4-byte region indicates whether the VMCS is a shadow VMCS (see Section 26.10).

Software should write the VMCS revision identifier to the VMCS region before using that region for a VMCS. The VMCS revision identifier is never written by the processor; VMPTRLD fails if its operand references a VMCS region whose VMCS revision identifier differs from that used by the processor. (VMPTRLD also fails if the shadow-VMCS indicator is 1 and the processor does not support the 1-setting of the "VMCS shadowing" VM-execution control; see Section 26.6.2) Software can discover the VMCS revision identifier that a processor uses by reading the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

Software should clear or set the shadow-VMCS indicator depending on whether the VMCS is to be an ordinary VMCS or a shadow VMCS (see Section 26.10). VMPTRLD fails if the shadow-VMCS indicator is set and the processor does not support the 1-setting of the "VMCS shadowing" VM-execution control. Software can discover support for this setting by reading the VMX capability MSR IA32_VMX_PROCBASED_CTLS2 (see Appendix A.3.3).

The next 4 bytes of the VMCS region are used for the **VMX-abort indicator**. The contents of these bits do not control processor operation in any way. A logical processor writes a non-zero value into these bits if a VMX abort occurs (see Section 29.7). Software may also write into this field.

The remainder of the VMCS region is used for **VMCS data** (those parts of the VMCS that control VMX non-root operation and the VMX transitions). The format of these data is implementation-specific. VMCS data are discussed in Section 26.3 through Section 26.9. To ensure proper behavior in VMX operation, software should maintain the VMCS region and related structures (enumerated in Section 26.11.4) in writeback cacheable memory. Future implementations may allow or require a different memory type[3]. Software should consult the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

26.3 ORGANIZATION OF VMCS DATA

The VMCS data are organized into six logical groups:

- **Guest-state area.** Processor state is saved into the guest-state area on VM exits and loaded from there on VM entries.
- **Host-state area.** Processor state is loaded from the host-state area on VM exits.
- **VM-execution control fields.** These fields control processor behavior in VMX non-root operation. They determine in part the causes of VM exits.
- **VM-exit control fields.** These fields control VM exits.
- **VM-entry control fields.** These fields control VM entries.
- **VM-exit information fields.** These fields receive information on VM exits and describe the cause and the nature of VM exits. On some processors, these fields are read-only.[4]

The VM-execution control fields, the VM-exit control fields, and the VM-entry control fields are sometimes referred to collectively as VMX controls.

1. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field. For all processors produced prior to this change, bit 31 of the VMCS revision identifier was 0.
2. Logical processors that use the same VMCS revision identifier use the same size for VMCS regions.
3. Alternatively, software may map any of these regions or structures with the UC memory type. Doing so is strongly discouraged unless necessary as it will cause the performance of transitions using those structures to suffer significantly. In addition, the processor will continue to use the memory type reported in the VMX capability MSR IA32_VMX_BASIC with exceptions noted in Appendix A.1.
4. Software can discover whether these fields can be written by reading the VMX capability MSR IA32_VMX_MISC (see Appendix A.6).

26.4 GUEST-STATE AREA

This section describes fields contained in the guest-state area of the VMCS. VM entries load processor state from these fields and VM exits store processor state into these fields. See Section 28.3.2 and Section 29.3 for details.

26.4.1 Guest Register State

The following fields in the guest-state area correspond to processor registers:

- Control registers CR0, CR3, and CR4 (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- Debug register DR7 (64 bits; 32 bits on processors that do not support Intel 64 architecture).
- RSP, RIP, and RFLAGS (64 bits each; 32 bits on processors that do not support Intel 64 architecture).[1]
- The following fields for each of the registers CS, SS, DS, ES, FS, GS, LDTR, and TR:
  - Selector (16 bits).
  - Base address (64 bits; 32 bits on processors that do not support Intel 64 architecture). The base-address fields for CS, SS, DS, and ES have only 32 architecturally-defined bits; nevertheless, the corresponding VMCS fields have 64 bits on processors that support Intel 64 architecture.
  - Segment limit (32 bits). The limit field is always a measure in bytes.
  - Access rights (32 bits). The format of this field is given in Table 26-2 and detailed as follows:
    - The low 16 bits correspond to bits 23:8 of the upper 32 bits of a 64-bit segment descriptor. While bits 19:16 of code-segment and data-segment descriptors correspond to the upper 4 bits of the segment limit, the corresponding bits (bits 11:8) are reserved in this VMCS field.
    - Bit 16 indicates an **unusable segment**. Attempts to use such a segment fault except in 64-bit mode. In general, a segment register is unusable if it has been loaded with a null selector.[2]
    - Bits 31:17 are reserved.

Table 26-2. Format of Access Rights

Bit Position(s)	Field
3:0	Segment type
4	S — Descriptor type (0 = system; 1 = code or data)
6:5	DPL — Descriptor privilege level
7	P — Segment present
11:8	Reserved
12	AVL — Available for use by system software

1. This chapter uses the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For processors that do not support Intel 64 architecture, this notation refers to the 32-bit forms of those registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to lower 32 bits of the indicated register.
2. There are a few exceptions to this statement. For example, a segment with a non-null selector may be unusable following a task switch that fails after its commit point; see "Interrupt 10—Invalid TSS Exception (#TS)" in Section 7.14, "Exception and Interrupt Handling in 64-bit Mode," of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A. In contrast, the TR register is usable after processor reset despite having a null selector; see Table 12-1 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

Table 26-2. Format of Access Rights (Contd.)

Bit Position(s)	Field
13	Reserved (except for CS) L — 64-bit mode active (for CS only)
14	D/B — Default operation size (0 = 16-bit segment; 1 = 32-bit segment)
15	G — Granularity
16	Segment unusable (0 = usable; 1 = unusable)
31:17	Reserved

The base address, segment limit, and access rights compose the "hidden" part (or "descriptor cache") of each segment register. These data are included in the VMCS because it is possible for a segment register's descriptor cache to be inconsistent with the segment descriptor in memory (in the GDT or the LDT) referenced by the segment register's selector.

The value of the DPL field for SS is always equal to the logical processor's current privilege level (CPL).[1]

On some processors, executions of VMWRITE ignore attempts to write non-zero values to any of bits 11:8 or bits 31:17. On such processors, VMREAD always returns 0 for those bits, and VM entry treats those bits as if they were all 0 (see Section 28.3.1.2).

- The following fields for each of the registers GDTR and IDTR:
  - Base address (64 bits; 32 bits on processors that do not support Intel 64 architecture).
  - Limit (32 bits). The limit fields contain 32 bits even though these fields are specified as only 16 bits in the architecture.
- The following MSRs:
  - IA32_DEBUGCTL (64 bits)
  - IA32_SYSENTER_CS (32 bits)
  - IA32_SYSENTER_ESP and IA32_SYSENTER_EIP (64 bits; 32 bits on processors that do not support Intel 64 architecture)
  - IA32_PERF_GLOBAL_CTRL (64 bits). This field is supported only on processors that support the 1-setting of the "load IA32_PERF_GLOBAL_CTRL" VM-entry control.
  - IA32_PAT (64 bits). This field is supported only on processors that support either the 1-setting of the "load IA32_PAT" VM-entry control or that of the "save IA32_PAT" VM-exit control.
  - IA32_EFER (64 bits). This field is supported only on processors that support either the 1-setting of the "load IA32_EFER" VM-entry control or that of the "save IA32_EFER" VM-exit control.
  - IA32_BNDCFGS (64 bits). This field is supported only on processors that support either the 1-setting of the "load IA32_BNDCFGS" VM-entry control or that of the "clear IA32_BNDCFGS" VM-exit control.
  - IA32_RTIT_CTL (64 bits). This field is supported only on processors that support either the 1-setting of the "load IA32_RTIT_CTL" VM-entry control or that of the "clear IA32_RTIT_CTL" VM-exit control.
  - IA32_LBR_CTL (64 bits). This field is supported only on processors that support either the 1-setting of the "load guest IA32_LBR_CTL" VM-entry control or that of the "clear IA32_LBR_CTL" VM-exit control.
  - IA32_S_CET (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is supported only on processors that support the 1-setting of the "load CET state" VM-entry control.
  - IA32_INTERRUPT_SSP_TABLE_ADDR (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is supported only on processors that support the 1-setting of the "load CET state" VM-entry control.

1. In protected mode, CPL is also associated with the RPL field in the CS selector. However, the RPL fields are not meaningful in real-address mode or in virtual-8086 mode.

— IA32_PKRS (64 bits). This field is supported only on processors that support the 1-setting of the "load PKRS" VM-entry control.

- The shadow-stack pointer register SSP (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is supported only on processors that support the 1-setting of the "load CET state" VM-entry control.
- The register SMBASE (32 bits). This register contains the base address of the logical processor's SMRAM image.

26.4.2 Guest Non-Register State

In addition to the register state described in Section 26.4.1, the guest-state area includes the following fields that characterize guest state but which do not correspond to processor registers:

- **Activity state** (32 bits). This field identifies the logical processor's activity state. When a logical processor is executing instructions normally, it is in the **active state**. Execution of certain instructions and the occurrence of certain events may cause a logical processor to transition to an **inactive state** in which it ceases to execute instructions.

  The following activity states are defined:[1]

  — 0: **Active**. The logical processor is executing instructions normally.

  — 1: **HLT**. The logical processor is inactive because it executed the HLT instruction.

  — 2: **Shutdown**. The logical processor is inactive because it incurred a **triple fault**[2] or some other serious error.

  — 3: **Wait-for-SIPI**. The logical processor is inactive because it is waiting for a startup-IPI (SIPI).

  Future processors may include support for other activity states. Software should read the VMX capability MSR IA32_VMX_MISC (see Appendix A.6) to determine what activity states are supported.
- **Interruptibility state** (32 bits). The IA-32 architecture includes features that permit certain events to be blocked for a period of time. This field contains information about such blocking. Details and the format of this field are given in Table 26-3.

Table 26-3. Format of Interruptibility State

Bit Position(s)	Bit Name	Notes
0	Blocking by STI	See the "STI—Set Interrupt Flag" section in Chapter 4 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B. Execution of STI with RFLAGS.IF = 0 blocks maskable interrupts on the instruction boundary following its execution.[1] Setting this bit indicates that this blocking is in effect.
1	Blocking by MOV SS	See Section 7.8.3, "Masking Exceptions and Interrupts When Switching Stacks," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A. Execution of a MOV to SS or a POP to SS blocks or suppresses certain debug exceptions as well as interrupts (maskable and nonmaskable) on the instruction boundary following its execution. Setting this bit indicates that this blocking is in effect.[2] This document uses the term "blocking by MOV SS," but it applies equally to POP SS.
2	Blocking by SMI	See Section 33.2, "System Management Interrupt (SMI)." System-management interrupts (SMIs) are disabled while the processor is in system-management mode (SMM). Setting this bit indicates that blocking of SMIs is in effect.

1. Execution of the MWAIT instruction may put a logical processor into an inactive state. However, this VMCS field never reflects this state. See Section 29.1.
2. A triple fault occurs when a logical processor encounters an exception while attempting to deliver a double fault.

Table 26-3. Format of Interruptibility State (Contd.)

Bit Position(s)	Bit Name	Notes
3	Blocking by NMI	See Section 7.7.1, "Handling Multiple NMIs," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A and Section 33.8, "NMI Handling While in SMM." Delivery of a non-maskable interrupt (NMI) or a system-management interrupt (SMI) blocks subsequent NMIs until the next execution of IRET. See Section 27.3 for how this behavior of IRET may change in VMX non-root operation. Setting this bit indicates that blocking of NMIs is in effect. Clearing this bit does not imply that NMIs are not (temporarily) blocked for other reasons. If the "virtual NMIs" VM-execution control (see Section 26.6.1) is 1, this bit does not control the blocking of NMIs. Instead, it refers to "virtual-NMI blocking" (the fact that guest software is not ready for an NMI).
4	Enclave interruption	Set to 1 if the VM exit occurred while the logical processor was in enclave mode. Such VM exits includes those caused by interrupts, non-maskable interrupts, system-management interrupts, INIT signals, and exceptions occurring in enclave mode as well as exceptions encountered during the delivery of such events incident to enclave mode. A VM exit that is incident to delivery of an event injected by VM entry leaves this bit unmodified.
31:5	Reserved	VM entry will fail if these bits are not 0. See Section 28.3.1.5.

NOTES:

1. Nonmaskable interrupts and system-management interrupts may also be inhibited on the instruction boundary following such an execution of STI.
2. System-management interrupts may also be inhibited on the instruction boundary following such an execution of MOV or POP.

- **Pending debug exceptions** (64 bits; 32 bits on processors that do not support Intel 64 architecture). IA-32 processors may recognize one or more debug exceptions without immediately delivering them.[1] This field contains information about such exceptions. This field is described in Table 26-4.

Table 26-4. Format of Pending-Debug-Exceptions

Bit Position(s)	Bit Name	Notes
3:0	B3 – B0	When set, each of these bits indicates that the corresponding breakpoint condition was met. Any of these bits may be set even if the corresponding enabling bit in DR7 is not set.
10:4	Reserved	VM entry fails if these bits are not 0. See Section 28.3.1.5.
11	BLD	When set, this bit indicates that a bus lock was asserted while OS bus-lock detection was enabled and CPL > 0 (see Section 19.3.1.6, "OS Bus-Lock Detection").[1]
12	Enabled breakpoint	When set, this bit indicates that at least one data or I/O breakpoint was met and was enabled in DR7; the XBEGIN instruction was executed immediately before the VM exit and advanced debugging of RTM transactional regions had been enabled; or a bus lock was asserted while CPL > 0 and OS bus-lock detection had been enabled.
13	Reserved	VM entry fails if this bit is not 0. See Section 28.3.1.5.

1. For example, execution of a MOV to SS or a POP to SS may inhibit some debug exceptions for one instruction. See Section 7.8.3 of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A. In addition, certain events incident to an instruction (for example, an INIT signal) may take priority over debug traps generated by that instruction. See Table 7-2 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

Table 26-4. Format of Pending-Debug-Exceptions (Contd.)

Bit Position(s)	Bit Name	Notes
14	BS	When set, this bit indicates that a debug exception would have been triggered by single-step execution mode.
15	Reserved	VM entry fails if this bit is not 0. See Section 28.3.1.5.
16	RTM	When set, this bit indicates that a debug exception (#DB) or a breakpoint exception (#BP) occurred inside an RTM region while advanced debugging of RTM transactional regions was enabled (see Section 17.3.7, "RTM-Enabled Debugger Support," of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1).[2]
63:17	Reserved	VM entry fails if these bits are not 0. See Section 28.3.1.5. Bits 63:32 exist only on processors that support Intel 64 architecture.

NOTES:

1. In general, the format of this field matches that of DR6. However, DR6 **clears** bit 11 to indicate detection of a bus lock, while this field **sets** the bit to indicate that condition.
2. In general, the format of this field matches that of DR6. However, DR6 **clears** bit 16 to indicate an RTM-related exception, while this field **sets** the bit to indicate that condition.

- **VMCS link pointer** (64 bits). If the "VMCS shadowing" VM-execution control is 1, the VMREAD and VMWRITE instructions access the VMCS referenced by this pointer (see Section 26.10). Otherwise, software should set this field to FFFFFFFF_FFFFFFFFH to avoid VM-entry failures (see Section 28.3.1.5).
- **VMX-preemption timer value** (32 bits). This field is supported only on processors that support the 1-setting of the "activate VMX-preemption timer" VM-execution control. This field contains the value that the VMX-preemption timer will use following the next VM entry with that setting. See Section 27.5.1 and Section 28.7.4.
- **Page-directory-pointer-table entries** (PDPTEs; 64 bits each). These four (4) fields (PDPTE0, PDPTE1, PDPTE2, and PDPTE3) are supported only on processors that support the 1-setting of the "enable EPT" VM-execution control. They correspond to the PDPTEs referenced by CR3 when PAE paging is in use (see Section 5.4 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A). They are used only if the "enable EPT" VM-execution control is 1.
- **Guest interrupt status** (16 bits). This field is supported only on processors that support the 1-setting of the "virtual-interrupt delivery" VM-execution control. It characterizes part of the guest's virtual-APIC state and does not correspond to any processor or APIC registers. It comprises two 8-bit subfields:
  - **Requesting virtual interrupt (RVI)**. This is the low byte of the guest interrupt status. The processor treats this value as the vector of the highest priority virtual interrupt that is requesting service. (The value 0 implies that there is no such interrupt.)
  - **Servicing virtual interrupt (SVI)**. This is the high byte of the guest interrupt status. The processor treats this value as the vector of the highest priority virtual interrupt that is in service. (The value 0 implies that there is no such interrupt.)

  See Chapter 31 for more information on the use of this field.
- **PML index** (16 bits). This field is supported only on processors that support the 1-setting of the "enable PML" VM-execution control. It contains the logical index of the next entry in the page-modification log. Because the page-modification log comprises 512 entries, the PML index is typically a value in the range 0–511. Details of the page-modification log and use of the PML index are given in Section 30.3.6.

26.5 HOST-STATE AREA

This section describes fields contained in the host-state area of the VMCS. As noted earlier, processor state is loaded from these fields on every VM exit (see Section 29.5).

All fields in the host-state area correspond to processor registers:

- CR0, CR3, and CR4 (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- RSP and RIP (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- Selector fields (16 bits each) for the segment registers CS, SS, DS, ES, FS, GS, and TR. There is no field in the host-state area for the LDTR selector.
- Base-address fields for FS, GS, TR, GDTR, and IDTR (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- The following MSRs:
  - IA32_SYSENTER_CS (32 bits)
  - IA32_SYSENTER_ESP and IA32_SYSENTER_EIP (64 bits; 32 bits on processors that do not support Intel 64 architecture).
  - IA32_PERF_GLOBAL_CTRL (64 bits). This field is supported only on processors that support the 1-setting of the "load IA32_PERF_GLOBAL_CTRL" VM-exit control.
  - IA32_PAT (64 bits). This field is supported only on processors that support the 1-setting of the "load IA32_PAT" VM-exit control.
  - IA32_EFER (64 bits). This field is supported only on processors that support the 1-setting of the "load IA32_EFER" VM-exit control.
  - IA32_S_CET (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is supported only on processors that support the 1-setting of the "load CET state" VM-exit control.
  - IA32_INTERRUPT_SSP_TABLE_ADDR (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is supported only on processors that support the 1-setting of the "load CET state" VM-exit control.
  - IA32_PKRS (64 bits). This field is supported only on processors that support the 1-setting of the "load PKRS" VM-exit control.
- The shadow-stack pointer register SSP (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is supported only on processors that support the 1-setting of the "load CET state" VM-exit control.

In addition to the state identified here, some processor state components are loaded with fixed values on every VM exit; there are no fields corresponding to these components in the host-state area. See Section 29.5 for details of how state is loaded on VM exits.

26.6 VM-EXECUTION CONTROL FIELDS

The VM-execution control fields govern VMX non-root operation. These are described in Section 26.6.1 through Section 26.6.8.

26.6.1 Pin-Based VM-Execution Controls

The pin-based VM-execution controls constitute a 32-bit vector that governs the handling of asynchronous events (for example: interrupts).[1] Table 26-5 lists the controls. See Chapter 28 for how these controls affect processor behavior in VMX non-root operation.

1. Some asynchronous events cause VM exits regardless of the settings of the pin-based VM-execution controls (see Section 27.2).

Table 26-5. Definitions of Pin-Based VM-Execution Controls

Bit Position(s)	Name	Description
0	External-interrupt exiting	If this control is 1, external interrupts cause VM exits. Otherwise, they are delivered normally through the guest interrupt-descriptor table (IDT). If this control is 1, the value of RFLAGS.IF does not affect interrupt blocking.
3	NMI exiting	If this control is 1, non-maskable interrupts (NMIs) cause VM exits. Otherwise, they are delivered normally using descriptor 2 of the IDT. This control also determines interactions between IRET and blocking by NMI (see Section 27.3).
5	Virtual NMIs	If this control is 1, NMIs are never blocked and the "blocking by NMI" bit (bit 3) in the interruptibility-state field indicates "virtual-NMI blocking" (see Table 26-3). This control also interacts with the "NMI-window exiting" VM-execution control (see Section 26.6.2).
6	Activate VMX-preemption timer	If this control is 1, the VMX-preemption timer counts down in VMX non-root operation; see Section 27.5.1. A VM exit occurs when the timer counts down to zero; see Section 27.2.
7	Process posted interrupts	If this control is 1, the processor treats interrupts with the posted-interrupt notification vector (see Section 26.6.8) specially, updating the virtual-APIC page with posted-interrupt requests (see Section 31.6).

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs IA32_VMX_PINBASED_CTLS and IA32_VMX_TRUE_PINBASED_CTLS (see Appendix A.3.1) to determine how to set reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 28.2.1.1).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 1, 2, and 4. The VMX capability MSR IA32_VMX_PINBASED_CTLS will always report that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR IA32_VMX_TRUE_PINBASED_CTLS MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

26.6.2 Processor-Based VM-Execution Controls

The processor-based VM-execution controls constitute three vectors that govern the handling of synchronous events, mainly those caused by the execution of specific instructions.[1] These are the **primary processor-based VM-execution controls** (32 bits), the **secondary processor-based VM-execution controls** (32 bits), and the tertiary **VM-execution controls** (64 bits).

Table 26-6 lists the primary processor-based VM-execution controls. See Chapter 26 for more details of how these controls affect processor behavior in VMX non-root operation.

Table 26-6. Definitions of Primary Processor-Based VM-Execution Controls

Bit Position(s)	Name	Description
2	Interrupt-window exiting	If this control is 1, a VM exit occurs at the beginning of any instruction if RFLAGS.IF = 1 and there are no other blocking of interrupts (see Section 26.4.2).
3	Use TSC offsetting	This control determines whether executions of RDTSC, executions of RDTSCP, and executions of RDMSR that read from the IA32_TIME_STAMP_COUNTER MSR return a value modified by the TSC offset field (see Section 26.6.5 and Section 27.3).
7	HLT exiting	This control determines whether executions of HLT cause VM exits.
9	INVLPG exiting	This determines whether executions of INVLPG and INVPCID cause VM exits.
10	MWAIT exiting	This control determines whether executions of MWAIT cause VM exits.
11	RDPMC exiting	This control determines whether executions of RDPMC cause VM exits.

1. Some instructions cause VM exits regardless of the settings of the processor-based VM-execution controls (see Section 27.1.2), as do task switches (see Section 27.2).

Table 26-6. Definitions of Primary Processor-Based VM-Execution Controls (Contd.)

Bit Position(s)	Name	Description
12	RDTSC exiting	This control determines whether executions of RDTSC and RDTSCP cause VM exits.
15	CR3-load exiting	In conjunction with the CR3-target controls (see Section 26.6.7), this control determines whether executions of MOV to CR3 cause VM exits. See Section 27.1.3. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
16	CR3-store exiting	This control determines whether executions of MOV from CR3 cause VM exits. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
17	Activate tertiary controls	This control determines whether the tertiary processor-based VM-execution controls are used. If this control is 0, the logical processor operates as if all the tertiary processor-based VM-execution controls were also 0.
19	CR8-load exiting	This control determines whether executions of MOV to CR8 cause VM exits.
20	CR8-store exiting	This control determines whether executions of MOV from CR8 cause VM exits.
21	Use TPR shadow	Setting this control to 1 enables TPR virtualization and other APIC-virtualization features. See Chapter 31.
22	NMI-window exiting	If this control is 1, a VM exit occurs at the beginning of any instruction if there is no virtual-NMI blocking (see Section 26.4.2).
23	MOV-DR exiting	This control determines whether executions of MOV DR cause VM exits.
24	Unconditional I/O exiting	This control determines whether executions of I/O instructions (IN, INS/INSB/INSW/INSD, OUT, and OUTS/OUTSB/OUTSW/OUTSD) cause VM exits.
25	Use I/O bitmaps	This control determines whether I/O bitmaps are used to restrict executions of I/O instructions (see Section 26.6.4 and Section 27.1.3). For this control, "0" means "do not use I/O bitmaps" and "1" means "use I/O bitmaps." If the I/O bitmaps are used, the setting of the "unconditional I/O exiting" control is ignored.
27	Monitor trap flag	If this control is 1, the monitor trap flag debugging feature is enabled. See Section 27.5.2.
28	Use MSR bitmaps	This control determines whether MSR bitmaps are used to control execution of the RDMSR and WRMSR instructions (see Section 26.6.9 and Section 27.1.3). For this control, "0" means "do not use MSR bitmaps" and "1" means "use MSR bitmaps." If the MSR bitmaps are not used, all executions of the RDMSR and WRMSR instructions cause VM exits.
29	MONITOR exiting	This control determines whether executions of MONITOR cause VM exits.
30	PAUSE exiting	This control determines whether executions of PAUSE cause VM exits.
31	Activate secondary controls	This control determines whether the secondary processor-based VM-execution controls are used. If this control is 0, the logical processor operates as if all the secondary processor-based VM-execution controls were also 0.

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs IA32_VMX_PROCBASED_CTLS and IA32_VMX_TRUE_PROCBASED_CTLS (see Appendix A.3.2) to determine how to set reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 28.2.1.1).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 1, 4–6, 8, 13–16, and 26. The VMX capability MSR IA32_VMX_PROCBASED_CTLS will always report that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR IA32_VMX_TRUE_PROCBASED_CTLS MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

Bit 31 of the primary processor-based VM-execution controls determines whether the secondary processor-based VM-execution controls are used. If that bit is 0, VM entry and VMX non-root operation function as if all the secondary processor-based VM-execution controls were 0. Processors that support only the 0-setting of bit 31 of

the primary processor-based VM-execution controls do not support the secondary processor-based VM-execution controls.

Table 26-7 lists the secondary processor-based VM-execution controls. See Chapter 26 for more details of how these controls affect processor behavior in VMX non-root operation.

Table 26-7. Definitions of Secondary Processor-Based VM-Execution Controls

Bit Position(s)	Name	Description
0	Virtualize APIC accesses	If this control is 1, the logical processor treats specially accesses to the page with the APIC-access address. See Section 31.4.
1	Enable EPT	If this control is 1, extended page tables (EPT) are enabled. See Section 30.3.
2	Descriptor-table exiting	This control determines whether executions of LGDT, LIDT, LLDT, LTR, SGDT, SIDT, SLDT, and STR cause VM exits.
3	Enable RDTSCP	If this control is 0, any execution of RDTSCP causes an invalid-opcode exception (#UD).
4	Virtualize x2APIC mode	If this control is 1, the logical processor treats specially RDMSR and WRMSR to APIC MSRs (in the range 800H–8FFH). See Section 31.5.
5	Enable VPID	If this control is 1, cached translations of linear addresses are associated with a virtual-processor identifier (VPID). See Section 30.1.
6	WBINVD exiting	This control determines whether executions of WBINVD and WBNOINVD cause VM exits.
7	Unrestricted guest	This control determines whether guest software may run in unpaged protected mode or in real-address mode.
8	APIC-register virtualization	If this control is 1, the logical processor virtualizes certain APIC accesses. See Section 31.4 and Section 31.5.
9	Virtual-interrupt delivery	This controls enables the evaluation and delivery of pending virtual interrupts as well as the emulation of writes to the APIC registers that control interrupt prioritization.
10	PAUSE-loop exiting	This control determines whether a series of executions of PAUSE can cause a VM exit (see Section 26.6.13 and Section 27.1.3).
11	RDRAND exiting	This control determines whether executions of RDRAND cause VM exits.
12	Enable INVPCID	If this control is 0, any execution of INVPCID causes a #UD.
13	Enable VM functions	Setting this control to 1 enables use of the VMFUNC instruction in VMX non-root operation. See Section 27.5.6.
14	VMCS shadowing	If this control is 1, executions of VMREAD and VMWRITE in VMX non-root operation may access a shadow VMCS (instead of causing VM exits). See Section 26.10 and Section 32.3.
15	Enable ENCLS exiting	If this control is 1, executions of ENCLS consult the ENCLS-exiting bitmap to determine whether the instruction causes a VM exit. See Section 26.6.16 and Section 27.1.3.
16	RDSEED exiting	This control determines whether executions of RDSEED cause VM exits.
17	Enable PML	If this control is 1, an access to a guest-physical address that sets an EPT dirty bit first adds an entry to the page-modification log. See Section 30.3.6.
18	EPT-violation #VE	If this control is 1, EPT violations may cause virtualization exceptions (#VE) instead of VM exits. See Section 27.5.7.
19	Conceal VMX from PT	If this control is 1, Intel Processor Trace suppresses from PIPs an indication that the processor was in VMX non-root operation and omits a VMCS packet from any PSB+ produced in VMX non-root operation (see Chapter 34).
20	Enable XSAVES/XRSTORS	If this control is 0, any execution of XSAVES or XRSTORS causes a #UD.
21	PASID translation	If this control is 1, PASID translation is performed for executions of ENQCMD and ENQCMDS. See Section 27.5.8.
22	Mode-based execute control for EPT	If this control is 1, EPT execute permissions are based on whether the linear address being accessed is supervisor mode or user mode. See Chapter 30.

Table 26-7. Definitions of Secondary Processor-Based VM-Execution Controls (Contd.)

Bit Position(s)	Name	Description
23	Sub-page write permissions for EPT	If this control is 1, EPT write permissions may be specified at the granularity of 128 bytes. See Section 30.3.4.
24	Intel PT uses guest physical addresses	If this control is 1, all output addresses used by Intel Processor Trace are treated as guest-physical addresses and translated using EPT. See Section 27.5.4.
25	Use TSC scaling	This control determines whether executions of RDTSC, executions of RDTSCP, and executions of RDMSR that read from the IA32_TIME_STAMP_COUNTER MSR return a value modified by the TSC multiplier field (see Section 26.6.5 and Section 27.3).
26	Enable user wait and pause	If this control is 0, any execution of TPAUSE, UMONITOR, or UMWAIT causes a #UD.
27	Enable PCONFIG	If this control is 0, any execution of PCONFIG causes a #UD.
28	Enable ENCLV exiting	If this control is 1, executions of ENCLV consult the ENCLV-exiting bitmap to determine whether the instruction causes a VM exit. See Section 26.6.17 and Section 27.1.3.
30	VMM bus-lock detection	This control determines whether assertion of a bus lock causes a VM exit. See Section 27.2.
31	Instruction timeout	If this control is 1, a VM exit occurs if certain operations prevent the processor from reaching an instruction boundary within a specified amount of time. See Section 26.6.25 and Section 27.2.

All other bits in this field are reserved to 0. Software should consult the VMX capability MSR IA32_VMX_PROCBASED_CTLS2 (see Appendix A.3.3) to determine which bits may be set to 1. Failure to clear reserved bits causes subsequent VM entries to fail (see Section 28.2.1.1).

Bit 17 of the primary processor-based VM-execution controls determines whether the tertiary processor-based VM-execution controls are used. If that bit is 0, VM entry and VMX non-root operation function as if all the tertiary processor-based VM-execution controls were 0. Processors that support only the 0-setting of bit 17 of the primary processor-based VM-execution controls do not support the tertiary processor-based VM-execution controls.

Table 26-8 lists the tertiary processor-based VM-execution controls. See Chapter 26 for more details of how these controls affect processor behavior in VMX non-root operation.

Table 26-8. Definitions of Tertiary Processor-Based VM-Execution Controls

Bit Position(s)	Name	Description
0	LOADIWKEY exiting	This control determines whether executions of LOADIWKEY cause VM exits.
1	Enable HLAT	This control enables hypervisor-managed linear-address translation. See Section 5.5.1.
2	EPT paging-write control	If this control is 1, EPT permissions can be specified to allow writes only for paging-related updates. See Section 30.3.3.2.
3	Guest-paging verification	If this control is 1, EPT permissions can be specified to prevent accesses using linear addresses whose translation has certain properties. See Section 30.3.3.2.
4	IPI virtualization	If this control is 1, virtualization of interprocessor interrupts (IPIs) is enabled. See Section 31.1.6.
6	Enable MSR-list instructions	If this control is 0, any execution of RDMSRLIST or WRMSRLIST causes a #UD.
7	Virtualize IA32_SPEC_CTRL	If this control is 1, the operation of the RDMSR and WRMSR instructions is changed when accessing the IA32_SPEC_CTRL MSR. See Section 26.3.

All other bits in this field are reserved to 0. Software should consult the VMX capability MSR IA32_VMX_PROCBASED_CTLS3 (see Appendix A.3.4) to determine which bits may be set to 1. Failure to clear reserved bits causes subsequent VM entries to fail (see Section 28.2.1.1).

26.6.3 Exception Bitmap

The **exception bitmap** is a 32-bit field that contains one bit for each exception. When an exception occurs, its vector is used to select a bit in this field. If the bit is 1, the exception causes a VM exit. If the bit is 0, the exception is delivered normally through the IDT, using the descriptor corresponding to the exception's vector.

Whether a page fault (exception with vector 14) causes a VM exit is determined by bit 14 in the exception bitmap as well as the error code produced by the page fault and two 32-bit fields in the VMCS (the **page-fault error-code mask** and **page-fault error-code match)**. See Section 27.2 for details.

26.6.4 I/O-Bitmap Addresses

The VM-execution control fields include the 64-bit physical addresses of **I/O bitmaps** A and B (each of which are 4 KBytes in size). I/O bitmap A contains one bit for each I/O port in the range 0000H through 7FFFH; I/O bitmap B contains bits for ports in the range 8000H through FFFFH.

A logical processor uses these bitmaps if and only if the "use I/O bitmaps" control is 1. If the bitmaps are used, execution of an I/O instruction causes a VM exit if any bit in the I/O bitmaps corresponding to a port it accesses is 1. See Section 27.1.3 for details. If the bitmaps are used, their addresses must be 4-KByte aligned.

26.6.5 Time-Stamp Counter Offset and Multiplier

The VM-execution control fields include a 64-bit **TSC-offset** field. If the "RDTSC exiting" control is 0 and the "use TSC offsetting" control is 1, this field controls executions of the RDTSC and RDTSCP instructions. It also controls executions of the RDMSR instruction that read from the IA32_TIME_STAMP_COUNTER MSR. For all of these, the value of the TSC offset is added to the value of the time-stamp counter, and the sum is returned to guest software in EDX:EAX.

Processors that support the 1-setting of the "use TSC scaling" control also support a 64-bit **TSC-multiplier** field. If this control is 1 (and the "RDTSC exiting" control is 0 and the "use TSC offsetting" control is 1), this field also affects the executions of the RDTSC, RDTSCP, and RDMSR instructions identified above. Specifically, the contents of the time-stamp counter is first multiplied by the TSC multiplier before adding the TSC offset.

See Chapter 26 for a detailed treatment of the behavior of RDTSC, RDTSCP, and RDMSR in VMX non-root operation.

26.6.6 Guest/Host Masks and Read Shadows for CR0 and CR4

VM-execution control fields include **guest/host masks** and **read shadows** for the CR0 and CR4 registers. These fields control executions of instructions that access those registers (including CLTS, LMSW, MOV CR, and SMSW). They are 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not.

In general, bits set to 1 in a guest/host mask correspond to bits "owned" by the host:

- Guest attempts to set them (using CLTS, LMSW, or MOV to CR) to values differing from the corresponding bits in the corresponding read shadow cause VM exits.
- Guest reads (using MOV from CR or SMSW) return values for these bits from the corresponding read shadow.

Bits cleared to 0 correspond to bits "owned" by the guest; guest attempts to modify them succeed and guest reads return values for these bits from the control register itself.

See Chapter 28 for details regarding how these fields affect VMX non-root operation.

26.6.7 CR3-Target Controls

The VM-execution control fields include a set of 4 **CR3-target values** and a **CR3-target count**. The CR3-target values each have 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not. The CR3-target count has 32 bits on all processors.

An execution of MOV to CR3 in VMX non-root operation does not cause a VM exit if its source operand matches one of these values. If the CR3-target count is *n*, only the first *n* CR3-target values are considered; if the CR3-target count is 0, MOV to CR3 always causes a VM exit.

There are no limitations on the values that can be written for the CR3-target values. VM entry fails (see Section 28.2) if the CR3-target count is greater than 4.

Future processors may support a different number of CR3-target values. Software should read the VMX capability MSR IA32_VMX_MISC (see Appendix A.6) to determine the number of values supported.

26.6.8 Controls for APIC Virtualization

There are three mechanisms by which software accesses registers of the logical processor's local APIC:

- If the local APIC is in xAPIC mode, it can perform memory-mapped accesses to addresses in the 4-KByte page referenced by the physical address in the IA32_APIC_BASE MSR (see Section 12.4.4, "Local APIC Status and Location," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A, and the Intel® 64 Architecture Processor Topology Enumeration Technical Paper).[1]
- If the local APIC is in x2APIC mode, it can accesses the local APIC's registers using the RDMSR and WRMSR instructions (see the Intel® 64 Architecture Processor Topology Enumeration Technical Paper).
- In 64-bit mode, it can access the local APIC's task-priority register (TPR) using the MOV CR8 instruction.

Several processor-based VM-execution controls (see Section 26.6.2) control such accesses. These are "use TPR shadow", "virtualize APIC accesses", "virtualize x2APIC mode", "virtual-interrupt delivery", "APIC-register virtualization", and "IPI virtualization". These controls interact with the following fields:

- **APIC-access address** (64 bits). This field contains the physical address of the 4-KByte **APIC-access page**. If the "virtualize APIC accesses" VM-execution control is 1, access to this page may cause VM exits or be virtualized by the processor. See Section 31.4.

  The APIC-access address exists only on processors that support the 1-setting of the "virtualize APIC accesses" VM-execution control.
- **Virtual-APIC address** (64 bits). This field contains the physical address of the 4-KByte **virtual-APIC page**. The processor uses the virtual-APIC page to virtualize certain accesses to APIC registers and to manage virtual interrupts; see Chapter 31.

  Depending on the setting of the controls indicated earlier, the virtual-APIC page may be accessed by the following operations:

  — The MOV CR8 instructions (see Section 31.3).

  — Accesses to the APIC-access page if, in addition, the "virtualize APIC accesses" VM-execution control is 1 (see Section 31.4).

  — The RDMSR and WRMSR instructions if, in addition, the value of ECX is in the range 800H–8FFH (indicating an APIC MSR) and the "virtualize x2APIC mode" VM-execution control is 1 (see Section 31.5).

  If the "use TPR shadow" VM-execution control is 1, VM entry ensures that the virtual-APIC address is 4-KByte aligned. The virtual-APIC address exists only on processors that support the 1-setting of the "use TPR shadow" VM-execution control.
- **TPR threshold** (32 bits). Bits 3:0 of this field determine the threshold below which bits 7:4 of VTPR (see Section 31.1.1) cannot fall. If the "virtual-interrupt delivery" VM-execution control is 0, a VM exit occurs after an operation (e.g., an execution of MOV to CR8) that reduces the value of those bits below the TPR threshold. See Section 31.1.2.

  The TPR threshold exists only on processors that support the 1-setting of the "use TPR shadow" VM-execution control.
- **EOI-exit bitmap** (4 fields; 64 bits each). These fields are supported only on processors that support the 1-setting of the "virtual-interrupt delivery" VM-execution control. They are used to determine which virtualized writes to the APIC's EOI register cause VM exits:

1. If the local APIC does not support x2APIC mode, it is always in xAPIC mode.

— EOI_EXIT0 contains bits for vectors from 0 (bit 0) to 63 (bit 63).
— EOI_EXIT1 contains bits for vectors from 64 (bit 0) to 127 (bit 63).
— EOI_EXIT2 contains bits for vectors from 128 (bit 0) to 191 (bit 63).
— EOI_EXIT3 contains bits for vectors from 192 (bit 0) to 255 (bit 63).

See Section 31.1.4 for more information on the use of this field.

- **Posted-interrupt notification vector** (16 bits). This field is supported only on processors that support the 1-setting of the "process posted interrupts" VM-execution control. Its low 8 bits contain the interrupt vector that is used to notify a logical processor that virtual interrupts have been posted. See Section 31.6 for more information on the use of this field.
- **Posted-interrupt descriptor address** (64 bits). This field is supported only on processors that support the 1-setting of the "process posted interrupts" VM-execution control. It is the physical address of a 64-byte aligned posted interrupt descriptor. See Section 31.6 for more information on the use of this field.
- **PID-pointer table address** (64 bits). This field contains the physical address of the **PID-pointer table**. If the "IPI virtualization" VM-execution control is 1, the logical processor uses entries in this table to virtualize IPIs. See Section 31.1.6.
- **Last PID-pointer index** (16 bits). This field contains the index of the last entry in the PID-pointer table.

26.6.9 MSR-Bitmap Address

On processors that support the 1-setting of the "use MSR bitmaps" VM-execution control, the VM-execution control fields include the 64-bit physical address of four contiguous **MSR bitmaps**, which are each 1-KByte in size. This field does not exist on processors that do not support the 1-setting of that control. The four bitmaps are:

- **Read bitmap for low MSRs** (located at the MSR-bitmap address)**.** This contains one bit for each MSR address in the range 00000000H to 00001FFFH. The bit determines whether an execution of RDMSR applied to that MSR causes a VM exit.
- **Read bitmap for high MSRs** (located at the MSR-bitmap address plus 1024)**.** This contains one bit for each MSR address in the range C0000000H toC0001FFFH. The bit determines whether an execution of RDMSR applied to that MSR causes a VM exit.
- **Write bitmap for low MSRs** (located at the MSR-bitmap address plus 2048)**.** This contains one bit for each MSR address in the range 00000000H to 00001FFFH. The bit determines whether an execution of WRMSR applied to that MSR causes a VM exit.
- **Write bitmap for high MSRs** (located at the MSR-bitmap address plus 3072)**.** This contains one bit for each MSR address in the range C0000000H toC0001FFFH. The bit determines whether an execution of WRMSR applied to that MSR causes a VM exit.

A logical processor uses these bitmaps if and only if the "use MSR bitmaps" control is 1. If the bitmaps are used, an execution of RDMSR or WRMSR causes a VM exit if the value of RCX is in neither of the ranges covered by the bitmaps or if the appropriate bit in the MSR bitmaps (corresponding to the instruction and the RCX value) is 1. See Section 27.1.3 for details. If the bitmaps are used, their address must be 4-KByte aligned.

26.6.10 Executive-VMCS Pointer

The executive-VMCS pointer is a 64-bit field used in the dual-monitor treatment of system-management interrupts (SMIs) and system-management mode (SMM). SMM VM exits save this field as described in Section 33.15.2. VM entries that return from SMM use this field as described in Section 33.15.4.

26.6.11 Extended-Page-Table Pointer (EPTP)

The **extended-page-table pointer** (EPTP) contains the address of the base of EPT PML4 table (see Section 30.3.2), as well as other EPT configuration information. The format of this field is shown in Table 26-9.

Table 26-9. Format of Extended-Page-Table Pointer

Bit Position(s)	Field
2:0	EPT paging-structure memory type (see Section 30.3.7): 0 = Uncacheable (UC) 6 = Write-back (WB) Other values are reserved.[1]
5:3	This value is 1 less than the EPT page-walk length (see Section 30.3.2)
6	Setting this control to 1 enables accessed and dirty flags for EPT (see Section 30.3.5)[2]
7	Setting this control to 1 enables enforcement of access rights for supervisor shadow-stack pages (see Section 30.3.3.2)[3]
11:8	Reserved
N–1:12	Bits N–1:12 of the physical address of the 4-KByte aligned EPT paging-structure (an EPT PML4 table with 4-level EPT and an EPT PML5 table with 5-level EPT)[4]
63:N	Reserved

NOTES:

1. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine what EPT paging-structure memory types are supported.
2. Not all processors support accessed and dirty flags for EPT. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine whether the processor supports this feature.
3. Not all processors enforce access rights for shadow-stack pages. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine whether the processor supports this feature.
4. N is the physical-address width supported by the logical processor. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

The EPTP exists only on processors that support the 1-setting of the "enable EPT" VM-execution control.

26.6.12 Virtual-Processor Identifier (VPID)

The **virtual-processor identifier** (VPID) is a 16-bit field. It exists only on processors that support the 1-setting of the "enable VPID" VM-execution control. See Section 30.1 for details regarding the use of this field.

26.6.13 Controls for PAUSE-Loop Exiting

On processors that support the 1-setting of the "PAUSE-loop exiting" VM-execution control, the VM-execution control fields include the following 32-bit fields:

- **PLE_Gap**. Software can configure this field as an upper bound on the amount of time between two successive executions of PAUSE in a loop.
- **PLE_Window**. Software can configure this field as an upper bound on the amount of time a guest is allowed to execute in a PAUSE loop.

These fields measure time based on a counter that runs at the same rate as the timestamp counter (TSC). See Section 27.1.3 for more details regarding PAUSE-loop exiting.

26.6.14 VM-Function Controls

The **VM-function controls** constitute a 64-bit vector that governs use of the VMFUNC instruction in VMX non-root operation. This field is supported only on processors that support the 1-settings of both the "activate secondary controls" primary processor-based VM-execution control and the "enable VM functions" secondary processor-based VM-execution control.

Table 26-10 lists the VM-function controls. See Section 27.5.6 for more details of how these controls affect processor behavior in VMX non-root operation.

Table 26-10. Definitions of VM-Function Controls

Bit Position(s)	Name	Description
0	EPTP switching	The EPTP-switching VM function changes the EPT pointer to a value chosen from the EPTP list. See Section 27.5.6.3.

All other bits in this field are reserved to 0. Software should consult the VMX capability MSR IA32_VMX_VMFUNC (see Appendix A.11) to determine which bits are reserved. Failure to clear reserved bits causes subsequent VM entries to fail (see Section 28.2.1.1).

Processors that support the 1-setting of the "EPTP switching" VM-function control also support a 64-bit field called the **EPTP-list address**. This field contains the physical address of the 4-KByte **EPTP list**. The EPTP list comprises 512 8-Byte entries (each an EPTP value) and is used by the EPTP-switching VM function (see Section 27.5.6.3).

26.6.15 VMCS Shadowing Bitmap Addresses

On processors that support the 1-setting of the "VMCS shadowing" VM-execution control, the VM-execution control fields include the 64-bit physical addresses of the **VMREAD bitmap** and the **VMWRITE bitmap**. Each bitmap is 4 KBytes in size and thus contains 32 KBits. The addresses are the **VMREAD-bitmap address** and the **VMWRITE-bitmap address**.

If the "VMCS shadowing" VM-execution control is 1, executions of VMREAD and VMWRITE may consult these bitmaps (see Section 26.10 and Section 32.3).

26.6.16 ENCLS-Exiting Bitmap

The **ENCLS-exiting bitmap** is a 64-bit field. If the "enable ENCLS exiting" VM-execution control is 1, execution of ENCLS causes a VM exit if the bit in this field corresponding to the value of EAX is 1. If the bit is 0, the instruction executes normally. See Section 27.1.3 for more information.

26.6.17 ENCLV-Exiting Bitmap

The **ENCLV-exiting bitmap** is a 64-bit field. If the "enable ENCLV exiting" VM-execution control is 1, execution of ENCLV causes a VM exit if the bit in this field corresponding to the value of EAX is 1. If the bit is 0, the instruction executes normally. See Section 27.1.3 for more information.

26.6.18 PCONFIG-Exiting Bitmap

The **PCONFIG-exiting bitmap** is a 64-bit field. If the "enable PCONFIG" VM-execution control is 1, execution of PCONFIG causes a VM exit if the bit in this field corresponding to the value of EAX is 1. If the control is 0, any execution of PCONFIG causes a #UD. See Section 27.1.3 for more information.

26.6.19 Control Field for Page-Modification Logging

The **PML address** is a 64-bit field. It is the 4-KByte aligned address of the **page-modification log**. The page-modification log consists of 512 64-bit entries. It is used for the page-modification logging feature. Details of the page-modification logging are given in Section 30.3.6.

If the "enable PML" VM-execution control is 1, VM entry ensures that the PML address is 4-KByte aligned. The PML address exists only on processors that support the 1-setting of the "enable PML" VM-execution control.

26.6.20 Controls for Virtualization Exceptions

On processors that support the 1-setting of the "EPT-violation #VE" VM-execution control, the VM-execution control fields include the following:

- **Virtualization-exception information address** (64 bits). This field contains the physical address of the **virtualization-exception information area**. When a logical processor encounters a virtualization exception, it saves virtualization-exception information at the virtualization-exception information address; see Section 27.5.7.2.
- **EPTP index** (16 bits). When an EPT violation causes a virtualization exception, the processor writes the value of this field to the virtualization-exception information area. The EPTP-switching VM function updates this field (see Section 27.5.6.3).

26.6.21 XSS-Exiting Bitmap

On processors that support the 1-setting of the "enable XSAVES/XRSTORS" VM-execution control, the VM-execution control fields include a 64-bit **XSS-exiting bitmap**. If the "enable XSAVES/XRSTORS" VM-execution control is 1, executions of XSAVES and XRSTORS may consult this bitmap (see Section 27.1.3 and Section 27.3).

26.6.22 Sub-Page-Permission-Table Pointer (SPPTP)

If the sub-page write-permission feature of EPT is enabled, EPT write permissions may be determined at a 128-byte granularity (see Section 30.3.4). These permissions are determined using a hierarchy of sub-page-permission structures in memory.

The root of this hierarchy is referenced by a VM-execution control field called the **sub-page-permission-table pointer** (SPPTP). The SPPTP contains the address of the base of the root SPP table (see Section 30.3.4.2). The format of this field is shown in Table 26-9.

Table 26-11. Format of Sub-Page-Permission-Table Pointer

Bit Position(s)	Field
11:0	Reserved
N–1:12	Bits N–1:12 of the physical address of the 4-KByte aligned root SPP table
63:N[1]	Reserved

NOTES:

1. N is the processor's physical-address width. Software can determine this width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

The SPPTP exists only on processors that support the 1-setting of the "sub-page write permissions for EPT" VM-execution control.

26.6.23 Fields Related to Hypervisor-Managed Linear-Address Translation

Two fields are used when the "enable HLAT" VM-execution control is 1, enabling HLAT paging:

- The **hypervisor-managed linear-address translation pointer** (HLAT pointer or HLATP) is used by HLAT paging to locate and access the first paging structure used for linear-address translation (see Section 5.5). The format of this field is shown in Table 26-12.

Table 26-12. Format of Hypervisor-Managed Linear-Address Translation Pointer

Bit Position(s)	Field
2:0	Reserved
3 (PWT)	Page-level write-through; indirectly determines the memory type used to access the first HLAT paging structure during linear-address translation.
4 (PCD)	Page-level cache disable; indirectly determines the memory type used to access the first HLAT paging structure during linear-address translation.
11:5	Reserved
N–1:12	Guest-physical address (4KB-aligned) of the first HLAT paging structure during linear-address translation.[1]
63:N	Reserved

NOTES:

1. N is the physical-address width supported by the logical processor. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

- The HLAT prefix size. The value of this field determines which linear address are subject to HLAT paging. See Section 5.5.1.

These fields exist only on processors that support the 1-setting of the "enable HLAT" VM-execution control.

26.6.24 Fields Related to PASID Translation

Two 64-bit VM-execution control fields are used when the "PASID translation" VM-execution control is 1, enabling translation of PASIDs for executions of ENQCMD and ENQCMDS: the **low PASID directory address** and the **high PASID directory address**. These are the physical addresses of the low PASID directory and the high PASID directory, respectively. These fields exist only on processors that support the 1-setting of the "PASID translation" VM-execution control.

See Section 27.5.8 for information on the PASID-translation process for ENQCMD and ENQCMDS.

26.6.25 Instruction-Timeout Control

On processors that support the 1-setting of the "instruction timeout" VM-execution control, the VM-execution control fields include a 32-bit **instruction-timeout control**. The processor interprets the value of this field as an amount of time as measured in units of crystal clock cycles.[1] If the "instruction timeout" VM-execution control is 1, a VM exit occurs if certain operations prevent the processor from reaching an instruction boundary within this amount of time.

1. CPUID.15H:ECX enumerates the nominal frequency of the core crystal clock in Hz.

26.6.26 Fields Controlling Virtualization of the IA32_SPEC_CTRL MSR

On processors that support the 1-setting of the "virtualize IA32_SPEC_CTRL" VM-execution control, the VM-execution control fields include the following 64-bit fields:

- **IA32_SPEC_CTRL mask.** Setting a bit in this field prevents guest software from modifying the corresponding bit in the IA32_SPEC_CTRL MSR.
- **IA32_SPEC_CTRL shadow.** This field contains the value that guest software expects to be in the IA32_SPEC_CTRL MSR.

Section 27.3 discusses how these fields are used in VMX non-root operation.

26.7 VM-EXIT CONTROL FIELDS

The VM-exit control fields govern the behavior of VM exits. They are discussed in Section 26.7.1 and Section 26.7.2.

26.7.1 VM-Exit Controls

The VM-exit controls constitute two vectors that govern the basic operation of VM exits. These are the **primary VM-exit controls** (32 bits) and the **secondary VM-exits controls** (64 bits).

Table 26-13 lists the primary VM-exit controls. See Chapter 28 for complete details of how these controls affect VM exits.

Table 26-13. Definitions of Primary VM-Exit Controls

Bit Position(s)	Name	Description
2	Save debug controls	This control determines whether DR7 and the IA32_DEBUGCTL MSR are saved on VM exit. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
9	Host address-space size	On processors that support Intel 64 architecture, this control determines whether a logical processor is in 64-bit mode after the next VM exit. Its value is loaded into CS.L, IA32_EFER.LME, and IA32_EFER.LMA on every VM exit.[1] This control must be 0 on processors that do not support Intel 64 architecture.
12	Load IA32_PERF_GLOBAL_CTRL	This control determines whether the IA32_PERF_GLOBAL_CTRL MSR is loaded on VM exit.
15	Acknowledge interrupt on exit	This control affects VM exits due to external interrupts: ▪ If such a VM exit occurs and this control is 1, the logical processor acknowledges the interrupt controller, acquiring the interrupt's vector. The vector is stored in the VM-exit interruption-information field, which is marked valid. ▪ If such a VM exit occurs and this control is 0, the interrupt is not acknowledged and the VM-exit interruption-information field is marked invalid.
18	Save IA32_PAT	This control determines whether the IA32_PAT MSR is saved on VM exit.
19	Load IA32_PAT	This control determines whether the IA32_PAT MSR is loaded on VM exit.
20	Save IA32_EFER	This control determines whether the IA32_EFER MSR is saved on VM exit.
21	Load IA32_EFER	This control determines whether the IA32_EFER MSR is loaded on VM exit.
22	Save VMX-preemption timer value	This control determines whether the value of the VMX-preemption timer is saved on VM exit.
23	Clear IA32_BNDCFGS	This control determines whether the IA32_BNDCFGS MSR is cleared on VM exit.
24	Conceal VMX from PT	If this control is 1, Intel Processor Trace does not produce a paging information packet (PIP) on a VM exit or a VMCS packet on an SMM VM exit (see Chapter 34).

Table 26-13. Definitions of Primary VM-Exit Controls (Contd.)

Bit Position(s)	Name	Description
25	Clear IA32_RTIT_CTL	This control determines whether the IA32_RTIT_CTL MSR is cleared on VM exit.
26	Clear IA32_LBR_CTL	This control determines whether the IA32_LBR_CTL MSR is cleared on VM exit.
27	Clear UINV	This control determines whether UINV is cleared on VM exit.
28	Load CET state	This control determines whether CET-related MSRs and SSP are loaded on VM exit.
29	Load PKRS	This control determines whether the IA32_PKRS MSR is loaded on VM exit.
30	Save IA32_PERF_GLOBAL_CTL	This control determines whether the IA32_PERF_GLOBAL_CTL MSR is saved on VM exit.
31	Activate secondary controls	This control determines whether the secondary VM-exit controls are used. If this control is 0, the logical processor operates as if all the secondary VM-exit controls were also 0.

NOTES:

1. Since the Intel 64 architecture specifies that IA32_EFER.LMA is always set to the logical-AND of CR0.PG and IA32_EFER.LME, and since CR0.PG is always 1 in VMX root operation, IA32_EFER.LMA is always identical to IA32_EFER.LME in VMX root operation.

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs IA32_VMX_EXIT_CTLS and IA32_VMX_TRUE_EXIT_CTLS (see Appendix A.4) to determine how it should set the reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 28.2.1.2).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 0–8, 10, 11, 13, 14, 16, and 17. The VMX capability MSR IA32_VMX_EXIT_CTLS always reports that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR IA32_VMX_TRUE_EXIT_CTLS MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

Bit 31 of the primary processor-based VM-exit controls determines whether the secondary VM-exit controls are used. If that bit is 0, VM entries and VM exits function as if all the secondary VM-exit controls were 0. Processors that support only the 0-setting of bit 31 of the primary VM-exit controls do not support the secondary VM-exit controls.

Table 26-14 lists the secondary VM-exit controls. See Chapter 28 for more details of how these controls affect VM exits.

Table 26-14. Definitions of Secondary VM-Exit Controls

Bit Position(s)	Name	Description
3	Prematurely busy shadow stack	If this control is 1, VM exits that cause a shadow stack to become prematurely busy (see Section 18.2.3, "Supervisor Shadow Stack Token," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1) indicate this fact and save additional information into the VMCS.

All other bits in this field are reserved to 0. Software should consult the VMX capability MSR IA32_VMX_EXIT_CTLS2 (see Appendix A.4.2) to determine which bits may be set to 1. Failure to clear reserved bits causes subsequent VM entries to fail (see Section 28.2.1.2).

26.7.2 VM-Exit Controls for MSRs

A VMM may specify lists of MSRs to be stored and loaded on VM exits. The following VM-exit control fields determine how MSRs are stored on VM exits:

- **VM-exit MSR-store count** (32 bits). This field specifies the number of MSRs to be stored on VM exit. It is recommended that this count not exceed 512.[1] Otherwise, unpredictable processor behavior (including a machine check) may result during VM exit.

- **VM-exit MSR-store address** (64 bits). This field contains the physical address of the VM-exit MSR-store area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-exit MSR-store count. The format of each entry is given in Table 26-15. If the VM-exit MSR-store count is not zero, the address must be 16-byte aligned.

Table 26-15. Format of an MSR Entry

Bit Position(s)	Contents
31:0	MSR index
63:32	Reserved
127:64	MSR data

See Section 29.4 for how this area is used on VM exits.

The following VM-exit control fields determine how MSRs are loaded on VM exits:

- **VM-exit MSR-load count** (32 bits). This field contains the number of MSRs to be loaded on VM exit. It is recommended that this count not exceed 512. Otherwise, unpredictable processor behavior (including a machine check) may result during VM exit.[1]
- **VM-exit MSR-load address** (64 bits). This field contains the physical address of the VM-exit MSR-load area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-exit MSR-load count (see Table 26-15). If the VM-exit MSR-load count is not zero, the address must be 16-byte aligned.

See Section 29.6 for how this area is used on VM exits.

26.8 VM-ENTRY CONTROL FIELDS

The VM-entry control fields govern the behavior of VM entries. They are discussed in Sections 26.8.1 through 26.8.3.

26.8.1 VM-Entry Controls

The **VM-entry controls** constitute a 32-bit vector that governs the basic operation of VM entries. Table 26-16 lists the controls supported. See Chapter 26 for how these controls affect VM entries.

Table 26-16. Definitions of VM-Entry Controls

Bit Position(s)	Name	Description
2	Load debug controls	This control determines whether DR7 and the IA32_DEBUGCTL MSR are loaded on VM entry. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
9	IA-32e mode guest	On processors that support Intel 64 architecture, this control determines whether the logical processor is in IA-32e mode after VM entry. Its value is loaded into IA32_EFER.LMA as part of VM entry.[1] This control must be 0 on processors that do not support Intel 64 architecture.
10	Entry to SMM	This control determines whether the logical processor is in system-management mode (SMM) after VM entry. This control must be 0 for any VM entry from outside SMM.
11	Deactivate dual-monitor treatment	If set to 1, the default treatment of SMIs and SMM is in effect after the VM entry (see Section 33.15.7). This control must be 0 for any VM entry from outside SMM.

1. Future implementations may allow more MSRs to be stored reliably. Software should consult the VMX capability MSR IA32_VMX_-MISC to determine the number supported (see Appendix A.6).

1. Future implementations may allow more MSRs to be loaded reliably. Software should consult the VMX capability MSR IA32_VMX_-MISC to determine the number supported (see Appendix A.6).

Table 26-16. Definitions of VM-Entry Controls (Contd.)

Bit Position(s)	Name	Description
13	Load IA32_PERF_GLOBAL_CTRL	This control determines whether the IA32_PERF_GLOBAL_CTRL MSR is loaded on VM entry.
14	Load IA32_PAT	This control determines whether the IA32_PAT MSR is loaded on VM entry.
15	Load IA32_EFER	This control determines whether the IA32_EFER MSR is loaded on VM entry.
16	Load IA32_BNDCFGS	This control determines whether the IA32_BNDCFGS MSR is loaded on VM entry.
17	Conceal VMX from PT	If this control is 1, Intel Processor Trace does not produce a paging information packet (PIP) on a VM entry or a VMCS packet on a VM entry that returns from SMM (see Chapter 34).
18	Load IA32_RTIT_CTL	This control determines whether the IA32_RTIT_CTL MSR is loaded on VM entry.
19	Load UINV	This control determines whether UINV is loaded on VM entry.
20	Load CET state	This control determines whether CET-related MSRs and SSP are loaded on VM entry.
21	Load guest IA32_LBR_CTL	This control determines whether the IA32_LBR_CTL MSR is loaded on VM entry.
22	Load PKRS	This control determines whether the IA32_PKRS MSR is loaded on VM entry.

NOTES:

1. Bit 5 of the IA32_VMX_MISC MSR is read as 1 on any logical processor that supports the 1-setting of the "unrestricted guest" VM-execution control. If it is read as 1, every VM exit stores the value of IA32_EFER.LMA into the "IA-32e mode guest" VM-entry control (see Section 29.2).

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs IA32_VMX_ENTRY_CTLS and IA32_VMX_TRUE_ENTRY_CTLS (see Appendix A.5) to determine how it should set the reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 28.2.1.3).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 0–8 and 12. The VMX capability MSR IA32_VMX_ENTRY_CTLS always reports that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR IA32_VMX_TRUE_ENTRY_CTLS MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

26.8.2 VM-Entry Controls for MSRs

A VMM may specify a list of MSRs to be loaded on VM entries. The following VM-entry control fields manage this functionality:

- **VM-entry MSR-load count** (32 bits). This field contains the number of MSRs to be loaded on VM entry. It is recommended that this count not exceed 512. Otherwise, unpredictable processor behavior (including a machine check) may result during VM entry.[1]
- **VM-entry MSR-load address** (64 bits). This field contains the physical address of the VM-entry MSR-load area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-entry MSR-load count. The format of entries is described in Table 26-15. If the VM-entry MSR-load count is not zero, the address must be 16-byte aligned.

See Section 28.4 for details of how this area is used on VM entries.

26.8.3 VM-Entry Controls for Event Injection

1. Future implementations may allow more MSRs to be loaded reliably. Software should consult the VMX capability MSR IA32_VMX_-MISC to determine the number supported (see Appendix A.6).

VM entry can be configured to conclude by delivering an event through the IDT (after all guest state and MSRs have been loaded). This process is called **event injection** and is controlled by the following three VM-entry control fields:

- **VM-entry interruption-information field** (32 bits). This field provides details about the event to be injected. Table 26-17 describes the field.

Table 26-17. Format of the VM-Entry Interruption-Information Field

Bit Position(s)	Content
7:0	Vector of interrupt or exception
10:8	Interruption type: 0: External interrupt 1: Reserved 2: Non-maskable interrupt (NMI) 3: Hardware exception (e.g,. #PF) 4: Software interrupt (INT *n*) 5: Privileged software exception (INT1) 6: Software exception (INT3 or INTO) 7: Other event
11	Deliver error code (0 = do not deliver; 1 = deliver)
30:12	Reserved
31	Valid

  - The **vector** (bits 7:0) determines which entry in the IDT is used or which other event is injected.
  - The **interruption type** (bits 10:8) determines details of how the injection is performed. In general, a VMM should use the type hardware exception for all exceptions **other than** the following:
    - breakpoint exceptions (#BP; a VMM should use the type software exception);
    - overflow exceptions (#OF a VMM should use the use type software exception); and
    - those debug exceptions (#DB) that are generated by INT1 (a VMM should use the use type privileged software exception).[1]

    The type **other event** is used for injection of events that are not delivered through the IDT.[2]
  - For exceptions, the **deliver-error-code bit** (bit 11) determines whether delivery pushes an error code on the guest stack.
  - VM entry injects an event if and only if the **valid bit** (bit 31) is 1. The valid bit in this field is cleared on every VM exit (see Section 29.2).
- **VM-entry exception error code** (32 bits). This field is used if and only if the valid bit (bit 31) and the deliver-error-code bit (bit 11) are both set in the VM-entry interruption-information field.
- **VM-entry instruction length** (32 bits). For injection of events whose type is software interrupt, software exception, or privileged software exception, this field is used to determine the value of RIP that is pushed on the stack.

See Section 28.6 for details regarding the mechanics of event injection, including the use of the interruption type and the VM-entry instruction length.

VM exits clear the valid bit (bit 31) in the VM-entry interruption-information field.

26.9 VM-EXIT INFORMATION FIELDS

The VMCS contains a section of fields that contain information about the most recent VM exit.

1. The type hardware exception should be used for all other debug exceptions.
2. INT1 and INT3 refer to the instructions with opcodes F1 and CC, respectively, and not to INT *n* with values 1 or 3 for *n*.

On some processors, attempts to write to these fields with VMWRITE fail (see "VMWRITE—Write Field to Virtual-Machine Control Structure" in Chapter 31).[1]

26.9.1 Basic VM-Exit Information

The following VM-exit information fields provide basic information about a VM exit:

- **Exit reason** (32 bits). This field encodes the reason for the VM exit and has the structure given in Table 26-18.

Table 26-18. Format of Exit Reason

Bit Position(s)	Contents
15:0	Basic exit reason.
16	Always cleared to 0.
24:17	Not currently defined.
25	A VM exit saves this bit as 1 to indicate that the VM exit caused a shadow stack to become prematurely busy.
26	A VM exit saves this bit as 1 to indicate that the VM exit occurred after assertion of a bus lock while the "VMM bus-lock detection" VM-execution control was 1.
27	A VM exit saves this bit as 1 to indicate that the VM exit was incident to enclave mode.
28	Pending MTF VM exit.
29	VM exit from VMX root operation.
30	Not currently defined.
31	VM-entry failure (0 = true VM exit; 1 = VM-entry failure)

  - Bits 15:0 provide basic information about the cause of the VM exit (if bit 31 is clear) or of the VM-entry failure (if bit 31 is set). Appendix C enumerates the basic exit reasons.
  - Bit 16 is always cleared to 0.
  - Bit 25 is set to 1 if the "prematurely busy shadow stack" VM-exit control is 1 and the VM exit caused a shadow stack to become prematurely busy (see Section 27.4.3). Otherwise, the bit is cleared.
  - Bit 26 is set to 1 if the VM exit occurred after assertion of a bus lock while the "VMM bus-lock detection" VM-execution control was 1. Such VM exits include those that occur due to the 1-setting of that control as well as others that might occur during execution of an instruction that asserted a bus lock.
  - Bit 27 is set to 1 if the VM exit occurred while the logical processor was in enclave mode.

    A VM exit also sets this bit if it is incident to delivery of an event injected by VM entry and the guest interruptibility-state field indicates an enclave interrupt (bit 4 of the field is 1). See Section 29.2.1 for details.
  - Bit 28 is set only by an SMM VM exit (see Section 33.15.2) that took priority over an MTF VM exit (see Section 27.5.2) that would have occurred had the SMM VM exit not occurred. See Section 33.15.2.3.
  - Bit 29 is set if and only if the processor was in VMX root operation at the time the VM exit occurred. This can happen only for SMM VM exits. See Section 33.15.2.
  - Because some VM-entry failures load processor state from the host-state area (see Section 28.8), software must be able to distinguish such cases from true VM exits. Bit 31 is used for that purpose.
- **Exit qualification** (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field contains additional information about the cause of VM exits due to the following: debug exceptions; page-fault exceptions; start-up IPIs (SIPIs); task switches; INVEPT; INVLPG;INVVPID; LGDT; LIDT; LLDT; LTR; SGDT; SIDT; SLDT; STR; VMCLEAR; VMPTRLD; VMPTRST; VMREAD; VMWRITE; VMXON; XRSTORS; XSAVES; control-

1. Software can discover whether these fields can be written by reading the VMX capability MSR IA32_VMX_MISC (see Appendix A.6).

register accesses; MOV DR; I/O instructions; and MWAIT. The format of the field depends on the cause of the VM exit. See Section 29.2.1 for details.

- **Guest-linear address** (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is used in the following cases:
  - — VM exits due to attempts to execute LMSW with a memory operand.
  - — VM exits due to attempts to execute INS or OUTS.
  - — VM exits due to system-management interrupts (SMIs) that arrive immediately after retirement of I/O instructions.
  - — Certain VM exits due to EPT violations

  See Section 29.2.1 and Section 33.15.2.3 for details of when and how this field is used.
- **Guest-physical address** (64 bits). This field is used by VM exits due to EPT violations and EPT misconfigurations. See Section 29.2.1 for details of when and how this field is used.

26.9.2 Information for VM Exits Due to Vectored Events

Event-specific information is provided for VM exits due to the following vectored events: exceptions (including those generated by the instructions INT3, INTO, INT1, BOUND, UD0, UD1, and UD2); external interrupts that occur while the "acknowledge interrupt on exit" VM-exit control is 1; and non-maskable interrupts (NMIs). This information is provided in the following fields:

- **VM-exit interruption information** (32 bits). This field receives basic information associated with the event causing the VM exit. Table 26-19 describes this field.

Table 26-19. Format of the VM-Exit Interruption-Information Field

Bit Position(s)	Content
7:0	Vector of interrupt or exception
10:8	Interruption type: 0: External interrupt 1: Not used 2: Non-maskable interrupt (NMI) 3: Hardware exception 4: Not used 5: Privileged software exception 6: Software exception 7: Not used
11	Error code valid (0 = invalid; 1 = valid)
12	NMI unblocking due to IRET
30:13	Not currently defined
31	Valid

- **VM-exit interruption error code** (32 bits). For VM exits caused by hardware exceptions that would have delivered an error code on the stack, this field receives that error code.

Section 29.2.2 provides details of how these fields are saved on VM exits.

26.9.3 Information for VM Exits That Occur During Event Delivery

Additional information is provided for VM exits that occur during event delivery in VMX non-root operation.[1] This information is provided in the following fields:

1. This includes cases in which the event delivery was caused by event injection as part of VM entry; see Section 28.6.1.2.

- **IDT-vectoring information** (32 bits). This field receives basic information associated with the event that was being delivered when the VM exit occurred. Table 26-20 describes this field.

Table 26-20. Format of the IDT-Vectoring Information Field

Bit Position(s)	Content
7:0	Vector of interrupt or exception
10:8	Interruption type: 0: External interrupt 1: Not used 2: Non-maskable interrupt (NMI) 3: Hardware exception 4: Software interrupt 5: Privileged software exception 6: Software exception 7: Not used
11	Error code valid (0 = invalid; 1 = valid)
30:12	Not currently defined
31	Valid

- **IDT-vectoring error code** (32 bits). For VM exits the occur during delivery of hardware exceptions that would have delivered an error code on the stack, this field receives that error code.

See Section 29.2.4 provides details of how these fields are saved on VM exits.

26.9.4 Information for VM Exits Due to Instruction Execution

The following fields are used for VM exits caused by attempts to execute certain instructions in VMX non-root operation:

- **VM-exit instruction length** (32 bits). For VM exits resulting from instruction execution, this field receives the length in bytes of the instruction whose execution led to the VM exit.[1] See Section 29.2.5 for details of when and how this field is used.
- **VM-exit instruction information** (32 bits). This field is used for VM exits due to attempts to execute INS, INVEPT, INVVPID, LIDT, LGDT, LLDT, LTR, OUTS, SIDT, SGDT, SLDT, STR, VMCLEAR, VMPTRLD, VMPTRST, VMREAD, VMWRITE, or VMXON.[2] The format of the field depends on the cause of the VM exit. See Section 29.2.5 for details.

The following fields (64 bits each; 32 bits on processors that do not support Intel 64 architecture) are used only for VM exits due to SMIs that arrive immediately after retirement of I/O instructions. They provide information about that I/O instruction:

- **I/O RCX**. The value of RCX before the I/O instruction started.
- **I/O RSI**. The value of RSI before the I/O instruction started.
- **I/O RDI**. The value of RDI before the I/O instruction started.
- **I/O RIP**. The value of RIP before the I/O instruction started (the RIP that addressed the I/O instruction).

1. This field is also used for VM exits that occur during the delivery of a software interrupt or software exception.
2. Whether the processor provides this information on VM exits due to attempts to execute INS or OUTS can be determined by consulting the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

26.9.5 VM-Instruction Error Field

The 32-bit **VM-instruction error field** does not provide information about the most recent VM exit. In fact, it is not modified on VM exits. Instead, it provides information about errors encountered by a non-faulting execution of one of the VMX instructions.

26.10 VMCS TYPES: ORDINARY AND SHADOW

Every VMCS is either an **ordinary VMCS** or a **shadow VMCS**. A VMCS's type is determined by the shadow-VMCS indicator in the VMCS region (this is the value of bit 31 of the first 4 bytes of the VMCS region; see Table 26-1): 0 indicates an ordinary VMCS, while 1 indicates a shadow VMCS. Shadow VMCSs are supported only on processors that support the 1-setting of the "VMCS shadowing" VM-execution control (see Section 26.6.2).

A shadow VMCS differs from an ordinary VMCS in two ways:

- An ordinary VMCS can be used for VM entry but a shadow VMCS cannot. Attempts to perform VM entry when the current VMCS is a shadow VMCS fail (see Section 28.1).
- The VMREAD and VMWRITE instructions can be used in VMX non-root operation to access a shadow VMCS but not an ordinary VMCS. This fact results from the following:
  - If the "VMCS shadowing" VM-execution control is 0, execution of the VMREAD and VMWRITE instructions in VMX non-root operation always cause VM exits (see Section 27.1.3).
  - If the "VMCS shadowing" VM-execution control is 1, execution of the VMREAD and VMWRITE instructions in VMX non-root operation can access the VMCS referenced by the VMCS link pointer (see Section 32.3).
  - If the "VMCS shadowing" VM-execution control is 1, VM entry ensures that any VMCS referenced by the VMCS link pointer is a shadow VMCS (see Section 28.3.1.5).

In VMX root operation, both types of VMCSs can be accessed with the VMREAD and VMWRITE instructions.

Software should not modify the shadow-VMCS indicator in the VMCS region of a VMCS that is active. Doing so may cause the VMCS to become corrupted (see Section 26.11.1). Before modifying the shadow-VMCS indicator, software should execute VMCLEAR for the VMCS to ensure that it is not active.

26.11 SOFTWARE USE OF THE VMCS AND RELATED STRUCTURES

This section details guidelines that software should observe when using a VMCS and related structures. It also provides descriptions of consequences for failing to follow guidelines.

26.11.1 Software Use of Virtual-Machine Control Structures

To ensure proper processor behavior, software should observe certain guidelines when using an active VMCS.

No VMCS should ever be active on more than one logical processor. If a VMCS is to be "migrated" from one logical processor to another, the first logical processor should execute VMCLEAR for the VMCS (to make it inactive on that logical processor and to ensure that all VMCS data are in memory) before the other logical processor executes VMPTRLD for the VMCS (to make it active on the second logical processor).[1] A VMCS that is made active on more than one logical processor may become **corrupted** (see below).

Software should not modify the shadow-VMCS indicator (see Table 26-1) in the VMCS region of a VMCS that is active. Doing so may cause the VMCS to become corrupted. Before modifying the shadow-VMCS indicator, software should execute VMCLEAR for the VMCS to ensure that it is not active.

Software should use the VMREAD and VMWRITE instructions to access the different fields in the current VMCS (see Section 26.11.2). Software should never access or modify the VMCS data of an active VMCS using ordinary

1. As noted in Section 26.1, execution of the VMPTRLD instruction makes a VMCS is active. In addition, VM entry makes active any shadow VMCS referenced by the VMCS link pointer in the current VMCS. If a shadow VMCS is made active by VM entry, it is necessary to execute VMCLEAR for that VMCS before allowing that VMCS to become active on another logical processor.

memory operations, in part because the format used to store the VMCS data is implementation-specific and not architecturally defined, and also because a logical processor may maintain some VMCS data of an active VMCS on the processor and not in the VMCS region. The following items detail some of the hazards of accessing VMCS data using ordinary memory operations:

- Any data read from a VMCS with an ordinary memory read does not reliably reflect the state of the VMCS. Results may vary from time to time or from logical processor to logical processor.
- Writing to a VMCS with an ordinary memory write is not guaranteed to have a deterministic effect on the VMCS. Doing so may cause the VMCS to become corrupted (see below).

(Software can avoid these hazards by removing any linear-address mappings to a VMCS region before executing a VMPTRLD for that region and by not remapping it until after executing VMCLEAR for that region.)

If a logical processor leaves VMX operation, any VMCSs active on that logical processor may be corrupted (see below). To prevent such corruption of a VMCS that may be used either after a return to VMX operation or on another logical processor, software should execute VMCLEAR for that VMCS before executing the VMXOFF instruction or removing power from the processor (e.g., as part of a transition to the S3 and S4 power states).

This section has identified operations that may cause a VMCS to become corrupted. These operations may cause the VMCS's data to become undefined. Behavior may be unpredictable if that VMCS used subsequently on any logical processor. The following items detail some hazards of VMCS corruption:

- VM entries may fail for unexplained reasons or may load undesired processor state.
- The processor may not correctly support VMX non-root operation as documented in Chapter 26 and may generate unexpected VM exits.
- VM exits may load undesired processor state, save incorrect state into the VMCS, or cause the logical processor to transition to a shutdown state.

26.11.2 VMREAD, VMWRITE, and Encodings of VMCS Fields

Every field of the VMCS is associated with a 32-bit value that is its **encoding**. The encoding is provided in an operand to VMREAD and VMWRITE when software wishes to read or write that field. These instructions fail if given, in 64-bit mode, an operand that sets an encoding bit beyond bit 32. See Chapter 31 for a description of these instructions.

The structure of the 32-bit encodings of the VMCS components is determined principally by the width of the fields and their function in the VMCS. See Table 26-21.

Table 26-21. Structure of VMCS Component Encoding

Bit Position(s)	Contents
0	Access type (0 = full; 1 = high); must be full for 16-bit, 32-bit, and natural-width fields
9:1	Index
11:10	Type: 0: control 1: VM-exit information 2: guest state 3: host state
12	Reserved (must be 0)
14:13	Width: 0: 16-bit 1: 64-bit 2: 32-bit 3: natural-width
31:15	Reserved (must be 0)

The following items detail the meaning of the bits in each encoding:

- **Field width.** Bits 14:13 encode the width of the field.
  - A value of 0 indicates a 16-bit field.
  - A value of 1 indicates a 64-bit field.
  - A value of 2 indicates a 32-bit field.
  - A value of 3 indicates a **natural-width** field. Such fields have 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not.

  Fields whose encodings use value 1 are specially treated to allow 32-bit software access to all 64 bits of the field. Such access is allowed by defining, for each such field, an encoding that allows direct access to the high 32 bits of the field. See below.
- **Field type.** Bits 11:10 encode the type of VMCS field: control, guest-state, host-state, or VM-exit information. (The last category also includes the VM-instruction error field.)
- **Index.** Bits 9:1 distinguish components with the same field width and type.
- **Access type.** Bit 0 must be 0 for all fields except for 64-bit fields (those with field-width 1; see above). A VMREAD or VMWRITE using an encoding with this bit cleared to 0 accesses the entire field. For a 64-bit field with field-width 1, a VMREAD or VMWRITE using an encoding with this bit set to 1 accesses only the high 32 bits of the field.

Appendix B gives the encodings of all fields in the VMCS.

The following describes the operation of VMREAD and VMWRITE based on processor mode, VMCS-field width, and access type:

- 16-bit fields:
  - A VMREAD returns the value of the field in bits 15:0 of the destination operand; other bits of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 15:0 of the source operand into the VMCS field; other bits of the source operand are not used.
- 32-bit fields:
  - A VMREAD returns the value of the field in bits 31:0 of the destination operand; in 64-bit mode, bits 63:32 of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 31:0 of the source operand into the VMCS field; in 64-bit mode, bits 63:32 of the source operand are not used.
- 64-bit fields and natural-width fields using the full access type outside IA-32e mode.
  - A VMREAD returns the value of bits 31:0 of the field in its destination operand; bits 63:32 of the field are ignored.
  - A VMWRITE writes the value of its source operand to bits 31:0 of the field and clears bits 63:32 of the field.
- 64-bit fields and natural-width fields using the full access type in 64-bit mode (only on processors that support Intel 64 architecture).
  - A VMREAD returns the value of the field in bits 63:0 of the destination operand
  - A VMWRITE writes the value of bits 63:0 of the source operand into the VMCS field.
- 64-bit fields using the high access type.
  - A VMREAD returns the value of bits 63:32 of the field in bits 31:0 of the destination operand; in 64-bit mode, bits 63:32 of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 31:0 of the source operand to bits 63:32 of the field; in 64-bit mode, bits 63:32 of the source operand are not used.

Software seeking to read a 64-bit field outside IA-32e mode can use VMREAD with the full access type (reading bits 31:0 of the field) and VMREAD with the high access type (reading bits 63:32 of the field); the order of the two VMREAD executions is not important. Software seeking to modify a 64-bit field outside IA-32e mode should first

use VMWRITE with the full access type (establishing bits 31:0 of the field while clearing bits 63:32) and then use VMWRITE with the high access type (establishing bits 63:32 of the field).

26.11.3 Initializing a VMCS

Software should initialize fields in a VMCS (using VMWRITE) before using the VMCS for VM entry. Failure to do so may result in unpredictable behavior; for example, a VM entry may fail for unexplained reasons, or a successful transition (VM entry or VM exit) may load processor state with unexpected values.

It is not necessary to initialize fields that the logical processor will not use. (For example, it is not necessary to initialize the MSR-bitmap address if the "use MSR bitmaps" VM-execution control is 0.)

A processor maintains some VMCS information that cannot be modified with the VMWRITE instruction; this includes a VMCS's launch state (see Section 26.1). Such information may be stored in the VMCS data portion of a VMCS region. Because the format of this information is implementation-specific, there is no way for software to know, when it first allocates a region of memory for use as a VMCS region, how the processor will determine this information from the contents of the memory region.

In addition to its other functions, the VMCLEAR instruction initializes any implementation-specific information in the VMCS region referenced by its operand. To avoid the uncertainties of implementation-specific behavior, software should execute VMCLEAR on a VMCS region before making the corresponding VMCS active with VMPTRLD for the first time. (Figure 26-1 illustrates how execution of VMCLEAR puts a VMCS into a well-defined state.)

The following software usage is consistent with these limitations:

- VMCLEAR should be executed for a VMCS before it is used for VM entry for the first time.
- VMLAUNCH should be used for the first VM entry using a VMCS after VMCLEAR has been executed for that VMCS.
- VMRESUME should be used for any subsequent VM entry using a VMCS (until the next execution of VMCLEAR for the VMCS).

It is expected that, in general, VMRESUME will have lower latency than VMLAUNCH. Since "migrating" a VMCS from one logical processor to another requires use of VMCLEAR (see Section 26.11.1), which sets the launch state of the VMCS to "clear", such migration requires the next VM entry to be performed using VMLAUNCH. Software developers can avoid the performance cost of increased VM-entry latency by avoiding unnecessary migration of a VMCS from one logical processor to another.

26.11.4 Software Access to Related Structures

In addition to data in the VMCS region itself, VMX non-root operation can be controlled by data structures that are referenced by pointers in a VMCS (for example, the I/O bitmaps). While the pointers to these data structures are parts of the VMCS, the data structures themselves are not. They are not accessible using VMREAD and VMWRITE but by ordinary memory writes.

Software should ensure that each such data structure is modified only when no logical processor with a current VMCS that references it is in VMX non-root operation. Doing otherwise may lead to unpredictable behavior (including behaviors identified in Section 26.11.1). Exceptions are made for the following data structures (subject to detailed discussion in the sections indicated): EPT paging structures and the data structures used to locate SPP vectors (Section 30.4.3); the virtual-APIC page (Section 31.1); the posted interrupt descriptor (Section 31.6); and the virtualization-exception information area (Section 27.5.7.2).

26.11.5 VMXON Region

Before executing VMXON, software allocates a region of memory (called the VMXON region)[1] that the logical processor uses to support VMX operation. The physical address of this region (the VMXON pointer) is provided in an operand to VMXON. The VMXON pointer is subject to the limitations that apply to VMCS pointers:

1. The amount of memory required for the VMXON region is the same as that required for a VMCS region. This size is implementation specific and can be determined by consulting the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

- The VMXON pointer must be 4-KByte aligned (bits 11:0 must be zero).
- The VMXON pointer must not set any bits beyond the processor's physical-address width.[1,2]

Before executing VMXON, software should write the VMCS revision identifier (see Section 26.2) to the VMXON region. (Specifically, it should write the 31-bit VMCS revision identifier to bits 30:0 of the first 4 bytes of the VMXON region; bit 31 should be cleared to 0.) It need not initialize the VMXON region in any other way. Software should use a separate region for each logical processor and should not access or modify the VMXON region of a logical processor between execution of VMXON and VMXOFF on that logical processor. Doing otherwise may lead to unpredictable behavior (including behaviors identified in Section 26.11.1).

1. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
2. If IA32_VMX_BASIC[48] is read as 1, the VMXON pointer must not set any bits in the range 63:32; see Appendix A.1.

22. Updates to Chapter 27, Volume 3C

Change bars and violet text show changes to Chapter 27 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C:* System Programming Guide, Part 3.

Changes to this chapter:

- Added new material (in multiple sections) on WRMSRNS and the new MSR-list instructions.

CHAPTER 27
VMX NON-ROOT OPERATION

In a virtualized environment using VMX, the guest software stack typically runs on a logical processor in VMX non-root operation. This mode of operation is similar to that of ordinary processor operation outside of the virtualized environment. This chapter describes the differences between VMX non-root operation and ordinary processor operation with special attention to causes of VM exits (which bring a logical processor from VMX non-root operation to root operation). The differences between VMX non-root operation and ordinary processor operation are described in the following sections:

- Section 27.1, "Instructions That Cause VM Exits."
- Section 27.2, "Other Causes of VM Exits."
- Section 27.3, "Changes to Instruction Behavior in VMX Non-Root Operation."
- Section 27.4, "Other Changes in VMX Non-Root Operation."
- Section 27.5, "Features Specific to VMX Non-Root Operation."
- Section 27.6, "Unrestricted Guests."

Chapter 27, "VMX Non-Root Operation," describes the data control structures that govern VMX non-root operation. Chapter 27, "VMX Non-Root Operation," describes the operation of VM entries by which the processor transitions from VMX root operation to VMX non-root operation. Chapter 27, "VMX Non-Root Operation," describes the operation of VM exits by which the processor transitions from VMX non-root operation to VMX root operation.

Chapter 30, "VMX Support for Address Translation," describes two features that support address translation in VMX non-root operation. Chapter 31, "APIC Virtualization and Virtual Interrupts," describes features that support virtualization of interrupts and the Advanced Programmable Interrupt Controller (APIC) in VMX non-root operation.

27.1 INSTRUCTIONS THAT CAUSE VM EXITS

Certain instructions may cause VM exits if executed in VMX non-root operation. Unless otherwise specified, such VM exits are "fault-like," meaning that the instruction causing the VM exit does not execute and no processor state is updated by the instruction. Section 29.1 details architectural state in the context of a VM exit.

Section 27.1.1 defines the prioritization between faults and VM exits for instructions subject to both. Section 27.1.2 identifies instructions that cause VM exits whenever they are executed in VMX non-root operation (and thus can never be executed in VMX non-root operation). Section 27.1.3 identifies instructions that cause VM exits depending on the settings of certain VM-execution control fields (see Section 26.6).

27.1.1 Relative Priority of Faults and VM Exits

The following principles describe the ordering between existing faults and VM exits:

- Certain exceptions have priority over VM exits. These include invalid-opcode exceptions, faults based on privilege level,[1] and general-protection exceptions that are based on checking I/O permission bits in the task-state segment (TSS). For example, execution of RDMSR with CPL = 3 generates a general-protection exception and not a VM exit.[2]
- Faults incurred while fetching instruction operands have priority over VM exits that are conditioned based on the contents of those operands (see LMSW in Section 27.1.3).
- VM exits caused by execution of the INS and OUTS instructions (resulting either because the "unconditional I/O exiting" VM-execution control is 1 or because the "use I/O bitmaps control is 1) have priority over the following faults:

1. These include faults generated by attempts to execute, in virtual-8086 mode, privileged instructions that are not recognized in that mode.
2. MOV DR is an exception to this rule; see Section 27.1.3.

  - A general-protection fault due to the relevant segment (ES for INS; DS for OUTS unless overridden by an instruction prefix) being unusable
  - A general-protection fault due to an offset beyond the limit of the relevant segment
  - An alignment-check exception
- Fault-like VM exits have priority over exceptions other than those mentioned above. For example, RDMSR of a non-existent MSR with CPL = 0 generates a VM exit and not a general-protection exception.

When Section 27.1.2 or Section 27.1.3 (below) identify an instruction execution that may lead to a VM exit, it is assumed that the instruction does not incur a fault that takes priority over a VM exit.

27.1.2 Instructions That Cause VM Exits Unconditionally

The following instructions cause VM exits when they are executed in VMX non-root operation: CPUID, GETSEC,[1] INVD, and XSETBV. This is also true of instructions introduced with VMX: INVEPT, INVVPID, VMCALL,[2] VMCLEAR, VMLAUNCH, VMPTRLD, VMPTRST, VMRESUME, VMXOFF, and VMXON.

27.1.3 Instructions That Cause VM Exits Conditionally

Certain instructions cause VM exits in VMX non-root operation depending on the setting of the VM-execution controls. The following instructions can cause "fault-like" VM exits based on the conditions described:[3]

- **CLTS.** The CLTS instruction causes a VM exit if the bits in position 3 (corresponding to CR0.TS) are set in both the CR0 guest/host mask and the CR0 read shadow.
- **ENCLS.** The ENCLS instruction causes a VM exit if the "enable ENCLS exiting" VM-execution control is 1 and one of the following is true:
  - The value of EAX is less than 63 and the corresponding bit in the ENCLS-exiting bitmap is 1 (see Section 26.6.16).
  - The value of EAX is greater than or equal to 63 and bit 63 in the ENCLS-exiting bitmap is 1.
- **ENCLV.** The ENCLV instruction causes a VM exit if the "enable ENCLV exiting" VM-execution control is 1 and one of the following is true:
  - The value of EAX is less than 63 and the corresponding bit in the ENCLV-exiting bitmap is 1 (see Section 26.6.17).
  - The value of EAX is greater than or equal to 63 and bit 63 in the ENCLV-exiting bitmap is 1.
- **ENQCMD, ENQCMDS.** The behavior of each of these instructions is determined by the setting of the "PASID translation" VM-execution control. If that control is 0, the instruction executes normally. If the control is 1, instruction behavior is modified and may cause a VM exit. See Section 27.5.8.
- **HLT.** The HLT instruction causes a VM exit if the "HLT exiting" VM-execution control is 1.
- **IN, INS/INSB/INSW/INSD, OUT, OUTS/OUTSB/OUTSW/OUTSD.** The behavior of each of these instructions is determined by the settings of the "unconditional I/O exiting" and "use I/O bitmaps" VM-execution controls:
  - If both controls are 0, the instruction executes normally.

---

1. An execution of GETSEC in VMX non-root operation causes a VM exit if CR4.SMXE[Bit 14] = 1 regardless of the value of CPL or RAX. An execution of GETSEC causes an invalid-opcode exception (#UD) if CR4.SMXE[Bit 14] = 0.
2. Under the dual-monitor treatment of SMIs and SMM, executions of VMCALL cause SMM VM exits in VMX root operation outside SMM. See Section 33.15.2.
3. Items in this section may refer to secondary processor-based VM-execution controls and tertiary processor-based VM-execution controls. If bit 31 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the secondary processor-based VM-execution controls were all 0; similarly, if bit 17 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the tertiary processor-based VM-execution controls were all 0. See Section 26.6.2.

— If the "unconditional I/O exiting" VM-execution control is 1 and the "use I/O bitmaps" VM-execution control is 0, the instruction causes a VM exit.

— If the "use I/O bitmaps" VM-execution control is 1, the instruction causes a VM exit if it attempts to access an I/O port corresponding to a bit set to 1 in the appropriate I/O bitmap (see Section 26.6.4). If an I/O operation "wraps around" the 16-bit I/O-port space (accesses ports FFFFH and 0000H), the I/O instruction causes a VM exit (the "unconditional I/O exiting" VM-execution control is ignored if the "use I/O bitmaps" VM-execution control is 1).

See Section 27.1.1 for information regarding the priority of VM exits relative to faults that may be caused by the INS and OUTS instructions.

- **INVLPG.** The INVLPG instruction causes a VM exit if the "INVLPG exiting" VM-execution control is 1.
- **INVPCID.** The INVPCID instruction causes a VM exit if the "INVLPG exiting" and "enable INVPCID" VM-execution controls are both 1.
- **LGDT, LIDT, LLDT, LTR, SGDT, SIDT, SLDT, STR.** These instructions cause VM exits if the "descriptor-table exiting" VM-execution control is 1.
- **LMSW.** In general, the LMSW instruction causes a VM exit if it would write, for any bit set in the low 4 bits of the CR0 guest/host mask, a value different than the corresponding bit in the CR0 read shadow. LMSW never clears bit 0 of CR0 (CR0.PE); thus, LMSW causes a VM exit if either of the following are true:
  — The bits in position 0 (corresponding to CR0.PE) are set in both the CR0 guest/host mask and the source operand, and the bit in position 0 is clear in the CR0 read shadow.
  — For any bit position in the range 3:1, the bit in that position is set in the CR0 guest/host mask and the values of the corresponding bits in the source operand and the CR0 read shadow differ.
- **LOADIWKEY.** The LOADIWKEY instruction causes a VM exit if the "LOADIWKEY exiting" VM-execution control is 1.
- **MONITOR.** The MONITOR instruction causes a VM exit if the "MONITOR exiting" VM-execution control is 1.
- **MOV from CR3.** The MOV from CR3 instruction causes a VM exit if the "CR3-store exiting" VM-execution control is 1. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.
- **MOV from CR8.** The MOV from CR8 instruction causes a VM exit if the "CR8-store exiting" VM-execution control is 1.
- **MOV to CR0.** The MOV to CR0 instruction causes a VM exit unless the value of its source operand matches, for the position of each bit set in the CR0 guest/host mask, the corresponding bit in the CR0 read shadow. (If every bit is clear in the CR0 guest/host mask, MOV to CR0 cannot cause a VM exit.)
- **MOV to CR3.** The MOV to CR3 instruction causes a VM exit unless the "CR3-load exiting" VM-execution control is 0 or the value of its source operand is equal to one of the CR3-target values specified in the VMCS. Only the first *n* CR3-target values are considered, where *n* is the CR3-target count. If the "CR3-load exiting" VM-execution control is 1 and the CR3-target count is 0, MOV to CR3 always causes a VM exit.

  The first processors to support the virtual-machine extensions supported only the 1-setting of the "CR3-load exiting" VM-execution control. These processors always consult the CR3-target controls to determine whether an execution of MOV to CR3 causes a VM exit.
- **MOV to CR4.** The MOV to CR4 instruction causes a VM exit unless the value of its source operand matches, for the position of each bit set in the CR4 guest/host mask, the corresponding bit in the CR4 read shadow.
- **MOV to CR8.** The MOV to CR8 instruction causes a VM exit if the "CR8-load exiting" VM-execution control is 1.
- **MOV DR.** The MOV DR instruction causes a VM exit if the "MOV-DR exiting" VM-execution control is 1. Such VM exits represent an exception to the principles identified in Section 27.1.1 in that they take priority over the following: general-protection exceptions based on privilege level; and invalid-opcode exceptions that occur because CR4.DE=1 and the instruction specified access to DR4 or DR5.
- **MWAIT.** The MWAIT instruction causes a VM exit if the "MWAIT exiting" VM-execution control is 1. If this control is 0, the behavior of the MWAIT instruction may be modified (see Section 27.3).
- **PAUSE.** The behavior of each of this instruction depends on CPL and the settings of the "PAUSE exiting" and "PAUSE-loop exiting" VM-execution controls**:**
  — CPL = 0.

- If the "PAUSE exiting" and "PAUSE-loop exiting" VM-execution controls are both 0, the PAUSE instruction executes normally.
- If the "PAUSE exiting" VM-execution control is 1, the PAUSE instruction causes a VM exit (the "PAUSE-loop exiting" VM-execution control is ignored if CPL = 0 and the "PAUSE exiting" VM-execution control is 1).
- If the "PAUSE exiting" VM-execution control is 0 and the "PAUSE-loop exiting" VM-execution control is 1, the following treatment applies.

  The processor determines the amount of time between this execution of PAUSE and the previous execution of PAUSE at CPL 0. If this amount of time exceeds the value of the VM-execution control field PLE_Gap, the processor considers this execution to be the first execution of PAUSE in a loop. (It also does so for the first execution of PAUSE at CPL 0 after VM entry.)

  Otherwise, the processor determines the amount of time since the most recent execution of PAUSE that was considered to be the first in a loop. If this amount of time exceeds the value of the VM-execution control field PLE_Window, a VM exit occurs.

  For purposes of these computations, time is measured based on a counter that runs at the same rate as the timestamp counter (TSC).

— CPL > 0.

- If the "PAUSE exiting" VM-execution control is 0, the PAUSE instruction executes normally.
- If the "PAUSE exiting" VM-execution control is 1, the PAUSE instruction causes a VM exit.

The "PAUSE-loop exiting" VM-execution control is ignored if CPL > 0.

- **PCONFIG.** The PCONFIG instruction causes a VM exit if the "enable PCONFIG" VM-execution control is 1 and one of the following is true:

  — The value of EAX is less than 63 and the corresponding bit in the PCONFIG-exiting bitmap is 1 (see Section 26.6.18).

  — The value of EAX is greater than or equal to 63 and bit 63 in the PCONFIG-exiting bitmap is 1.

  If the "enable PCONFIG" VM-execution control is 1 and neither of the previous items hold, the PCONFIG instruction executes normally.
- **RDMSR.** The RDMSR instruction causes a VM exit if any of the following are true:

  — The "use MSR bitmaps" VM-execution control is 0.

  — The value of ECX is not in the ranges 00000000H – 00001FFFH and C0000000H – C0001FFFH.

  — The value of ECX is in the range 00000000H – 00001FFFH and bit *n* in read bitmap for low MSRs is 1, where *n* is the value of ECX.

  — The value of ECX is in the range C0000000H – C0001FFFH and bit *n* in read bitmap for high MSRs is 1, where *n* is the value of ECX & 00001FFFH.

  See Section 26.6.9 for details regarding how these bitmaps are identified.
- **RDMSRLIST.** The RDMSRLIST instruction causes a VM exit if the "enable MSR-list instructions" VM-execution control is 1 and the "use MSR bitmaps" VM-execution control is 0. If both controls are 1, the instruction reads one MSR at a time normally, storing the value read to memory and clearing the corresponding bit in RCX. An attempt to read MSR X causes a VM exit if any of the following are true:

  — X is not in the ranges 00000000H – 00001FFFH and C0000000H – C0001FFFH.

  — X is in the range 00000000H – 00001FFFH and bit X in read bitmap for low MSRs is 1.

  — X is in the range C0000000H – C0001FFFH and bit *n* in read bitmap for high MSRs is 1, where *n* is the value of X & 00001FFFH.

  If an attempt to read an MSR causes a VM exit, the corresponding bit in RCX is not cleared, the MSR is not read, and no value is stored to memory.
- **RDPMC.** The RDPMC instruction causes a VM exit if the "RDPMC exiting" VM-execution control is 1.
- **RDRAND.** The RDRAND instruction causes a VM exit if the "RDRAND exiting" VM-execution control is 1.

- **RDSEED.** The RDSEED instruction causes a VM exit if the "RDSEED exiting" VM-execution control is 1.
- **RDTSC.** The RDTSC instruction causes a VM exit if the "RDTSC exiting" VM-execution control is 1.
- **RDTSCP.** The RDTSCP instruction causes a VM exit if the "RDTSC exiting" and "enable RDTSCP" VM-execution controls are both 1.
- **RSM.** The RSM instruction causes a VM exit if executed in system-management mode (SMM).[1]
- **TPAUSE.** The TPAUSE instruction causes a VM exit if the "RDTSC exiting" and "enable user wait and pause" VM-execution controls are both 1.
- **UMWAIT.** The UMWAIT instruction causes a VM exit if the "RDTSC exiting" and "enable user wait and pause" VM-execution controls are both 1.
- **VMREAD.** The VMREAD instruction causes a VM exit if any of the following are true:
  - The "VMCS shadowing" VM-execution control is 0.
  - Bits 63:15 (bits 31:15 outside 64-bit mode) of the register source operand are not all 0.
  - Bit *n* in VMREAD bitmap is 1, where *n* is the value of bits 14:0 of the register source operand. See Section 26.6.15 for details regarding how the VMREAD bitmap is identified.

  If the VMREAD instruction does not cause a VM exit, it reads from the VMCS referenced by the VMCS link pointer. See Chapter 32, "VMREAD—Read Field from Virtual-Machine Control Structure" for details of the operation of the VMREAD instruction.
- **VMWRITE.** The VMWRITE instruction causes a VM exit if any of the following are true:
  - The "VMCS shadowing" VM-execution control is 0.
  - Bits 63:15 (bits 31:15 outside 64-bit mode) of the register source operand are not all 0.
  - Bit *n* in VMWRITE bitmap is 1, where *n* is the value of bits 14:0 of the register source operand. See Section 26.6.15 for details regarding how the VMWRITE bitmap is identified.

  If the VMWRITE instruction does not cause a VM exit, it writes to the VMCS referenced by the VMCS link pointer. See Chapter 32, "VMWRITE—Write Field to Virtual-Machine Control Structure" for details of the operation of the VMWRITE instruction.
- **WBINVD.** The WBINVD instruction causes a VM exit if the "WBINVD exiting" VM-execution control is 1.
- **WBNOINVD.** The WBNOINVD instruction causes a VM exit if the "WBINVD exiting" VM-execution control is 1.
- **WRMSR, WRMSRNS.** Execution of one of these instructions causes a VM exit if any of the following are true:
  - The "use MSR bitmaps" VM-execution control is 0.
  - The value of ECX is not in the ranges 00000000H – 00001FFFH and C0000000H – C0001FFFH.
  - The value of ECX is in the range 00000000H – 00001FFFH and bit *n* in write bitmap for low MSRs is 1, where *n* is the value of ECX.
  - The value of ECX is in the range C0000000H – C0001FFFH and bit *n* in write bitmap for high MSRs is 1, where *n* is the value of ECX & 00001FFFH.

  See Section 26.6.9 for details regarding how these bitmaps are identified.
- **WRMSRLIST.** The WRMSRLIST instruction causes a VM exit if the "enable MSR-list instructions" VM-execution control is 1 and the "use MSR bitmaps" VM-execution control is 0. If both controls are 1, the instruction writes one MSR at a time normally, using a value read from memory and clearing the corresponding bit in RCX. An attempt to write MSR X causes a VM exit if any of the following are true:
  - X is not in the ranges 00000000H – 00001FFFH and C0000000H – C0001FFFH.
  - X is in the range 00000000H – 00001FFFH and bit X in write bitmap for low MSRs is 1.
  - X is in the range C0000000H – C0001FFFH and bit *n* in write bitmap for high MSRs is 1, where *n* is the value of X & 00001FFFH.

1. Execution of the RSM instruction outside SMM causes an invalid-opcode exception regardless of whether the processor is in VMX operation. It also does so in VMX root operation in SMM; see Section 33.15.3.

If an attempt to write an MSR causes a VM exit, the corresponding bit in RCX is not cleared, no value is read from memory, and the MSR is not written.

- **XRSTORS.** The XRSTORS instruction causes a VM exit if the "enable XSAVES/XRSTORS" VM-execution control is 1and any bit is set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap (see Section 26.6.21).
- **XSAVES.** The XSAVES instruction causes a VM exit if the "enable XSAVES/XRSTORS" VM-execution control is 1 and any bit is set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap (see Section 26.6.21).

27.2 OTHER CAUSES OF VM EXITS

In addition to VM exits caused by instruction execution, the following events can cause VM exits:[1]

- **Exceptions.** Exceptions (faults, traps, and aborts) cause VM exits based on the exception bitmap (see Section 26.6.3). If an exception occurs, its vector (in the range 0–31) is used to select a bit in the exception bitmap. If the bit is 1, a VM exit occurs; if the bit is 0, the exception is delivered normally through the guest IDT. This use of the exception bitmap applies also to exceptions generated by the instructions INT1, INT3, INTO, BOUND, UD0, UD1, and UD2.[2]

  Page faults (exceptions with vector 14) are specially treated. When a page fault occurs, a processor consults (1) bit 14 of the exception bitmap; (2) the error code produced with the page fault [PFEC]; (3) the page-fault error-code mask field [PFEC_MASK]; and (4) the page-fault error-code match field [PFEC_MATCH]. It checks if PFEC & PFEC_MASK = PFEC_MATCH. If there is equality, the specification of bit 14 in the exception bitmap is followed (for example, a VM exit occurs if that bit is set). If there is inequality, the meaning of that bit is reversed (for example, a VM exit occurs if that bit is clear).

  Thus, if software desires VM exits on all page faults, it can set bit 14 in the exception bitmap to 1 and set the page-fault error-code mask and match fields each to 00000000H. If software desires VM exits on no page faults, it can set bit 14 in the exception bitmap to 1, the page-fault error-code mask field to 00000000H, and the page-fault error-code match field to FFFFFFFFH.
- **Triple fault.** A VM exit occurs if the logical processor encounters an exception while attempting to call the double-fault handler and that exception itself does not cause a VM exit due to the exception bitmap. This applies to the case in which the double-fault exception was generated within VMX non-root operation, the case in which the double-fault exception was generated during event injection by VM entry, and to the case in which VM entry is injecting a double-fault exception.
- **External interrupts.** An external interrupt causes a VM exit if the "external-interrupt exiting" VM-execution control is 1 (see Section 31.6 for an exception.) Otherwise, the processor handles the interrupt is normally.[3] (If a logical processor is in the shutdown state or the wait-for-SIPI state, external interrupts are blocked. The processor does handle the interrupt and no VM exit occurs.)
- **Non-maskable interrupts (NMIs).** An NMI causes a VM exit if the "NMI exiting" VM-execution control is 1. Otherwise, it is delivered using descriptor 2 of the IDT. (If a logical processor is in the wait-for-SIPI state, NMIs are blocked. The NMI is not delivered through the IDT and no VM exit occurs.)
- **INIT signals.** INIT signals cause VM exits. A logical processor performs none of the operations normally associated with these events. Such exits do not modify register state or clear pending events as they would outside of VMX operation. (If a logical processor is in the wait-for-SIPI state, INIT signals are blocked. They do not cause VM exits in this case.)
- **Start-up IPIs (SIPIs). SIPIs cause VM exits.** If a logical processor is not in the wait-for-SIPI activity state when a SIPI arrives, no VM exit occurs and the SIPI is discarded. VM exits due to SIPIs do not perform any of

1. Items in this section may refer to secondary processor-based VM-execution controls and tertiary processor-based VM-execution controls. If bit 31 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the secondary processor-based VM-execution controls were all 0; similarly, if bit 17 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the tertiary processor-based VM-execution controls were all 0. See Section 26.6.2.
2. INT1 and INT3 refer to the instructions with opcodes F1 and CC, respectively, and not to INT *n* with value 1 or 3 for n.
3. Normal handling usually means delivery through the IDT, but it could also mean treatment of the interrupt as a user-interrupt notification.

the normal operations associated with those events: they do not modify register state as they would outside of VMX operation. (If a logical processor is not in the wait-for-SIPI state, SIPIs are blocked. They do not cause VM exits in this case.)

- **Task switches.** Task switches are not allowed in VMX non-root operation. Any attempt to effect a task switch in VMX non-root operation causes a VM exit. See Section 27.4.2.
- **System-management interrupts (SMIs).** If the logical processor is using the dual-monitor treatment of SMIs and system-management mode (SMM), SMIs cause SMM VM exits. See Section 33.15.2.[1]
- **VMX-preemption timer.** A VM exit occurs when the timer counts down to zero. See Section 27.5.1 for details of operation of the VMX-preemption timer.

  Debug-trap exceptions and higher priority events take priority over VM exits caused by the VMX-preemption timer. VM exits caused by the VMX-preemption timer take priority over VM exits caused by the "NMI-window exiting" VM-execution control and lower priority events.

  These VM exits wake a logical processor from the same inactive states as would a non-maskable interrupt. Specifically, they wake a logical processor from the shutdown state and from the states entered using the HLT and MWAIT instructions. These VM exits do not occur if the logical processor is in the wait-for-SIPI state.
- **Bus locks.** Assertion of a bus lock (see Section 10.1.2) causes a VM exit if the "VMM bus-lock detection" VM-execution control is 1. Such a VM exit is trap-like because it is generated after execution of an instruction that asserts a bus lock. The VM exit thus does not prevent assertion of the bus lock. These VM exits take priority over system-management interrupts (SMIs), INIT signals, and lower priority events.
- **Instruction timeout.** If the "instruction timeout" VM-execution control is 1, a VM exit occurs if certain operations prevent the processor from reaching an instruction boundary within the amount of time specified by the instruction-timeout control VM-execution control field (see Section 26.6.25).

In addition, there are controls that cause VM exits based on the readiness of guest software to receive interrupts:

- If the "interrupt-window exiting" VM-execution control is 1, a VM exit occurs before execution of any instruction if RFLAGS.IF = 1 and there is no blocking of events by STI or by MOV SS (see Table 26-3).

  Non-maskable interrupts (NMIs) and higher priority events take priority over VM exits caused by this control. VM exits caused by this control take priority over external interrupts and lower priority events.

  These VM exits wake a logical processor from the same inactive states as would an external interrupt. Specifically, they wake a logical processor from the states entered using the HLT and MWAIT instructions. These VM exits do not occur if the logical processor is in the shutdown state or the wait-for-SIPI state.
- If the "NMI-window exiting" VM-execution control is 1, a VM exit occurs before execution of any instruction if there is no virtual-NMI blocking and there is no blocking of events by MOV SS and no blocking of events by STI (see Table 26-3).

  VM exits caused by the VMX-preemption timer and higher priority events take priority over VM exits caused by this control. VM exits caused by this control take priority over non-maskable interrupts (NMIs) and lower priority events.

  These VM exits wake a logical processor from the same inactive states as would an NMI. Specifically, they wake a logical processor from the shutdown state and from the states entered using the HLT and MWAIT instructions. These VM exits do not occur if the logical processor is in the wait-for-SIPI state.

Conditions necessary for some of the VM exits identified in this section may hold immediately after VM entry. If they do, a corresponding VM exit occurs at that time.

27.3 CHANGES TO INSTRUCTION BEHAVIOR IN VMX NON-ROOT OPERATION

The behavior of some instructions is changed in VMX non-root operation. Some of these changes are determined by the settings of certain VM-execution control fields. The following items detail such changes:[2]

- **CLTS.** Behavior of the CLTS instruction is determined by the bits in position 3 (corresponding to CR0.TS) in the CR0 guest/host mask and the CR0 read shadow:

1. Under the dual-monitor treatment of SMIs and SMM, SMIs also cause SMM VM exits if they occur in VMX root operation outside SMM. If the processor is using the default treatment of SMIs and SMM, SMIs are delivered as described in Section 33.14.1.

  - If bit 3 in the CR0 guest/host mask is 0, CLTS clears CR0.TS normally (the value of bit 3 in the CR0 read shadow is irrelevant in this case), unless CR0.TS is fixed to 1 in VMX operation (see Section 25.8), in which case CLTS causes a general-protection exception.
  - If bit 3 in the CR0 guest/host mask is 1 and bit 3 in the CR0 read shadow is 0, CLTS completes but does not change the contents of CR0.TS.
  - If the bits in position 3 in the CR0 guest/host mask and the CR0 read shadow are both 1, CLTS causes a VM exit.
- **ENQCMD, ENQCMDS.** Each of these instructions performs a 64-byte enqueue store that includes a PASID value in bits 19:0. For ENQCMD, the PASID is normally the value of IA32_PASID[19:0], while for ENQCMDS, the PASID is normally read from memory.

  The behavior of each of these instructions (and in particular the PASID value used for the enqueue store) is determined by the setting of the "PASID translation" VM-execution control:

  - If the "PASID translation" VM-execution control is 0, the instruction operates normally.
  - If the "PASID translation" VM-execution control is 1, the PASID value used for the enqueue store is determined by the PASID-translation process described in Section 27.5.8. (Note the PASID translation may result in a VM exit, in which case the enqueue store is not performed.)

  An execution of ENQCMD or ENQCMDS performs PASID translation only after checking for conditions that may result in general-protection exception (the check of IA32_PASID.Valid for ENQCMD; the privilege-level check for ENQCMDS), after loading the instruction's source operand from memory, and thus after any faults or VM exits that the loading may cause (e.g., page faults or EPT violations). PASID translation occurs before the actual enqueue store and thus before any faults or VM exits that it may cause.
- **INVPCID.** Behavior of the INVPCID instruction is determined first by the setting of the "enable INVPCID" VM-execution control:
  - If the "enable INVPCID" VM-execution control is 0, INVPCID causes an invalid-opcode exception (#UD). This exception takes priority over any other exception the instruction may incur.
  - If the "enable INVPCID" VM-execution control is 1, treatment is based on the setting of the "INVLPG exiting" VM-execution control:
    - If the "INVLPG exiting" VM-execution control is 0, INVPCID operates normally.
    - If the "INVLPG exiting" VM-execution control is 1, INVPCID causes a VM exit.
- **IRET.** Behavior of IRET with regard to NMI blocking (see Table 26-3) is determined by the settings of the "NMI exiting" and "virtual NMIs" VM-execution controls:
  - If the "NMI exiting" VM-execution control is 0, IRET operates normally and unblocks NMIs. (If the "NMI exiting" VM-execution control is 0, the "virtual NMIs" control must be 0; see Section 28.2.1.1.)
  - If the "NMI exiting" VM-execution control is 1, IRET does not affect blocking of NMIs. If, in addition, the "virtual NMIs" VM-execution control is 1, the logical processor tracks virtual-NMI blocking. In this case, IRET removes any virtual-NMI blocking.

  The unblocking of NMIs or virtual NMIs specified above occurs even if IRET causes a fault.
- **LMSW.** Outside of VMX non-root operation, LMSW loads its source operand into CR0[3:0], but it does not clear CR0.PE if that bit is set. In VMX non-root operation, an execution of LMSW that does not cause a VM exit (see Section 27.1.3) leaves unmodified any bit in CR0[3:0] corresponding to a bit set in the CR0 guest/host mask. An attempt to set any other bit in CR0[3:0] to a value not supported in VMX operation (see Section 25.8) causes a general-protection exception. Attempts to clear CR0.PE are ignored without fault.
- **MOV from CR0.** The behavior of MOV from CR0 is determined by the CR0 guest/host mask and the CR0 read shadow. For each position corresponding to a bit clear in the CR0 guest/host mask, the destination operand is loaded with the value of the corresponding bit in CR0. For each position corresponding to a bit set in the CR0 guest/host mask, the destination operand is loaded with the value of the corresponding bit in the CR0 read

2. Items in this section may refer to secondary processor-based VM-execution controls and tertiary processor-based VM-execution controls. If bit 31 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the secondary processor-based VM-execution controls were all 0; similarly, if bit 17 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the tertiary processor-based VM-execution controls were all 0. See Section 26.6.2.

shadow. Thus, if every bit is cleared in the CR0 guest/host mask, MOV from CR0 reads normally from CR0; if every bit is set in the CR0 guest/host mask, MOV from CR0 returns the value of the CR0 read shadow.

Depending on the contents of the CR0 guest/host mask and the CR0 read shadow, bits may be set in the destination that would never be set when reading directly from CR0.

- **MOV from CR3.** If the "enable EPT" VM-execution control is 1 and an execution of MOV from CR3 does not cause a VM exit (see Section 27.1.3), the value loaded from CR3 is a guest-physical address; see Section 30.3.1.
- **MOV from CR4.** The behavior of MOV from CR4 is determined by the CR4 guest/host mask and the CR4 read shadow. For each position corresponding to a bit clear in the CR4 guest/host mask, the destination operand is loaded with the value of the corresponding bit in CR4. For each position corresponding to a bit set in the CR4 guest/host mask, the destination operand is loaded with the value of the corresponding bit in the CR4 read shadow. Thus, if every bit is cleared in the CR4 guest/host mask, MOV from CR4 reads normally from CR4; if every bit is set in the CR4 guest/host mask, MOV from CR4 returns the value of the CR4 read shadow.

  Depending on the contents of the CR4 guest/host mask and the CR4 read shadow, bits may be set in the destination that would never be set when reading directly from CR4.
- **MOV from CR8.** If the MOV from CR8 instruction does not cause a VM exit (see Section 27.1.3), its behavior is modified if the "use TPR shadow" VM-execution control is 1; see Section 31.3.
- **MOV to CR0.** An execution of MOV to CR0 that does not cause a VM exit (see Section 27.1.3) leaves unmodified any bit in CR0 corresponding to a bit set in the CR0 guest/host mask. Treatment of attempts to modify other bits in CR0 depends on the setting of the "unrestricted guest" VM-execution control:
  - If the control is 0, MOV to CR0 causes a general-protection exception if it attempts to set any bit in CR0 to a value not supported in VMX operation (see Section 25.8).
  - If the control is 1, MOV to CR0 causes a general-protection exception if it attempts to set any bit in CR0 other than bit 0 (PE) or bit 31 (PG) to a value not supported in VMX operation. It remains the case, however, that MOV to CR0 causes a general-protection exception if it would result in CR0.PE = 0 and CR0.PG = 1 or if it would result in CR0.PG = 1, CR4.PAE = 0, and IA32_EFER.LME = 1.
- **MOV to CR3.** If the "enable EPT" VM-execution control is 1 and an execution of MOV to CR3 does not cause a VM exit (see Section 27.1.3), the value loaded into CR3 is treated as a guest-physical address; see Section 30.3.1.
  - If PAE paging is not being used, the instruction does not use the guest-physical address to access memory and it does not cause it to be translated through EPT.[1]
  - If PAE paging is being used, the instruction translates the guest-physical address through EPT and uses the result to load the four (4) page-directory-pointer-table entries (PDPTEs). The instruction does not use the guest-physical addresses the PDPTEs to access memory and it does not cause them to be translated through EPT.
- **MOV to CR4.** An execution of MOV to CR4 that does not cause a VM exit (see Section 27.1.3) leaves unmodified any bit in CR4 corresponding to a bit set in the CR4 guest/host mask. Such an execution causes a general-protection exception if it attempts to set any bit in CR4 (not corresponding to a bit set in the CR4 guest/host mask) to a value not supported in VMX operation (see Section 25.8).
- **MOV to CR8.** If the MOV **to** CR8 instruction does not cause a VM exit (see Section 27.1.3), its behavior is modified if the "use TPR shadow" VM-execution control is 1; see Section 31.3.
- **MWAIT.** Behavior of the MWAIT instruction (which always causes an invalid-opcode exception—#UD—if CPL > 0) is determined by the setting of the "MWAIT exiting" VM-execution control:
  - If the "MWAIT exiting" VM-execution control is 1, MWAIT causes a VM exit.
  - If the "MWAIT exiting" VM-execution control is 0, MWAIT operates normally if one of the following are true: (1) ECX[0] is 0; (2) RFLAGS.IF = 1; or both of the following are true: (a) the "interrupt-window exiting" VM-execution control is 0; and (b) the logical processor has not recognized a pending virtual interrupt (see Section 29.2.1).

1. A logical processor uses PAE paging if CR0.PG = 1, CR4.PAE = 1 and IA32_EFER.LMA = 0. See Section 5.4 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

— If the "MWAIT exiting" VM-execution control is 0, ECX[0] = 1, and RFLAGS.IF = 0, MWAIT does not cause the processor to enter an implementation-dependent optimized state if either the "interrupt-window exiting" VM-execution control is 1 or the logical processor has recognized a pending virtual interrupt; instead, control passes to the instruction following the MWAIT instruction.

- **PCONFIG.** Behavior of the PCONFIG instruction is determined by the setting of the "enable PCONFIG" VM-execution control:
  - — If the "enable PCONFIG" VM-execution control is 0, PCONFIG causes an invalid-opcode exception (#UD). This exception takes priority over any exception the instruction may incur.
  - — If the "enable PCONFIG" VM-execution control is 1, PCONFIG may cause a VM exit as specified in Section 27.1.3; if it does not cause such a VM exit, it operates normally.
- **RDMSR.** Section 27.1.3 identifies when executions of the RDMSR instruction cause VM exits. If such an execution causes neither a fault due to CPL > 0 nor a VM exit, the instruction's behavior may be modified for certain values of ECX:
  - — If ECX contains 10H (indicating the IA32_TIME_STAMP_COUNTER MSR), the value returned by the instruction is determined by the setting of the "use TSC offsetting" VM-execution control:
    - If the control is 0, RDMSR operates normally, loading EAX:EDX with the value of the IA32_TIME_STAMP_COUNTER MSR.
    - If the control is 1, the value returned is determined by the setting of the "use TSC scaling" VM-execution control:
      - — If the control is 0, RDMSR loads EAX:EDX with the sum of the value of the IA32_TIME_STAMP_COUNTER MSR and the value of the TSC offset.
      - — If the control is 1, RDMSR first computes the product of the value of the IA32_TIME_STAMP_COUNTER MSR and the value of the TSC multiplier. It then shifts the value of the product right 48 bits and loads EAX:EDX with the sum of that shifted value and the value of the TSC offset.

    The 1-setting of the "use TSC-offsetting" VM-execution control does not affect executions of RDMSR if ECX contains 6E0H (indicating the IA32_TSC_DEADLINE MSR). Such executions return the APIC-timer deadline relative to the actual timestamp counter without regard to the TSC offset.
  - — If ECX contains 48H (indicating the IA32_SPEC_CTRL MSR), the value returned by the instruction is determined by the setting of the "virtualize IA32_SPEC_CTRL" VM-execution control:
    - If the control is 0, RDMSR operates normally, loading EAX:EDX with the value of the IA32_SPEC_CTRL MSR.
    - If the control is 1, the value returned is that of the IA32_SPEC_CTRL shadow field in the VMCS.
  - — If ECX is in the range 800H–8FFH (indicating an APIC MSR), instruction behavior may be modified if the "virtualize x2APIC mode" VM-execution control is 1; see Section 31.5.
- **RDMSRLIST.** Behavior of the RDMSRLIST instruction is determined first by the setting of the "enable MSR-list instructions" VM-execution control:
  - — If the "enable MSR-list instructions" VM-execution control is 0, RDMSRLIST causes an invalid-opcode exception (#UD). This exception takes priority over any other exception the instruction may incur.
  - — If the "enable MSR-list instructions" VM-execution control is 1, the instruction causes a general-protection exception (#GP) normally if CPL > 0. Otherwise, its operation depends on the setting of the "use MSR bitmaps" VM-execution control:
    - If the control is 0, the instruction causes a VM exit.
    - If the control is 1, the instruction commences normally, reading one MSR at a time. Reads of certain MSRs are treated specially as described above for RDMSR. In addition, attempts to access specific MSRs may cause VM exits; see Section 27.1.3 for details.
- **RDPID.** Behavior of the RDPID instruction is determined first by the setting of the "enable RDTSCP" VM-execution control:
  - — If the "enable RDTSCP" VM-execution control is 0, RDPID causes an invalid-opcode exception (#UD).

— If the "enable RDTSCP" VM-execution control is 1, RDPID operates normally.

- **RDTSC.** Behavior of the RDTSC instruction is determined by the settings of the "RDTSC exiting" and "use TSC offsetting" VM-execution controls:
  — If both controls are 0, RDTSC operates normally.
  — If the "RDTSC exiting" VM-execution control is 0 and the "use TSC offsetting" VM-execution control is 1, the value returned is determined by the setting of the "use TSC scaling" VM-execution control:
    - If the control is 0, RDTSC loads EAX:EDX with the sum of the value of the IA32_TIME_STAMP_COUNTER MSR and the value of the TSC offset.
    - If the control is 1, RDTSC first computes the product of the value of the IA32_TIME_STAMP_COUNTER MSR and the value of the TSC multiplier. It then shifts the value of the product right 48 bits and loads EAX:EDX with the sum of that shifted value and the value of the TSC offset.
  — If the "RDTSC exiting" VM-execution control is 1, RDTSC causes a VM exit.
- **RDTSCP.** Behavior of the RDTSCP instruction is determined first by the setting of the "enable RDTSCP" VM-execution control:
  — If the "enable RDTSCP" VM-execution control is 0, RDTSCP causes an invalid-opcode exception (#UD). This exception takes priority over any other exception the instruction may incur.
  — If the "enable RDTSCP" VM-execution control is 1, treatment is based on the settings of the "RDTSC exiting" and "use TSC offsetting" VM-execution controls:
    - If both controls are 0, RDTSCP operates normally.
    - If the "RDTSC exiting" VM-execution control is 0 and the "use TSC offsetting" VM-execution control is 1, the value returned is determined by the setting of the "use TSC scaling" VM-execution control:
      — If the control is 0, RDTSCP loads EAX:EDX with the sum of the value of the IA32_TIME_STAMP_COUNTER MSR and the value of the TSC offset.
      — If the control is 1, RDTSCP first computes the product of the value of the IA32_TIME_STAMP_COUNTER MSR and the value of the TSC multiplier. It then shifts the value of the product right 48 bits and loads EAX:EDX with the sum of that shifted value and the value of the TSC offset.

      In either case, RDTSCP also loads ECX with the value of bits 31:0 of the IA32_TSC_AUX MSR.
    - If the "RDTSC exiting" VM-execution control is 1, RDTSCP causes a VM exit.
- **SMSW.** The behavior of SMSW is determined by the CR0 guest/host mask and the CR0 read shadow. For each position corresponding to a bit clear in the CR0 guest/host mask, the destination operand is loaded with the value of the corresponding bit in CR0. For each position corresponding to a bit set in the CR0 guest/host mask, the destination operand is loaded with the value of the corresponding bit in the CR0 read shadow. Thus, if every bit is cleared in the CR0 guest/host mask, SMSW reads normally from CR0; if every bit is set in the CR0 guest/host mask, SMSW returns the value of the CR0 read shadow.

  Note the following: (1) for any memory destination or for a 16-bit register destination, only the low 16 bits of the CR0 guest/host mask and the CR0 read shadow are used (bits 63:16 of a register destination are left unchanged); (2) for a 32-bit register destination, only the low 32 bits of the CR0 guest/host mask and the CR0 read shadow are used (bits 63:32 of the destination are cleared); and (3) depending on the contents of the CR0 guest/host mask and the CR0 read shadow, bits may be set in the destination that would never be set when reading directly from CR0.
- **TPAUSE.** Behavior of the TPAUSE instruction is determined first by the setting of the "enable user wait and pause" VM-execution control:
  — If the "enable user wait and pause" VM-execution control is 0, TPAUSE causes an invalid-opcode exception (#UD). This exception takes priority over any exception the instruction may incur.
  — If the "enable user wait and pause" VM-execution control is 1, treatment is based on the setting of the "RDTSC exiting" VM-execution control:
    - If the "RDTSC exiting" VM-execution control is 0, the instruction delays for an amount of time called here the **physical delay**. The physical delay is first computed by determining the **virtual delay** (the time to delay relative to the guest's timestamp counter).

If IA32_UMWAIT_CONTROL[31:2] is zero, the virtual delay is the value in EDX:EAX minus the value that RDTSC would return (see above); if IA32_UMWAIT_CONTROL[31:2] is not zero, the virtual delay is the minimum of that difference and AND(IA32_UMWAIT_CONTROL,FFFFFFFCH).

The physical delay depends upon the settings of the "use TSC offsetting" and "use TSC scaling" VM-execution controls:

— If either control is 0, the physical delay is the virtual delay.

— If both controls are 1, the virtual delay is multiplied by 2^{48} (using a shift) to produce a 128-bit integer. That product is then divided by the TSC multiplier to produce a 64-bit integer. The physical delay is that quotient.

- If the "RDTSC exiting" VM-execution control is 1, TPAUSE causes a VM exit.

- **UMONITOR.** Behavior of the UMONITOR instruction is determined by the setting of the "enable user wait and pause" VM-execution control:

  — If the "enable user wait and pause" VM-execution control is 0, UMONITOR causes an invalid-opcode exception (#UD). This exception takes priority over any exception the instruction may incur.

  — If the "enable user wait and pause" VM-execution control is 1, UMONITOR operates normally.

- **UMWAIT.** Behavior of the UMWAIT instruction is determined first by the setting of the "enable user wait and pause" VM-execution control:

  — If the "enable user wait and pause" VM-execution control is 0, UMWAIT causes an invalid-opcode exception (#UD). This exception takes priority over any exception the instruction may incur.

  — If the "enable user wait and pause" VM-execution control is 1, treatment is based on the setting of the "RDTSC exiting" VM-execution control:

    - If the "RDTSC exiting" VM-execution control is 0, and if the instruction causes a delay, the amount of time delayed is called here the **physical delay**. The physical delay is first computed by determining the **virtual delay** (the time to delay relative to the guest's timestamp counter).

      If IA32_UMWAIT_CONTROL[31:2] is zero, the virtual delay is the value in EDX:EAX minus the value that RDTSC would return (see above); if IA32_UMWAIT_CONTROL[31:2] is not zero, the virtual delay is the minimum of that difference and AND(IA32_UMWAIT_CONTROL,FFFFFFFCH).

      The physical delay depends upon the settings of the "use TSC offsetting" and "use TSC scaling" VM-execution controls:

      — If either control is 0, the physical delay is the virtual delay.

      — If both controls are 1, the virtual delay is multiplied by 2^{48} (using a shift) to produce a 128-bit integer. That product is then divided by the TSC multiplier to produce a 64-bit integer. The physical delay is that quotient.

    - If the "RDTSC exiting" VM-execution control is 1, UMWAIT causes a VM exit.

- **WRMSR, WRMSRNS.** Section 27.1.3 identifies when an execution of WRMSR or WRMSRNS would cause a VM exit. If such an execution causes neither a fault due to CPL > 0 nor a VM exit, the instruction's behavior may be modified for certain values of ECX:

  — If ECX contains 48H (indicating the IA32_SPEC_CTRL MSR), instruction behavior depends on the setting of the "virtualize IA32_SPEC_CTRL" VM-execution control:

    - If the control is 0, WRMSR and WRMSRNS operate normally, loading the IA32_SPEC_CTRL MSR with the value in EAX:EDX.

    - If the control is 1, the instruction will attempt to write the IA32_SPEC_CTRL MSR using the instruction's source operand, but it will attempt to modify only those bits in positions corresponding to bits cleared in the IA32_SPEC_CTRL mask field in the VMCS.

      Specifically, the instruction attempts to write the MSR with the following value:

      (MSR_VAL & ISC_MASK) OR (SRC & NOT ISC_MASK),

      where MSR_VAL is the original value of the MSR, ISC_MASK is the IA32_SPEC_CTRL mask, and SRC is the instruction's source operand.

Any fault that would result from writing that value to the MSR (e.g., due to a reserved-bit violation) occurs normally. Otherwise, the value is written to the MSR.

Such a write to the MSR will have any side effects that would occur normally had the MSR been written with the value indicated above (including any side effects that may result from writing unchanged values to the masked bits).

If the write completes without a fault, the unmodified value of the source operand is written to the IA32_SPEC_CTRL shadow field in the VMCS.

— If ECX contains 79H (indicating IA32_BIOS_UPDT_TRIG MSR), no microcode update is loaded, and control passes to the next instruction. This implies that microcode updates cannot be loaded in VMX non-root operation.

— On processors that support Intel PT but which do not allow it to be used in VMX operation, if ECX contains 570H (indicating the IA32_RTIT_CTL MSR), the instruction causes a general-protection exception.[1]

— If ECX contains 808H (indicating the TPR MSR), 80BH (the EOI MSR), 830H (the ICR MSR), or 83FH (the self-IPI MSR), instruction behavior may be modified if the "virtualize x2APIC mode" VM-execution control is 1; see Section 31.5.

- **WRMSRLIST.** Behavior of the WRMSRLIST instruction is determined first by the setting of the "enable MSR-list instructions" VM-execution control:

  — If the "enable MSR-list instructions" VM-execution control is 0, WRMSRLIST causes an invalid-opcode exception (#UD). This exception takes priority over any other exception the instruction may incur.

  — If the "enable MSR-list instructions" VM-execution control is 1, the instruction causes a general-protection exception (#GP) normally if CPL > 0. Otherwise, its operation depends on the setting of the "use MSR bitmaps" VM-execution control:

    - If the control is 0, the instruction causes a VM exit.
    - If the control is 1, the instruction commences normally, writing one MSR at a time. Writes to certain MSRs are treated specially as described above for WRMSR and WRMSRNS. In addition, attempts to access specific MSRs may cause VM exits; see Section 27.1.3 for details.

- **XRSTORS.** Behavior of the XRSTORS instruction is determined first by the setting of the "enable XSAVES/XRSTORS" VM-execution control:

  — If the "enable XSAVES/XRSTORS" VM-execution control is 0, XRSTORS causes an invalid-opcode exception (#UD).

  — If the "enable XSAVES/XRSTORS" VM-execution control is 1, treatment is based on the value of the XSS-exiting bitmap (see Section 26.6.21):

    - XRSTORS causes a VM exit if any bit is set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap.
    - Otherwise, XRSTORS operates normally.

- **XSAVES.** Behavior of the XSAVES instruction is determined first by the setting of the "enable XSAVES/XRSTORS" VM-execution control:

  — If the "enable XSAVES/XRSTORS" VM-execution control is 0, XSAVES causes an invalid-opcode exception (#UD).

  — If the "enable XSAVES/XRSTORS" VM-execution control is 1, treatment is based on the value of the XSS-exiting bitmap (see Section 26.6.21):

    - XSAVES causes a VM exit if any bit is set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap.
    - Otherwise, XSAVES operates normally.

1. Software should read the VMX capability MSR IA32_VMX_MISC to determine whether the processor allows Intel PT to be used in VMX operation (see Appendix A.6).

27.4 OTHER CHANGES IN VMX NON-ROOT OPERATION

Treatments of event blocking, task switches, and certain shadow-stack updates may differ in VMX non-root operation as described in the following sections.

27.4.1 Event Blocking

Event blocking is modified in VMX non-root operation as follows:

- If the "external-interrupt exiting" VM-execution control is 1, RFLAGS.IF does not control the blocking of external interrupts. In this case, an external interrupt that is not blocked for other reasons causes a VM exit (even if RFLAGS.IF = 0).
- If the "external-interrupt exiting" VM-execution control is 1, external interrupts may or may not be blocked by STI or by MOV SS (behavior is implementation-specific).
- If the "NMI exiting" VM-execution control is 1, non-maskable interrupts (NMIs) may or may not be blocked by STI or by MOV SS (behavior is implementation-specific).

27.4.2 Treatment of Task Switches

Task switches are not allowed in VMX non-root operation. Any attempt to effect a task switch in VMX non-root operation causes a VM exit. However, the following checks are performed (in the order indicated), possibly resulting in a fault, before there is any possibility of a VM exit due to task switch:

1. If a task gate is being used, appropriate checks are made on its P bit and on the proper values of the relevant privilege fields. The following cases detail the privilege checks performed:
   a. If CALL, INT *n*, INT1, INT3, INTO, or JMP accesses a task gate in IA-32e mode, a general-protection exception occurs.
   b. If CALL, INT *n*, INT3, INTO, or JMP accesses a task gate outside IA-32e mode, privilege-levels checks are performed on the task gate but, if they pass, privilege levels are not checked on the referenced task-state segment (TSS) descriptor.
   c. If CALL or JMP accesses a TSS descriptor directly in IA-32e mode, a general-protection exception occurs.
   d. If CALL or JMP accesses a TSS descriptor directly outside IA-32e mode, privilege levels are checked on the TSS descriptor.
   e. If a non-maskable interrupt (NMI), an exception, or an external interrupt accesses a task gate in the IDT in IA-32e mode, a general-protection exception occurs.
   f. If a non-maskable interrupt (NMI), an exception other than breakpoint exceptions (#BP) and overflow exceptions (#OF), or an external interrupt accesses a task gate in the IDT outside IA-32e mode, no privilege checks are performed.
   g. If IRET is executed with RFLAGS.NT = 1 in IA-32e mode, a general-protection exception occurs.
   h. If IRET is executed with RFLAGS.NT = 1 outside IA-32e mode, a TSS descriptor is accessed directly and no privilege checks are made.
2. Checks are made on the new TSS selector (for example, that is within GDT limits).
3. The new TSS descriptor is read. (A page fault results if a relevant GDT page is not present).
4. The TSS descriptor is checked for proper values of type (depends on type of task switch), P bit, S bit, and limit.

Only if checks 1–4 all pass (do not generate faults) might a VM exit occur. However, the ordering between a VM exit due to a task switch and a page fault resulting from accessing the old TSS or the new TSS is implementation-specific. Some processors may generate a page fault (instead of a VM exit due to a task switch) if accessing either TSS would cause a page fault. Other processors may generate a VM exit due to a task switch even if accessing either TSS would cause a page fault.

If an attempt at a task switch through a task gate in the IDT causes an exception (before generating a VM exit due to the task switch) and that exception causes a VM exit, information about the event whose delivery that accessed the task gate is recorded in the IDT-vectoring information fields and information about the exception that caused

the VM exit is recorded in the VM-exit interruption-information fields. See Section 29.2. The fact that a task gate was being accessed is not recorded in the VMCS.

If an attempt at a task switch through a task gate in the IDT causes VM exit due to the task switch, information about the event whose delivery accessed the task gate is recorded in the IDT-vectoring fields of the VMCS. Since the cause of such a VM exit is a task switch and not an interruption, the valid bit for the VM-exit interruption information field is 0. See Section 29.2.

27.4.3 Shadow-Stack Updates

As noted in Section 18.2.3, "Supervisor Shadow Stack Token," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, a switch of shadow stack may occur as part of IDT event delivery or an execution of far CALL that changes the CPL, or as part of IDT event delivery that uses the interrupt stack table (IST).

As part of the shadow-stack switch, the processor gains exclusive access to the new stack through manipulation of the **supervisor shadow stack token** located at the base of the new shadow stack. The processor reads the token and, among other things, confirms that bit 0 of the token (its **busy bit**) is 0. If the busy bit is already 1, the transition (event delivery or far CALL) cause a general-protection fault and does not complete. If the busy bit is 0, the transition sets the busy bit by writing to the token in memory. (The update is atomic with the original read of the token.)

If the transition commenced with CPL < 3, it will follow the token update by pushing three items on the new shadow stack (for the old values of the CS selector, instruction pointer, and shadow-stack pointer). As noted in Section 18.2.3 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1, if any of the pushes causes a VM exit, the processor will revert to the old shadow stack and the busy bit in the new shadow stack's token remains set. The new shadow stack is said to be prematurely busy.

If the "prematurely busy shadow stack" VM-exit control is 1, a VM exit that results in a shadow stack becoming prematurely busy will indicate that fact through information saved in the VMCS. See Section 29.2.1.

27.5 FEATURES SPECIFIC TO VMX NON-ROOT OPERATION

Some VM-execution controls support features that are specific to VMX non-root operation. These are the VMX-preemption timer (Section 27.5.1) and the monitor trap flag (Section 27.5.2), translation of guest-physical addresses (Section 27.5.3 and Section 27.5.4), APIC virtualization (Section 27.5.5), VM functions (Section 27.5.6), and virtualization exceptions (Section 27.5.7).

27.5.1 VMX-Preemption Timer

If the last VM entry was performed with the 1-setting of "activate VMX-preemption timer" VM-execution control, the **VMX-preemption timer** counts down (from the value loaded by VM entry; see Section 28.7.4) in VMX non-root operation. When the timer counts down to zero, it stops counting down and a VM exit occurs (see Section 27.2).

The VMX-preemption timer counts down at rate proportional to that of the timestamp counter (TSC). Specifically, the timer counts down by 1 every time bit X in the TSC changes due to a TSC increment. The value of X is in the range 0–31 and can be determined by consulting the VMX capability MSR IA32_VMX_MISC (see Appendix A.6).

The VMX-preemption timer operates in the C-states C0, C1, and C2; it also operates in the shutdown and wait-for-SIPI states. If the timer counts down to zero in any state other than the wait-for SIPI state, the logical processor transitions to the C0 C-state and causes a VM exit; the timer does not cause a VM exit if it counts down to zero in the wait-for-SIPI state. The timer is not decremented in C-states deeper than C2.

Treatment of the timer in the case of system management interrupts (SMIs) and system-management mode (SMM) depends on whether the treatment of SMIs and SMM:

- If the default treatment of SMIs and SMM (see Section 33.14) is active, the VMX-preemption timer counts across an SMI to VMX non-root operation, subsequent execution in SMM, and the return from SMM via the RSM instruction. However, the timer can cause a VM exit only from VMX non-root operation. If the timer expires

during SMI, in SMM, or during RSM, a timer-induced VM exit occurs immediately after RSM with its normal priority unless it is blocked based on activity state (Section 27.2).

- If the dual-monitor treatment of SMIs and SMM (see Section 33.15) is active, transitions into and out of SMM are VM exits and VM entries, respectively. The treatment of the VMX-preemption timer by those transitions is mostly the same as for ordinary VM exits and VM entries; Section 33.15.2 and Section 33.15.4 detail some differences.

27.5.2 Monitor Trap Flag

The **monitor trap flag** is a debugging feature that causes VM exits to occur on certain instruction boundaries in VMX non-root operation. Such VM exits are called **MTF VM exits**. An MTF VM exit may occur on an instruction boundary in VMX non-root operation as follows:

- If the "monitor trap flag" VM-execution control is 1 and VM entry is injecting a vectored event (see Section 28.6.1), an MTF VM exit is pending on the instruction boundary before the first instruction following the VM entry.
- If VM entry is injecting a pending MTF VM exit (see Section 28.6.2), an MTF VM exit is pending on the instruction boundary before the first instruction following the VM entry. This is the case even if the "monitor trap flag" VM-execution control is 0.
- If the "monitor trap flag" VM-execution control is 1, VM entry is not injecting an event, and a pending event (e.g., debug exception or interrupt) is delivered before an instruction can execute, an MTF VM exit is pending on the instruction boundary following delivery of the event (or any nested exception).
- Suppose that the "monitor trap flag" VM-execution control is 1, VM entry is not injecting an event, and the first instruction following VM entry is a REP-prefixed string instruction:
  - If the first iteration of the instruction causes a fault, an MTF VM exit is pending on the instruction boundary following delivery of the fault (or any nested exception).
  - If the first iteration of the instruction does not cause a fault, an MTF VM exit is pending on the instruction boundary after that iteration.
- Suppose that the "monitor trap flag" VM-execution control is 1, VM entry is not injecting an event, and the first instruction following VM entry is the XBEGIN instruction. In this case, an MTF VM exit is pending at the fallback instruction address of the XBEGIN instruction. This behavior applies regardless of whether advanced debugging of RTM transactional regions has been enabled (see Section 17.3.7, "RTM-Enabled Debugger Support," of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1).
- Suppose that the "monitor trap flag" VM-execution control is 1, VM entry is not injecting an event, and the first instruction following VM entry is neither a REP-prefixed string instruction or the XBEGIN instruction:
  - If the instruction causes a fault, an MTF VM exit is pending on the instruction boundary following delivery of the fault (or any nested exception).[1]
  - If the instruction does not cause a fault, an MTF VM exit is pending on the instruction boundary following execution of that instruction. If the instruction is INT1, INT3, or INTO, this boundary follows delivery of any software exception. If the instruction is INT *n*, this boundary follows delivery of a software interrupt. If the instruction is HLT, the MTF VM exit will be from the HLT activity state.

No MTF VM exit occurs if another VM exit occurs before reaching the instruction boundary on which an MTF VM exit would be pending (e.g., due to an exception or triple fault).

An MTF VM exit occurs on the instruction boundary on which it is pending unless a higher priority event takes precedence or the MTF VM exit is blocked due to the activity state:

- System-management interrupts (SMIs), INIT signals, and higher priority events take priority over MTF VM exits. MTF VM exits take priority over debug-trap exceptions and lower priority events.
- No MTF VM exit occurs if the processor is in either the shutdown activity state or wait-for-SIPI activity state. If a non-maskable interrupt subsequently takes the logical processor out of the shutdown activity state without causing a VM exit, an MTF VM exit is pending after delivery of that interrupt.

1. This item includes the cases of an invalid opcode exception—#UD— generated by the UD0, UD1, and UD2 instructions and a BOUND-range exceeded exception—#BR—generated by the BOUND instruction.

Special treatment may apply to Intel SGX instructions or if the logical processor is in enclave mode. See Section 40.2 for details.

27.5.3 Translation of Guest-Physical Addresses Using EPT

The extended page-table mechanism (EPT) is a feature that can be used to support the virtualization of physical memory. When EPT is in use, certain physical addresses are treated as guest-physical addresses and are not used to access memory directly. Instead, guest-physical addresses are translated by traversing a set of EPT paging structures to produce physical addresses that are used to access memory.

Details of the EPT mechanism are given in Section 30.3.

27.5.4 Translation of Guest-Physical Addresses Used by Intel Processor Trace

As described in Chapter 34, Intel® Processor Trace (Intel PT) captures information about software execution using dedicated hardware facilities.

Intel PT can be configured so that the trace output is written to memory using physical addresses. For example, when the ToPA (table of physical addresses) output mechanism is used, the IA32_RTIT_OUTPUT_BASE MSR contains the physical address of the base of the current ToPA. Each entry in that table contains the physical address of an output region in memory. When an output region becomes full, the ToPA output mechanism directs subsequent trace output to the next output region as indicated in the ToPA.

When the "Intel PT uses guest physical addresses" VM-execution control is 1, the logical processor treats the addresses used by Intel PT (the output addresses as well as those used to discover the output addresses) as guest-physical addresses, translating to physical addresses using EPT before trace output is written to memory.

Translating these addresses through EPT implies that the trace-output mechanism may cause EPT violations and VM exits; details are provided in Section 27.5.4.1. Section 27.5.4.2 describes a mechanism that ensures that these VM exits do not cause loss of trace data.

27.5.4.1 Guest-Physical Address Translation for Intel PT: Details

When the "Intel PT uses guest physical addresses" VM-execution control is 1, the addresses used by Intel PT are treated as guest-physical addresses and translated using EPT. These addresses include the addresses of the output regions as well as the addresses of the ToPA entries that contain the output-region addresses.

Translation of accesses by the trace-output process may result in EPT violations or EPT misconfigurations (Section 30.3.3), resulting in VM exits. EPT violations resulting for the trace-output process always cause VM exits and are never converted to virtualization exceptions (Section 27.5.7.1).

If no EPT violation or EPT misconfiguration occurs and if page-modification logging (Section 30.3.6) is enabled, the address of an output region may be added to the page-modification log. If the log is full, a page-modification log-full event occurs, resulting in a VM exit.

If the "virtualize APIC accesses" VM-execution control is 1, a guest-physical address used by the trace-output process may be translated to an address on the APIC-access page. In this case, the access by the trace-output process causes an APIC-access VM exit as discussed in Section 31.4.6.1.

27.5.4.2 Trace-Address Pre-Translation (TAPT)

Because it buffers trace data produced by Intel PT before it is written to memory, the processor ensures that buffered data is not lost when a VM exit disables Intel PT. Specifically, the processor ensures that there is sufficient space left in the current output page for the buffered data. If this were not done, buffered trace data could be lost and the resulting trace corrupted.

To prevent the loss of buffered trace data, the processor uses a mechanism called **trace-address pre-translation** (**TAPT**). With TAPT, the processor translates using EPT the guest-physical address of the current output region before that address would be used to write buffered trace data to memory.

Because of TAPT, no translation (and thus no EPT violation) occurs at the time output is written to memory; the writes to memory use translations that were cached as part of TAPT. (The details given in Section 27.5.4.1 apply to TAPT.) TAPT ensures that, if a write to the output region would cause an EPT violation, the resulting VM exit is delivered at the time of TAPT, before the region would be used. This allows software to resolve the EPT violation at that time and ensures that, when it is necessary to write buffered trace data to memory, that data will not be lost due to an EPT violation.

TAPT (and resulting VM exits) may occur at any of the following times:

- When software in VMX non-root operation enables tracing by loading the IA32_RTIT_CTL MSR to set the TraceEn bit, using the WRMSR instruction or the XRSTORS instruction.

  Any VM exit resulting from TAPT in this case is trap-like: the WRMSR or XRSTORS completes before the VM exit occurs (for example, the value of CS:RIP saved in the guest-state area of the VMCS references the next instruction).
- At an instruction boundary when one output region becomes full and Intel PT transitions to the next output region.

  VM exits resulting from TAPT in this case take priority over any pending debug exceptions. Such a VM exit will save information about such exceptions in the guest-state area of the VMCS.
- As part of a VM entry that enables Intel PT. See Section 28.5 for details.

TAPT may translate not only the guest-physical address of the current output region but those of subsequent output regions as well. (Doing so may provide better protection of trace data.) This implies that any VM exits resulting from TAPT may result from the translation of output-region addresses other than that of the current output region.

27.5.5 APIC Virtualization

APIC virtualization is a collection of features that can be used to support the virtualization of interrupts and the Advanced Programmable Interrupt Controller (APIC). When APIC virtualization is enabled, the processor emulates many accesses to the APIC, tracks the state of the virtual APIC, and delivers virtual interrupts — all in VMX non-root operation without a VM exit.

Details of the APIC virtualization are given in Chapter 31.

27.5.6 VM Functions

A **VM function** is an operation provided by the processor that can be invoked from VMX non-root operation without a VM exit. VM functions are enabled and configured by the settings of different fields in the VMCS. Software in VMX non-root operation invokes a VM function with the **VMFUNC** instruction; the value of EAX selects the specific VM function being invoked.

Section 27.5.6.1 explains how VM functions are enabled. Section 27.5.6.2 specifies the behavior of the VMFUNC instruction. Section 27.5.6.3 describes a specific VM function called **EPTP switching**.

27.5.6.1 Enabling VM Functions

Software enables VM functions generally by setting the "enable VM functions" VM-execution control. A specific VM function is enabled by setting the corresponding VM-function control.

Suppose, for example, that software wants to enable EPTP switching (VM function 0; see Section 26.6.14).To do so, it must set the "activate secondary controls" VM-execution control (bit 31 of the primary processor-based VM-execution controls), the "enable VM functions" VM-execution control (bit 13 of the secondary processor-based VM-execution controls) and the "EPTP switching" VM-function control (bit 0 of the VM-function controls).

27.5.6.2 General Operation of the VMFUNC Instruction

The VMFUNC instruction causes an invalid-opcode exception (#UD) if the "enable VM functions" VM-execution controls is 0[1] or the value of EAX is greater than 63 (only VM functions 0–63 can be enable). Otherwise, the instruc-

tion causes a VM exit if the bit at position EAX is 0 in the VM-function controls (the selected VM function is not enabled). If such a VM exit occurs, the basic exit reason used is 59 (3BH), indicating "VMFUNC", and the length of the VMFUNC instruction is saved into the VM-exit instruction-length field. If the instruction causes neither an invalid-opcode exception nor a VM exit due to a disabled VM function, it performs the functionality of the VM function specified by the value in EAX.

Individual VM functions may perform additional fault checking (e.g., one might cause a general-protection exception if CPL > 0). In addition, specific VM functions may include checks that might result in a VM exit. If such a VM exit occurs, VM-exit information is saved as described in the previous paragraph. The specification of a VM function may indicate that additional VM-exit information is provided.

The specific behavior of the EPTP-switching VM function (including checks that result in VM exits) is given in Section 27.5.6.3.

27.5.6.3 EPTP Switching

EPTP switching is VM function 0. This VM function allows software in VMX non-root operation to load a new value for the EPT pointer (EPTP), thereby establishing a different EPT paging-structure hierarchy (see Section 30.3 for details of the operation of EPT). Software is limited to selecting from a list of potential EPTP values configured in advance by software in VMX root operation.

Specifically, the value of ECX is used to select an entry from the EPTP list, the 4-KByte structure referenced by the EPTP-list address (see Section 26.6.14; because this structure contains 512 8-Byte entries, VMFUNC causes a VM exit if ECX ≥ 512). The EPTP value in the selected entry is evaluated to determine whether it is valid for EPTP switching: a value is valid if (1) it is the same as the current EPTP value in bits 5:3 (these bits specify the EPT page-walk length); and (2) it would not cause VM entry to fail (see Section 28.2.1.1). If the value is invalid, a VM exit occurs. Otherwise, the value is stored in the EPTP field of the current VMCS and is used for subsequent accesses using guest-physical addresses. The following pseudocode provides details:

```
IF ECX ≥ 512
    THEN VM exit;
    ELSE
        tent_EPTP := 8 bytes from EPTP-list address + 8 * ECX;
        IF tent_EPTP is not a valid EPTP value (would cause VM entry to fail if in EPTP or change EPT page-walk length)
            THEN VM exit;
            ELSE
                write tent_EPTP to the EPTP field in the current VMCS;
                use tent_EPTP as the new EPTP value for address translation;
                IF processor supports the 1-setting of the "EPT-violation #VE" VM-execution control
                    THEN
                        write ECX[15:0] to EPTP-index field in current VMCS;
                        use ECX[15:0] as EPTP index for subsequent EPT-violation virtualization exceptions (see Section 27.5.7.2);
                FI;
        FI;
FI;
```

Execution of the EPTP-switching VM function does not modify the state of any registers; no flags are modified.

If the "Intel PT uses guest physical addresses" VM-execution control is 1 and IA32_RTIT_CTL.TraceEn = 1, any execution of the EPTP-switching VM function causes a VM exit.[1]

As noted in Section 27.5.6.2, an execution of the EPTP-switching VM function that causes a VM exit (as specified above), uses the basic exit reason 59, indicating "VMFUNC". The length of the VMFUNC instruction is saved into the VM-exit instruction-length field. No additional VM-exit information is provided.

---

1. "Enable VM functions" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the "enable VM functions" VM-execution control were 0. See Section 26.6.2.

1. Such a VM exit ensures the proper recording of trace data that might otherwise be lost during the change of EPT paging-structure hierarchy. Software handling the VM exit can change emulate the VM function and then resume the guest.

An execution of VMFUNC loads EPTP from the EPTP list (and thus does not cause a fault or VM exit) is called an **EPTP-switching VMFUNC**. After an EPTP-switching VMFUNC, control passes to the next instruction. The logical processor starts creating and using guest-physical and combined mappings associated with the new value of bits 51:12 of EPTP; the combined mappings created and used are associated with the current VPID and PCID (these are not changed by VMFUNC).[1] If the "enable VPID" VM-execution control is 0, an EPTP-switching VMFUNC invalidates combined mappings associated with VPID 0000H (for all PCIDs and for all EPTRTA values, where EPTRTA is the value of bits 51:12 of EPTP).

Because an EPTP-switching VMFUNC may change the translation of guest-physical addresses, it may affect use of the guest-physical address in CR3. The EPTP-switching VMFUNC cannot itself cause a VM exit due to an EPT violation or an EPT misconfiguration due to the translation of that guest-physical address through the new EPT paging structures. The following items provide details that apply if CR0.PG = 1:

- If 32-bit paging or 4-level paging[2] is in use (either CR4.PAE = 0 or IA32_EFER.LMA = 1), the next memory access with a linear address uses the translation of the guest-physical address in CR3 through the new EPT paging structures. As a result, this access may cause a VM exit due to an EPT violation or an EPT misconfiguration encountered during that translation.
- If PAE paging is in use (CR4.PAE = 1 and IA32_EFER.LMA = 0), an EPTP-switching VMFUNC **does not** load the four page-directory-pointer-table entries (PDPTEs) from the guest-physical address in CR3. The logical processor continues to use the four guest-physical addresses already present in the PDPTEs. The guest-physical address in CR3 is not translated through the new EPT paging structures (until some operation that would load the PDPTEs).

  The EPTP-switching VMFUNC cannot itself cause a VM exit due to an EPT violation or an EPT misconfiguration encountered during the translation of a guest-physical address in any of the PDPTEs. A subsequent memory access with a linear address uses the translation of the guest-physical address in the appropriate PDPTE through the new EPT paging structures. As a result, such an access may cause a VM exit due to an EPT violation or an EPT misconfiguration encountered during that translation.

If an EPTP-switching VMFUNC establishes an EPTP value that enables accessed and dirty flags for EPT (by setting bit 6), subsequent memory accesses may fail to set those flags as specified if there has been no appropriate execution of INVEPT since the last use of an EPTP value that does not enable accessed and dirty flags for EPT (because bit 6 is clear) and that is identical to the new value on bits 51:12.

IF the processor supports the 1-setting of the "EPT-violation #VE" VM-execution control, an EPTP-switching VMFUNC loads the value in ECX[15:0] into to EPTP-index field in current VMCS. Subsequent EPT-violation virtualization exceptions will save this value into the virtualization-exception information area (see Section 27.5.7.2).

27.5.7 Virtualization Exceptions

A **virtualization exception** is a new processor exception. It uses vector 20 and is abbreviated #VE.

A virtualization exception can occur only in VMX non-root operation. Virtualization exceptions occur only with certain settings of certain VM-execution controls. Generally, these settings imply that certain conditions that would normally cause VM exits instead cause virtualization exceptions

In particular, the 1-setting of the "EPT-violation #VE" VM-execution control causes some EPT violations to generate virtualization exceptions instead of VM exits. Section 27.5.7.1 provides the details of how the processor determines whether an EPT violation causes a virtualization exception or a VM exit.

When the processor encounters a virtualization exception, it saves information about the exception to the virtualization-exception information area; see Section 27.5.7.2.

After saving virtualization-exception information, the processor delivers a virtualization exception as it would any other exception; see Section 27.5.7.3 for details.

1. If the "enable VPID" VM-execution control is 0, the current VPID is 0000H; if CR4.PCIDE = 0, the current PCID is 000H.
2. Earlier versions of this manual used the term "IA-32e paging" to identify 4-level paging.

27.5.7.1 Convertible EPT Violations

If the "EPT-violation #VE" VM-execution control is 0 (e.g., on processors that do not support this feature), EPT violations always cause VM exits. If instead the control is 1, certain EPT violations may be converted to cause virtualization exceptions instead; such EPT violations are **convertible**.

The values of certain EPT paging-structure entries determine which EPT violations are convertible. Specifically, bit 63 of certain EPT paging-structure entries may be defined to mean **suppress #VE**:

- If bits 2:0 of an EPT paging-structure entry are all 0, the entry is not **present**.[1] If the processor encounters such an entry while translating a guest-physical address, it causes an EPT violation. The EPT violation is convertible if and only if bit 63 of the entry is 0.
- If an EPT paging-structure entry is present, the following cases apply:
  - If the value of the EPT paging-structure entry is not supported, the entry is **misconfigured**. If the processor encounters such an entry while translating a guest-physical address, it causes an EPT misconfiguration (not an EPT violation). EPT misconfigurations always cause VM exits.
  - If the value of the EPT paging-structure entry is supported, the following cases apply:
    - If bit 7 of the entry is 1, or if the entry is an EPT PTE, the entry maps a page. If the processor uses such an entry to translate a guest-physical address, and if an access to that address causes an EPT violation, the EPT violation is convertible if and only if bit 63 of the entry is 0.
    - If bit 7 of the entry is 0 and the entry is not an EPT PTE, the entry references another EPT paging structure. The processor does not use the value of bit 63 of the entry to determine whether any subsequent EPT violation is convertible.

If an access to a guest-physical address causes an EPT violation, bit 63 of exactly one of the EPT paging-structure entries used to translate that address is used to determine whether the EPT violation is convertible: either a entry that is not present (if the guest-physical address does not translate to a physical address) or an entry that maps a page (if it does).

A convertible EPT violation instead causes a virtualization exception if the following all hold:

- CR0.PE = 1;
- the logical processor is not in the process of delivering an event through the IDT;
- the EPT violation did not cause a shadow stack to become prematurely busy (see Section 27.4.3);
- the EPT violation does not result from the output process of Intel Processor Trace (Section 27.5.4); and
- the 32 bits at offset 4 in the virtualization-exception information area are all 0.

Delivery of virtualization exceptions writes the value FFFFFFFFH to offset 4 in the virtualization-exception information area (see Section 27.5.7.2). Thus, once a virtualization exception occurs, another can occur only if software clears this field.

27.5.7.2 Virtualization-Exception Information

Virtualization exceptions save data into the virtualization-exception information area (see Section 26.6.20). Table 27-1 enumerates the data saved and the format of the area.

Table 27-1. Format of the Virtualization-Exception Information Area

Byte Offset	Contents
0	The 32-bit value that would have been saved into the VMCS as an exit reason had a VM exit occurred instead of the virtualization exception. For EPT violations, this value is 48 (00000030H)
4	FFFFFFFFH

1. If the "mode-based execute control for EPT" VM-execution control is 1, an EPT paging-structure entry is present if any of bits 2:0 **or bit 10** is 1.

Table 27-1. Format of the Virtualization-Exception Information Area (Contd.)

Byte Offset	Contents
8	The 64-bit value that would have been saved into the VMCS as an exit qualification had a VM exit occurred instead of the virtualization exception
16	The 64-bit value that would have been saved into the VMCS as a guest-linear address had a VM exit occurred instead of the virtualization exception
24	The 64-bit value that would have been saved into the VMCS as a guest-physical address had a VM exit occurred instead of the virtualization exception
32	The current 16-bit value of the EPTP index VM-execution control (see Section 26.6.20 and Section 27.5.6.3)

A VMM may allow guest software to access the virtualization-exception information area. If it does, the guest software may modify that memory (e.g., to clear the 32-bit value at offset 4; see Section 27.5.7.1). (This is an exception to the general requirement given in Section 26.11.4.)

27.5.7.3 Delivery of Virtualization Exceptions

After saving virtualization-exception information, the processor treats a virtualization exception as it does other exceptions:

- If bit 20 (#VE) is 1 in the exception bitmap in the VMCS, a virtualization exception causes a VM exit (see below). If the bit is 0, the virtualization exception is delivered using gate descriptor 20 in the IDT.
- Virtualization exceptions produce no error code. Delivery of a virtualization exception pushes no error code on the stack.
- With respect to double faults, virtualization exceptions have the same severity as page faults. If delivery of a virtualization exception encounters a nested fault that is either contributory or a page fault, a double fault (#DF) is generated. See Chapter 7, "Interrupt 8—Double Fault Exception (#DF)" in Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

  It is not possible for a virtualization exception to be encountered while delivering another exception (see Section 27.5.7.1).

If a virtualization exception causes a VM exit directly (because bit 20 is 1 in the exception bitmap), information about the exception is saved normally in the VM-exit interruption information field in the VMCS (see Section 29.2.2). Specifically, the event is reported as a hardware exception with vector 20 and no error code. Bit 12 of the field (NMI unblocking due to IRET) is set normally.

If a virtualization exception causes a VM exit indirectly (because bit 20 is 0 in the exception bitmap and delivery of the exception generates an event that causes a VM exit), information about the exception is saved normally in the IDT-vectoring information field in the VMCS (see Section 29.2.4). Specifically, the event is reported as a hardware exception with vector 20 and no error code.

27.5.8 PASID Translation

The ENQCMD and ENQCMDS instructions each performs a 64-byte enqueue store that includes a 20-bit PASID value in bits 19:0. For ENQCMD, the PASID is normally the value of IA32_PASID[19:0], while for ENQCMDS, the PASID is normally read from memory.

If the "PASID translation" VM-execution control is 1, the PASID value identified in the previous paragraph is treated as a **guest PASID**. PASID translation converts this guest PASID to a 20-bit **host PASID**. After this translation, the enqueue store is performed, using the host PASID in place of the guest PASID.

PASID translation is implemented by two hierarchies of data structures (**PASID-translation hierarchies**) configured by a VMM. Guest PASIDs 00000H to 7FFFFH are translated through the low PASID-translation hierarchy, while guest PASIDs 80000 to FFFFFH are translated through the high PASID-translation hierarchy.

The root of each PASID-translation hierarchy is a 4-KByte **PASID directory**. The low PASID directory is located at the low PASID directory address, and the high PASID directory is located at the high PASID directory address (these physical addresses are VM-execution control fields in the VMCS). A PASID directory comprises 512 8-byte entries, each of which has the following format:

- Bit 0 is the entry's present bit. The entry is used only if this bit is 1.
- Bits 11:1 are reserved and must be 0.
- Bits M–1:12 specify the 4-KByte aligned address of a PASID table (see below), where M is the processor's physical-address width.
- Bits 63:M are reserved and must be 0.

A PASID-translation hierarchy also includes up to 512 4-KByte **PASID tables**; each of these is referenced by a PASID directory entry (see above). A PASID table comprises 1024 4-byte entries, each of which has the following format:

- Bits 19:0 are the host PASID specified by the entry.
- Bits 30:20 are reserved and must be 0.
- Bits 31 is the entry's valid bit. The entry is used only if this bit is 1.

When PASID translation is enabled, the guest PASID determined by the instruction (see above) is converted to a host PASID using the following process:

- If bit 19 of guest PASID is clear, the low PASID directory is used; otherwise, the high PASID directory is used.
- Bits 18:10 of the guest PASID select an entry from the PASID directory. A VM exit occurs if the entry's present bit is clear or if any reserved bit is set. Otherwise, bits M:0 of the entry (with bit 0 cleared) contain the physical address of a PASID table.
- Bits 9:0 of the guest PASID select an entry from the PASID table. A VM exit occurs if the entry's valid bit is clear or if any reserved bit is set. Otherwise, bits 19:0 of the entry are the host PASID.

If PASID translation results in a VM exit (due to a present or valid bit being clear, or a reserved bit being set), the instruction does not complete and no enqueue store is performed.

27.6 UNRESTRICTED GUESTS

The first processors to support VMX operation require CR0.PE and CR0.PG to be 1 in VMX operation (see Section 25.8). This restriction implies that guest software cannot be run in unpaged protected mode or in real-address mode. Later processors support a VM-execution control called "unrestricted guest".[1] If this control is 1, CR0.PE and CR0.PG may be 0 in VMX non-root operation. Such processors allow guest software to run in unpaged protected mode or in real-address mode. The following items describe the behavior of such software:

- The MOV CR0 instructions does not cause a general-protection exception simply because it would set either CR0.PE and CR0.PG to 0. See Section 27.3 for details.
- A logical processor treats the values of CR0.PE and CR0.PG in VMX non-root operation just as it does outside VMX operation. Thus, if CR0.PE = 0, the processor operates as it does normally in real-address mode (for example, it uses the 16-bit **interrupt table** to deliver interrupts and exceptions). If CR0.PG = 0, the processor operates as it does normally when paging is disabled.
- Processor operation is modified by the fact that the processor is in VMX non-root operation and by the settings of the VM-execution controls just as it is in protected mode or when paging is enabled. Instructions, interrupts, and exceptions that cause VM exits in protected mode or when paging is enabled also do so in real-address mode or when paging is disabled. The following examples should be noted:
  - If CR0.PG = 0, page faults do not occur and thus cannot cause VM exits.
  - If CR0.PE = 0, invalid-TSS exceptions do not occur and thus cannot cause VM exits.

1. "Unrestricted guest" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the "unrestricted guest" VM-execution control were 0. See Section 26.6.2.

  - If CR0.PE = 0, the following instructions cause invalid-opcode exceptions and do not cause VM exits: INVEPT, INVVPID, LLDT, LTR, SLDT, STR, VMCLEAR, VMLAUNCH, VMPTRLD, VMPTRST, VMREAD, VMRESUME, VMWRITE, VMXOFF, and VMXON.
- If CR0.PG = 0, each linear address is passed directly to the EPT mechanism for translation to a physical address.[1] The guest memory type passed on to the EPT mechanism is WB (writeback).

1. As noted in Section 28.2.1.1, the "enable EPT" VM-execution control must be 1 if the "unrestricted guest" VM-execution control is 1.

23. Updates to Chapter 28, Volume 3C

Change bars and violet text show changes to Chapter 28 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C:* System Programming Guide, Part 3.

Changes to this chapter:

- Minor updates, adding clarifications related to consistency checks on CR3. Additional corrections regarding checking the "deliver error code" bit in Section 28.2.1.3, "VM-Entry Control Fields."

CHAPTER 28
VM ENTRIES

Software can enter VMX non-root operation using either of the VM-entry instructions VMLAUNCH and VMRESUME. VMLAUNCH can be used only with a VMCS whose launch state is clear and VMRESUME can be used only with a VMCS whose the launch state is launched. VMLAUNCH should be used for the first VM entry after VMCLEAR; VMRESUME should be used for subsequent VM entries with the same VMCS.

Each VM entry performs the following steps in the order indicated:

1. Basic checks are performed to ensure that VM entry can commence (Section 28.1).
2. The control and host-state areas of the VMCS are checked to ensure that they are proper for supporting VMX non-root operation and that the VMCS is correctly configured to support the next VM exit (Section 28.2).
3. The following may be performed in parallel or in any order (Section 28.3):
   - The guest-state area of the VMCS is checked to ensure that, after the VM entry completes, the state of the logical processor is consistent with IA-32 and Intel 64 architectures.
   - Processor state is loaded from the guest-state area and based on controls in the VMCS.
   - Address-range monitoring is cleared.
4. MSRs are loaded from the VM-entry MSR-load area (Section 28.4).
5. If VMLAUNCH is being executed, the launch state of the VMCS is set to "launched."
6. If the "Intel PT uses guest physical addresses" VM-execution control is 1, trace-address pre-translation (TAPT) may occur (see Section 27.5.4 and Section 28.5).
7. An event may be injected in the guest context (Section 28.6).

Steps 1–4 above perform checks that may cause VM entry to fail. Such failures occur in one of the following three ways:

- Some of the checks in Section 28.1 may generate ordinary faults (for example, an invalid-opcode exception). Such faults are delivered normally.
- Some of the checks in Section 28.1 and all the checks in Section 28.2 cause control to pass to the instruction following the VM-entry instruction. The failure is indicated by setting RFLAGS.ZF[1] (if there is a current VMCS) or RFLAGS.CF (if there is no current VMCS). If there is a current VMCS, an error number indicating the cause of the failure is stored in the VM-instruction error field. See Chapter 31 for the error numbers.
- The checks in Section 28.3 and Section 28.4 cause processor state to be loaded from the host-state area of the VMCS (as would be done on a VM exit). Information about the failure is stored in the VM-exit information fields. See Section 28.8 for details.

EFLAGS.TF = 1 causes a VM-entry instruction to generate a single-step debug exception only if failure of one of the checks in Section 28.1 and Section 28.2 causes control to pass to the following instruction. A VM-entry does not generate a single-step debug exception in any of the following cases: (1) the instruction generates a fault; (2) failure of one of the checks in Section 28.3 or in loading MSRs causes processor state to be loaded from the host-state area of the VMCS; or (3) the instruction passes all checks in Section 28.1, Section 28.2, and Section 28.3 and there is no failure in loading MSRs.

Section 33.15 describes the dual-monitor treatment of system-management interrupts (SMIs) and system-management mode (SMM). Under this treatment, code running in SMM returns using VM entries instead of the RSM instruction. A VM entry **returns from SMM** if it is executed in SMM and the "entry to SMM" VM-entry control is 0. VM entries that return from SMM differ from ordinary VM entries in ways that are detailed in Section 33.15.4.

1. This chapter uses the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For IA-32 processors, this notation refers to the 32-bit forms of those registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to lower 32 bits of the indicated register.

28.1 BASIC VM-ENTRY CHECKS

Before a VM entry commences, the current state of the logical processor is checked in the following order:

1. If the logical processor is in virtual-8086 mode or compatibility mode, an invalid-opcode exception is generated.
2. If the current privilege level (CPL) is not zero, a general-protection exception is generated.
3. If there is no current VMCS, RFLAGS.CF is set to 1 and control passes to the next instruction.
4. If there is a current VMCS but the current VMCS is a shadow VMCS (see Section 26.10), RFLAGS.CF is set to 1 and control passes to the next instruction.
5. If there is a current VMCS that is not a shadow VMCS, the following conditions are evaluated in order; any of these cause VM entry to fail:
   a. If there is MOV-SS blocking (see Table 26-3).
   b. If the VM entry is invoked by VMLAUNCH and the VMCS launch state is not clear.
   c. If the VM entry is invoked by VMRESUME and the VMCS launch state is not launched.

   If any of these checks fail, RFLAGS.ZF is set to 1 and control passes to the next instruction. An error number indicating the cause of the failure is stored in the VM-instruction error field. See Chapter 31 for the error numbers.

28.2 CHECKS ON VMX CONTROLS AND HOST-STATE AREA

If the checks in Section 28.1 do not cause VM entry to fail, the control and host-state areas of the VMCS are checked to ensure that they are proper for supporting VMX non-root operation, that the VMCS is correctly configured to support the next VM exit, and that, after the next VM exit, the processor's state is consistent with the Intel 64 and IA-32 architectures.

VM entry fails if any of these checks fail. When such failures occur, control is passed to the next instruction, RFLAGS.ZF is set to 1 to indicate the failure, and the VM-instruction error field is loaded with an error number that indicates whether the failure was due to the controls or the host-state area (see Chapter 31).

These checks may be performed in any order. Thus, an indication by error number of one cause (for example, host state) does not imply that there are not also other errors. Different processors may thus give different error numbers for the same VMCS. Some checks prevent establishment of settings (or combinations of settings) that are currently reserved. Future processors may allow such settings (or combinations) and may not perform the corresponding checks. The correctness of software should not rely on VM-entry failures resulting from the checks documented in this section.

The checks on the controls and the host-state area are presented in Section 28.2.1 through Section 28.2.4. These sections reference VMCS fields that correspond to processor state. Unless otherwise stated, these references are to fields in the host-state area.

28.2.1 Checks on VMX Controls

This section identifies VM-entry checks on the VMX control fields.

28.2.1.1 VM-Execution Control Fields

VM entries perform the following checks on the VM-execution control fields:[1]

- Reserved bits in the pin-based VM-execution controls must be set properly. Software may consult the VMX capability MSRs to determine the proper settings (see Appendix A.3.1).

1. If the "activate secondary controls" primary processor-based VM-execution control is 0, VM entry operates as if each secondary processor-based VM-execution control were 0. Similarly, if the "activate tertiary controls" primary processor-based VM-execution control is 0, VM entry operates as if each tertiary processor-based VM-execution control were 0. See Section 26.6.2.

- Reserved bits in the primary processor-based VM-execution controls must be set properly. Software may consult the VMX capability MSRs to determine the proper settings (see Appendix A.3.2).
- If the "activate secondary controls" primary processor-based VM-execution control is 1, reserved bits in the secondary processor-based VM-execution controls must be cleared. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.3.3).

  If the "activate secondary controls" primary processor-based VM-execution control is 0 (or if the processor does not support the 1-setting of that control), no checks are performed on the secondary processor-based VM-execution controls. The logical processor operates as if all the secondary processor-based VM-execution controls were 0.
- If the "activate tertiary controls" primary processor-based VM-execution control is 1, reserved bits in the tertiary processor-based VM-execution controls must be cleared. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.3.4).

  If the "activate tertiary controls" primary processor-based VM-execution control is 0 (or if the processor does not support the 1-setting of that control), no checks are performed on the tertiary processor-based VM-execution controls. The logical processor operates as if all the tertiary processor-based VM-execution controls were 0.
- The CR3-target count must not be greater than 4. Future processors may support a different number of CR3-target values. Software should read the VMX capability MSR IA32_VMX_MISC to determine the number of values supported (see Appendix A.6).
- If the "use I/O bitmaps" VM-execution control is 1, bits 11:0 of each I/O-bitmap address must be 0. Neither address should set any bits beyond the processor's physical-address width.[1,2]
- If the "use MSR bitmaps" VM-execution control is 1, bits 11:0 of the MSR-bitmap address must be 0. The address should not set any bits beyond the processor's physical-address width.[3]
- If the "use TPR shadow" VM-execution control is 1, the virtual-APIC address must satisfy the following checks:
  - Bits 11:0 of the address must be 0.
  - The address should not set any bits beyond the processor's physical-address width.[4]

  If all of the above checks are satisfied and the "use TPR shadow" VM-execution control is 1, bytes 3:1 of VTPR (see Section 31.1.1) may be cleared (behavior may be implementation-specific).

  The clearing of these bytes may occur even if the VM entry fails. This is true either if the failure causes control to pass to the instruction following the VM-entry instruction or if it causes processor state to be loaded from the host-state area of the VMCS.
- If the "use TPR shadow" VM-execution control is 1 and the "virtual-interrupt delivery" VM-execution control is 0, bits 31:4 of the TPR threshold VM-execution control field must be 0.
- The following check is performed if the "use TPR shadow" VM-execution control is 1 and the "virtualize APIC accesses" and "virtual-interrupt delivery" VM-execution controls are both 0: the value of bits 3:0 of the TPR threshold VM-execution control field should not be greater than the value of bits 7:4 of VTPR (see Section 31.1.1).
- If the "NMI exiting" VM-execution control is 0, the "virtual NMIs" VM-execution control must be 0.
- If the "virtual NMIs" VM-execution control is 0, the "NMI-window exiting" VM-execution control must be 0.
- If the "virtualize APIC-accesses" VM-execution control is 1, the APIC-access address must satisfy the following checks:
  - Bits 11:0 of the address must be 0.
  - The address should not set any bits beyond the processor's physical-address width.[5]

---

1. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
2. If IA32_VMX_BASIC[48] is read as 1, these addresses must not set any bits in the range 63:32; see Appendix A.1.
3. If IA32_VMX_BASIC[48] is read as 1, this address must not set any bits in the range 63:32; see Appendix A.1.
4. If IA32_VMX_BASIC[48] is read as 1, this address must not set any bits in the range 63:32; see Appendix A.1.
5. If IA32_VMX_BASIC[48] is read as 1, this address must not set any bits in the range 63:32; see Appendix A.1.

- If the "use TPR shadow" VM-execution control is 0, the following VM-execution controls must also be 0: "virtualize x2APIC mode", "APIC-register virtualization", "virtual-interrupt delivery", and "IPI virtualization".
- If the "virtualize x2APIC mode" VM-execution control is 1, the "virtualize APIC accesses" VM-execution control must be 0.
- If the "virtual-interrupt delivery" VM-execution control is 1, the "external-interrupt exiting" VM-execution control must be 1.
- If the "process posted interrupts" VM-execution control is 1, the following must be true:
  - The "virtual-interrupt delivery" VM-execution control is 1.
  - The "acknowledge interrupt on exit" VM-exit control is 1.
  - The posted-interrupt notification vector has a value in the range 0–255 (bits 15:8 are all 0).
  - Bits 5:0 of the posted-interrupt descriptor address are all 0.
  - The posted-interrupt descriptor address does not set any bits beyond the processor's physical-address width.[1]
- If the "IPI virtualization" VM-execution control is 1, the following must be true:
  - Bits 2:0 of the PID-pointer table address are all 0.
  - The PID-pointer table address does not set any bits beyond the processor's physical-address width.
  - The address of the last entry in the PID-pointer table does not set any bits beyond the processor's physical-address width. (This address is the PID-pointer table address plus 8 times the last PID-pointer index.)
- If the "enable VPID" VM-execution control is 1, the value of the VPID VM-execution control field must not be 0000H.
- If the "enable EPT" VM-execution control is 1, the EPTP VM-execution control field (see Table 26-9 in Section 26.6.11) must satisfy the following checks:
  - The EPT memory type (bits 2:0) must be a value supported by the processor as indicated in the IA32_VMX_EPT_VPID_CAP MSR (see Appendix A.10).
  - Bits 5:3 must contain a value 1 less than an EPT page-walk length supported by the processor as indicated in the IA32_VMX_EPT_VPID_CAP MSR (see Section 30.3.2 and Appendix A.10).
  - Bit 6 (enable bit for accessed and dirty flags for EPT) must be 0 if bit 21 of the IA32_VMX_EPT_VPID_CAP MSR (see Appendix A.10) is read as 0, indicating that the processor does not support accessed and dirty flags for EPT.
  - Reserved bits 11:7 and 63:N (where N is the processor's physical-address width) must all be 0.
- The "enable EPT" VM-execution control must be 1 if any of the following VM-execution controls is 1: "enable PML," "unrestricted guest," "mode-based execute control for EPT," "sub-page write permissions for EPT," "Intel PT uses guest physical addresses," "enable HLAT," "EPT paging-write control," or "guest-paging verification."
- If the "enable PML" VM-execution control is 1, the PML address must satisfy the following checks:
  - Bits 11:0 of the address must be 0.
  - The address should not set any bits beyond the processor's physical-address width.
- If the "sub-page write permissions for EPT" VM-execution control is 1, the SPPTP VM-execution control field (see Table 26-11 in Section 26.6.22) must satisfy the following checks:
  - Bits 11:0 of the address must be 0.
  - The address should not set any bits beyond the processor's physical-address width.
- If the "enable VM functions" processor-based VM-execution control is 1, reserved bits in the VM-function controls must be clear. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.11). In addition, the following check is performed based on the setting of bits in the VM-function controls (see Section 26.6.14):

1. If IA32_VMX_BASIC[48] is read as 1, this address must not set any bits in the range 63:32; see Appendix A.1.

— If "EPTP switching" VM-function control is 1, the "enable EPT" VM-execution control must also be 1. In addition, the EPTP-list address must satisfy the following checks:

  • Bits 11:0 of the address must be 0.

  • The address must not set any bits beyond the processor's physical-address width.

If the "enable VM functions" processor-based VM-execution control is 0, no checks are performed on the VM-function controls.

- If the "VMCS shadowing" VM-execution control is 1, the VMREAD-bitmap and VMWRITE-bitmap addresses must each satisfy the following checks:
  — Bits 11:0 of the address must be 0.
  — The address must not set any bits beyond the processor's physical-address width.
- If the "EPT-violation #VE" VM-execution control is 1, the virtualization-exception information address must satisfy the following checks:
  — Bits 11:0 of the address must be 0.
  — The address must not set any bits beyond the processor's physical-address width.
- If the logical processor is operating with Intel PT enabled (if IA32_RTIT_CTL.TraceEn = 1) at the time of VM entry, the "load IA32_RTIT_CTL" VM-entry control must be 0.
- If the "Intel PT uses guest physical addresses" VM-execution control is 1, the "load IA32_RTIT_CTL" VM-entry control and the "clear IA32_RTIT_CTL" VM-exit control must both be 1.
- If the "use TSC scaling" VM-execution control is 1, the TSC-multiplier must not be zero.
- If the "enable HLAT" VM-execution control is 1, the following bits in the HLATP VM-execution control field (see Table 26-12 in Section 26.6.23) must be zero: bits 2:0, bits 11:5, and bits beyond the processor's physical-address width.
- If the "PASID translation" VM-execution control is 1, the low PASID directory address and the high PASID directory address must each satisfy the following checks:
  — Bits 11:0 of the address must be 0.
  — The address must not set any bits beyond the processor's physical-address width.

28.2.1.2 VM-Exit Control Fields

VM entries perform the following checks on the VM-exit control fields.

- Reserved bits in the primary VM-exit controls must be set properly. Software may consult the VMX capability MSRs to determine the proper settings (see Appendix A.4.1).
- If the "activate secondary controls" primary VM-exit control is 1, reserved bits in the secondary VM-exit controls must be cleared. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.4.2).
- If the "activate secondary controls" primary VM-exit control is 0 (or if the processor does not support the 1-setting of that control), no checks are performed on the secondary VM-exit controls. The logical processor operates as if all the secondary VM-exit controls were 0.
- If the "activate VMX-preemption timer" VM-execution control is 0, the "save VMX-preemption timer value" VM-exit control must also be 0.
- The following checks are performed for the VM-exit MSR-store address if the VM-exit MSR-store count field is non-zero:
  — The lower 4 bits of the VM-exit MSR-store address must be 0. The address should not set any bits beyond the processor's physical-address width.[1]

1. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

— The address of the last byte in the VM-exit MSR-store area should not set any bits beyond the processor's physical-address width. The address of this last byte is VM-exit MSR-store address + (MSR count * 16) – 1. (The arithmetic used for the computation uses more bits than the processor's physical-address width.)

If IA32_VMX_BASIC[48] is read as 1, neither address should set any bits in the range 63:32; see Appendix A.1.

- The following checks are performed for the VM-exit MSR-load address if the VM-exit MSR-load count field is non-zero:
  — The lower 4 bits of the VM-exit MSR-load address must be 0. The address should not set any bits beyond the processor's physical-address width.
  — The address of the last byte in the VM-exit MSR-load area should not set any bits beyond the processor's physical-address width. The address of this last byte is VM-exit MSR-load address + (MSR count * 16) – 1. (The arithmetic used for the computation uses more bits than the processor's physical-address width.)

  If IA32_VMX_BASIC[48] is read as 1, neither address should set any bits in the range 63:32; see Appendix A.1.

28.2.1.3 VM-Entry Control Fields

VM entries perform the following checks on the VM-entry control fields.

- Reserved bits in the VM-entry controls must be set properly. Software may consult the VMX capability MSRs to determine the proper settings (see Appendix A.5).
- Fields relevant to VM-entry event injection must be set properly. These fields are the VM-entry interruption-information field (see Table 26-17 in Section 26.8.3), the VM-entry exception error code, and the VM-entry instruction length. If the valid bit (bit 31) in the VM-entry interruption-information field is 1, the following must hold:
  — The field's interruption type (bits 10:8) is not set to a reserved value. Value 1 is reserved on all logical processors; value 7 (other event) is reserved on logical processors that do not support the 1-setting of the "monitor trap flag" VM-execution control.
  — The field's vector (bits 7:0) is consistent with the interruption type:
    - If the interruption type is non-maskable interrupt (NMI), the vector is 2.
    - If the interruption type is hardware exception, the vector is at most 31.
    - If the interruption type is other event, the vector is 0 (pending MTF VM exit).
  — The field's deliver-error-code bit (bit 11) is 1 if each of the following holds: (1) the interruption type is hardware exception; (2) either (a) the "unrestricted guest" VM-execution control is 0; or (b) bit 0 (corresponding to CR0.PE) is set in the CR0 field in the guest-state area; (3) IA32_VMX_BASIC[56] is read as 0 (see Appendix A.1); and (4) the vector indicates one of the following exceptions: #DF (vector 8), #TS (10), #NP (11), #SS (12), #GP (13), #PF (14), or #AC (17).
  — The field's deliver-error-code bit is 0 if any of the following holds: (1) the interruption type is not hardware exception; (2) both (a) the "unrestricted guest" VM-execution control is 1; and (b) bit 0 is clear in the CR0 field in the guest-state area; or (3) IA32_VMX_BASIC[56] is read as 0 and the vector is in one of the following ranges: 0–7, 9, 15, 16, or 18–31.
  — Reserved bits in the field (30:12) are 0.
  — If the deliver-error-code bit (bit 11) is 1, bits 31:16 of the VM-entry exception error-code field are 0.
  — If the interruption type is software interrupt, software exception, or privileged software exception, the VM-entry instruction-length field is in the range 0–15. A VM-entry instruction length of 0 is allowed only if IA32_VMX_MISC[30] is read as 1; see Appendix A.6.
- The following checks are performed for the VM-entry MSR-load address if the VM-entry MSR-load count field is non-zero:
  — The lower 4 bits of the VM-entry MSR-load address must be 0. The address should not set any bits beyond the processor's physical-address width.[1]

— The address of the last byte in the VM-entry MSR-load area should not set any bits beyond the processor's physical-address width. The address of this last byte is VM-entry MSR-load address + (MSR count * 16) – 1. (The arithmetic used for the computation uses more bits than the processor's physical-address width.)

If IA32_VMX_BASIC[48] is read as 1, neither address should set any bits in the range 63:32; see Appendix A.1.

- If the processor is not in SMM, the "entry to SMM" and "deactivate dual-monitor treatment" VM-entry controls must be 0.
- The "entry to SMM" and "deactivate dual-monitor treatment" VM-entry controls cannot both be 1.

28.2.2 Checks on Host Control Registers, MSRs, and SSP

The following checks are performed on fields in the host-state area that correspond to control registers and MSRs:

- The CR0 field must not set any bit to a value not supported in VMX operation (see Section 25.8).[1]
- The CR4 field must not set any bit to a value not supported in VMX operation (see Section 25.8).
- If bit 23 in the CR4 field (corresponding to CET) is 1, bit 16 in the CR0 field (WP) must also be 1.
- On processors that support Intel 64 architecture, the CR3 field must be such that bits reserved in CR3 (including those in the range 51:32 beyond the processor's physical-address width) must be 0.[2,3]
- On processors that support Intel 64 architecture, the IA32_SYSENTER_ESP field and the IA32_SYSENTER_EIP field must each contain a canonical address.
- If the "load IA32_PERF_GLOBAL_CTRL" VM-exit control is 1, bits reserved in the IA32_PERF_GLOBAL_CTRL MSR must be 0 in the field for that register (see Figure 21-3).
- If the "load IA32_PAT" VM-exit control is 1, the value of the field for the IA32_PAT MSR must be one that could be written by WRMSR without fault at CPL 0. Specifically, each of the 8 bytes in the field must have one of the values 0 (UC), 1 (WC), 4 (WT), 5 (WP), 6 (WB), or 7 (UC-).
- If the "load IA32_EFER" VM-exit control is 1, bits reserved in the IA32_EFER MSR must be 0 in the field for that register. In addition, the values of the LMA and LME bits in the field must each be that of the "host address-space size" VM-exit control.
- If the "load CET state" VM-exit control is 1, the IA32_S_CET field must not set any bits reserved in the IA32_S_CET MSR, and bit 10 (corresponding to SUPPRESS) and bit 11 (TRACKER) in the field cannot both be set.
- If the "load CET state" VM-exit control is 1, bits 1:0 must be 0 in the SSP field.
- If the "load PKRS" VM-exit control is 1, bits 63:32 must be 0 in the IA32_PKRS field.

28.2.3 Checks on Host Segment and Descriptor-Table Registers

The following checks are performed on fields in the host-state area that correspond to segment and descriptor-table registers:

- In the selector field for each of CS, SS, DS, ES, FS, GS, and TR, the RPL (bits 1:0) and the TI flag (bit 2) must be 0.
- The selector fields for CS and TR cannot be 0000H.
- The selector field for SS cannot be 0000H if the "host address-space size" VM-exit control is 0.

1. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

1. The bits corresponding to CR0.NW (bit 29) and CR0.CD (bit 30) are never checked because the values of these bits are not changed by VM exit; see Section 29.5.1.
2. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
3. Bit 63 of the CR3 field in the host-state area must be 0. This is true even though, If CR4.PCIDE = 1, bit 63 of the source operand to MOV to CR3 is used to determine whether cached translation information is invalidated.

- On processors that support Intel 64 architecture, the base-address fields for FS, GS, GDTR, IDTR, and TR must contain canonical addresses.

28.2.4 Checks Related to Address-Space Size

On processors that support Intel 64 architecture, the following checks related to address-space size are performed on VMX controls and fields in the host-state area:

- If the logical processor is outside IA-32e mode (if IA32_EFER.LMA = 0) at the time of VM entry, the following must hold:
  - The "IA-32e mode guest" VM-entry control is 0.
  - The "host address-space size" VM-exit control is 0.
- If the logical processor is in IA-32e mode (if IA32_EFER.LMA = 1) at the time of VM entry, the "host address-space size" VM-exit control must be 1.
- If the "host address-space size" VM-exit control is 0, the following must hold:
  - The "IA-32e mode guest" VM-entry control is 0.
  - Bit 17 of the CR4 field (corresponding to CR4.PCIDE) is 0.
  - Bits 63:32 in the RIP field are 0.
  - If the "load CET state" VM-exit control is 1, bits 63:32 in the IA32_S_CET field and in the SSP field are 0.
- If the "host address-space size" VM-exit control is 1, the following must hold:
  - Bit 5 of the CR4 field (corresponding to CR4.PAE) is 1.
  - The RIP field contains a canonical address.
  - If the "load CET state" VM-exit control is 1, the IA32_S_CET field and the SSP field contain canonical addresses.
- If the "load CET state" VM-exit control is 1, the IA32_INTERRUPT_SSP_TABLE_ADDR field contains a canonical address.

On processors that do not support Intel 64 architecture, checks are performed to ensure that the "IA-32e mode guest" VM-entry control and the "host address-space size" VM-exit control are both 0.

28.3 CHECKING AND LOADING GUEST STATE

If all checks on the VMX controls and the host-state area pass (see Section 28.2), the following operations take place concurrently: (1) the guest-state area of the VMCS is checked to ensure that, after the VM entry completes, the state of the logical processor is consistent with IA-32 and Intel 64 architectures; (2) processor state is loaded from the guest-state area or as specified by the VM-entry control fields; and (3) address-range monitoring is cleared.

Because the checking and the loading occur concurrently, a failure may be discovered only after some state has been loaded. For this reason, the logical processor responds to such failures by loading state from the host-state area, as it would for a VM exit. See Section 28.8.

28.3.1 Checks on the Guest State Area

This section describes checks performed on fields in the guest-state area. These checks may be performed in any order. Some checks prevent establishment of settings (or combinations of settings) that are currently reserved. Future processors may allow such settings (or combinations) and may not perform the corresponding checks. The correctness of software should not rely on VM-entry failures resulting from the checks documented in this section.

The following subsections reference fields that correspond to processor state. Unless otherwise stated, these references are to fields in the guest-state area.

28.3.1.1 Checks on Guest Control Registers, Debug Registers, and MSRs

The following checks are performed on fields in the guest-state area corresponding to control registers, debug registers, and MSRs:

- The CR0 field must not set any bit to a value not supported in VMX operation (see Section 25.8). The following are exceptions:
  - Bit 0 (corresponding to CR0.PE) and bit 31 (PG) are not checked if the "unrestricted guest" VM-execution control is 1.[1]
  - Bit 29 (corresponding to CR0.NW) and bit 30 (CD) are never checked because the values of these bits are not changed by VM entry; see Section 28.3.2.1.
- If bit 31 in the CR0 field (corresponding to PG) is 1, bit 0 in that field (PE) must also be 1.[2]
- The CR4 field must not set any bit to a value not supported in VMX operation (see Section 25.8).
- If bit 23 in the CR4 field (corresponding to CET) is 1, bit 16 in the CR0 field (WP) must also be 1.
- If the "load debug controls" VM-entry control is 1, bits reserved in the IA32_DEBUGCTL MSR must be 0 in the field for that register. The first processors to support the virtual-machine extensions supported only the 1-setting of this control and thus performed this check unconditionally.
- The following checks are performed on processors that support Intel 64 architecture:
  - If the "IA-32e mode guest" VM-entry control is 1, bit 31 in the CR0 field (corresponding to CR0.PG) and bit 5 in the CR4 field (corresponding to CR4.PAE) must each be 1.[3]
  - If the "IA-32e mode guest" VM-entry control is 0, bit 17 in the CR4 field (corresponding to CR4.PCIDE) must be 0.
  - The CR3 field must be such that bits reserved in CR3 (including those in the range 51:32 beyond the processor's physical-address width) are 0.[4,5]
  - If the "load debug controls" VM-entry control is 1, bits 63:32 in the DR7 field must be 0. The first processors to support the virtual-machine extensions supported only the 1-setting of this control and thus performed this check unconditionally (if they supported Intel 64 architecture).
  - The IA32_SYSENTER_ESP field and the IA32_SYSENTER_EIP field must each contain a canonical address.
  - If the "load CET state" VM-entry control is 1, the IA32_S_CET field and the IA32_INTERRUPT_SSP_TABLE_ADDR field must contain canonical addresses.
- If the "load IA32_PERF_GLOBAL_CTRL" VM-entry control is 1, bits reserved in the IA32_PERF_GLOBAL_CTRL MSR must be 0 in the field for that register (see Figure 21-3).
- If the "load IA32_PAT" VM-entry control is 1, the value of the field for the IA32_PAT MSR must be one that could be written by WRMSR without fault at CPL 0. Specifically, each of the 8 bytes in the field must have one of the values 0 (UC), 1 (WC), 4 (WT), 5 (WP), 6 (WB), or 7 (UC-).
- If the "load IA32_EFER" VM-entry control is 1, the following checks are performed on the field for the IA32_EFER MSR:
  - Bits reserved in the IA32_EFER MSR must be 0.
  - Bit 10 (corresponding to IA32_EFER.LMA) must equal the value of the "IA-32e mode guest" VM-entry control. It must also be identical to bit 8 (LME) if bit 31 in the CR0 field (corresponding to CR0.PG) is 1.[6]

1. "Unrestricted guest" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the "unrestricted guest" VM-execution control were 0. See Section 26.6.2.
2. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, bit 0 in the CR0 field must be 1 unless the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
3. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, bit 31 in the CR0 field must be 1 unless the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
4. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
5. Bit 63 of the CR3 field in the guest-state area must be 0. This is true even though, If CR4.PCIDE = 1, bit 63 of the source operand to MOV to CR3 is used to determine whether cached translation information is invalidated.

- If the "load IA32_BNDCFGS" VM-entry control is 1, the following checks are performed on the field for the IA32_BNDCFGS MSR:
  - Bits reserved in the IA32_BNDCFGS MSR must be 0.
  - The linear address in bits 63:12 must be canonical.
- If the "load IA32_RTIT_CTL" VM-entry control is 1, bits reserved in the IA32_RTIT_CTL MSR must be 0 in the field for that register (see Table 33-6).
- If the "load CET state" VM-entry control is 1, the IA32_S_CET field must not set any bits reserved in the IA32_S_CET MSR, and bit 10 (corresponding to SUPPRESS) and bit 11 (TRACKER) of the field cannot both be set.
- If the "load guest IA32_LBR_CTL" VM-entry control is 1, bits reserved in the IA32_LBR_CTL MSR must be 0 in the field for that register.
- If the "load PKRS" VM-entry control is 1, bits 63:32 must be 0 in the IA32_PKRS field.
- If the "load UINV" VM-entry control is 1, bits 15:8 must be 0 in the guest UINV field.

28.3.1.2 Checks on Guest Segment Registers

This section specifies the checks on the fields for CS, SS, DS, ES, FS, GS, TR, and LDTR. The following terms are used in defining these checks:

- The guest will be **virtual-8086** if the VM flag (bit 17) is 1 in the RFLAGS field in the guest-state area.
- The guest will be **IA-32e mode** if the "IA-32e mode guest" VM-entry control is 1. (This is possible only on processors that support Intel 64 architecture.)
- Any one of these registers is said to be **usable** if the unusable bit (bit 16) is 0 in the access-rights field for that register.

The following are the checks on these fields:

- Selector fields.
  - TR. The TI flag (bit 2) must be 0.
  - LDTR. If LDTR is usable, the TI flag (bit 2) must be 0.
  - SS. If the guest will not be virtual-8086 and the "unrestricted guest" VM-execution control is 0, the RPL (bits 1:0) must equal the RPL of the selector field for CS.[1]
- Base-address fields.
  - CS, SS, DS, ES, FS, GS. If the guest will be virtual-8086, the address must be the selector field shifted left 4 bits (multiplied by 16).
  - The following checks are performed on processors that support Intel 64 architecture:
    - TR, FS, GS. The address must be canonical.
    - LDTR. If LDTR is usable, the address must be canonical.
    - CS. Bits 63:32 of the address must be zero.
    - SS, DS, ES. If the register is usable, bits 63:32 of the address must be zero.
- Limit fields for CS, SS, DS, ES, FS, GS. If the guest will be virtual-8086, the field must be 0000FFFFH.
- Access-rights fields.
  - CS, SS, DS, ES, FS, GS.
    - If the guest will be virtual-8086, the field must be 000000F3H. This implies the following:
      - Bits 3:0 (Type) must be 3, indicating an expand-up read/write accessed data segment.

6. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, bit 31 in the CR0 field must be 1 unless the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

1. "Unrestricted guest" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the "unrestricted guest" VM-execution control were 0. See Section 26.6.2.

— Bit 4 (S) must be 1.

— Bits 6:5 (DPL) must be 3.

— Bit 7 (P) must be 1.

— Bits 11:8 (reserved), bit 12 (software available), bit 13 (reserved/L), bit 14 (D/B), bit 15 (G), bit 16 (unusable), and bits 31:17 (reserved) must all be 0.

- If the guest will not be virtual-8086, the different sub-fields are considered separately:
  — Bits 3:0 (Type).
    - CS. The values allowed depend on the setting of the "unrestricted guest" VM-execution control:
      — If the control is 0, the Type must be 9, 11, 13, or 15 (accessed code segment).
      — If the control is 1, the Type must be either 3 (read/write accessed expand-up data segment) or one of 9, 11, 13, and 15 (accessed code segment).
    - SS. If SS is usable, the Type must be 3 or 7 (read/write, accessed data segment).
    - DS, ES, FS, GS. The following checks apply if the register is usable:
      — Bit 0 of the Type must be 1 (accessed).
      — If bit 3 of the Type is 1 (code segment), then bit 1 of the Type must be 1 (readable).

  — Bit 4 (S). If the register is CS or if the register is usable, S must be 1.

  — Bits 6:5 (DPL).
    - CS.
      — If the Type is 3 (read/write accessed expand-up data segment), the DPL must be 0. The Type can be 3 only if the "unrestricted guest" VM-execution control is 1.
      — If the Type is 9 or 11 (non-conforming code segment), the DPL must equal the DPL in the access-rights field for SS.
      — If the Type is 13 or 15 (conforming code segment), the DPL cannot be greater than the DPL in the access-rights field for SS.
    - SS.
      — If the "unrestricted guest" VM-execution control is 0, the DPL must equal the RPL from the selector field.
      — The DPL must be 0 either if the Type in the access-rights field for CS is 3 (read/write accessed expand-up data segment) or if bit 0 in the CR0 field (corresponding to CR0.PE) is 0.[1]
    - DS, ES, FS, GS. The DPL cannot be less than the RPL in the selector field if (1) the "unrestricted guest" VM-execution control is 0; (2) the register is usable; and (3) the Type in the access-rights field is in the range 0 – 11 (data segment or non-conforming code segment).

  — Bit 7 (P). If the register is CS or if the register is usable, P must be 1.

  — Bits 11:8 (reserved). If the register is CS or if the register is usable, these bits must all be 0.

  — Bit 14 (D/B). For CS, D/B must be 0 if the guest will be IA-32e mode and the L bit (bit 13) in the access-rights field is 1.

  — Bit 15 (G). The following checks apply if the register is CS or if the register is usable:
    - If any bit in the limit field in the range 11:0 is 0, G must be 0.
    - If any bit in the limit field in the range 31:20 is 1, G must be 1.

1. The following apply if either the "unrestricted guest" VM-execution control or bit 31 of the primary processor-based VM-execution controls is 0: (1) bit 0 in the CR0 field must be 1 if the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation; and (2) the Type in the access-rights field for CS cannot be 3.

  - Bits 31:17 (reserved). If the register is CS or if the register is usable, these bits must all be 0.
- TR. The different sub-fields are considered separately:
  - Bits 3:0 (Type).
    - If the guest will not be IA-32e mode, the Type must be 3 (16-bit busy TSS) or 11 (32-bit busy TSS).
    - If the guest will be IA-32e mode, the Type must be 11 (64-bit busy TSS).
  - Bit 4 (S). S must be 0.
  - Bit 7 (P). P must be 1.
  - Bits 11:8 (reserved). These bits must all be 0.
  - Bit 15 (G).
    - If any bit in the limit field in the range 11:0 is 0, G must be 0.
    - If any bit in the limit field in the range 31:20 is 1, G must be 1.
  - Bit 16 (Unusable). The unusable bit must be 0.
  - Bits 31:17 (reserved). These bits must all be 0.
- LDTR. The following checks on the different sub-fields apply only if LDTR is usable:
  - Bits 3:0 (Type). The Type must be 2 (LDT).
  - Bit 4 (S). S must be 0.
  - Bit 7 (P). P must be 1.
  - Bits 11:8 (reserved). These bits must all be 0.
  - Bit 15 (G).
    - If any bit in the limit field in the range 11:0 is 0, G must be 0.
    - If any bit in the limit field in the range 31:20 is 1, G must be 1.
  - Bits 31:17 (reserved). These bits must all be 0.

28.3.1.3 Checks on Guest Descriptor-Table Registers

The following checks are performed on the fields for GDTR and IDTR:

- On processors that support Intel 64 architecture, the base-address fields must contain canonical addresses.
- Bits 31:16 of each limit field must be 0.

28.3.1.4 Checks on Guest RIP, RFLAGS, and SSP

The following checks are performed on fields in the guest-state area corresponding to RIP, RFLAGS, and SSP (shadow-stack pointer):

- RIP. The following checks are performed on processors that support Intel 64 architecture:
  - Bits 63:32 must be 0 if the "IA-32e mode guest" VM-entry control is 0 or if the L bit (bit 13) in the access-rights field for CS is 0.
  - If the processor supports N < 64 linear-address bits, bits 63:N must be identical if the "IA-32e mode guest" VM-entry control is 1 and the L bit in the access-rights field for CS is 1.[1] (No check applies if the processor supports 64 linear-address bits.) The guest RIP value is not required to be canonical; the value of bit N-1 may differ from that of bit N.

1. Software can determine the number N by executing CPUID with 80000008H in EAX. The number of linear-address bits supported is returned in bits 15:8 of EAX.

- RFLAGS.
  - Reserved bits 63:22 (bits 31:22 on processors that do not support Intel 64 architecture), bit 15, bit 5 and bit 3 must be 0 in the field, and reserved bit 1 must be 1.
  - The VM flag (bit 17) must be 0 either if the "IA-32e mode guest" VM-entry control is 1 or if bit 0 in the CR0 field (corresponding to CR0.PE) is 0.[1]
  - The IF flag (RFLAGS[bit 9]) must be 1 if the valid bit (bit 31) in the VM-entry interruption-information field is 1 and the interruption type (bits 10:8) is external interrupt.
- SSP. The following checks are performed if the "load CET state" VM-entry control is 1
  - Bits 1:0 must be 0.
  - If the processor supports the Intel 64 architecture, bits 63:N must be identical, where N is the CPU's maximum linear-address width. (This check does not apply if the processor supports 64 linear-address bits.) The guest SSP value is not required to be canonical; the value of bit N-1 may differ from that of bit N.

28.3.1.5 Checks on Guest Non-Register State

The following checks are performed on fields in the guest-state area corresponding to non-register state:

- Activity state.
  - The activity-state field must contain a value in the range 0 – 3, indicating an activity state supported by the implementation (see Section 26.4.2). Future processors may include support for other activity states. Software should read the VMX capability MSR IA32_VMX_MISC (see Appendix A.6) to determine what activity states are supported.
  - The activity-state field must not indicate the HLT state if the DPL (bits 6:5) in the access-rights field for SS is not 0.[2]
  - The activity-state field must indicate the active state if the interruptibility-state field indicates blocking by either MOV-SS or by STI (if either bit 0 or bit 1 in that field is 1).
  - If the valid bit (bit 31) in the VM-entry interruption-information field is 1, the interruption to be delivered (as defined by interruption type and vector) must not be one that would normally be blocked while a logical processor is in the activity state corresponding to the contents of the activity-state field. The following items enumerate the interruptions (as specified in the VM-entry interruption-information field) whose injection is allowed for the different activity states:
    - Active. Any interruption is allowed.
    - HLT. The only events allowed are the following:
      - Those with interruption type external interrupt or non-maskable interrupt (NMI).
      - Those with interruption type hardware exception and vector 1 (debug exception) or vector 18 (machine-check exception).
      - Those with interruption type other event and vector 0 (pending MTF VM exit).

      See Table 26-17 in Section 26.8.3 for details regarding the format of the VM-entry interruption-information field.
    - Shutdown. Only NMIs and machine-check exceptions are allowed.
    - Wait-for-SIPI. No interruptions are allowed.
  - The activity-state field must not indicate the wait-for-SIPI state if the "entry to SMM" VM-entry control is 1.
- Interruptibility state.
  - The reserved bits (bits 31:5) must be 0.
  - The field cannot indicate blocking by both STI and MOV SS (bits 0 and 1 cannot both be 1).

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, bit 0 in the CR0 field must be 1 unless the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
2. As noted in Section 26.4.1, SS.DPL corresponds to the logical processor's current privilege level (CPL).

— Bit 0 (blocking by STI) must be 0 if the IF flag (bit 9) is 0 in the RFLAGS field.

— Bit 0 (blocking by STI) and bit 1 (blocking by MOV-SS) must both be 0 if the valid bit (bit 31) in the VM-entry interruption-information field is 1 and the interruption type (bits 10:8) in that field has value 0, indicating external interrupt, or value 2, indicating non-maskable interrupt (NMI).

— Bit 2 (blocking by SMI) must be 0 if the processor is not in SMM.

— Bit 2 (blocking by SMI) must be 1 if the "entry to SMM" VM-entry control is 1.

— Bit 3 (blocking by NMI) must be 0 if the "virtual NMIs" VM-execution control is 1, the valid bit (bit 31) in the VM-entry interruption-information field is 1, and the interruption type (bits 10:8) in that field has value 2 (indicating NMI).

— If bit 4 (enclave interruption) is 1, bit 1 (blocking by MOV-SS) must be 0 and the processor must support for SGX by enumerating CPUID.(EAX=07H,ECX=0):EBX.SGX[bit 2] as 1.

NOTE

If the "virtual NMIs" VM-execution control is 0, there is no requirement that bit 3 be 0 if the valid bit in the VM-entry interruption-information field is 1 and the interruption type in that field has value 2.

- Pending debug exceptions.
  — Bits 11:4, bit 13, bit 15, and bits 63:17 (bits 31:17 on processors that do not support Intel 64 architecture) must be 0.
  — The following checks are performed if any of the following holds: (1) the interruptibility-state field indicates blocking by STI (bit 0 in that field is 1); (2) the interruptibility-state field indicates blocking by MOV SS (bit 1 in that field is 1); or (3) the activity-state field indicates HLT:
    - Bit 14 (BS) must be 1 if the TF flag (bit 8) in the RFLAGS field is 1 and the BTF flag (bit 1) in the IA32_DEBUGCTL field is 0.
    - Bit 14 (BS) must be 0 if the TF flag (bit 8) in the RFLAGS field is 0 or the BTF flag (bit 1) in the IA32_DEBUGCTL field is 1.
  — The following checks are performed if bit 16 (RTM) is 1:
    - Bits 11:0, bits 15:13, and bits 63:17 (bits 31:17 on processors that do not support Intel 64 architecture) must be 0; bit 12 must be 1.
    - The processor must support for RTM by enumerating CPUID.(EAX=07H,ECX=0):EBX[bit 11] as 1.
    - The interruptibility-state field must not indicate blocking by MOV SS (bit 1 in that field must be 0).
- VMCS link pointer. The following checks apply if the field contains a value other than FFFFFFFF_FFFFFFFFH:
  — Bits 11:0 must be 0.
  — Bits beyond the processor's physical-address width must be 0.[1,2]
  — The 4 bytes located in memory referenced by the value of the field (as a physical address) must satisfy the following:
    - Bits 30:0 must contain the processor's VMCS revision identifier (see Section 26.2).[3]
    - Bit 31 must contain the setting of the "VMCS shadowing" VM-execution control.[4] This implies that the referenced VMCS is a shadow VMCS (see Section 26.10) if and only if the "VMCS shadowing" VM-execution control is 1.

1. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
2. If IA32_VMX_BASIC[48] is read as 1, this field must not set any bits in the range 63:32; see Appendix A.1.
3. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field. For all processors produced prior to this change, bit 31 of the VMCS revision identifier was 0.
4. "VMCS shadowing" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the "VMCS shadowing" VM-execution control were 0. See Section 26.6.2.

— If the processor is not in SMM or the "entry to SMM" VM-entry control is 1, the field must not contain the current VMCS pointer.

— If the processor is in SMM and the "entry to SMM" VM-entry control is 0, the field must differ from the executive-VMCS pointer.

28.3.1.6 Checks on Guest Page-Directory-Pointer-Table Entries

If CR0.PG =1, CR4.PAE = 1, and IA32_EFER.LME = 0, the logical processor uses **PAE paging** (see Section 5.4 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A).[1] When PAE paging is in use, the physical address in CR3 references a table of **page-directory-pointer-table entries** (PDPTEs). A MOV to CR3 when PAE paging is in use checks the validity of the PDPTEs.

A VM entry is to a guest that uses PAE paging if (1) bit 31 (corresponding to CR0.PG) is set in the CR0 field in the guest-state area; (2) bit 5 (corresponding to CR4.PAE) is set in the CR4 field; and (3) the "IA-32e mode guest" VM-entry control is 0. Such a VM entry checks the validity of the PDPTEs:

- If the "enable EPT" VM-execution control is 0, VM entry checks the validity of the PDPTEs referenced by the CR3 field in the guest-state area if either (1) PAE paging was not in use before the VM entry; or (2) the value of CR3 is changing as a result of the VM entry. VM entry may check their validity even if neither (1) nor (2) hold.[2]
- If the "enable EPT" VM-execution control is 1, VM entry checks the validity of the PDPTE fields in the guest-state area (see Section 26.4.2).

A VM entry to a guest that does not use PAE paging does not check the validity of any PDPTEs.

A VM entry that checks the validity of the PDPTEs uses the same checks that are used when CR3 is loaded with MOV to CR3 when PAE paging is in use.[3] If MOV to CR3 would cause a general-protection exception due to the PDPTEs that would be loaded (e.g., because a reserved bit is set), the VM entry fails.

28.3.2 Loading Guest State

Processor state is updated on VM entries in the following ways:

- Some state is loaded from the guest-state area.
- Some state is determined by VM-entry controls.
- The page-directory pointers are loaded based on the values of certain control registers.

This loading may be performed in any order and in parallel with the checking of VMCS contents (see Section 28.3.1).

The loading of guest state is detailed in Section 28.3.2.1 to Section 28.3.2.4. These sections reference VMCS fields that correspond to processor state. Unless otherwise stated, these references are to fields in the guest-state area.

In addition to the state loading described in this section, VM entries may load MSRs from the VM-entry MSR-load area (see Section 28.4). This loading occurs only after the state loading described in this section and the checking of VMCS contents described in Section 28.3.1.

28.3.2.1 Loading Guest Control Registers, Debug Registers, and MSRs

The following items describe how guest control registers, debug registers, and MSRs are loaded on VM entry:

---

1. On processors that support Intel 64 architecture, the physical-address extension may support more than 36 physical-address bits. Software can determine the number physical-address bits supported by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
2. "Enable EPT" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the "enable EPT" VM-execution control were 0. See Section 26.6.2.
3. This implies that (1) bits 11:9 in each PDPTE are ignored; and (2) if bit 0 (present) is clear in one of the PDPTEs, bits 63:1 of that PDPTE are ignored.

- CR0 is loaded from the CR0 field with the exception of the following bits, which are never modified on VM entry: ET (bit 4); reserved bits 15:6, 17, and 28:19; NW (bit 29) and CD (bit 30).[1] The values of these bits in the CR0 field are ignored.
- CR3 and CR4 are loaded from the CR3 field and the CR4 field, respectively.
- If the "load debug controls" VM-entry control is 1, DR7 is loaded from the DR7 field with the exception that bit 12 and bits 15:14 are always 0 and bit 10 is always 1. The values of these bits in the DR7 field are ignored.

  The first processors to support the virtual-machine extensions supported only the 1-setting of the "load debug controls" VM-entry control and thus always loaded DR7 from the DR7 field.
- The following describes how certain MSRs are loaded using fields in the guest-state area:
  - If the "load debug controls" VM-entry control is 1, the IA32_DEBUGCTL MSR is loaded from the IA32_DEBUGCTL field. The first processors to support the virtual-machine extensions supported only the 1-setting of this control and thus always loaded the IA32_DEBUGCTL MSR from the IA32_DEBUGCTL field.
  - The IA32_SYSENTER_CS MSR is loaded from the IA32_SYSENTER_CS field. Since this field has only 32 bits, bits 63:32 of the MSR are cleared to 0.
  - The IA32_SYSENTER_ESP and IA32_SYSENTER_EIP MSRs are loaded from the IA32_SYSENTER_ESP field and the IA32_SYSENTER_EIP field, respectively. On processors that do not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are cleared to 0.
  - The following are performed on processors that support Intel 64 architecture:
    - The MSRs FS.base and GS.base are loaded from the base-address fields for FS and GS, respectively (see Section 28.3.2.2).
    - If the "load IA32_EFER" VM-entry control is 0, bits in the IA32_EFER MSR are modified as follows:
      - IA32_EFER.LMA is loaded with the setting of the "IA-32e mode guest" VM-entry control.
      - If CR0 is being loaded so that CR0.PG = 1, IA32_EFER.LME is also loaded with the setting of the "IA-32e mode guest" VM-entry control.[2] Otherwise, IA32_EFER.LME is unmodified.

      See below for the case in which the "load IA32_EFER" VM-entry control is 1
  - If the "load IA32_PERF_GLOBAL_CTRL" VM-entry control is 1, the IA32_PERF_GLOBAL_CTRL MSR is loaded from the IA32_PERF_GLOBAL_CTRL field.
  - If the "load IA32_PAT" VM-entry control is 1, the IA32_PAT MSR is loaded from the IA32_PAT field.
  - If the "load IA32_EFER" VM-entry control is 1, the IA32_EFER MSR is loaded from the IA32_EFER field.
  - If the "load IA32_BNDCFGS" VM-entry control is 1, the IA32_BNDCFGS MSR is loaded from the IA32_BNDCFGS field.
  - If the "load IA32_RTIT_CTL" VM-entry control is 1, the IA32_RTIT_CTL MSR is loaded from the IA32_RTIT_CTL field.
  - If the "load CET" VM-entry control is 1, the IA32_S_CET and IA32_INTERRUPT_SSP_TABLE_ADDR MSRs are loaded from the IA32_S_CET field and the IA32_INTERRUPT_SSP_TABLE_ADDR field, respectively. On processors that do not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are cleared to 0.
  - If the "load guest IA32_LBR_CTL" VM-entry control is 1, the IA32_LBR_CTL MSR is loaded from the IA32_LBR_CTL guest state field.
  - If the "load PKRS" VM-entry control is 1, the IA32_PKRS MSR is loaded from the IA32_PKRS field.
  - If the "load UINV" VM-entry control is 1, UINV is loaded with the low 8 bits of the UINV field. UINV is represented in bits 39:32 of the IA32_UINTR_MISC MSR. The remainder of the MSR is not modified.

1. Bits 15:6, bit 17, and bit 28:19 of CR0 and CR0.ET are unchanged by executions of MOV to CR0. Bits 15:6, bit 17, and bit 28:19 of CR0 are always 0 and CR0.ET is always 1.
2. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, VM entry must be loading CR0 so that CR0.PG = 1 unless the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

With the exception of FS.base and GS.base, any of these MSRs is subsequently overwritten if it appears in the VM-entry MSR-load area. See Section 28.4.

- The SMBASE register is unmodified by all VM entries except those that return from SMM.

28.3.2.2 Loading Guest Segment Registers and Descriptor-Table Registers

For each of CS, SS, DS, ES, FS, GS, TR, and LDTR, fields are loaded from the guest-state area as follows:

- The unusable bit is loaded from the access-rights field. This bit can never be set for TR (see Section 28.3.1.2). If it is set for one of the other registers, the following apply:
  - For each of CS, SS, DS, ES, FS, and GS, uses of the segment cause faults (general-protection exception or stack-fault exception) outside 64-bit mode, just as they would had the segment been loaded using a null selector. This bit does not cause accesses to fault in 64-bit mode.
  - If this bit is set for LDTR, uses of LDTR cause general-protection exceptions in all modes, just as they would had LDTR been loaded using a null selector.

  If this bit is clear for any of CS, SS, DS, ES, FS, GS, TR, and LDTR, a null selector value does not cause a fault (general-protection exception or stack-fault exception).
- TR. The selector, base, limit, and access-rights fields are loaded.
- CS.
  - The following fields are always loaded: selector, base address, limit, and (from the access-rights field) the L, D, and G bits.
  - For the other fields, the unusable bit of the access-rights field is consulted:
    - If the unusable bit is 0, all of the access-rights field is loaded.
    - If the unusable bit is 1, the remainder of CS access rights are undefined after VM entry.
- SS, DS, ES, FS, GS, and LDTR.
  - The selector fields are loaded.
  - For the other fields, the unusable bit of the corresponding access-rights field is consulted:
    - If the unusable bit is 0, the base-address, limit, and access-rights fields are loaded.
    - If the unusable bit is 1, the base address, the segment limit, and the remainder of the access rights are undefined after VM entry with the following exceptions:
      - Bits 3:0 of the base address for SS are cleared to 0.
      - SS.DPL is always loaded from the SS access-rights field. This will be the current privilege level (CPL) after the VM entry completes.
      - SS.B is always set to 1.
      - The base addresses for FS and GS are loaded from the corresponding fields in the VMCS. On processors that support Intel 64 architecture, the values loaded for base addresses for FS and GS are also manifest in the FS.base and GS.base MSRs.
      - On processors that support Intel 64 architecture, bits 63:32 of the base addresses for SS, DS, and ES are cleared to 0.

GDTR and IDTR are loaded using the base and limit fields.

28.3.2.3 Loading Guest RIP, RSP, RFLAGS, and SSP

RSP, RIP, and RFLAGS are loaded from the RSP field, the RIP field, and the RFLAGS field, respectively.

If the "load CET" VM-entry control is 1, SSP (shadow-stack pointer) is loaded from the SSP field.

The following items regard the upper 32 bits of these fields on VM entries that are not to 64-bit mode:

- Bits 63:32 of RSP are undefined outside 64-bit mode. Thus, a logical processor may ignore the contents of bits 63:32 of the RSP field on VM entries that are not to 64-bit mode.

- As noted in Section 28.3.1.4, bits 63:32 of the RIP and RFLAGS fields must be 0 on VM entries that are not to 64-bit mode. (The same is true for SSP for VM entries that are not to 64-bit mode when the "load CET" VM-entry control is 1.)

28.3.2.4 Loading Page-Directory-Pointer-Table Entries

As noted in Section 28.3.1.6, the logical processor uses PAE paging if CR0.PG = 1, CR4.PAE = 1, and IA32_EFER.LME = 0. A VM entry to a guest that uses PAE paging loads the PDPTEs into internal, non-architectural registers based on the setting of the "enable EPT" VM-execution control:

- If the control is 0, the PDPTEs are loaded from the page-directory-pointer table referenced by the physical address in the value of CR3 being loaded by the VM entry (see Section 28.3.2.1). The values loaded are treated as physical addresses in VMX non-root operation.
- If the control is 1, the PDPTEs are loaded from corresponding fields in the guest-state area (see Section 26.4.2). The values loaded are treated as guest-physical addresses in VMX non-root operation.

28.3.2.5 Updating Non-Register State

Section 30.4 describes how the VMX architecture controls how a logical processor manages information in the TLBs and paging-structure caches. The following items detail how VM entries invalidate cached mappings:

- If the "enable VPID" VM-execution control is 0, the logical processor invalidates linear mappings and combined mappings associated with VPID 0000H (for all PCIDs); combined mappings for VPID 0000H are invalidated for all EPTRTA values (EPTRTA is the value of bits 51:12 of EPTP).
- VM entries are not required to invalidate any guest-physical mappings, nor are they required to invalidate any linear mappings or combined mappings if the "enable VPID" VM-execution control is 1.

If the "virtual-interrupt delivery" VM-execution control is 1, VM entry loads the values of RVI and SVI from the guest interrupt-status field in the VMCS (see Section 26.4.2). After doing so, the logical processor first causes PPR virtualization (Section 31.1.3) and then evaluates pending virtual interrupts (Section 31.2.1).

If a virtual interrupt is recognized, it may be delivered in VMX non-root operation immediately after VM entry (including any specified event injection) completes; see Section 28.7.5. See Section 31.2.2 for details regarding the delivery of virtual interrupts.

28.3.3 Clearing Address-Range Monitoring

The Intel 64 and IA-32 architectures allow software to monitor a specified address range using the MONITOR and MWAIT instructions. See Section 10.10.4 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A. VM entries clear any address-range monitoring that may be in effect.

28.4 LOADING MSRS

VM entries may load MSRs from the VM-entry MSR-load area (see Section 26.8.2). Specifically each entry in that area (up to the number specified in the VM-entry MSR-load count) is processed in order by loading the MSR indexed by bits 31:0 with the contents of bits 127:64 as they would be written by WRMSR.[1]

Processing of an entry fails in any of the following cases:

- The value of bits 31:0 is either C0000100H (the IA32_FS_BASE MSR) or C0000101 (the IA32_GS_BASE MSR).
- The value of bits 31:8 is 000008H, meaning that the indexed MSR is one that allows access to an APIC register when the local APIC is in x2APIC mode.
- The value of bits 31:0 indicates an MSR that can be written only in system-management mode (SMM) and the VM entry did not commence in SMM. (IA32_SMM_MONITOR_CTL is an MSR that can be written only in SMM.)

1. Because attempts to modify the value of IA32_EFER.LMA by WRMSR are ignored, attempts to modify it using the VM-entry MSR-load area are also ignored.

- The value of bits 31:0 indicates an MSR that cannot be loaded on VM entries for model-specific reasons. A processor may prevent loading of certain MSRs even if they can normally be written by WRMSR. Such model-specific behavior is documented in Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4.
- Bits 63:32 are not all 0.
- An attempt to write bits 127:64 to the MSR indexed by bits 31:0 of the entry would cause a general-protection exception if executed via WRMSR with CPL = 0.[1]

The VM entry fails if processing fails for any entry. The logical processor responds to such failures by loading state from the host-state area, as it would for a VM exit. See Section 28.8.

If any MSR is being loaded in such a way that would architecturally require a TLB flush, the TLBs are updated so that, after VM entry, the logical processor will not use any translations that were cached before the transition.

28.5 TRACE-ADDRESS PRE-TRANSLATION (TAPT)

When the "Intel PT uses guest physical addresses" VM-execution control is 1, the addresses used by Intel PT are treated as guest-physical addresses, and these are translated to physical addresses using EPT.

VM entry uses **trace-address pre-translation** (**TAPT**) to prevent buffered trace data from being lost due to an EPT violation; see Section 27.5.4.2. VM entry uses TAPT only if Intel PT will be enabled following VM entry (IA32_RTIT_CTL.TraceEn = 1) and only if the "Intel PT uses guest physical addresses" VM-execution control is 1

As noted in Section 27.5.4, TAPT may cause a VM exit due to an EPT violation, EPT misconfiguration, page-modification log-full event, or APIC access. If such a VM exit occurs as a result of TAPT during VM entry, the VM exit operates as if it had occurred in VMX non-root operation after the VM entry completed (in the guest context).

If TAPT during VM entry causes a VM exit, the VM entry does not perform event injection (Section 28.6), even if the valid bit in the VM-entry interruption-information field is 1. Such VM exits save the contents of VM-entry interruption-information and VM-entry exception error code fields into the IDT-vectoring information and IDT-vectoring error code fields, respectively.

28.6 EVENT INJECTION

If the valid bit in the VM-entry interruption-information field (see Section 26.8.3) is 1, VM entry causes an event to be delivered (or made pending) after all components of guest state have been loaded (including MSRs) and after the VM-execution control fields have been established.

- If the interruption type in the field is 0 (external interrupt), 2 (non-maskable interrupt); 3 (hardware exception), 4 (software interrupt), 5 (privileged software exception), or 6 (software exception), the event is delivered as described in Section 28.6.1.
- If the interruption type in the field is 7 (other event) and the vector field is 0, an MTF VM exit is pending after VM entry. See Section 28.6.2.

28.6.1 Vectored-Event Injection

VM entry delivers an injected vectored event within the guest context established by VM entry. This means that delivery occurs after all components of guest state have been loaded (including MSRs) and after the VM-execution

1. If CR0.PG = 1, WRMSR to the IA32_EFER MSR causes a general-protection exception if it would modify the LME bit. If VM entry has established CR0.PG = 1, the IA32_EFER MSR should not be included in the VM-entry MSR-load area for the purpose of modifying the LME bit.

control fields have been established.[1] The event is delivered using the vector in that field to select a descriptor in the IDT. Since event injection occurs after loading IDTR from the guest-state area, this is the guest IDT.

Section 28.6.1.1 provides details of vectored-event injection. In general, the event is delivered exactly as if it had been generated normally.

An exception is made if the following all hold: bit 25 (UINTR) is set to 1 in the guest CR4 field and the "IA-32e mode guest" VM-entry control is 1, and VM entry is modified if it is injecting an external interrupt whose vector is the value that UINV would have after VM entry. In this case, the logical processor then performs user-interrupt notification processing as specified in Section 8.5.2 instead of the process described in Section 28.6.1.1. (If the guest activity-state field indicated the HLT state, the logical processor enters the HLT state following user-interrupt notification processing.)

If event delivery (or user-interrupt notification processing; see above) encounters a nested exception (for example, a general-protection exception because the vector indicates a descriptor beyond the IDT limit), the exception bitmap is consulted using the vector of that exception:

- If the bit for the nested exception is 0, the nested exception is delivered normally. If the nested exception is benign, it is delivered through the IDT. If it is contributory or a page fault, a double fault may be generated, depending on the nature of the event whose delivery encountered the nested exception. See Chapter 7, "Interrupt 8—Double Fault Exception (#DF)" in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.[2]
- If the bit for the nested exception is 1, a VM exit occurs. Section 28.6.1.2 details cases in which event injection causes a VM exit.

28.6.1.1 Details of Vectored-Event Injection

The event-injection process is controlled by the contents of the VM-entry interruption information field (format given in Table 26-17), the VM-entry exception error-code field, and the VM-entry instruction-length field. The following items provide details of the process:

- The value pushed on the stack for RFLAGS is generally that which was loaded from the guest-state area. The value pushed for the RF flag is not modified based on the type of event being delivered. However, the pushed value of RFLAGS may be modified if a software interrupt is being injected into a guest that will be in virtual-8086 mode (see below). After RFLAGS is pushed on the stack, the value in the RFLAGS register is modified as is done normally when delivering an event through the IDT.
- The instruction pointer that is pushed on the stack depends on the type of event and whether nested exceptions occur during its delivery. The term **current guest RIP** refers to the value to be loaded from the guest-state area. The value pushed is determined as follows:[3]
  - — If VM entry successfully injects (with no nested exception) an event with interruption type external interrupt, NMI, or hardware exception, the current guest RIP is pushed on the stack.
  - — If VM entry successfully injects (with no nested exception) an event with interruption type software interrupt, privileged software exception, or software exception, the current guest RIP is incremented by the VM-entry instruction length before being pushed on the stack.
  - — If VM entry encounters an exception while injecting an event and that exception does not cause a VM exit, the current guest RIP is pushed on the stack regardless of event type or VM-entry instruction length. If the encountered exception does cause a VM exit that saves RIP, the saved RIP is current guest RIP.
- If the deliver-error-code bit (bit 11) is set in the VM-entry interruption-information field, the contents of the VM-entry exception error-code field is pushed on the stack as an error code would be pushed during delivery of an exception.

---

1. This does not imply that injection of an exception or interrupt will cause a VM exit due to the settings of VM-execution control fields (such as the exception bitmap) that would cause a VM exit if the event had occurred in VMX non-root operation. In contrast, a nested exception encountered during event delivery may cause a VM exit; see Section 28.6.1.1.
2. Hardware exceptions with the following unused vectors are considered benign: 15 and 21–31. A hardware exception with vector 20 is considered benign unless the processor supports the 1-setting of the "EPT-violation #VE" VM-execution control; in that case, it has the same severity as page faults.
3. While these items refer to RIP, the width of the value pushed (16 bits, 32 bits, or 64 bits) is determined normally.

- DR6, DR7, and the IA32_DEBUGCTL MSR are not modified by event injection, even if the event has vector 1 (normal deliveries of debug exceptions, which have vector 1, do update these registers).
- If VM entry is injecting a software interrupt and the guest will be in virtual-8086 mode (RFLAGS.VM = 1), no general-protection exception can occur due to RFLAGS.IOPL < 3. A VM monitor should check RFLAGS.IOPL before injecting such an event and, if desired, inject a general-protection exception instead of a software interrupt.
- If VM entry is injecting a software interrupt and the guest will be in virtual-8086 mode with virtual-8086 mode extensions (RFLAGS.VM = CR4.VME = 1), event delivery is subject to VME-based interrupt redirection based on the software interrupt redirection bitmap in the task-state segment (TSS) as follows:
  - If bit *n* in the bitmap is clear (where *n* is the number of the software interrupt), the interrupt is directed to an 8086 program interrupt handler: the processor uses a 16-bit interrupt-vector table (IVT) located at linear address zero. If the value of RFLAGS.IOPL is less than 3, the following modifications are made to the value of RFLAGS that is pushed on the stack: IOPL is set to 3, and IF is set to the value of VIF.
  - If bit *n* in the bitmap is set (where *n* is the number of the software interrupt), the interrupt is directed to a protected-mode interrupt handler. (In other words, the injection is treated as described in the next item.) In this case, the software interrupt does not invoke such a handler if RFLAGS.IOPL < 3 (a general-protection exception occurs instead). However, as noted above, RFLAGS.IOPL cannot cause an injected software interrupt to cause such a exception. Thus, in this case, the injection invokes a protected-mode interrupt handler independent of the value of RFLAGS.IOPL.

  Injection of events of other types are not subject to this redirection.
- If VM entry is injecting a software interrupt (not redirected as described above) or software exception, privilege checking is performed on the IDT descriptor being accessed as would be the case for executions of INT *n*, INT3, or INTO (the descriptor's DPL cannot be less than CPL). There is no checking of RFLAGS.IOPL, even if the guest will be in virtual-8086 mode. Failure of this check may lead to a nested exception. Injection of an event with interruption type external interrupt, NMI, hardware exception, and privileged software exception, or with interruption type software interrupt and being redirected as described above, do not perform these checks.
- If VM entry is injecting a non-maskable interrupt (NMI) and the "virtual NMIs" VM-execution control is 1, virtual-NMI blocking is in effect after VM entry.
- The transition causes a last-branch record to be logged if the LBR bit is set in the IA32_DEBUGCTL MSR. This is true even for events such as debug exceptions, which normally clear the LBR bit before delivery.
- The last-exception record MSRs (LERs) may be updated based on the setting of the LBR bit in the IA32_DEBUGCTL MSR. Events such as debug exceptions, which normally clear the LBR bit before they are delivered, and therefore do not normally update the LERs, may do so as part of VM-entry event injection.
- If injection of an event encounters a nested exception, the value of the EXT bit (bit 0) in any error code for that nested exception is determined as follows:
  - If event being injected has interruption type external interrupt, NMI, hardware exception, or privileged software exception and encounters a nested exception (but does not produce a double fault), the error code for that exception sets the EXT bit.
  - If event being injected is a software interrupt or a software exception and encounters a nested exception, the error code for that exception clears the EXT bit.
  - If event delivery encounters a nested exception and delivery of that exception encounters another exception (but does not produce a double fault), the error code for that exception sets the EXT bit.
  - If a double fault is produced, the error code for the double fault is 0000H (the EXT bit is clear).

28.6.1.2 VM Exits During Event Injection

An event being injected never causes a VM exit directly regardless of the settings of the VM-execution controls. For example, setting the "NMI exiting" VM-execution control to 1 does not cause a VM exit due to injection of an NMI.

However, the event-delivery process may lead to a VM exit:

- If the vector in the VM-entry interruption-information field identifies a task gate in the IDT, the attempted task switch may cause a VM exit just as it would had the injected event occurred during normal execution in VMX non-root operation (see Section 27.4.2).

- If event delivery encounters a nested exception, a VM exit may occur depending on the contents of the exception bitmap (see Section 27.2).
- If event delivery generates a double-fault exception (due to a nested exception); the logical processor encounters another nested exception while attempting to call the double-fault handler; and that exception does not cause a VM exit due to the exception bitmap; then a VM exit occurs due to triple fault (see Section 27.2).
- If event delivery injects a double-fault exception and encounters a nested exception that does not cause a VM exit due to the exception bitmap, then a VM exit occurs due to triple fault (see Section 27.2).
- If the "virtualize APIC accesses" VM-execution control is 1 and event delivery generates an access to the APIC-access page, that access is treated as described in Section 31.4 and may cause a VM exit.[1]

If the event-delivery process does cause a VM exit, the processor state before the VM exit is determined just as it would be had the injected event occurred during normal execution in VMX non-root operation. If the injected event directly accesses a task gate that cause a VM exit or if the first nested exception encountered causes a VM exit, information about the injected event is saved in the IDT-vectoring information field (see Section 29.2.4).

The material in this section applies also if injection of an external interrupt results in user-interrupt notification processing instead of event delivery (see Section 28.6.1 earlier).

28.6.1.3 Event Injection for VM Entries to Real-Address Mode

If VM entry is loading CR0.PE with 0, any injected vectored event is delivered as would normally be done in real-address mode.[2] Specifically, VM entry uses the vector provided in the VM-entry interruption-information field to select a 4-byte entry from an interrupt-vector table at the linear address in IDTR.base. Further details are provided in Section 15.1.4 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

Because bit 11 (deliver error code) in the VM-entry interruption-information field must be 0 if CR0.PE will be 0 after VM entry (see Section 28.2.1.3), vectored events injected with CR0.PE = 0 do not push an error code on the stack. This is consistent with event delivery in real-address mode.

If event delivery encounters a fault (due to a violation of IDTR.limit or of SS.limit), the fault is treated as if it had occurred during event delivery in VMX non-root operation. Such a fault may lead to a VM exit as discussed in Section 28.6.1.2.

28.6.2 Injection of Pending MTF VM Exits

If the interruption type in the VM-entry interruption-information field is 7 (other event) and the vector field is 0, VM entry causes an MTF VM exit to be pending on the instruction boundary following VM entry. This is the case even if the "monitor trap flag" VM-execution control is 0. See Section 27.5.2 for the treatment of pending MTF VM exits.

28.7 SPECIAL FEATURES OF VM ENTRY

This section details a variety of features of VM entry. It uses the following terminology: a VM entry is **vectoring** if the valid bit (bit 31) of the VM-entry interruption information field is 1 and the interruption type in the field is 0 (external interrupt), 2 (non-maskable interrupt); 3 (hardware exception), 4 (software interrupt), 5 (privileged software exception), or 6 (software exception).

1. "Virtualize APIC accesses" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the "virtualize APIC accesses" VM-execution control were 0. See Section 26.6.2.
2. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, VM entry must be loading CR0.PE with 1 unless the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

28.7.1 Interruptibility State

The interruptibility-state field in the guest-state area (see Table 26-3) contains bits that control blocking by STI, blocking by MOV SS, and blocking by NMI. This field impacts event blocking after VM entry as follows:

- If the VM entry is vectoring, there is no blocking by STI or by MOV SS following the VM entry, regardless of the contents of the interruptibility-state field.
- If the VM entry is not vectoring, the following apply:
  - Events are blocked by STI if and only if bit 0 in the interruptibility-state field is 1. This blocking is cleared after the guest executes one instruction or incurs an exception (including a debug exception made pending by VM entry; see Section 28.7.3).
  - Events are blocked by MOV SS if and only if bit 1 in the interruptibility-state field is 1. This may affect the treatment of pending debug exceptions; see Section 28.7.3. This blocking is cleared after the guest executes one instruction or incurs an exception (including a debug exception made pending by VM entry).
- The blocking of non-maskable interrupts (NMIs) is determined as follows:
  - If the "virtual NMIs" VM-execution control is 0, NMIs are blocked if and only if bit 3 (blocking by NMI) in the interruptibility-state field is 1. If the "NMI exiting" VM-execution control is 0, execution of the IRET instruction removes this blocking (even if the instruction generates a fault). If the "NMI exiting" control is 1, IRET does not affect this blocking.
  - The following items describe the use of bit 3 (blocking by NMI) in the interruptibility-state field if the "virtual NMIs" VM-execution control is 1:
    - The bit's value does not affect the blocking of NMIs after VM entry. NMIs are not blocked in VMX non-root operation (except for ordinary blocking for other reasons, such as by the MOV SS instruction, the wait-for-SIPI state, etc.)
    - The bit's value determines whether there is virtual-NMI blocking after VM entry. If the bit is 1, virtual-NMI blocking is in effect after VM entry. If the bit is 0, there is no virtual-NMI blocking after VM entry unless the VM entry is injecting an NMI (see Section 28.6.1.1). Execution of IRET removes virtual-NMI blocking (even if the instruction generates a fault).

  If the "NMI exiting" VM-execution control is 0, the "virtual NMIs" control must be 0; see Section 28.2.1.1.
- Blocking of system-management interrupts (SMIs) is determined as follows:
  - If the VM entry was not executed in system-management mode (SMM), SMI blocking is unchanged by VM entry.
  - If the VM entry was executed in SMM, SMIs are blocked after VM entry if and only if the bit 2 in the interruptibility-state field is 1.

28.7.2 Activity State

The activity-state field in the guest-state area controls whether, after VM entry, the logical processor is active or in one of the inactive states identified in Section 26.4.2. The use of this field is determined as follows:

- If the VM entry is vectoring, the logical processor is in the active state after VM entry. While the consistency checks described in Section 28.3.1.5 on the activity-state field do apply in this case, the contents of the activity-state field do not determine the activity state after VM entry.
- If the VM entry is not vectoring, the logical processor ends VM entry in the activity state specified in the guest-state area. If VM entry ends with the logical processor in an inactive activity state, the VM entry generates any special bus cycle that is normally generated when that activity state is entered from the active state. If VM entry would end with the logical processor in the shutdown state and the logical processor is in SMX operation,[1] an Intel® TXT shutdown condition occurs. The error code used is 0000H, indicating "legacy shutdown." See the Intel® Trusted Execution Technology Preliminary Architecture Specification.

1. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENTER]. See Chapter 6, "Safer Mode Extensions Reference," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B.

- Some activity states unconditionally block certain events. The following blocking is in effect after any VM entry that puts the processor in the indicated state:
  - The active state blocks start-up IPIs (SIPIs). SIPIs that arrive while a logical processor is in the active state and in VMX non-root operation are discarded and do not cause VM exits.
  - The HLT state blocks start-up IPIs (SIPIs). SIPIs that arrive while a logical processor is in the HLT state and in VMX non-root operation are discarded and do not cause VM exits.
  - The shutdown state blocks external interrupts and SIPIs. External interrupts that arrive while a logical processor is in the shutdown state and in VMX non-root operation do not cause VM exits even if the "external-interrupt exiting" VM-execution control is 1. SIPIs that arrive while a logical processor is in the shutdown state and in VMX non-root operation are discarded and do not cause VM exits.
  - The wait-for-SIPI state blocks external interrupts, non-maskable interrupts (NMIs), INIT signals, and system-management interrupts (SMIs). Such events do not cause VM exits if they arrive while a logical processor is in the wait-for-SIPI state and in VMX non-root operation.

28.7.3 Delivery of Pending Debug Exceptions after VM Entry

The pending debug exceptions field in the guest-state area indicates whether there are debug exceptions that have not yet been delivered (see Section 26.4.2). This section describes how these are treated on VM entry.

There are no pending debug exceptions after VM entry if any of the following are true:

- The VM entry is vectoring with one of the following interruption types: external interrupt, non-maskable interrupt (NMI), hardware exception, or privileged software exception.
- The interruptibility-state field does not indicate blocking by MOV SS and the VM entry is vectoring with either of the following interruption type: software interrupt or software exception.
- The VM entry is not vectoring and the activity-state field indicates either shutdown or wait-for-SIPI.

If none of the above hold, the pending debug exceptions field specifies the debug exceptions that are pending for the guest. There are **valid pending debug exceptions** if either the BS bit (bit 14) or the enable-breakpoint bit (bit 12) is 1. If there are valid pending debug exceptions, they are handled as follows:

- If the VM entry is not vectoring, the pending debug exceptions are treated as they would had they been encountered normally in guest execution:
  - If the logical processor is not blocking such exceptions (the interruptibility-state field indicates no blocking by MOV SS), a debug exception is delivered after VM entry (see below).
  - If the logical processor is blocking such exceptions (due to blocking by MOV SS), the pending debug exceptions are held pending or lost as would normally be the case.
- If the VM entry is vectoring (with interruption type software interrupt or software exception and with blocking by MOV SS), the following items apply:
  - For injection of a software interrupt or of a software exception with vector 3 (#BP) or vector 4 (#OF) — or a privileged software exception with vector 1 (#DB) — the pending debug exceptions are treated as they would had they been encountered normally in guest execution if the corresponding instruction (INT1, INT3, or INTO) were executed after a MOV SS that encountered a debug trap.
  - For injection of a software exception with a vector other than 3 and 4, the pending debug exceptions may be lost or they may be delivered after injection (see below).

If there are no valid pending debug exceptions (as defined above), no pending debug exceptions are delivered after VM entry.

If a pending debug exception is delivered after VM entry, it has the priority of "traps on the previous instruction" (see Section 7.9 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A). Thus, INIT signals and system-management interrupts (SMIs) take priority of such an exception, as do VM exits induced by the TPR threshold (see Section 28.7.7) and pending MTF VM exits (see Section 28.7.8. The exception takes priority over any pending non-maskable interrupt (NMI) or external interrupt and also over VM exits due to the 1-settings of the "interrupt-window exiting" and "NMI-window exiting" VM-execution controls.

A pending debug exception delivered after VM entry causes a VM exit if the bit 1 (#DB) is 1 in the exception bitmap. If it does not cause a VM exit, it updates DR6 normally.

28.7.4 VMX-Preemption Timer

If the "activate VMX-preemption timer" VM-execution control is 1, VM entry starts the VMX-preemption timer with the unsigned value in the VMX-preemption timer-value field.

It is possible for the VMX-preemption timer to expire during VM entry (e.g., if the value in the VMX-preemption timer-value field is zero). If this happens (and if the VM entry was not to the wait-for-SIPI state), a VM exit occurs with its normal priority after any event injection and before execution of any instruction following VM entry. For example, any pending debug exceptions established by VM entry (see Section 28.7.3) take priority over a timer-induced VM exit. (The timer-induced VM exit will occur after delivery of the debug exception, unless that exception or its delivery causes a different VM exit.)

See Section 27.5.1 for details of the operation of the VMX-preemption timer in VMX non-root operation, including the blocking and priority of the VM exits that it causes.

28.7.5 Interrupt-Window Exiting and Virtual-Interrupt Delivery

If "interrupt-window exiting" VM-execution control is 1, an open interrupt window may cause a VM exit immediately after VM entry (see Section 27.2 for details). If the "interrupt-window exiting" VM-execution control is 0 but the "virtual-interrupt delivery" VM-execution control is 1, a virtual interrupt may be delivered immediately after VM entry (see Section 28.3.2.5 and Section 31.2.1).

The following items detail the treatment of these events:

- These events occur after any event injection specified for VM entry.
- Non-maskable interrupts (NMIs) and higher priority events take priority over these events. These events take priority over external interrupts and lower priority events.
- These events wake the logical processor if it just entered the HLT state because of a VM entry (see Section 28.7.2). They do not occur if the logical processor just entered the shutdown state or the wait-for-SIPI state.

28.7.6 NMI-Window Exiting

The "NMI-window exiting" VM-execution control may cause a VM exit to occur immediately after VM entry (see Section 27.2 for details).

The following items detail the treatment of these VM exits:

- These VM exits follow event injection if such injection is specified for VM entry.
- Debug-trap exceptions (see Section 28.7.3) and higher priority events take priority over VM exits caused by this control. VM exits caused by this control take priority over non-maskable interrupts (NMIs) and lower priority events.
- VM exits caused by this control wake the logical processor if it just entered either the HLT state or the shutdown state because of a VM entry (see Section 28.7.2). They do not occur if the logical processor just entered the wait-for-SIPI state.

28.7.7 VM Exits Induced by the TPR Threshold

If the "use TPR shadow" and "virtualize APIC accesses" VM-execution controls are both 1 and the "virtual-interrupt delivery" VM-execution control is 0, a VM exit occurs immediately after VM entry if the value of bits 3:0 of the TPR threshold VM-execution control field is greater than the value of bits 7:4 of VTPR (see Section 31.1.1).[1]

1. "Virtualize APIC accesses" and "virtual-interrupt delivery" are secondary processor-based VM-execution controls. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if these controls were 0. See Section 26.6.2.

The following items detail the treatment of these VM exits:

- The VM exits are not blocked if RFLAGS.IF = 0 or by the setting of bits in the interruptibility-state field in guest-state area.
- The VM exits follow event injection if such injection is specified for VM entry.
- VM exits caused by this control take priority over system-management interrupts (SMIs), INIT signals, and lower priority events. They thus have priority over the VM exits described in Section 28.7.5, Section 28.7.6, and Section 28.7.8, as well as any interrupts or debug exceptions that may be pending at the time of VM entry.
- These VM exits wake the logical processor if it just entered the HLT state as part of a VM entry (see Section 28.7.2). They do not occur if the logical processor just entered the shutdown state or the wait-for-SIPI state.

  If such a VM exit is suppressed because the processor just entered the shutdown state, it occurs after the delivery of any event that cause the logical processor to leave the shutdown state while remaining in VMX non-root operation (e.g., due to an NMI that occurs while the "NMI-exiting" VM-execution control is 0).
- The basic exit reason is "TPR below threshold."

28.7.8 Pending MTF VM Exits

As noted in Section 28.6.2, VM entry may cause an MTF VM exit to be pending immediately after VM entry. The following items detail the treatment of these VM exits:

- System-management interrupts (SMIs), INIT signals, and higher priority events take priority over these VM exits. These VM exits take priority over debug-trap exceptions and lower priority events.
- These VM exits wake the logical processor if it just entered the HLT state because of a VM entry (see Section 28.7.2). They do not occur if the logical processor just entered the shutdown state or the wait-for-SIPI state.

28.7.9 VM Entries and Advanced Debugging Features

VM entries are not logged with last-branch records, do not produce branch-trace messages, and do not update the branch-trace store.

28.7.10 User-Interrupt Recognition After VM Entry

A VM entry results in recognition of a pending user interrupt if it completes with CR4.UINTR = IA32_EFER.LMA = 1 and with UIRR ≠ 0; otherwise, no pending user interrupt is recognized.

28.8 VM-ENTRY FAILURES DURING OR AFTER LOADING GUEST STATE

VM-entry failures due to the checks identified in Section 28.3.1 and failures during the MSR loading identified in Section 28.4 are treated differently from those that occur earlier in VM entry. In these cases, the following steps take place:

1. Information about the VM-entry failure is recorded in the VM-exit information fields:
   - Exit reason.
     - Bits 15:0 of this field contain the basic exit reason. It is loaded with a number indicating the general cause of the VM-entry failure. The following numbers are used:

       33. VM-entry failure due to invalid guest state. A VM entry failed one of the checks identified in Section 28.3.1.

       34. VM-entry failure due to MSR loading. A VM entry failed in an attempt to load MSRs (see Section 28.4).

       41. VM-entry failure due to machine-check event. A machine-check event occurred during VM entry (see Section 28.9).

- Bit 31 is set to 1 to indicate a VM-entry failure.
- The remainder of the field (bits 30:16) is cleared.

— Exit qualification. This field is set based on the exit reason.

- VM-entry failure due to invalid guest state. In most cases, the exit qualification is cleared to 0. The following non-zero values are used in the cases indicated:
  1. Not used.
  2. Failure was due to a problem loading the PDPTEs (see Section 28.3.1.6).
  3. Failure was due to an attempt to inject a non-maskable interrupt (NMI) into a guest that is blocking events through the STI blocking bit in the interruptibility-state field.
  4. Failure was due to an invalid VMCS link pointer (see Section 28.3.1.5).

  VM-entry checks on guest-state fields may be performed in any order. Thus, an indication by exit qualification of one cause does not imply that there are not also other errors. Different processors may give different exit qualifications for the same VMCS.
- VM-entry failure due to MSR loading. The exit qualification is loaded to indicate which entry in the VM-entry MSR-load area caused the problem (1 for the first entry, 2 for the second, etc.).

— All other VM-exit information fields are unmodified.

2. Processor state is loaded as would be done on a VM exit (see Section 29.5). If this results in [CR4.PAE & CR0.PG & ~IA32_EFER.LMA] = 1, page-directory-pointer-table entries (PDPTEs) may be checked and loaded (see Section 29.5.4).
3. The state of blocking by NMI is what it was before VM entry.
4. MSRs are loaded as specified in the VM-exit MSR-load area (see Section 29.6).

Although this process resembles that of a VM exit, many steps taken during a VM exit do not occur for these VM-entry failures:

- Most VM-exit information fields are not updated (see step 1 above).
- The valid bit in the VM-entry interruption-information field is not cleared.
- The guest-state area is not modified.
- No MSRs are saved into the VM-exit MSR-store area.

28.9 MACHINE-CHECK EVENTS DURING VM ENTRY

If a machine-check event occurs during a VM entry, one of the following occurs:

- The machine-check event is handled as if it occurred before the VM entry:
  — If CR4.MCE = 0, operation of the logical processor depends on whether the logical processor is in SMX operation:[1]
    - If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs. The error code used is 000CH, indicating "unrecoverable machine-check condition."
    - If the logical processor is outside SMX operation, it goes to the shutdown state.
  — If CR4.MCE = 1, a machine-check exception (#MC) is delivered through the IDT.
- The machine-check event is handled after VM entry completes:
  — If the VM entry ends with CR4.MCE = 0, operation of the logical processor depends on whether the logical processor is in SMX operation:

1. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENTER]. A logical processor is outside SMX operation if GETSEC[SENTER] has not been executed or if GETSEC[SEXIT] was executed after the last execution of GETSEC[SENTER]. See Chapter 7, "Safer Mode Extensions Reference," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2D.

    - If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs with error code 000CH (unrecoverable machine-check condition).
    - If the logical processor is outside SMX operation, it goes to the shutdown state.
  — If the VM entry ends with CR4.MCE = 1, a machine-check exception (#MC) is generated:
    - If bit 18 (#MC) of the exception bitmap is 0, the exception is delivered through the guest IDT.
    - If bit 18 of the exception bitmap is 1, the exception causes a VM exit.
- A VM-entry failure occurs as described in Section 28.8. The basic exit reason is 41, for "VM-entry failure due to machine-check event."

The first option is not used if the machine-check event occurs after any guest state has been loaded. The second option is used only if VM entry is able to load all guest state.

24. Updates to Chapter 29, Volume 3C

Change bars and violet text show changes to Chapter 29 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C:* System Programming Guide, Part 3.

Changes to this chapter:

- Added new material (in multiple sections) on WRMSRNS and the new MSR-list instructions.

CHAPTER 29
VM EXITS

VM exits occur in response to certain instructions and events in VMX non-root operation as detailed in Section 27.1 through Section 27.2. VM exits perform the following operations:

1. Information about the cause of the VM exit is recorded in the VM-exit information fields and VM-entry control fields are modified as described in Section 29.2.
2. Processor state is saved in the guest-state area (Section 29.3).
3. MSRs may be saved in the VM-exit MSR-store area (Section 29.4). This step is not performed for SMM VM exits that activate the dual-monitor treatment of SMIs and SMM.
4. The following may be performed in parallel and in any order (Section 29.5):
   — Processor state is loaded based in part on the host-state area and some VM-exit controls. This step is not performed for SMM VM exits that activate the dual-monitor treatment of SMIs and SMM. See Section 33.15.6 for information on how processor state is loaded by such VM exits.
   — Address-range monitoring is cleared.
5. MSRs may be loaded from the VM-exit MSR-load area (Section 29.6). This step is not performed for SMM VM exits that activate the dual-monitor treatment of SMIs and SMM.

VM exits are not logged with last-branch records, do not produce branch-trace messages, and do not update the branch-trace store.

Section 29.1 clarifies the nature of the architectural state before a VM exit begins. The steps described above are detailed in Section 29.2 through Section 29.6.

Section 33.15 describes the dual-monitor treatment of system-management interrupts (SMIs) and system-management mode (SMM). Under this treatment, ordinary transitions to SMM are replaced by VM exits to a separate SMM monitor. Called **SMM VM exits**, these are caused by the arrival of an SMI or the execution of VMCALL in VMX root operation. SMM VM exits differ from other VM exits in ways that are detailed in Section 33.15.2.

29.1 ARCHITECTURAL STATE BEFORE A VM EXIT

This section describes the architectural state that exists before a VM exit, especially for VM exits caused by events that would normally be delivered through the IDT. Note the following:

- An exception causes a VM exit **directly** if the bit corresponding to that exception is set in the exception bitmap. A non-maskable interrupt (NMI) causes a VM exit directly if the "NMI exiting" VM-execution control is 1. An external interrupt causes a VM exit directly if the "external-interrupt exiting" VM-execution control is 1. A start-up IPI (SIPI) that arrives while a logical processor is in the wait-for-SIPI activity state causes a VM exit directly. INIT signals that arrive while the processor is not in the wait-for-SIPI activity state cause VM exits directly.
- An exception, NMI, external interrupt, or software interrupt causes a VM exit **indirectly** if it does not do so directly but delivery of the event causes a nested exception, double fault, task switch, APIC access (see Section 31.4), EPT violation, EPT misconfiguration, page-modification log-full event (see Section 30.3.6), or SPP-related event (see Section 30.3.4) that causes a VM exit.
- An event **results** in a VM exit if it causes a VM exit (directly or indirectly).

The following bullets detail when architectural state is and is not updated in response to VM exits:

- If an event causes a VM exit directly, it does not update architectural state as it would have if it had it not caused the VM exit:
  — A debug exception does not update DR6, DR7, or IA32_DEBUGCTL. (Information about the nature of the debug exception is saved in the exit qualification field.)
  — A page fault does not update CR2. (The linear address causing the page fault is saved in the exit-qualification field.)

  - An NMI causes subsequent NMIs to be blocked, but only after the VM exit completes.
  - An external interrupt does not acknowledge the interrupt controller and the interrupt remains pending, unless the "acknowledge interrupt on exit" VM-exit control is 1. In such a case, the interrupt controller is acknowledged and the interrupt is no longer pending.
  - The flags L0 – L3 in DR7 (bit 0, bit 2, bit 4, and bit 6) are not cleared when a task switch causes a VM exit.
  - If a task switch causes a VM exit, none of the following are modified by the task switch: old task-state segment (TSS); new TSS; old TSS descriptor; new TSS descriptor; RFLAGS.NT[1]; or the TR register.
  - No last-exception record is made if the event that would do so directly causes a VM exit.
  - If a machine-check exception causes a VM exit directly, this does not prevent machine-check MSRs from being updated. These are updated by the machine-check event itself and not the resulting machine-check exception.
  - If the logical processor is in an inactive state (see Section 26.4.2) and not executing instructions, some events may be blocked but others may return the logical processor to the active state. Unblocked events may cause VM exits.[2] If an unblocked event causes a VM exit directly, a return to the active state occurs only after the VM exit completes.[3] The VM exit generates any special bus cycle that is normally generated when the active state is entered from that activity state.

    MTF VM exits (see Section 27.5.2 and Section 28.7.8) are not blocked in the HLT activity state. If an MTF VM exit occurs in the HLT activity state, the logical processor returns to the active state only after the VM exit completes. MTF VM exits are blocked the shutdown state and the wait-for-SIPI state.

- If an event causes a VM exit indirectly, the event does update architectural state:
  - A debug exception updates DR6, DR7, and the IA32_DEBUGCTL MSR. No debug exceptions are considered pending.
  - A page fault updates CR2.
  - An NMI causes subsequent NMIs to be blocked before the VM exit commences.
  - An external interrupt acknowledges the interrupt controller and the interrupt is no longer pending.
  - If the logical processor had been in an inactive state, it enters the active state and, before the VM exit commences, generates any special bus cycle that is normally generated when the active state is entered from that activity state.
  - There is no blocking by STI or by MOV SS when the VM exit commences.
  - Processor state that is normally updated as part of delivery through the IDT (CS, RIP, SS, RSP, RFLAGS) is not modified. However, the incomplete delivery of the event may write to the stack.
  - The treatment of last-exception records is implementation dependent:
    - Some processors make a last-exception record when beginning the delivery of an event through the IDT (before it can encounter a nested exception). Such processors perform this update even if the event encounters a nested exception that causes a VM exit (including the case where nested exceptions lead to a triple fault).
    - Other processors delay making a last-exception record until event delivery has reached some event handler successfully (perhaps after one or more nested exceptions). Such processors do not update the last-exception record if a VM exit or triple fault occurs before an event handler is reached.

---

1. This chapter uses the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For processors that do not support Intel 64 architecture, this notation refers to the 32-bit forms of those registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to lower 32 bits of the indicated register.
2. If a VM exit takes the processor from an inactive state resulting from execution of a specific instruction (HLT or MWAIT), the value saved for RIP by that VM exit will reference the following instruction.
3. An exception is made if the logical processor had been inactive due to execution of MWAIT; in this case, it is considered to have become active before the VM exit.

- If the "virtual NMIs" VM-execution control is 1, VM entry injects an NMI, and delivery of the NMI causes a nested exception, double fault, task switch, EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event, or APIC access that causes a VM exit, virtual-NMI blocking is in effect before the VM exit commences.
- If a VM exit results from a fault, EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event that is encountered during execution of IRET and the "NMI exiting" VM-execution control is 0, any blocking by NMI is cleared before the VM exit commences. However, the previous state of blocking by NMI may be recorded in the exit qualification or in the VM-exit interruption-information field; see Section 29.2.3.
- If a VM exit results from a fault, EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event that is encountered during execution of IRET and the "virtual NMIs" VM-execution control is 1, virtual-NMI blocking is cleared before the VM exit commences. However, the previous state of blocking by NMI may be recorded in the exit qualification or in the VM-exit interruption-information field; see Section 29.2.3.
- Suppose that a VM exit is caused directly by an x87 FPU Floating-Point Error (#MF) or by any of the following events if the event was unblocked due to (and given priority over) an x87 FPU Floating-Point Error: an INIT signal, an external interrupt, an NMI, an SMI; or a machine-check exception. In these cases, there is no blocking by STI or by MOV SS when the VM exit commences.
- Normally, a last-branch record may be made when an event is delivered through the IDT. However, if such an event results in a VM exit before delivery is complete, no last-branch record is made.
- If machine-check exception results in a VM exit, processor state is suspect and may result in suspect state being saved to the guest-state area. A VM monitor should consult the RIPV and EIPV bits in the IA32_MCG_STATUS MSR before resuming a guest that caused a VM exit resulting from a machine-check exception.
- If a VM exit results from a fault, APIC access (see Section 31.4), EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event that is encountered while executing an instruction, data breakpoints due to that instruction may have been recognized and information about them may be saved in the pending debug exceptions field (unless the VM exit clears that field; see Section 29.3.4).
- The following VM exits are considered to happen after an instruction is executed:
  - — VM exits resulting from debug traps (single-step, I/O breakpoints, and data breakpoints).
  - — VM exits resulting from debug exceptions (data breakpoints) whose recognition was delayed by blocking by MOV SS.
  - — VM exits resulting from some machine-check exceptions.
  - — Trap-like VM exits due to execution of MOV to CR8 when the "CR8-load exiting" VM-execution control is 0 and the "use TPR shadow" VM-execution control is 1 (see Section 31.3). (Such VM exits can occur only from 64-bit mode and thus only on processors that support Intel 64 architecture.)
  - — Trap-like VM exits due to execution of WRMSR when the "use MSR bitmaps" VM-execution control is 1; the value of ECX is in the range 800H–8FFH; and the bit corresponding to the ECX value in write bitmap for low MSRs is 0; and the "virtualize x2APIC mode" VM-execution control is 1. See Section 31.5.
  - — VM exits caused by APIC-write emulation (see Section 31.4.3.2) that result from APIC accesses as part of instruction execution.

  For these VM exits, the instruction's modifications to architectural state complete before the VM exit occurs. Such modifications include those to the logical processor's interruptibility state (see Table 26-3). If there had been blocking by MOV SS, POP SS, or STI before the instruction executed, such blocking is no longer in effect.

A VM exit that occurs in enclave mode sets bit 27 of the exit-reason field and bit 4 of the guest interruptibility-state field. Before such a VM exit is delivered, an Asynchronous Enclave Exit (AEX) occurs (see Chapter 38, "Enclave Exiting Events"). An AEX modifies architectural state (Section 38.3). In particular, the processor establishes the following architectural state as indicated:

- The following bits in RFLAGS are cleared: CF, PF, AF, ZF, SF, OF, and RF.
- FS and GS are restored to the values they had prior to the most recent enclave entry.
- RIP is loaded with the AEP of interrupted enclave thread.
- RSP is loaded from the URSP field in the enclave's state-save area (SSA).

29.2 RECORDING VM-EXIT INFORMATION AND UPDATING VM-ENTRY CONTROL FIELDS

VM exits begin by recording information about the nature of and reason for the VM exit in the VM-exit information fields. Section 29.2.1 to Section 29.2.5 detail the use of these fields.

In addition to updating the VM-exit information fields, the valid bit (bit 31) is cleared in the VM-entry interruption-information field. If bit 5 of the IA32_VMX_MISC MSR (index 485H) is read as 1 (see Appendix A.6), the value of IA32_EFER.LMA is stored into the "IA-32e mode guest" VM-entry control.[1]

29.2.1 Basic VM-Exit Information

Section 26.9.1 defines the basic VM-exit information fields. The following items detail their use.

- **Exit reason.**
  - Bits 15:0 of this field contain the basic exit reason. It is loaded with a number indicating the general cause of the VM exit. Appendix C lists the numbers used and their meaning.
  - Bit 25 is set if the "prematurely busy shadow stack" VM-exit control is 1 and the VM exit caused a shadow stack become prematurely busy (see Section 27.4.3). Otherwise, the bit is cleared.
  - Bit 26 of this field is set to 1 if the VM exit occurred after assertion of a bus lock while the "VMM bus-lock detection" VM-execution control was 1. Such VM exits include those that occur due to the 1-setting of that control as well as others that might occur during execution of an instruction that asserted a bus lock.
  - Bit 27 of this field is set to 1 if the VM exit occurred while the logical processor was in enclave mode.

    Such VM exits include those caused by interrupts, non-maskable interrupts, system-management interrupts, INIT signals, and exceptions occurring in enclave mode as well as exceptions encountered during the delivery of such events incident to enclave mode.

    A VM exit also sets this bit if it is incident to delivery of an event injected by VM entry and the guest interruptibility-state field indicates an enclave interruption (bit 4 of the field is 1).
  - The remainder of the field (bits 31:28 and bits 24:16) is cleared to 0 (certain SMM VM exits may set some of these bits; see Section 33.15.2.3).[2]
- **Exit qualification.** This field is saved for VM exits due to the following causes: debug exceptions; page-fault exceptions; start-up IPIs (SIPIs); system-management interrupts (SMIs) that arrive immediately after the execution of I/O instructions; task switches; INVEPT; INVLPG; INVPCID; INVVPID; LGDT; LIDT; LLDT; LTR; RDMSRLIST; SGDT; SIDT; SLDT; STR; VMCLEAR; VMPTRLD; VMPTRST; VMREAD; VMWRITE; VMXON; WBINVD; WBNOINVD; WRMSR; WRMSRLIST; WRMSRNS; XRSTORS; XSAVES; control-register accesses; MOV DR; I/O instructions; MWAIT; accesses to the APIC-access page (see Section 31.4); EPT violations (see Section 30.3.3.2); EOI virtualization (see Section 31.1.4); APIC-write emulation (see Section 31.4.3.3); page-modification log full (see Section 30.3.6); SPP-related events (see Section 30.3.4); and instruction timeout (see Section 27.2). For all other VM exits, this field is cleared. The following items provide details:
  - For a debug exception, the exit qualification contains information about the debug exception. The information has the format given in Table 29-1.

Table 29-1. Exit Qualification for Debug Exceptions

Bit Position(s)	Contents
3:0	B3 – B0. When set, each of these bits indicates that the corresponding breakpoint condition was met. Any of these bits may be set even if its corresponding enabling bit in DR7 is not set.
10:4	Not currently defined.

1. Bit 5 of the IA32_VMX_MISC MSR is read as 1 on any logical processor that supports the 1-setting of the "unrestricted guest" VM-execution control.
2. Bit 31 of this field is set on certain VM-entry failures; see Section 28.8.

Table 29-1. Exit Qualification for Debug Exceptions (Contd.)

Bit Position(s)	Contents
11	BLD. When set, this bit indicates that a bus lock was asserted while OS bus-lock detection was enabled and CPL > 0 (see Section 19.3.1.6 ("OS Bus-Lock Detection")).[1]
12	Not currently defined.
13	BD. When set, this bit indicates that the cause of the debug exception is "debug register access detected."
14	BS. When set, this bit indicates that the cause of the debug exception is either the execution of a single instruction (if RFLAGS.TF = 1 and IA32_DEBUGCTL.BTF = 0) or a taken branch (if RFLAGS.TF = DEBUGCTL.BTF = 1).
15	Not currently defined.
16	RTM. When set, this bit indicates that a debug exception (#DB) or a breakpoint exception (#BP) occurred inside an RTM region while advanced debugging of RTM transactional regions was enabled (see Section 17.3.7, "RTM-Enabled Debugger Support," of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1).[2]
63:17	Not currently defined. Bits 63:32 exist only on processors that support Intel 64 architecture.

NOTES:

1. In general, the format of this field matches that of DR6. However, DR6 **clears** bit 11 to indicate detection of a bus lock, while this field **sets** the bit to indicate that condition.
2. In general, the format of this field matches that of DR6. However, DR6 **clears** bit 16 to indicate an RTM-related exception, while this field **sets** the bit to indicate that condition.

— For a page-fault exception, the exit qualification contains the linear address that caused the page fault. If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata. On processors that support Intel 64 architecture, bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit.

If the page-fault exception occurred during execution of an instruction in enclave mode (and not during delivery of an event incident to enclave mode), bits 11:0 of the exit qualification are cleared.

— For a start-up IPI (SIPI), the exit qualification contains the SIPI vector information in bits 7:0. Bits 63:8 of the exit qualification are cleared to 0.

— For a task switch, the exit qualification contains details about the task switch, encoded as shown in Table 29-2.

— For INVLPG, the exit qualification contains the linear-address operand of the instruction.

- On processors that support Intel 64 architecture, bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit.
- If the INVLPG source operand specifies an unusable segment, the linear address specified in the exit qualification will match the linear address that the INVLPG would have used if no VM exit occurred. This address is not architecturally defined and may be implementation-specific.

Table 29-2. Exit Qualification for Task Switches

Bit Position(s)	Contents
15:0	Selector of task-state segment (TSS) to which the guest attempted to switch
29:16	Not currently defined

Table 29-2. Exit Qualification for Task Switches (Contd.)

Bit Position(s)	Contents
31:30	Source of task switch initiation: 0: CALL instruction 1: IRET instruction 2: JMP instruction 3: Task gate in IDT
63:32	Not currently defined. These bits exist only on processors that support Intel 64 architecture.

— For INVEPT, INVPCID, INVVPID, LGDT, LIDT, LLDT, LTR, SGDT, SIDT, SLDT, STR, VMCLEAR, VMPTRLD, VMPTRST, VMREAD, VMWRITE, VMXON, XRSTORS, and XSAVES, the exit qualification receives the value of the instruction's displacement field, which is sign-extended to 64 bits if necessary (32 bits on processors that do not support Intel 64 architecture). If the instruction has no displacement (for example, has a register operand), zero is stored into the exit qualification.

  On processors that support Intel 64 architecture, an exception is made for RIP-relative addressing (used only in 64-bit mode). Such addressing causes an instruction to use an address that is the sum of the displacement field and the value of RIP that references the following instruction. In this case, the exit qualification is loaded with the sum of the displacement field and the appropriate RIP value.

  In all cases, bits of this field beyond the instruction's address size are undefined. For example, suppose that the address-size field in the VM-exit instruction-information field (see Section 26.9.4 and Section 29.2.5) reports an *n*-bit address size. Then bits 63:*n* (bits 31:*n* on processors that do not support Intel 64 architecture) of the instruction displacement are undefined.

— For a control-register access, the exit qualification contains information about the access and has the format given in Table 29-3.

— For MOV DR, the exit qualification contains information about the instruction and has the format given in Table 29-4.

— For an I/O instruction, the exit qualification contains information about the instruction and has the format given in Table 29-5.

— For MWAIT, the exit qualification contains a value that indicates whether address-range monitoring hardware was armed. The exit qualification is set either to 0 (if address-range monitoring hardware is not armed) or to 1 (if address-range monitoring hardware is armed).

— For RDMSRLIST and WRMSRLIST, the exit qualification depends on the setting of the "use MSR bitmaps" VM-execution control. If the control is 0, the exit qualification is zero. If the control is 1, the exit qualification is the index of the MSR whose access caused the VM exit (see Section 27.1.3).

— WBINVD and WBNOINVD use the same basic exit reason (see Appendix C). For WBINVD, the exit qualification is 0, while for WBNOINVD it is 1.

— WRMSR and WRMSRNS use the same basic exit reason (see Appendix C). For WRMSR, the exit qualification is 0, while for WRMSRNS it is 1.

— For an APIC-access VM exit resulting from a linear access or a guest-physical access to the APIC-access page (see Section 31.4), the exit qualification contains information about the access and has the format given in Table 29-6.[1]

  If the access to the APIC-access page occurred during execution of an instruction in enclave mode (and not during delivery of an event incident to enclave mode), bits 11:0 of the exit qualification are cleared.

  Such a VM exit that set bits 15:12 of the exit qualification to 0000b (data read during instruction execution) or 0001b (data write during instruction execution) set bit 12—which distinguishes data read from data

1. The exit qualification is undefined if the access was part of the logging of a branch record or a processor-event-based-sampling (PEBS) record to the DS save area. It is recommended that software configure the paging structures so that no address in the DS save area translates to an address on the APIC-access page.

write—to that which would have been stored in bit 1—W/R—of the page-fault error code had the access caused a page fault instead of an APIC-access VM exit. This implies the following:

- For an APIC-access VM exit caused by the CLFLUSH and CLFLUSHOPT instructions, the access type is "data read during instruction execution."
- For an APIC-access VM exit caused by the ENTER instruction, the access type is "data write during instruction execution."

Table 29-3. Exit Qualification for Control-Register Accesses

Bit Positions	Contents
3:0	Number of control register (0 for CLTS and LMSW). Bit 3 is always 0 on processors that do not support Intel 64 architecture as they do not support CR8.
5:4	Access type: 0 = MOV to CR 1 = MOV from CR 2 = CLTS 3 = LMSW
6	LMSW operand type: 0 = register 1 = memory For CLTS and MOV CR, cleared to 0
7	Not currently defined
11:8	For MOV CR, the general-purpose register: 0 = RAX 1 = RCX 2 = RDX 3 = RBX 4 = RSP 5 = RBP 6 = RSI 7 = RDI 8–15 represent R8–R15, respectively (used only on processors that support Intel 64 architecture) For CLTS and LMSW, cleared to 0
15:12	Not currently defined
31:16	For LMSW, the LMSW source data For CLTS and MOV CR, cleared to 0
63:32	Not currently defined. These bits exist only on processors that support Intel 64 architecture.

- For an APIC-access VM exit caused by the MASKMOVQ instruction or the MASKMOVDQU instruction, the access type is "data write during instruction execution."
- For an APIC-access VM exit caused by the MONITOR instruction, the access type is "data read during instruction execution."
- For an APIC-access VM exit caused directly by an access to a linear address in the DS save area (BTS or PEBS), the access type is "linear access for monitoring."
- For an APIC-access VM exit caused by a guest-physical access performed for an access to the DS save area (e.g., to access a paging structure to translate a linear address), the access type is "guest-physical access for monitoring or trace."

- For an APIC-access VM exit caused by trace-address pre-translation (TAPT) when the "Intel PT uses guest physical addresses" VM-execution control is 1, the access type is "guest-physical access for monitoring or trace."

Such a VM exit stores 1 for bit 31 for IDT-vectoring information field (see Section 29.2.4) if and only if it sets bits 15:12 of the exit qualification to 0011b (linear access during event delivery) or 1010b (guest-physical access during event delivery).

See Section 31.4.4 for further discussion of these instructions and APIC-access VM exits.

For APIC-access VM exits resulting from physical accesses to the APIC-access page (see Section 31.4.6), the exit qualification is undefined.

— For an EPT violation, the exit qualification contains information about the access causing the EPT violation and has the format given in Table 29-7.

As noted in that table, the format and meaning of the exit qualification depends on the setting of the "mode-based execute control for EPT" VM-execution control and whether the processor supports advanced VM-exit information for EPT violations.[1]

An EPT violation that occurs during as a result of execution of a read-modify-write operation sets bit 1 (data write). Whether it also sets bit 0 (data read) is implementation-specific and, for a given implementation, may differ for different kinds of read-modify-write operations.

Table 29-4. Exit Qualification for MOV DR

Bit Position(s)	Contents
2:0	Number of debug register
3	Not currently defined
4	Direction of access (0 = MOV to DR; 1 = MOV from DR)
7:5	Not currently defined
11:8	General-purpose register: 0 = RAX 1 = RCX 2 = RDX 3 = RBX 4 = RSP 5 = RBP 6 = RSI 7 = RDI 8 –15 = R8 – R15, respectively
63:12	Not currently defined. Bits 63:32 exist only on processors that support Intel 64 architecture.

1. Software can determine whether advanced VM-exit information for EPT violations is supported by consulting the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10).

Table 29-5. Exit Qualification for I/O Instructions

Bit Position(s)	Contents
2:0	Size of access: 0 = 1-byte 1 = 2-byte 3 = 4-byte Other values not used
3	Direction of the attempted access (0 = OUT, 1 = IN)
4	String instruction (0 = not string; 1 = string)
5	REP prefixed (0 = not REP; 1 = REP)
6	Operand encoding (0 = DX, 1 = immediate)
15:7	Not currently defined
31:16	Port number (as specified in DX or in an immediate operand)
63:32	Not currently defined. These bits exist only on processors that support Intel 64 architecture.

Table 29-6. Exit Qualification for APIC-Access VM Exits from Linear Accesses and Guest-Physical Accesses

Bit Position(s)	Contents
11:0	▪ If the APIC-access VM exit is due to a linear access, the offset of access within the APIC page. ▪ Undefined if the APIC-access VM exit is due a guest-physical access
15:12	Access type: 0 = linear access for a data read during instruction execution 1 = linear access for a data write during instruction execution 2 = linear access for an instruction fetch 3 = linear access (read or write) during event delivery 4 = linear access for monitoring 10 = guest-physical access during event delivery 11 = guest-physical access for monitoring or trace 15 = guest-physical access for an instruction fetch or during instruction execution Other values not used
16	This bit is set for certain accesses that are asynchronous to instruction execution and not part of event delivery. These includes guest-physical accesses related to trace output by Intel PT (see Section 27.5.4), accesses related to PEBS on processors with the "EPT-friendly" enhancement (see Section 21.9.5), and accesses that occur during user-interrupt delivery (see Section 8.4.2).
63:17	Not currently defined. Bits 63:32 exist only on processors that support Intel 64 architecture.

Bit 12 reports "NMI unblocking due to IRET"; see Section 29.2.3.

Bit 16 is set for certain accesses that are asynchronous to instruction execution and not part of event delivery. These include trace-address pre-translation (TAPT) for Intel PT (see Section 27.5.4), accesses related to PEBS on processors with the "EPT-friendly" enhancement (see Section 21.9.5), and accesses as part of user-interrupt delivery (see Section 8.4.2).

— For VM exits caused as part of EOI virtualization (Section 31.1.4), bits 7:0 of the exit qualification are set to vector of the virtual interrupt that was dismissed by the EOI virtualization. Bits above bit 7 are cleared.

— For APIC-write VM exits (Section 31.4.3.3), bits 11:0 of the exit qualification are set to the page offset of the write access that caused the VM exit.[1] Bits above bit 11 are cleared.

— For a VM exit due to a page-modification log-full event (Section 30.3.6), bit 12 of the exit qualification reports "NMI unblocking due to IRET" (see Section 29.2.3). Bit 16 is set if the VM exit occurs during TAPT, EPT-friendly PEBS, or user-interrupt delivery. All other bits of the exit qualification are undefined.

— For a VM exit due to an SPP-related event (Section 30.3.4), bit 11 of the exit qualification indicates the type of event: 0 indicates an SPP misconfiguration and 1 indicates an SPP miss. Bit 12 of the exit qualification reports "NMI unblocking due to IRET" (see Section 29.2.3). Bit 16 is set if the VM exit occurs during TAPT EPT-friendly PEBS, or user-interrupt delivery. All other bits of the exit qualification are undefined.

— If the "PASID translation" VM-execution control, PASID translation is performed for executions of the ENQCMD and ENQCMDS instructions (see Section 27.5.8). PASID translation may fail, resulting in a VM exit. Such a VM exit saves an exit qualification specified in the following items:

  • For ENQCMD, the exit qualification is IA32_PASID[19:0].

  • For ENQCMDS, the exit qualification contains the low 32 bits of the instruction's source operand (which had been read from memory prior to PASID translation).

— For a VM exit due to an instruction timeout (Section 27.2), bit 0 indicates (if set) that the context of the virtual machine is invalid and that the VM should not be resumed. Bit 12 of the exit qualification reports "NMI unblocking due to IRET" (see Section 29.2.3). All other bits of the exit qualification are undefined.

- **Guest linear address.** For some VM exits, this field receives a linear address that pertains to the VM exit. The field is set for different VM exits as follows:

  — VM exits due to attempts to execute LMSW with a memory operand. In these cases, this field receives the linear address of that operand. Bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit. If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata.

  — VM exits due to attempts to execute INS or OUTS for which the relevant segment is usable (if the relevant segment is not usable, the value is undefined). (ES is always the relevant segment for INS; for OUTS, the relevant segment is DS unless overridden by an instruction prefix.) The linear address is the base address of relevant segment plus (E)DI (for INS) or (E)SI (for OUTS). Bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit. If linear-address masking had been in effect (Section 4.4), the address recorded is the original address before any masking (and may thus contain any metadata).

  — VM exits due to EPT violations that set bit 7 of the exit qualification (see Table 29-7; these are all EPT violations except those resulting from an attempt to load the PDPTEs as of execution of the MOV CR instruction and those due to TAPT). The linear address may translate to the guest-physical address whose access caused the EPT violation. Alternatively, translation of the linear address may reference a paging-structure entry whose access caused the EPT violation. Bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit. If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata.

    If the EPT violation occurred during execution of an instruction in enclave mode (and not during delivery of an event incident to enclave mode), bits 11:0 of this field are cleared.

  — VM exits due to SPP-related events. If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata.

  — If the "prematurely busy shadow stack" VM-exit control is 1, certain VM exits (besides those noted above) save the linear address that pertains to the VM exit if the VM exit caused a shadow stack to become prematurely busy (see Section 27.4.3). This is true for VM exits due for these reasons: EPT misconfiguration, page-modification log-full event, and instruction timeout. (A VM exit due to instruction timeout that sets bit 0 of the exit qualification, indicating that VM context is invalid, does not save a valid linear address.) If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata.

  — For all other VM exits, the field is undefined.

1. Execution of WRMSR with ECX = 83FH (self-IPI MSR) can lead to an APIC-write VM exit; the exit qualification for such an APIC-write VM exit is 3F0H.

- **Guest-physical address.** For a VM exit due to an EPT violation, an EPT misconfiguration, or an SPP-related event, this field receives the guest-physical address that caused the EPT violation or EPT misconfiguration. For all other VM exits, the field is undefined.

  If the EPT violation or EPT misconfiguration occurred during execution of an instruction in enclave mode (and not during delivery of an event incident to enclave mode), bits 11:0 of this field are cleared.

Table 29-7. Exit Qualification for EPT Violations

Bit Position(s)	Contents
0	Set if the access causing the EPT violation was a data read.[1]
1	Set if the access causing the EPT violation was a data write.[1]
2	Set if the access causing the EPT violation was an instruction fetch.
3	The logical-AND of bit 0 in the EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation (indicates whether the guest-physical address was readable).[2]
4	The logical-AND of bit 1 in the EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation (indicates whether the guest-physical address was writeable).[2]
5	The logical-AND of bit 2 in the EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation.[2] If the "mode-based execute control for EPT" VM-execution control is 0, this indicates whether the guest-physical address was executable. If that control is 1, this indicates whether the guest-physical address was executable for supervisor-mode linear addresses.
6	If the "mode-based execute control" VM-execution control is 0, the value of this bit is undefined. If that control is 1, this bit is the logical-AND of bit 10 in the EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation. In this case, it indicates whether the guest-physical address was executable for user-mode linear addresses.[3]
7	Set if the guest linear-address field is valid. The guest linear-address field is valid for all EPT violations except those resulting from an attempt to load the guest PDPTEs as part of the execution of the MOV CR instruction and those due to trace-address pre-translation (TAPT; Section 27.5.4).
8	If bit 7 is 1: ▪ Set if the access causing the EPT violation is to a guest-physical address that is the translation of a linear address. ▪ Clear if the access causing the EPT violation is to a paging-structure entry as part of a page walk or the update of an accessed or dirty bit. Reserved if bit 7 is 0 (cleared to 0).
9	If bit 7 is 1, bit 8 is 1, and the processor supports advanced VM-exit information for EPT violations,[4] this bit is 0 if the linear address is a supervisor-mode linear address and 1 if it is a user-mode linear address. (If CR0.PG = 0, the translation of every linear address is a user-mode linear address and thus this bit will be 1.) Otherwise, this bit is undefined.
10	If bit 7 is 1, bit 8 is 1, and the processor supports advanced VM-exit information for EPT violations,[4] this bit is 0 if paging translates the linear address to a read-only page and 1 if it translates to a read/write page. (If CR0.PG = 0, every linear address is read/write and thus this bit will be 1.) Otherwise, this bit is undefined.
11	If bit 7 is 1, bit 8 is 1, and the processor supports advanced VM-exit information for EPT violations,[4] this bit is 0 if paging translates the linear address to an executable page and 1 if it translates to an execute-disable page. (If CR0.PG = 0, CR4.PAE = 0, or IA32_EFER.NXE = 0, every linear address is executable and thus this bit will be 0.) Otherwise, this bit is undefined.
12	NMI unblocking due to IRET (see Section 29.2.3).

Table 29-7. Exit Qualification for EPT Violations (Contd.)

Bit Position(s)	Contents
13	Set if the access causing the EPT violation was a shadow-stack access.
14	If supervisor shadow-stack control is enabled (by setting bit 7 of EPTP), this bit is the same as bit 60 in the EPT paging-structure entry that maps the page of the guest-physical address of the access causing the EPT violation. Otherwise (or if translation of the guest-physical address terminates before reaching an EPT paging-structure entry that maps a page), this bit is undefined.
15	This bit is set if the EPT violation was caused as a result of guest-paging verification. See Section 30.3.3.2.
16	This bit is set if the access was asynchronous to instruction execution not the result of event delivery. The bit is set if the access is related to trace output by Intel PT (see Section 27.5.4), accesses related to PEBS on processors with the "EPT-friendly" enhancement (see Section 21.9.5), or to user-interrupt delivery (see Section 8.4.2). Otherwise, this bit is cleared.
63:17	Not currently defined. Bits 63:32 exist only on processors that support Intel 64 architecture.

NOTES:

1. If accessed and dirty flags for EPT are enabled, processor accesses to guest paging-structure entries are treated as writes with regard to EPT violations (see Section 30.3.3.2). If such an access causes an EPT violation, the processor sets both bit 0 and bit 1 of the exit qualification.
2. Bits 5:3 are cleared to 0 if either (1) any of EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation is not present; or (2) 4-level EPT is in use and the guest-physical address sets any bits in the range 51:48 (see Section 30.3.2).
3. Bit 6 is cleared to 0 if (1) the "mode-based execute control" VM-execution control is 1; and (2) either (a) any of EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation is not present; or (b) 4-level EPT is in use and the guest-physical address sets any bits in the range 51:48 (see Section 30.3.2).
4. Software can determine whether advanced VM-exit information for EPT violations is supported by consulting the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10).

29.2.2 Information for VM Exits Due to Vectored Events

Section 26.9.2 defines fields containing information for VM exits due to the following events: exceptions (including those generated by the instructions INT1, INT3, INTO, BOUND, UD0, UD1, and UD2); external interrupts that occur while the "acknowledge interrupt on exit" VM-exit control is 1; and non-maskable interrupts (NMIs).[1] Such VM exits include those that occur on an attempt at a task switch that causes an exception before generating the VM exit due to the task switch that causes the VM exit.

The following items detail the use of these fields:

- **VM-exit interruption information** (format given in Table 26-19). The following items detail how this field is established for VM exits due to these events:
  - For an exception, bits 7:0 receive the exception vector (at most 31). For an NMI, bits 7:0 are set to 2. For an external interrupt, bits 7:0 receive the vector.
  - Bits 10:8 are set to 0 (external interrupt), 2 (non-maskable interrupt), 3 (hardware exception), 5 (privileged software exception), or 6 (software exception). Hardware exceptions comprise all exceptions except the following:
    - Debug exceptions (#DB) generated by the INT1 instruction; these are privileged software exceptions. (Other debug exceptions are considered hardware exceptions, as are those caused by executions of INT1 in enclave mode.)
    - Breakpoint exceptions (#BP; generated by INT3) and overflow exceptions (#OF; generated by INTO); these are software exceptions. (A #BP that occurs in enclave mode is considered a hardware exception.)

1. INT1 and INT3 refer to the instructions with opcodes F1 and CC, respectively, and not to INT *n* with value 1 or 3 for n.

BOUND-range exceeded exceptions (#BR; generated by BOUND) and invalid opcode exceptions (#UD) generated by UD0, UD1, and UD2 are hardware exceptions.

— Bit 11 is set to 1 if the VM exit is caused by a hardware exception that would have delivered an error code on the stack. This bit is always 0 if the VM exit occurred while the logical processor was in real-address mode (CR0.PE=0).[1] If bit 11 is set to 1, the error code is placed in the VM-exit interruption error code (see below).

— Bit 12 reports "NMI unblocking due to IRET"; see Section 29.2.3. The value of this bit is undefined if the VM exit is due to a double fault (the interruption type is hardware exception and the vector is 8).

— Bits 30:13 are always set to 0.

— Bit 31 is always set to 1.

For other VM exits (including those due to external interrupts when the "acknowledge interrupt on exit" VM-exit control is 0), the field is marked invalid (by clearing bit 31) and the remainder of the field is undefined.

- **VM-exit interruption error code**.

— For VM exits that set both bit 31 (valid) and bit 11 (error code valid) in the VM-exit interruption-information field, this field receives the error code that would have been pushed on the stack had the event causing the VM exit been delivered normally through the IDT. The EXT bit is set in this field exactly when it would be set normally. For exceptions that occur during the delivery of double fault (if the IDT-vectoring information field indicates a double fault), the EXT bit is set to 1, assuming that (1) that the exception would produce an error code normally (if not incident to double-fault delivery) and (2) that the error code uses the EXT bit (not for page faults, which use a different format).

— For other VM exits, the value of this field is undefined.

29.2.3 Information About NMI Unblocking Due to IRET

A VM exit may occur during execution of the IRET instruction for reasons including the following: faults, EPT violations, page-modification log-full events, SPP-related events, or instruction timeouts.

An execution of IRET that commences while non-maskable interrupts (NMIs) are blocked will unblock NMIs even if a fault or VM exit occurs; the state saved by such a VM exit will indicate that NMIs were not blocked.

VM exits for the reasons enumerated above provide more information to software by saving a bit called "NMI unblocking due to IRET." This bit is defined if (1) either the "NMI exiting" VM-execution control is 0 or the "virtual NMIs" VM-execution control is 1; (2) the VM exit does not set the valid bit in the IDT-vectoring information field (see Section 29.2.4); and (3) the VM exit is not due to a double fault. In these cases, the bit is defined as follows:

- The bit is 1 if the VM exit resulted from a memory access as part of execution of the IRET instruction and one of the following holds:
  — The "virtual NMIs" VM-execution control is 0 and blocking by NMI (see Table 26-3) was in effect before execution of IRET.
  — The "virtual NMIs" VM-execution control is 1 and virtual-NMI blocking was in effect before execution of IRET.
- The bit is 0 for all other relevant VM exits.

For VM exits due to faults, NMI unblocking due to IRET is saved in bit 12 of the VM-exit interruption-information field (Section 29.2.2). For VM exits due to EPT violations, page-modification log-full events, SPP-related events, and instruction timeouts, NMI unblocking due to IRET is saved in bit 12 of the exit qualification (Section 29.2.1).

(Executions of IRET may also incur VM exits due to APIC accesses and EPT misconfigurations. These VM exits do not report information about NMI unblocking due to IRET.)

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, a logical processor cannot be in real-address mode unless the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

29.2.4 Information for VM Exits During Event Delivery

Section 26.9.3 defined fields containing information for VM exits that occur while delivering an event through the IDT and as a result of any of the following cases:[1]

- A fault occurs during event delivery and causes a VM exit (because the bit associated with the fault is set to 1 in the exception bitmap).
- A task switch is invoked through a task gate in the IDT. The VM exit occurs due to the task switch only after the initial checks of the task switch pass (see Section 27.4.2).
- Event delivery causes an APIC-access VM exit (see Section 31.4).
- An EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event that occurs during event delivery.
- Any of the above VM exits that occur during user-interrupt notification processing (see Section 8.5.2). Such VM exits will be treated as if they occurred during delivery of an external interrupt with the vector UINV.

These fields are used for VM exits that occur during delivery of events injected as part of VM entry (see Section 28.6.1.2).

A VM exit is not considered to occur during event delivery in any of the following circumstances:

- The original event causes the VM exit directly (for example, because the original event is a non-maskable interrupt (NMI) and the "NMI exiting" VM-execution control is 1).
- The original event results in a double-fault exception that causes the VM exit directly.
- The VM exit occurred as a result of fetching the first instruction of the handler invoked by the event delivery.
- The VM exit is caused by a triple fault.
- The original event was a software interrupt (INT *n*) executed in virtual-8086 mode with EFLAGS.IOPL < 3 and the VM exit was due to a general-protection exception (#GP) that occurred because either CR4.VME = 0 or bit *n* of the software interrupt redirection bit map in the TSS is set.

The following items detail the use of these fields:

- IDT-vectoring information (format given in Table 26-20). The following items detail how this field is established for VM exits that occur during event delivery:
  - If the VM exit occurred during delivery of an exception, bits 7:0 receive the exception vector (at most 31). If the VM exit occurred during delivery of an NMI, bits 7:0 are set to 2. If the VM exit occurred during delivery of an external interrupt, bits 7:0 receive the vector.
  - Bits 10:8 are set to indicate the type of event that was being delivered when the VM exit occurred: 0 (external interrupt), 2 (non-maskable interrupt), 3 (hardware exception), 4 (software interrupt), 5 (privileged software interrupt), or 6 (software exception).

    Hardware exceptions comprise all exceptions except the following:[2]

    - Debug exceptions (#DB) generated by the INT1 instruction; these are privileged software exceptions. (Other debug exceptions are considered hardware exceptions, as are those caused by executions of INT1 in enclave mode.)
    - Breakpoint exceptions (#BP; generated by INT3) and overflow exceptions (#OF; generated by INTO); these are software exceptions. (A #BP that occurs in enclave mode is considered a hardware exception.)

    BOUND-range exceeded exceptions (#BR; generated by BOUND) and invalid opcode exceptions (#UD) generated by UD0, UD1, and UD2 are hardware exceptions.
  - Bit 11 is set to 1 if the VM exit occurred during delivery of a hardware exception that would have delivered an error code on the stack. This bit is always 0 if the VM exit occurred while the logical processor was in

1. This includes the case in which a VM exit occurs while delivering a software interrupt (INT *n*) through the 16-bit IVT (interrupt vector table) that is used in virtual-8086 mode with virtual-machine extensions (if RFLAGS.VM = CR4.VME = 1).
2. In the following items, INT1 and INT3 refer to the instructions with opcodes F1 and CC, respectively, and not to INT *n* with value 1 or 3 for n.

real-address mode (CR0.PE=0).[1] If bit 11 is set to 1, the error code is placed in the IDT-vectoring error code (see below).

— Bit 12 is undefined.

— Bits 30:13 are always set to 0.

— Bit 31 is always set to 1.

For other VM exits, the field is marked invalid (by clearing bit 31) and the remainder of the field is undefined.

- IDT-vectoring error code.
  - For VM exits that set both bit 31 (valid) and bit 11 (error code valid) in the IDT-vectoring information field, this field receives the error code that would have been pushed on the stack by the event that was being delivered through the IDT at the time of the VM exit. The EXT bit is set in this field when it would be set normally.
  - For other VM exits, the value of this field is undefined.

29.2.5 Information for VM Exits Due to Instruction Execution

Section 26.9.4 defined fields containing information for VM exits that occur due to instruction execution. (The VM-exit instruction length is also used for VM exits that occur during the delivery of a software interrupt or software exception.) The following items detail their use.

- **VM-exit instruction length.** This field is used in the following cases:
  - For fault-like VM exits due to attempts to execute one of the following instructions that cause VM exits unconditionally (see Section 27.1.2) or based on the settings of VM-execution controls (see Section 27.1.3): CLTS, CPUID, ENCLS, GETSEC, HLT, IN, INS, INVD, INVEPT, INVLPG, INVPCID, INVVPID, LGDT, LIDT, LLDT, LMSW, LOADIWKEY, LTR, MONITOR, MOV CR, MOV DR, MWAIT, OUT, OUTS, PAUSE, PCONFIG, RDMSR, RDPMC, RDRAND, RDSEED, RDTSC, RDTSCP, RSM, SGDT, SIDT, SLDT, STR, TPAUSE, UMWAIT, VMCALL, VMCLEAR, VMLAUNCH, VMPTRLD, VMPTRST, VMREAD, VMRESUME, VMWRITE, VMXOFF, VMXON, WBINVD, WBNOINVD, WRMSR, XRSTORS, XSETBV, and XSAVES.[2]
  - For VM exits due to software exceptions (those generated by executions of INT3 or INTO) or privileged software exceptions (those generated by executions of INT1).
  - For VM exits due to faults encountered during delivery of a software interrupt, privileged software exception, or software exception.
  - For VM exits due to attempts to effect a task switch via instruction execution. These are VM exits that produce an exit reason indicating task switch and either of the following:
    - An exit qualification indicating execution of CALL, IRET, or JMP instruction.
    - An exit qualification indicating a task gate in the IDT and an IDT-vectoring information field indicating that the task gate was encountered during delivery of a software interrupt, privileged software exception, or software exception.
  - For APIC-access VM exits and for VM exits caused by EPT violations, page-modification log-full events, and SPP-related events encountered during delivery of a software interrupt, privileged software exception, or software exception.[3]
  - For VM exits due executions of VMFUNC that fail because one of the following is true:

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, a logical processor cannot be in real-address mode unless the "unrestricted guest" VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
2. This item applies only to fault-like VM exits. It does not apply to trap-like VM exits following executions of the MOV to CR8 instruction when the "use TPR shadow" VM-execution control is 1 or to those following executions of the WRMSR instruction when the "virtualize x2APIC mode" VM-execution control is 1.
3. The VM-exit instruction-length field is not defined following APIC-access VM exits resulting from physical accesses (see Section 31.4.6) even if encountered during delivery of a software interrupt, privileged software exception, or software exception.

- EAX indicates a VM function that is not enabled (the bit at position EAX is 0 in the VM-function controls; see Section 27.5.6.2).
- EAX = 0 and either ECX ≥ 512 or the value of ECX selects an invalid tentative EPTP value (see Section 27.5.6.3).

In all the above cases, this field receives the length in bytes (1–15) of the instruction (including any instruction prefixes) whose execution led to the VM exit (see the next paragraph for one exception).

The cases of VM exits encountered during delivery of a software interrupt, privileged software exception, or software exception include those encountered during delivery of events injected as part of VM entry (see Section 28.6.1.2). If the original event was injected as part of VM entry, this field receives the value of the VM-entry instruction length.

All VM exits other than those listed in the above items leave this field undefined.

If the VM exit occurred in enclave mode, this field is cleared (none of the previous items apply).

Table 29-8. Format of the VM-Exit Instruction-Information Field as Used for INS and OUTS

Bit Position(s)	Content
6:0	Undefined.
9:7	Address size: 0: 16-bit 1: 32-bit 2: 64-bit (used only on processors that support Intel 64 architecture) Other values not used.
14:10	Undefined.
17:15	Segment register: 0: ES 1: CS 2: SS 3: DS 4: FS 5: GS Other values not used. Undefined for VM exits due to execution of INS.
31:18	Undefined.

- **VM-exit instruction information**. For VM exits due to attempts to execute INS, INVEPT, INVPCID, INVVPID, LIDT, LGDT, LLDT, LOADIWKEY, LTR, OUTS, RDRAND, RDSEED, SIDT, SGDT, SLDT, STR, TPAUSE, UMWAIT, VMCLEAR, VMPTRLD, VMPTRST, VMREAD, VMWRITE, VMXON, XRSTORS, or XSAVES, this field receives information about the instruction that caused the VM exit. The format of the field depends on the identity of the instruction causing the VM exit:
  - For VM exits due to attempts to execute INS or OUTS, the field has the format is given in Table 29-8.[1]
  - For VM exits due to attempts to execute INVEPT, INVPCID, or INVVPID, the field has the format is given in Table 29-9.
  - For VM exits due to attempts to execute LIDT, LGDT, SIDT, or SGDT, the field has the format is given in Table 29-10.
  - For VM exits due to attempts to execute LLDT, LTR, SLDT, or STR, the field has the format is given in Table 29-11.
  - For VM exits due to attempts to execute RDRAND or RDSEED, the field has the format is given in Table 29-12.

1. The format of the field was undefined for these VM exits on the first processors to support the virtual-machine extensions. Software can determine whether the format specified in Table 29-8 is used by consulting the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

— For VM exits due to attempts to execute TPAUSE or UMWAIT, the field has the format is given in Table 29-13.

— For VM exits due to attempts to execute VMCLEAR, VMPTRLD, VMPTRST, VMXON, XRSTORS, or XSAVES, the field has the format is given in Table 29-14.

— For VM exits due to attempts to execute VMREAD or VMWRITE, the field has the format is given in Table 29-15.

— For VM exits due to attempts to execute LOADIWKEY, the field has the format is given in Table 29-16.

For all other VM exits, the field is undefined, unless the VM exit occurred in enclave mode, in which case the field is cleared.

- **I/O RCX, I/O RSI, I/O RDI, I/O RIP**. These fields are undefined except for SMM VM exits due to system-management interrupts (SMIs) that arrive immediately after retirement of I/O instructions. See Section 33.15.2.3. Note that, if the VM exit occurred in enclave mode, these fields are all cleared.

Table 29-9. Format of the VM-Exit Instruction-Information Field as Used for INVEPT, INVPCID, and INVVPID

Bit Position(s)	Content
1:0	Scaling: 0: no scaling 1: scale by 2 2: scale by 4 3: scale by 8 (used only on processors that support Intel 64 architecture) Undefined for instructions with no index register (bit 22 is set).
6:2	Undefined.
9:7	Address size: 0: 16-bit 1: 32-bit 2: 64-bit (used only on processors that support Intel 64 architecture) Other values not used.
10	Cleared to 0.
14:11	Undefined.
17:15	Segment register: 0: ES 1: CS 2: SS 3: DS 4: FS 5: GS Other values not used.
21:18	IndexReg: 0 = RAX 1 = RCX 2 = RDX 3 = RBX 4 = RSP 5 = RBP 6 = RSI 7 = RDI 8–15 represent R8–R15, respectively (used only on processors that support Intel 64 architecture) Undefined for instructions with no index register (bit 22 is set).
22	IndexReg invalid (0 = valid; 1 = invalid)
26:23	BaseReg (encoded as IndexReg above) Undefined for memory instructions with no base register (bit 27 is set).

29.3 SAVING GUEST STATE

VM exits save certain components of processor state into corresponding fields in the guest-state area of the VMCS (see Section 26.4). On processors that support Intel 64 architecture, the full value of each natural-width field (see Section 26.11.2) is saved regardless of the mode of the logical processor before and after the VM exit.

In general, the state saved is that which was in the logical processor at the time the VM exit commences. See Section 29.1 for a discussion of which architectural updates occur at that time.

Section 29.3.1 through Section 29.3.4 provide details for how various components of processor state are saved. These sections reference VMCS fields that correspond to processor state. Unless otherwise stated, these references are to fields in the guest-state area.

29.3.1 Saving Control Registers, Debug Registers, and MSRs

Contents of certain control registers, debug registers, and MSRs are saved as follows:

- The contents of CR0, CR3, CR4, and the IA32_SYSENTER_CS, IA32_SYSENTER_ESP, and IA32_SYSENTER_EIP MSRs are saved into the corresponding fields. Bits 63:32 of the IA32_SYSENTER_CS MSR are not saved. On processors that do not support Intel 64 architecture, bits 63:32 of the IA32_SYSENTER_ESP and IA32_SYSENTER_EIP MSRs are not saved.
- If the "save debug controls" VM-exit control is 1, the contents of DR7 and the IA32_DEBUGCTL MSR are saved into the corresponding fields. The first processors to support the virtual-machine extensions supported only the 1-setting of this control and thus always saved data into these fields.
- If the "save IA32_PAT" VM-exit control is 1, the contents of the IA32_PAT MSR are saved into the corresponding field.
- If the "save IA32_EFER" VM-exit control is 1, the contents of the IA32_EFER MSR are saved into the corresponding field.
- If the processor supports either the 1-setting of the "load IA32_BNDCFGS" VM-entry control or that of the "clear IA32_BNDCFGS" VM-exit control, the contents of the IA32_BNDCFGS MSR are saved into the corresponding field.

- If the processor supports either the 1-setting of the "load IA32_RTIT_CTL" VM-entry control or that of the "clear IA32_RTIT_CTL" VM-exit control, the contents of the IA32_RTIT_CTL MSR are saved into the corresponding field.
- If the processor supports the 1-setting of the "load CET" VM-entry control, the contents of the IA32_S_CET and IA32_INTERRUPT_SSP_TABLE_ADDR MSRs are saved into the corresponding fields. On processors that do not support Intel 64 architecture, bits 63:32 of these MSRs are not saved.
- If the processor supports either the 1-setting of the "load guest IA32_LBR_CTL" VM-entry control or that of the "clear IA32_LBR_CTL" VM-exit control, the contents of the IA32_LBR_CTL MSR are saved into the corresponding field.
- If the processor supports the 1-setting of the "load PKRS" VM-entry control, the contents of the IA32_PKRS MSR are saved into the corresponding field.
- If a processor supports user interrupts, every VM exit saves UINV into the guest UINV field in the VMCS (bits 15:8 of the field are cleared).
- If the "save IA32_PERF_GLOBAL_CTL" VM-exit control is 1, the contents of the IA32_PERF_GLOBAL_CTL MSR are saved into the corresponding field.
- The value of the SMBASE field is undefined after all VM exits except SMM VM exits. See Section 33.15.2.

29.3.2 Saving Segment Registers and Descriptor-Table Registers

For each segment register (CS, SS, DS, ES, FS, GS, LDTR, or TR), the values saved for the base-address, segment-limit, and access rights are based on whether the register was unusable (see Section 26.4.1) before the VM exit:

- If the register was unusable, the values saved into the following fields are undefined: (1) base address; (2) segment limit; and (3) bits 7:0 and bits 15:12 in the access-rights field. The following exceptions apply:
  - CS.
    - The base-address and segment-limit fields are saved.
    - The L, D, and G bits are saved in the access-rights field.
  - SS.
    - DPL is saved in the access-rights field.
    - On processors that support Intel 64 architecture, bits 63:32 of the value saved for the base address are always zero.
  - DS and ES. On processors that support Intel 64 architecture, bits 63:32 of the values saved for the base addresses are always zero.
  - FS and GS. The base-address field is saved.
- If the register was not unusable, the values saved into the following fields are those which were in the register before the VM exit: (1) base address; (2) segment limit; and (3) bits 7:0 and bits 15:12 in access rights.
- Bits 31:17 and 11:8 in the access-rights field are always cleared. Bit 16 is set to 1 if and only if the segment is unusable.

The contents of the GDTR and IDTR registers are saved into the corresponding base-address and limit fields.

29.3.3 Saving RIP, RSP, RFLAGS, and SSP

The contents of the RIP, RSP, RFLAGS, and SSP (shadow-stack pointer) registers are saved as follows:

- The value saved in the RIP field is determined by the nature and cause of the VM exit:
  - If the VM exit occurred in enclave mode, the value saved is the AEP of interrupted enclave thread (the remaining items do not apply).
  - If the VM exit occurs due to by an attempt to execute an instruction that causes VM exits unconditionally or that has been configured to cause a VM exit via the VM-execution controls, the value saved references that instruction.

  - If the VM exit is caused by an occurrence of an INIT signal, a start-up IPI (SIPI), or system-management interrupt (SMI), the value saved is that which was in RIP before the event occurred.
  - If the VM exit occurs due to the 1-setting of either the "interrupt-window exiting" VM-execution control or the "NMI-window exiting" VM-execution control, the value saved is that which would be in the register had the VM exit not occurred.
  - If the VM exit is due to an external interrupt, non-maskable interrupt (NMI), or hardware exception (as defined in Section 29.2.2), the value saved is the return pointer that would have been saved (either on the stack had the event been delivered through a trap or interrupt gate,[1] or into the old task-state segment had the event been delivered through a task gate).
  - If the VM exit is due to a triple fault, the value saved is the return pointer that would have been saved (either on the stack had the event been delivered through a trap or interrupt gate, or into the old task-state segment had the event been delivered through a task gate) had delivery of the double fault not encountered the nested exception that caused the triple fault.
  - If the VM exit is due to a software exception (due to an execution of INT3 or INTO) or a privileged software exception (due to an execution of INT1), the value saved references the INT3, INTO, or INT1 instruction that caused that exception.
  - Suppose that the VM exit is due to a task switch that was caused by execution of CALL, IRET, or JMP or by execution of a software interrupt (INT *n*), software exception (due to execution of INT3 or INTO), or privileged software exception (due to execution of INT1) that encountered a task gate in the IDT. The value saved references the instruction that caused the task switch (CALL, IRET, JMP, INT *n*, INT3, INTO, INT1).
  - Suppose that the VM exit is due to a task switch that was caused by a task gate in the IDT that was encountered for any reason except the direct access by a software interrupt or software exception. The value saved is that which would have been saved in the old task-state segment had the task switch completed normally.
  - If the VM exit is due to an execution of MOV to CR8 or WRMSR that reduced the value of bits 7:4 of VTPR (see Section 31.1.1) below that of TPR threshold VM-execution control field (see Section 31.1.2), the value saved references the instruction following the MOV to CR8 or WRMSR.
  - If the VM exit was caused by APIC-write emulation (see Section 31.4.3.2) that results from an APIC access as part of instruction execution, the value saved references the instruction following the one whose execution caused the APIC-write emulation.
- The contents of the RSP register are saved into the RSP field.
- With the exception of the resume flag (RF; bit 16), the contents of the RFLAGS register is saved into the RFLAGS field. RFLAGS.RF is saved as follows:
  - If the VM exit occurred in enclave mode, the value saved is 0 (the remaining items do not apply).
  - If the VM exit is caused directly by an event that would normally be delivered through the IDT, the value saved is that which would appear in the saved RFLAGS image (either that which would be saved on the stack had the event been delivered through a trap or interrupt gate[2] or into the old task-state segment had the event been delivered through a task gate) had the event been delivered through the IDT. See below for VM exits due to task switches caused by task gates in the IDT.
  - If the VM exit is caused by a triple fault, the value saved is that which the logical processor would have in RF in the RFLAGS register had the triple fault taken the logical processor to the shutdown state.
  - If the VM exit is caused by a task switch (including one caused by a task gate in the IDT), the value saved is that which would have been saved in the RFLAGS image in the old task-state segment (TSS) had the task switch completed normally without exception.
  - If the VM exit is caused by an attempt to execute an instruction that unconditionally causes VM exits or one that was configured to do with a VM-execution control, the value saved is 0.[3]

1. The reference here is to the full value of RIP before any truncation that would occur had the stack width been only 32 bits or 16 bits.
2. The reference here is to the full value of RFLAGS before any truncation that would occur had the stack width been only 32 bits or 16 bits.

  - For APIC-access VM exits and for VM exits caused by EPT violations, EPT misconfigurations, page-modification log-full events, or SPP-related events, the value saved depends on whether the VM exit occurred during delivery of an event through the IDT:
    - If the VM exit stored 0 for bit 31 for IDT-vectoring information field (because the VM exit did not occur during delivery of an event through the IDT; see Section 29.2.4), the value saved is 1.
    - If the VM exit stored 1 for bit 31 for IDT-vectoring information field (because the VM exit did occur during delivery of an event through the IDT), the value saved is the value that would have appeared in the saved RFLAGS image had the event been delivered through the IDT (see above).
  - For all other VM exits, the value saved is the value RFLAGS.RF had before the VM exit occurred.
- If the processor supports the 1-setting of the "load CET" VM-entry control, the contents of the SSP register are saved into the SSP field.

29.3.4 Saving Non-Register State

Information corresponding to guest non-register state is saved as follows:

- The activity-state field is saved with the logical processor's activity state before the VM exit.[1] See Section 29.1 for details of how events leading to a VM exit may affect the activity state. If the VM exit occurred during user-interrupt notification processing (see Section 8.5.2) and the logical processor would have entered the HLT state following user-interrupt notification processing, the saved activity state is "HLT".
- The interruptibility-state field is saved to reflect the logical processor's interruptibility before the VM exit.
  - See Section 29.1 for details of how events leading to a VM exit may affect this state.
  - VM exits that end outside system-management mode (SMM) save bit 2 (blocking by SMI) as 0 regardless of the state of such blocking before the VM exit.
  - Bit 3 (blocking by NMI) is treated specially if the "virtual NMIs" VM-execution control is 1. In this case, the value saved for this field does not indicate the blocking of NMIs but rather the state of virtual-NMI blocking.
  - Bit 4 (enclave interruption) is set to 1 if the VM exit occurred while the logical processor was in enclave mode.

    Such VM exits includes those caused by interrupts, non-maskable interrupts, system-management interrupts, INIT signals, and exceptions occurring in enclave mode as well as exceptions encountered during the delivery of such events incident to enclave mode.

    A VM exit that is incident to delivery of an event injected by VM entry leaves this bit unmodified.
- The pending debug exceptions field is saved as clear for all VM exits except the following:
  - A VM exit caused by an INIT signal, a machine-check exception, or a system-management interrupt (SMI).
  - A VM exit with basic exit reason "TPR below threshold",[2] "virtualized EOI", "APIC write", "monitor trap flag," or "bus-lock detected."
  - A VM exit due to trace-address pre-translation (TAPT; see Section 27.5.4) or due to accesses related to PEBS on processors with the "EPT-friendly" enhancement (see Section 21.9.5). Such VM exits can have basic exit reason "APIC access," "EPT violation," "EPT misconfiguration," "page-modification log full," or "SPP-related event." When due to TAPT or PEBS, these VM exits (with the exception of those due to EPT misconfigurations) set bit 16 of the exit qualification, indicating that they are asynchronous to instruction execution and not part of event delivery.

---

3. This is true even if RFLAGS.RF was 1 before the instruction was executed. If, in response to such a VM exit, a VM monitor re-enters the guest to re-execute the instruction that caused the VM exit (for example, after clearing the VM-execution control that caused the VM exit), the instruction may encounter a code breakpoint that has already been processed. A VM monitor can avoid this by setting the guest value of RFLAGS.RF to 1 before resuming guest software.

1. If this activity state was an inactive state resulting from execution of a specific instruction (HLT or MWAIT), the value saved for RIP by that VM exit will reference the following instruction.

2. This item includes VM exits that occur as a result of certain VM entries (Section 28.7.7).

— VM exits that are not caused by debug exceptions and that occur while there is MOV-SS blocking of debug exceptions.

For VM exits that do not clear the field, the value saved is determined as follows:

— Each of bits 3:0 may be set if it corresponds to a matched breakpoint. This may be true even if the corresponding breakpoint is not enabled in DR7.

— Suppose that a VM exit is due to an INIT signal, a machine-check exception, or an SMI; or that a VM exit has basic exit reason "TPR below threshold" or "monitor trap flag." In this case, the value saved sets bits corresponding to the causes of any debug exceptions that were pending at the time of the VM exit.

If the VM exit occurs immediately after VM entry, the value saved may match that which was loaded on VM entry (see Section 28.7.3). Otherwise, the following items apply:

- Bit 12 (enabled breakpoint) is set to 1 in any of the following cases:
  — If there was at least one matched data or I/O breakpoint that was enabled in DR7.
  — If it had been set on VM entry, causing there to be valid pending debug exceptions (see Section 28.7.3) and the VM exit occurred before those exceptions were either delivered or lost.
  — If the XBEGIN instruction was executed immediately before the VM exit and advanced debugging of RTM transactional regions had been enabled (see Section 17.3.7, "RTM-Enabled Debugger Support," of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1). (This does not apply to VM exits with basic exit reason "monitor trap flag.")
  — If a bus lock was asserted while CPL > 0 and OS bus-lock detection was enabled.

  In other cases, bit 12 is cleared to 0.
- Bit 14 (BS) is set if RFLAGS.TF = 1 in either of the following cases:
  — IA32_DEBUGCTL.BTF = 0 and the cause of a pending debug exception was the execution of a single instruction.
  — IA32_DEBUGCTL.BTF = 1 and the cause of a pending debug exception was a taken branch.
- Bit 16 (RTM) is set if a debug exception (#DB) or a breakpoint exception (#BP) occurred inside an RTM region while advanced debugging of RTM transactional regions had been enabled. (This does not apply to VM exits with basic exit reason "monitor trap flag.")

— Suppose that a VM exit is due to another reason (but not a debug exception) and occurs while there is MOV-SS blocking of debug exceptions. In this case, the value saved sets bits corresponding to the causes of any debug exceptions that were pending at the time of the VM exit. If the VM exit occurs immediately after VM entry (no instructions were executed in VMX non-root operation), the value saved may match that which was loaded on VM entry (see Section 28.7.3). Otherwise, the following items apply:

- Bit 12 (enabled breakpoint) is set to 1 if there was at least one matched data or I/O breakpoint that was enabled in DR7. Bit 12 is also set if it had been set on VM entry, causing there to be valid pending debug exceptions (see Section 28.7.3) and the VM exit occurred before those exceptions were either delivered or lost. In other cases, bit 12 is cleared to 0.
- The setting of bit 14 (BS) is implementation-specific. However, it is not set if RFLAGS.TF = 0 or IA32_DEBUGCTL.BTF = 1.

— The reserved bits in the field are cleared.

- If the "save VMX-preemption timer value" VM-exit control is 1, the value of timer is saved into the VMX-preemption timer-value field. This is the value loaded from this field on VM entry as subsequently decremented (see Section 27.5.1). VM exits due to timer expiration save the value 0. Other VM exits may also save the value 0 if the timer expired during VM exit. (If the "save VMX-preemption timer value" VM-exit control is 0, VM exit does not modify the value of the VMX-preemption timer-value field.)
- If the logical processor supports the 1-setting of the "enable EPT" VM-execution control, values are saved into the four (4) PDPTE fields as follows:

  — If the "enable EPT" VM-execution control is 1 and the logical processor was using PAE paging at the time of the VM exit, the PDPTE values currently in use are saved:[1]
    - The values saved into bits 11:9 of each of the fields is undefined.

- If the value saved into one of the fields has bit 0 (present) clear, the value saved into bits 63:1 of that field is undefined. That value need not correspond to the value that was loaded by VM entry or to any value that might have been loaded in VMX non-root operation.
- If the value saved into one of the fields has bit 0 (present) set, the value saved into bits 63:12 of the field is a guest-physical address.

— If the "enable EPT" VM-execution control is 0 or the logical processor was not using PAE paging at the time of the VM exit, the values saved are undefined.

29.4 SAVING MSRS

After processor state is saved to the guest-state area, values of MSRs may be stored into the VM-exit MSR-store area (see Section 26.7.2). Specifically each entry in that area (up to the number specified in the VM-exit MSR-store count) is processed in order by storing the value of the MSR indexed by bits 31:0 (as they would be read by RDMSR) into bits 127:64. Processing of an entry fails in either of the following cases:

- The value of bits 31:8 is 000008H, meaning that the indexed MSR is one that allows access to an APIC register when the local APIC is in x2APIC mode.
- The value of bits 31:0 indicates an MSR that can be read only in system-management mode (SMM) and the VM exit will not end in SMM. (IA32_SMBASE is an MSR that can be read only in SMM.)
- The value of bits 31:0 indicates an MSR that cannot be saved on VM exits for model-specific reasons. A processor may prevent certain MSRs (based on the value of bits 31:0) from being stored on VM exits, even if they can normally be read by RDMSR. Such model-specific behavior is documented in Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4.
- Bits 63:32 of the entry are not all 0.
- An attempt to read the MSR indexed by bits 31:0 would cause a general-protection exception if executed via RDMSR with CPL = 0.

A VMX abort occurs if processing fails for any entry. See Section 29.7.

29.5 LOADING HOST STATE

Processor state is updated on VM exits in the following ways:

- Some state is loaded from or otherwise determined by the contents of the host-state area.
- Some state is determined by VM-exit controls.
- Some state is established in the same way on every VM exit.
- The page-directory pointers are loaded based on the values of certain control registers.

This loading may be performed in any order.

On processors that support Intel 64 architecture, the full values of each 64-bit field loaded (for example, the base address for GDTR) is loaded regardless of the mode of the logical processor before and after the VM exit.

The loading of host state is detailed in Section 29.5.1 to Section 29.5.5. These sections reference VMCS fields that correspond to processor state. Unless otherwise stated, these references are to fields in the host-state area.

A logical processor is in IA-32e mode after a VM exit only if the "host address-space size" VM-exit control is 1. If the logical processor was in IA-32e mode before the VM exit and this control is 0, a VMX abort occurs. See Section 29.7.

In addition to loading host state, VM exits clear address-range monitoring (Section 29.5.6).

---

1. A logical processor uses PAE paging if CR0.PG = 1, CR4.PAE = 1 and IA32_EFER.LMA = 0. See Section 5.4 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A. "Enable EPT" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM exit functions as if the "enable EPT" VM-execution control were 0. See Section 26.6.2.

After the state loading described in this section, VM exits may load MSRs from the VM-exit MSR-load area (see Section 29.6). This loading occurs only after the state loading described in this section.

29.5.1 Loading Host Control Registers, Debug Registers, MSRs

VM exits load new values for controls registers, debug registers, and some MSRs:

- CR0, CR3, and CR4 are loaded from the CR0 field, the CR3 field, and the CR4 field, respectively, with the following exceptions:
  - The following bits are not modified:
    - For CR0, ET, CD, NW; bits 63:32 (on processors that support Intel 64 architecture), 28:19, 17, and 15:6; and any bits that are fixed in VMX operation (see Section 25.8).[1]
    - For CR3, bits 63:52 and bits in the range 51:32 beyond the processor's physical-address width (they are cleared to 0).[2] (This item applies only to processors that support Intel 64 architecture.)
    - For CR4, any bits that are fixed in VMX operation (see Section 25.8).
  - CR4.PAE is set to 1 if the "host address-space size" VM-exit control is 1.
  - CR4.PCIDE is set to 0 if the "host address-space size" VM-exit control is 0.
- DR7 is set to 400H.
- If the "clear UINV" VM-exit control is 1, VM exit clears UINV.
- The following MSRs are established as follows:
  - The IA32_DEBUGCTL MSR is cleared to 00000000_00000000H.
  - The IA32_SYSENTER_CS MSR is loaded from the IA32_SYSENTER_CS field. Since that field has only 32 bits, bits 63:32 of the MSR are cleared to 0.
  - The IA32_SYSENTER_ESP and IA32_SYSENTER_EIP MSRs are loaded from the IA32_SYSENTER_ESP and IA32_SYSENTER_EIP fields, respectively.

    If the processor does not support the Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are cleared to 0.

    If the processor supports the Intel 64 architecture with N < 64 linear-address bits, each of bits 63:N is set to the value of bit N–1.[3]
  - The following steps are performed on processors that support Intel 64 architecture:
    - The MSRs FS.base and GS.base are loaded from the base-address fields for FS and GS, respectively (see Section 29.5.2).
    - The LMA and LME bits in the IA32_EFER MSR are each loaded with the setting of the "host address-space size" VM-exit control.
  - If the "load IA32_PERF_GLOBAL_CTRL" VM-exit control is 1, the IA32_PERF_GLOBAL_CTRL MSR is loaded from the IA32_PERF_GLOBAL_CTRL field. Bits that are reserved in that MSR are maintained with their reserved values.
  - If the "load IA32_PAT" VM-exit control is 1, the IA32_PAT MSR is loaded from the IA32_PAT field. Bits that are reserved in that MSR are maintained with their reserved values.
  - If the "load IA32_EFER" VM-exit control is 1, the IA32_EFER MSR is loaded from the IA32_EFER field. Bits that are reserved in that MSR are maintained with their reserved values.

---

1. Bits 28:19, 17, and 15:6 of CR0 and CR0.ET are unchanged by executions of MOV to CR0. CR0.ET is always 1 and the other bits are always 0.
2. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.
3. Software can determine the number N by executing CPUID with 80000008H in EAX. The number of linear-address bits supported is returned in bits 15:8 of EAX.

— If the "clear IA32_BNDCFGS" VM-exit control is 1, the IA32_BNDCFGS MSR is cleared to 00000000_00000000H; otherwise, it is not modified.

— If the "clear IA32_RTIT_CTL" VM-exit control is 1, the IA32_RTIT_CTL MSR is cleared to 00000000_00000000H; otherwise, it is not modified.

— If the "load CET" VM-exit control is 1, the IA32_S_CET and IA32_INTERRUPT_SSP_TABLE_ADDR MSRs are loaded from the IA32_S_CET and IA32_INTERRUPT_SSP_TABLE_ADDR fields, respectively.

If the processor does not support the Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are cleared to 0.

If the processor supports the Intel 64 architecture with N < 64 linear-address bits, each of bits 63:N is set to the value of bit N–1.

— If the "load PKRS" VM-exit control is 1, the IA32_PKRS MSR is loaded from the IA32_PKRS field. Bits 63:32 of that MSR are maintained with zeroes.

With the exception of FS.base and GS.base, any of these MSRs is subsequently overwritten if it appears in the VM-exit MSR-load area. See Section 29.6.

29.5.2 Loading Host Segment and Descriptor-Table Registers

Each of the registers CS, SS, DS, ES, FS, GS, and TR is loaded as follows (see below for the treatment of LDTR):

- The selector is loaded from the selector field. The segment is unusable if its selector is loaded with zero. The checks specified in Section 28.2.3 limit the selector values that may be loaded. In particular, CS and TR are never loaded with zero and are thus never unusable. SS can be loaded with zero only on processors that support Intel 64 architecture and only if the VM exit is to 64-bit mode (64-bit mode allows use of segments marked unusable).
- The base address is set as follows:
  — CS. Cleared to zero.
  — SS, DS, and ES. Undefined if the segment is unusable; otherwise, cleared to zero.
  — FS and GS. Undefined (but, on processors that support Intel 64 architecture, canonical) if the segment is unusable and the VM exit is not to 64-bit mode; otherwise, loaded from the base-address field.

  If the processor supports the Intel 64 architecture and the processor supports N < 64 linear-address bits, each of bits 63:N is set to the value of bit N–1.[1] The values loaded for base addresses for FS and GS are also manifest in the FS.base and GS.base MSRs.
  — TR. Loaded from the host-state area. If the processor supports the Intel 64 architecture and the processor supports N < 64 linear-address bits, each of bits 63:N is set to the value of bit N–1.
- The segment limit is set as follows:
  — CS. Set to FFFFFFFFH (corresponding to a descriptor limit of FFFFFH and a G-bit setting of 1).
  — SS, DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to FFFFFFFFH.
  — TR. Set to 00000067H.
- The type field and S bit are set as follows:
  — CS. Type set to 11 and S set to 1 (execute/read, accessed, non-conforming code segment).
  — SS, DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, type set to 3 and S set to 1 (read/write, accessed, expand-up data segment).
  — TR. Type set to 11 and S set to 0 (busy 32-bit task-state segment).
- The DPL is set as follows:
  — CS, SS, and TR. Set to 0. The current privilege level (CPL) will be 0 after the VM exit completes.

1. Software can determine the number N by executing CPUID with 80000008H in EAX. The number of linear-address bits supported is returned in bits 15:8 of EAX.

  - DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to 0.
- The P bit is set as follows:
  - CS, TR. Set to 1.
  - SS, DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to 1.
- On processors that support Intel 64 architecture, CS.L is loaded with the setting of the "host address-space size" VM-exit control. Because the value of this control is also loaded into IA32_EFER.LMA (see Section 29.5.1), no VM exit is ever to compatibility mode (which requires IA32_EFER.LMA = 1 and CS.L = 0).
- D/B.
  - CS. Loaded with the inverse of the setting of the "host address-space size" VM-exit control. For example, if that control is 0, indicating a 32-bit guest, CS.D/B is set to 1.
  - SS. Set to 1.
  - DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to 1.
  - TR. Set to 0.
- G.
  - CS. Set to 1.
  - SS, DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to 1.
  - TR. Set to 0.

The host-state area does not contain a selector field for LDTR. LDTR is established as follows on all VM exits: the selector is cleared to 0000H, the segment is marked unusable and is otherwise undefined.

The base addresses for GDTR and IDTR are loaded from the GDTR base-address field and the IDTR base-address field, respectively. If the processor supports the Intel 64 architecture and the processor supports N < 64 linear-address bits, each of bits 63:N of each base address is set to the value of bit N–1 of that base address. The GDTR and IDTR limits are each set to FFFFH.

29.5.3 Loading Host RIP, RSP, RFLAGS, and SSP

RIP and RSP are loaded from the RIP field and the RSP field, respectively. RFLAGS is cleared, except bit 1, which is always set.

If the "load CET" VM-exit control is 1, SSP (shadow-stack pointer) is loaded from the SSP field.

29.5.4 Checking and Loading Host Page-Directory-Pointer-Table Entries

If CR0.PG = 1, CR4.PAE = 1, and IA32_EFER.LMA = 0, the logical processor uses **PAE paging**. See Section 5.4 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.[1] When in PAE paging is in use, the physical address in CR3 references a table of **page-directory-pointer-table entries** (PDPTEs). A MOV to CR3 when PAE paging is in use checks the validity of the PDPTEs and, if they are valid, loads them into the processor (into internal, non-architectural registers).

A VM exit is to a VMM that uses PAE paging if (1) bit 5 (corresponding to CR4.PAE) is set in the CR4 field in the host-state area of the VMCS; and (2) the "host address-space size" VM-exit control is 0. Such a VM exit may check the validity of the PDPTEs referenced by the CR3 field in the host-state area of the VMCS. Such a VM exit must check their validity if either (1) PAE paging was not in use before the VM exit; or (2) the value of CR3 is changing as a result of the VM exit. A VM exit to a VMM that does not use PAE paging must not check the validity of the PDPTEs.

A VM exit that checks the validity of the PDPTEs uses the same checks that are used when CR3 is loaded with MOV to CR3 when PAE paging is in use. If MOV to CR3 would cause a general-protection exception due to the

1. On processors that support Intel 64 architecture, the physical-address extension may support more than 36 physical-address bits. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

PDPTEs that would be loaded (e.g., because a reserved bit is set), a VMX abort occurs (see Section 29.7). If a VM exit to a VMM that uses PAE does not cause a VMX abort, the PDPTEs are loaded into the processor as would MOV to CR3, using the value of CR3 being load by the VM exit.

29.5.5 Updating Non-Register State

VM exits affect the non-register state of a logical processor as follows:

- A logical processor is always in the active state after a VM exit.
- Event blocking is affected as follows:
  - — There is no blocking by STI or by MOV SS after a VM exit.
  - — VM exits caused directly by non-maskable interrupts (NMIs) cause blocking by NMI (see Table 26-3). Other VM exits do not affect blocking by NMI. (See Section 29.1 for the case in which an NMI causes a VM exit indirectly.)
- There are no pending debug exceptions after a VM exit.

Section 30.4 describes how the VMX architecture controls how a logical processor manages information in the TLBs and paging-structure caches. The following items detail how VM exits invalidate cached mappings:

- If the "enable VPID" VM-execution control is 0, the logical processor invalidates linear mappings and combined mappings associated with VPID 0000H (for all PCIDs); combined mappings for VPID 0000H are invalidated for all EPTRTA values (EPTRTA is the value of bits 51:12 of EPTP).
- VM exits are not required to invalidate any guest-physical mappings, nor are they required to invalidate any linear mappings or combined mappings if the "enable VPID" VM-execution control is 1.

29.5.6 Clearing Address-Range Monitoring

The Intel 64 and IA-32 architectures allow software to monitor a specified address range using the MONITOR and MWAIT instructions. See Section 10.10.4 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A. VM exits clear any address-range monitoring that may be in effect.

29.6 LOADING MSRS

VM exits may load MSRs from the VM-exit MSR-load area (see Section 26.7.2). Specifically each entry in that area (up to the number specified in the VM-exit MSR-load count) is processed in order by loading the MSR indexed by bits 31:0 with the contents of bits 127:64 as they would be written by WRMSR.

Processing of an entry fails in any of the following cases:

- The value of bits 31:0 is either C0000100H (the IA32_FS_BASE MSR) or C0000101H (the IA32_GS_BASE MSR).
- The value of bits 31:8 is 000008H, meaning that the indexed MSR is one that allows access to an APIC register when the local APIC is in x2APIC mode.
- The value of bits 31:0 indicates an MSR that can be written only in system-management mode (SMM) and the VM exit will not end in SMM. (IA32_SMM_MONITOR_CTL is an MSR that can be written only in SMM.)
- The value of bits 31:0 indicates an MSR that cannot be loaded on VM exits for model-specific reasons. A processor may prevent loading of certain MSRs even if they can normally be written by WRMSR. Such model-specific behavior is documented in Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4.
- Bits 63:32 are not all 0.
- An attempt to write bits 127:64 to the MSR indexed by bits 31:0 of the entry would cause a general-protection exception if executed via WRMSR with CPL = 0.[1]

If processing fails for any entry, a VMX abort occurs. See Section 29.7.

If any MSR is being loaded in such a way that would architecturally require a TLB flush, the TLBs are updated so that, after VM exit, the logical processor does not use any translations that were cached before the transition.

29.7 VMX ABORTS

A problem encountered during a VM exit leads to a **VMX abort**. A VMX abort takes a logical processor into a shut-down state as described below.

A VMX abort does not modify the VMCS data in the VMCS region of any active VMCS. The contents of these data are thus suspect after the VMX abort.

On a VMX abort, a logical processor saves a nonzero 32-bit VMX-abort indicator field at byte offset 4 in the VMCS region of the VMCS whose misconfiguration caused the failure (see Section 26.2). The following values are used:

1. There was a failure in saving guest MSRs (see Section 29.4).
2. Host checking of the page-directory-pointer-table entries (PDPTEs) failed (see Section 29.5.4).
3. The current VMCS has been corrupted (through writes to the corresponding VMCS region) in such a way that the logical processor cannot complete the VM exit properly.
4. There was a failure on loading host MSRs (see Section 29.6).
5. There was a machine-check event during VM exit (see Section 29.8).
6. The logical processor was in IA-32e mode before the VM exit and the "host address-space size" VM-exit control was 0 (see Section 29.5).

Some of these causes correspond to failures during the loading of state from the host-state area. Because the loading of such state may be done in any order (see Section 29.5) a VM exit that might lead to a VMX abort for multiple reasons (for example, the current VMCS may be corrupt and the host PDPTEs might not be properly configured). In such cases, the VMX-abort indicator could correspond to any one of those reasons.

A logical processor never reads the VMX-abort indicator in a VMCS region and writes it only with one of the non-zero values mentioned above. The VMX-abort indicator allows software on one logical processor to diagnose the VMX-abort on another. For this reason, it is recommended that software running in VMX root operation zero the VMX-abort indicator in the VMCS region of any VMCS that it uses.

After saving the VMX-abort indicator, operation of a logical processor experiencing a VMX abort depends on whether the logical processor is in SMX operation:[1]

- If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs. The error code used is 000DH, indicating "VMX abort." See the Intel® Trusted Execution Technology Measured Launched Environment Programming Guide.
- If the logical processor is outside SMX operation, it issues a special bus cycle (to notify the chipset) and enters the **VMX-abort shutdown state**. RESET is the only event that wakes a logical processor from the VMX-abort shutdown state. The following events do not affect a logical processor in this state: machine-check events; INIT signals; external interrupts; non-maskable interrupts (NMIs); start-up IPIs (SIPIs); and system-management interrupts (SMIs).

29.8 MACHINE-CHECK EVENTS DURING VM EXIT

If a machine-check event occurs during VM exit, one of the following occurs:

---

1. Note the following about processors that support Intel 64 architecture. If CR0.PG = 1, WRMSR to the IA32_EFER MSR causes a general-protection exception if it would modify the LME bit. Since CR0.PG is always 1 in VMX operation, the IA32_EFER MSR should not be included in the VM-exit MSR-load area for the purpose of modifying the LME bit.

1. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENTER]. A logical processor is outside SMX operation if GETSEC[SENTER] has not been executed or if GETSEC[SEXIT] was executed after the last execution of GETSEC[SENTER]. See Chapter 7, "Safer Mode Extensions Reference," in Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2D.

- The machine-check event is handled as if it occurred before the VM exit:
  - If CR4.MCE = 0, operation of the logical processor depends on whether the logical processor is in SMX operation:[1]
    - If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs. The error code used is 000CH, indicating "unrecoverable machine-check condition."
    - If the logical processor is outside SMX operation, it goes to the shutdown state.
  - If CR4.MCE = 1, a machine-check exception (#MC) is generated:
    - If bit 18 (#MC) of the exception bitmap is 0, the exception is delivered through the guest IDT.
    - If bit 18 of the exception bitmap is 1, the exception causes a VM exit.
- The machine-check event is handled after VM exit completes:
  - If the VM exit ends with CR4.MCE = 0, operation of the logical processor depends on whether the logical processor is in SMX operation:
    - If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs with error code 000CH (unrecoverable machine-check condition).
    - If the logical processor is outside SMX operation, it goes to the shutdown state.
  - If the VM exit ends with CR4.MCE = 1, a machine-check exception (#MC) is delivered through the host IDT.
- A VMX abort is generated (see Section 29.7). The logical processor blocks events as done normally in VMX abort. The VMX abort indicator is 5, for "machine-check event during VM exit."

The first option is not used if the machine-check event occurs after any host state has been loaded. The second option is used only if VM entry is able to load all host state.

29.9 USER-INTERRUPT RECOGNITION AFTER VM EXIT

A VM exit results in recognition of a pending user interrupt if it completes with CR4.UINTR = IA32_EFER.LMA = 1 and with UIRR ≠ 0; otherwise, no pending user interrupt is recognized.

25. Updates to Chapter 34, Volume 3C

Change bars and violet text show changes to Chapter 34 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C:* System Programming Guide, Part 3.

Changes to this chapter:

- Updated Table 34-26, "MODE.Exec Packet Definition," to correct an error in the description. Previously, the description listed EBX bit 6 as the "Event Trace Support" bit; however, this bit is EBX bit 7.

CHAPTER 34
INTEL® PROCESSOR TRACE

34.1 OVERVIEW

Intel® Processor Trace (**Intel PT**) is an extension of Intel® Architecture that captures information about software execution using dedicated hardware facilities that cause only minimal performance perturbation to the software being traced. This information is collected in **data packets**. The initial implementations of Intel PT offer **control flow tracing**, which generates a variety of packets to be processed by a software decoder. The packets include timing, program flow information (e.g., branch targets, branch taken/not taken indications) and program-induced mode related information (e.g., Intel TSX state transitions, CR3 changes). These packets may be buffered internally before being sent to the memory subsystem or other output mechanism available in the platform. Debug software can process the trace data and reconstruct the program flow.

Intel Processor Trace was first introduced in Intel® processors based on Broadwell microarchitecture and Intel Atom® processors based on Goldmont microarchitecture. Later generations include additional trace sources, including software trace instrumentation using PTWRITE, and Power Event tracing.

34.1.1 Features and Capabilities

Intel PT's control flow trace generates a variety of packets that, when combined with the binaries of a program by a post-processing tool, can be used to produce an exact execution trace. The packets record flow information such as instruction pointers (IP), indirect branch targets, and directions of conditional branches within contiguous code regions (basic blocks).

Intel PT can also be configured to log software-generated packets using PTWRITE, and packets describing processor power management events. Further, Precise Event-Based Sampling (PEBS) can be configured to log PEBS records in the Intel PT trace; see Section 21.5.5.2.

In addition, the packets record other contextual, timing, and bookkeeping information that enables both functional and performance debugging of applications. Intel PT has several control and filtering capabilities available to customize the tracing information collected and to append other processor state and timing information to enable debugging. For example, there are modes that allow packets to be filtered based on the current privilege level (CPL) or the value of CR3.

Configuration of the packet generation and filtering capabilities are programmed via a set of MSRs. The MSRs generally follow the naming convention of IA32_RTIT_*. The capability provided by these configuration MSRs are enumerated by CPUID, see Section 34.3. Details of the MSRs for configuring Intel PT are described in Section 34.2.8.

34.1.1.1 Packet Summary

After a tracing tool has enabled and configured the appropriate MSRs, the processor will collect and generate trace information in the following categories of packets (for more details on the packets, see Section 34.4):

- Packets about basic information on program execution; these include:
  - Packet Stream Boundary (PSB) packets: PSB packets act as 'heartbeats' that are generated at regular intervals (e.g., every 4K trace packet bytes). These packets allow the packet decoder to find the packet boundaries within the output data stream; a PSB packet should be the first packet that a decoder looks for when beginning to decode a trace.
  - Paging Information Packet (PIP): PIPs record modifications made to the CR3 register. This information, along with information from the operating system on the CR3 value of each process, allows the debugger to attribute linear addresses to their correct application source.
  - Time-Stamp Counter (TSC) packets: TSC packets aid in tracking wall-clock time, and contain some portion of the software-visible time-stamp counter.
  - Core Bus Ratio (CBR) packets: CBR packets contain the core:bus clock ratio.

  - Mini Time Counter (MTC) packets: MTC packets provide periodic indication of the passing of wall-clock time.
  - Cycle Count (CYC) packets: CYC packets provide indication of the number of processor core clock cycles that pass between packets.
  - Overflow (OVF) packets: OVF packets are sent when the processor experiences an internal buffer overflow, resulting in packets being dropped. This packet notifies the decoder of the loss and can help the decoder to respond to this situation.
- Packets about control flow information:
  - Taken Not-Taken (TNT) packets: TNT packets track the "direction" of direct conditional branches (taken or not taken).
  - Target IP (TIP) packets: TIP packets record the target IP of indirect branches, exceptions, interrupts, and other branches or events. These packets can contain the IP, although that IP value may be compressed by eliminating upper bytes that match the last IP. There are various types of TIP packets; they are covered in more detail in Section 34.4.2.2.
  - Flow Update Packets (FUP): FUPs provide the source IP addresses for asynchronous events (interrupt and exceptions), as well as other cases where the source address cannot be determined from the binary.
  - MODE packets: These packets provide the decoder with important processor execution information so that it can properly interpret the dis-assembled binary and trace log. MODE packets have a variety of formats that indicate details such as the execution mode (16-bit, 32-bit, or 64-bit).
- Packets inserted by software:
  - PTWRITE (PTW) packets: includes the value of the operand passed to the PTWRITE instruction (see "PTWRITE—Write Data to a Processor Trace Packet" in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B).
- Packets about processor power management events:
  - MWAIT packets: Indicate successful completion of an MWAIT operation to a C-state deeper than C0.0.
  - Power State Entry (PWRE) packets: Indicate entry to a C-state deeper than C0.0.
  - Power State Exit (PWRX) packets: Indicate exit from a C-state deeper than C0.0, returning to C0.
  - Execution Stopped (EXSTOP) packets: Indicate that software execution has stopped, due to events such as P-state change, C-state change, or thermal throttling.
- Packets containing groups of processor state values:
  - Block Begin Packets (BBP): Indicate the type of state held in the following group.
  - Block Item Packets (BIP): Indicate the state values held in the group.
  - Block End Packets (BEP): Indicate the end of the current group.

34.2 INTEL® PROCESSOR TRACE OPERATIONAL MODEL

This section describes the overall Intel Processor Trace mechanism and the essential concepts relevant to how it operates.

34.2.1 Change of Flow Instruction (COFI) Tracing

A basic program block is a section of code where no jumps or branches occur. The instruction pointers (IPs) in this block of code need not be traced, as the processor will execute them from start to end without redirecting code flow. Instructions such as branches, and events such as exceptions or interrupts, can change the program flow. These instructions and events that change program flow are called Change of Flow Instructions (COFI). There are three categories of COFI:

- Direct transfer COFI.
- Indirect transfer COFI.
- Far transfer COFI.

The following subsections describe the COFI events that result in trace packet generation. Table 33-1 lists branch instruction by COFI types. For detailed description of specific instructions, see the Intel® 64 and IA-32 Architectures Software Developer's Manual.

Table 33-1. COFI Type for Branch Instructions

COFI Type	Instructions
Conditional Branch	JA, JAE, JB, JBE, JC, JCXZ, JECXZ, JRCXZ, JE, JG, JGE, JL, JLE, JNA, JNAE, JNB, JNBE, JNC, JNE, JNG, JNGE, JNL, JNLE, JNO, JNP, JNS, JNZ, JO, JP, JPE, JPO, JS, JZ, LOOP, LOOPE, LOOPNE, LOOPNZ, LOOPZ
Unconditional Direct Branch	JMP (E9 xx, EB xx), CALL (E8 xx)
Indirect Branch	JMP (FF /4), CALL (FF /2), RET (C3, C2 xx)
Far Transfers	INT1, INT3, INT *n*, INTO, IRET, IRETD, IRETQ, JMP (EA xx, FF /5), CALL (9A xx, FF /3), RET (CB, CA xx), SYSCALL, SYSRET, SYSENTER, SYSEXIT, VMLAUNCH, VMRESUME

34.2.1.1 Direct Transfer COFI

Direct Transfer COFI are relative branches. This means that their target is an IP whose offset from the current IP is embedded in the instruction bytes. It is not necessary to indicate target of these instructions in the trace output since it can be obtained through the source disassembly. Conditional branches need to indicate only whether the branch is taken or not. Unconditional branches do not need any recording in the trace output. There are two sub-categories:

- **Conditional Branch (Jcc, J*CXZ) and LOOP**

  To track this type of instruction, the processor encodes a single bit (taken or not taken — TNT) to indicate the program flow after the instruction.

  Jcc, J*CXZ, and LOOP can be traced with TNT bits. To improve the trace packet output efficiency, the processor will compact several TNT bits into a single packet.

- **Unconditional Direct Jumps**

  There is no trace output required for direct unconditional jumps (like JMP near relative or CALL near relative) since they can be directly inferred from the application assembly. Direct unconditional jumps do not generate a TNT bit or a Target IP packet, though TIP.PGD and TIP.PGE packets can be generated by unconditional direct jumps that toggle Intel PT enables (see Section 34.2.6).

34.2.1.2 Indirect Transfer COFI

Indirect transfer instructions involve updating the IP from a register or memory location. Since the register or memory contents can vary at any time during execution, there is no way to know the target of the indirect transfer until the register or memory contents are read. As a result, the disassembled code is not sufficient to determine the target of this type of COFI. Therefore, tracing hardware must send out the destination IP in the trace packet for debug software to determine the target address of the COFI. Note that this IP may be a linear or effective address (see Section 34.3.1.1).

An indirect transfer instruction generates a Target IP Packet (TIP) that contains the target address of the branch. There are two sub-categories:

- **Near JMP Indirect and Near Call Indirect**

  As previously mentioned, the target of an indirect COFI resides in the contents of either a register or memory location. Therefore, the processor must generate a packet that includes this target address to allow the decoder to determine the program flow.

- **Near RET**

  When a CALL instruction executes, it pushes onto the stack the address of the next instruction following the CALL. Upon completion of the call procedure, the RET instruction is often used to pop the return address off of the call stack and redirect code flow back to the instruction following the CALL.

  A RET instruction simply transfers program flow to the address it popped off the stack. Because a called procedure may change the return address on the stack before executing the RET instruction, debug software

can be misled if it assumes that code flow will return to the instruction following the last CALL. Therefore, even for near RET, a Target IP Packet may be sent.

— **RET Compression**

A special case is applied if the target of the RET is consistent with what would be expected from tracking the CALL stack. If it is assured that the decoder has seen the corresponding CALL (with "corresponding" defined as the CALL with matching stack depth), and the RET target is the instruction after that CALL, the RET target may be "compressed". In this case, only a single TNT bit of "taken" is generated instead of a Target IP Packet. To ensure that the decoder will not be confused in cases of RET compression, only RETs that correspond to CALLs which have been seen since the last PSB packet may be compressed in a given logical processor. For details, see "Indirect Transfer Compression for Returns (RET)" in Section 34.4.2.2.

34.2.1.3 Far Transfer COFI

All operations that change the instruction pointer and are not near jumps are "far transfers". This includes exceptions, interrupts, traps, TSX aborts, and instructions that do far transfers.

All far transfers will produce a Target IP (TIP) packet, which provides the destination IP address. For those far transfers that cannot be inferred from the binary source (e.g., asynchronous events such as exceptions and interrupts), the TIP will be preceded by a Flow Update packet (FUP), which provides the source IP address at which the event was taken. Table 33-23 indicates exactly which IP will be included in the FUP generated by a far transfer.

34.2.2 Software Trace Instrumentation with PTWRITE

PTWRITE provides a mechanism by which software can instrument the Intel PT trace. PTWRITE is a ring3-accessible instruction that can be passed to a register or memory variable, see "PTWRITE—Write Data to a Processor Trace Packet" in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B, for details. The contents of that variable will be used as the payload for the PTW packet (see Table 33-40 "PTW Packet Definition"), inserted at the time of PTWRITE retirement, assuming PTWRITE is enabled and all other filtering conditions are met. Decode and analysis software will then be able to determine the meaning of the PTWRITE packet based on the IP of the associated PTWRITE instruction.

PTWRITE is enabled via IA32_RTIT_CTL.PTWEn[12] (see Table 33-6). Optionally, the user can use IA32_RTIT_CTL.FUPonPTW[5] to enable PTW packets to be followed by FUP packets containing the IP of the associated PTWRITE instruction. Support for PTWRITE is introduced in Intel Atom processors based on the Goldmont Plus microarchitecture.

34.2.3 Power Event Tracing

Power Event Trace is a capability that exposes core- and thread-level sleep state and power down transition information. When this capability is enabled, the trace will expose information about:

— Scenarios where software execution stops.
  - Due to sleep state entry, frequency change, or other powerdown.
  - Includes the IP, when in the tracing context.

— The requested and resolved hardware thread C-state.
  - Including indication of hardware autonomous C-state entry.

— The last and deepest core C-state achieved during a sleep session.

— The reason for C-state wake.

This information is in addition to the bus ratio (CBR) information provided by default after any powerdown, and the timing information (TSC, TMA, MTC, CYC) provided during or after a powerdown state.

Power Event Trace is enabled via IA32_RTIT_CTL.PwrEvtEn[4]. Support for Power Event Tracing is introduced in Intel Atom processors based on the Goldmont Plus microarchitecture.

34.2.4 Event Tracing

Event Trace is a capability that exposes details about the asynchronous events, when they are generated, and when their corresponding software event handler completes execution. These include:

- Interrupts, including NMI and SMI, including the interrupt vector when defined.
- Faults, exceptions including the fault vector.
  - Page faults additionally include the page fault address, when in context.
- Event handler returns, including IRET and RSM.
- VM exits and VM entries.[1]
  - VM exits include the values written to the "exit reason" and "exit qualification" VMCS fields.
- INIT and SIPI events.
- TSX aborts, including the abort status returned for the RTM instructions.
- Shutdown.

Additionally, it provides indication of the status of the Interrupt Flag (IF), to indicate when interrupts are masked.

Event Trace is enabled via IA32_RTIT_CTL.EventEn[31]. Event Trace information is conveyed in Control Flow Event (CFE) and Event Data (EVD) packets, as well as the legacy MODE.Exec packet. See Section 34.4.2 for packet details. Support for Event Trace is introduced in Intel® processors based on Gracemont microarchitecture.

34.2.5 Trace Filtering

Intel Processor Trace provides filtering capabilities, by which the debug/profile tool can control what code is traced.

34.2.5.1 Filtering by Current Privilege Level (CPL)

Intel PT provides the ability to configure a logical processor to generate trace packets only when CPL = 0, when CPL > 0, or regardless of CPL.

CPL filtering ensures that no IPs or other architectural state information associated with the filtered CPL can be seen in the log. For example, if the processor is configured to trace only when CPL > 0, and software executes SYSCALL (changing the CPL to 0), the destination IP of the SYSCALL will be suppressed from the generated packet (see the discussion of TIP.PGD in Section 34.4.2.5).

It should be noted that CPL is always 0 in real-address mode and that CPL is always 3 in virtual-8086 mode. To trace code in these modes, filtering should be configured accordingly.

When software is executing in a non-enabled CPL, ContextEn is cleared. See Section 34.2.6.1 for details.

34.2.5.2 Filtering by CR3

Intel PT supports a CR3-filtering mechanism by which the generation of packets containing architectural states can be enabled or disabled based on the value of CR3. A debugger can use CR3 filtering to trace only a single application without context switching the state of the RTIT MSRs. For the reconstruction of traces from software with multiple threads, debug software may wish to context-switch for the state of the RTIT MSRs (if the operating system does not provide context-switch support) to separate the output for the different threads (see Section 34.3.5, "Context Switch Consideration").

To trace for only a single CR3 value, software can write that value to the IA32_RTIT_CR3_MATCH MSR, and set IA32_RTIT_CTL.CR3Filter. When CR3 value does not match IA32_RTIT_CR3_MATCH and IA32_RTIT_CTL.CR3Filter is 1, ContextEn is forced to 0, and packets containing architectural states will not be generated. Some other packets can be generated when ContextEn is 0; see Section 34.2.6.3 for details. When CR3 does match IA32_RTIT_CR3_MATCH (or when IA32_RTIT_CTL.CR3Filter is 0), CR3 filtering does not force ContextEn to 0 (although it could be 0 due to other filters or modes).

1. Logging of VMX transitions depends on VMCS configuration, see Section 34.5.1.

CR3 matches IA32_RTIT_CR3_MATCH if the two registers are identical for bits 63:12, or 63:5 when in PAE paging mode; the lower 5 bits of CR3 and IA32_RTIT_CR3_MATCH are ignored. CR3 filtering is independent of the value of CR0.PG.

When CR3 filtering is in use, PIP packets may still be seen in the log if the processor is configured to trace when CPL = 0 (IA32_RTIT_CTL.OS = 1). If not, no PIP packets will be seen.

34.2.5.3 Filtering by IP

Trace packet generation with configurable filtering by IP is supported if CPUID.(EAX=14H, ECX=0):EBX[bit 2] = 1. Intel PT can be configured to enable the generation of packets containing architectural states only when the processor is executing code within certain IP ranges. If the IP is outside of these ranges, generation of some packets is blocked.

IP filtering is enabled using the ADDRn_CFG fields in the IA32_RTIT_CTL MSR (Section 34.2.8.2), where the digit 'n' is a zero-based number that selects which address range is being configured. Each ADDRn_CFG field configures the use of the register pair IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B (Section 34.2.8.5). IA32_RTIT_ADDRn_A defines the base and IA32_RTIT_ADDRn_B specifies the limit of the range in which tracing is enabled. Thus each range, referred to as the ADDRn range, is defined by [IA32_RTIT_ADDRn_A, IA32_RTIT_ADDRn_B]. There can be multiple such ranges, software can query CPUID (Section 34.3.1) for the number of ranges supported on a processor.

Default behavior (ADDRn_CFG=0) defines no IP filter range, meaning FilterEn is always set. In this case code at any IP can be traced, though other filters, such as CR3 or CPL, could limit tracing. When ADDRn_CFG is set to enable IP filtering (see Section 34.3.1), tracing will commence when a taken branch or event is seen whose target address is in the ADDRn range.

While inside a tracing region and with FilterEn is set, leaving the tracing region may only be detected once a taken branch or event with a target outside the range is retired. If an ADDRn range is entered or exited by executing the next sequential instruction, rather than by a control flow transfer, FilterEn may not toggle immediately. See Section 34.2.6.5 for more details on FilterEn.

Note that these address range base and limit values are inclusive, such that the range includes the first and last instruction whose first instruction byte is in the ADDRn range.

Depending upon processor implementation, IP filtering may be based on linear or effective address. This can cause different behavior between implementations if CSbase is not equal to zero or in real mode. See Section 34.3.1.1 for details. Software can query CPUID to determine filters are based on linear or effective address (Section 34.3.1).

Note that some packets, such as MTC (Section 34.3.7) and other timing packets, do not depend on FilterEn. For details on which packets depend on FilterEn, and hence are impacted by IP filtering, see Section 34.4.1.

TraceStop

The ADDRn ranges can also be configured to cause tracing to be disabled upon entry to the specified region. This is intended for cases where unexpected code is executed, and the user wishes to immediately stop generating packets in order to avoid overwriting previously written packets.

The TraceStop mechanism works much the same way that IP filtering does, and uses the same address comparison logic. The TraceStop region base and limit values are programmed into one or more ADDRn ranges, but IA32_RTIT_CTL.ADDRn_CFG is configured with the TraceStop encoding. Like FilterEn, TraceStop is detected when a taken branch or event lands in a TraceStop region.

Further, TraceStop requires that TriggerEn=1 at the beginning of the branch/event, and ContextEn=1 upon completion of the branch/event. When this happens, the CPU will set IA32_RTIT_STATUS.Stopped, thereby clearing TriggerEn and hence disabling packet generation. This may generate a TIP.PGD packet with the target IP of the branch or event that entered the TraceStop region. Finally, a TraceStop packet will be inserted, to indicate that the condition was hit.

If a TraceStop condition is encountered during buffer overflow (Section 34.3.8), it will not be dropped, but will instead be signaled once the overflow has resolved.

Note that a TraceStop event does not guarantee that all internally buffered packets are flushed out of internal buffers. To ensure that this has occurred, the user should clear TraceEn.

To resume tracing after a TraceStop event, the user must first disable Intel PT by clearing IA32_RTIT_CTL.TraceEn before the IA32_RTIT_STATUS.Stopped bit can be cleared. At this point Intel PT can be reconfigured, and tracing resumed.

Note that the IA32_RTIT_STATUS.Stopped bit can also be set using the ToPA STOP bit. See Section 34.2.7.2.

IP Filtering Example

The following table gives an example of IP filtering behavior. Assume that IA32_RTIT_ADDRn_A = the IP of RangeBase, and that IA32_RTIT_ADDRn_B = the IP of RangeLimit, while IA32_RTIT_CTL.ADDRn_CFG = 0x1 (enable ADDRn range as a FilterEn range).

Table 33-2. IP Filtering Packet Example

Code Flow	Packets

`Bar:`
`  jmp RangeBase // jump into filter range`
`RangeBase:`
`  jcc Foo // not taken`
`  add eax, 1`
`Foo:`
`  jmp RangeLimit+1 // jump out of filter range`
`RangeLimit:`
`  nop`
`  jcc Bar`
	TIP.PGE(RangeBase)
	TNT(0)
	TIP.PGD(RangeLimit+1)

IP Filtering and TraceStop

It is possible for the user to configure IP filter range(s) and TraceStop range(s) that overlap. In this case, code executing in the non-overlapping portion of either range will behave as would be expected from that range. Code executing in the overlapping range will get TraceStop behavior.

34.2.6 Packet Generation Enable Controls

Intel Processor Trace includes a variety of controls that determine whether a packet is generated. In general, most packets are sent only if Packet Enable (**PacketEn**) is set. PacketEn is an internal state maintained in hardware in response to software configurable enable controls, PacketEn is not visible to software directly. The relationship of PacketEn to the software-visible controls in the configuration MSRs is described in this section.

34.2.6.1 Packet Enable (PacketEn)

When PacketEn is set, the processor is in the mode that Intel PT is monitoring. PacketEn is composed of other states according to this relationship:

```
PacketEn := TriggerEn AND ContextEn AND FilterEn AND BranchEn
```

These constituent controls are detailed in the following subsections.

PacketEn ultimately determines when the processor is tracing. When PacketEn is set, all control flow packets are enabled. When PacketEn is clear, no control flow packets are generated, though other packets (timing and bookkeeping packets) may still be sent. See Section 34.2.7 for details of PacketEn and packet generation.

Note that, on processors that do not support IP filtering (i.e., CPUID.(EAX=14H, ECX=0):EBX[bit 2] = 0), FilterEn is treated as always set.

34.2.6.2 Trigger Enable (TriggerEn)

Trigger Enable (**TriggerEn**) is the primary indicator that trace packet generation is active. TriggerEn is set when IA32_RTIT_CTL.TraceEn is set, and cleared by any of the following conditions:

- TraceEn is cleared by software.
- A TraceStop condition is encountered and IA32_RTIT_STATUS.Stopped is set.
- IA32_RTIT_STATUS.Error is set due to an operational error (see Section 34.3.10).

Software can discover the current TriggerEn value by reading the IA32_RTIT_STATUS.TriggerEn bit. When TriggerEn is clear, tracing is inactive and no packets are generated.

34.2.6.3 Context Enable (ContextEn)

Context Enable (**ContextEn**) indicates whether the processor is in the state or mode that software configured hardware to trace. For example, if execution with CPL = 0 code is not being traced (IA32_RTIT_CTL.OS = 0), then ContextEn will be 0 when the processor is in CPL0.

Software can discover the current ContextEn value by reading the IA32_RTIT_STATUS.ContextEn bit. ContextEn is defined as follows:

```
ContextEn = !((IA32_RTIT_CTL.OS = 0 AND CPL = 0) OR
(IA32_RTIT_CTL.USER = 0 AND CPL > 0) OR (IS_IN_A_PRODUCTION_ENCLAVE[1]) OR
(IA32_RTIT_CTL.CR3Filter = 1 AND IA32_RTIT_CR3_MATCH does not match CR3)
```

If the clearing of ContextEn causes PacketEn to be cleared, a Packet Generation Disable (TIP.PGD) packet is generated, but its IP payload is suppressed. If the setting of ContextEn causes PacketEn to be set, a Packet Generation Enable (TIP.PGE) packet is generated.

When ContextEn is 0, control flow packets (TNT, FUP, TIP.*, MODE.*) are not generated, and no Linear Instruction Pointers (LIPs) are exposed. However, some packets, such as MTC and PSB (see Section 34.4.2.16 and Section 34.4.2.17), may still be generated while ContextEn is 0. For details of which packets are generated only when ContextEn is set, see Section 34.4.1.

The processor does not update ContextEn when TriggerEn = 0.

The value of ContextEn will toggle only when TriggerEn = 1.

34.2.6.4 Branch Enable (BranchEn)

This value is based purely on the IA32_RTIT_CTL.BranchEn value. If **BranchEn** is not set, then relevant COFI packets (TNT, TIP*, FUP, MODE.*) are suppressed. Other packets related to timing (TSC, TMA, MTC, CYC), as well as PSB, will be generated normally regardless. Further, PIP and VMCS continue to be generated, as indicators of what software is running.

34.2.6.5 Filter Enable (FilterEn)

Filter Enable indicates that the Instruction Pointer (IP) is within the range of IPs that Intel PT is configured to watch. Software can get the state of Filter Enable by a RDMSR of IA32_RTIT_STATUS.FilterEn. For details on configuration and use of IP filtering, see Section 34.2.5.3.

On clearing of FilterEn that also clears PacketEn, a Packet Generation Disable (TIP.PGD) will be generated, but unlike the ContextEn case, the IP payload may not be suppressed. For direct, unconditional branches, as well as for indirect branches (including RETs), the PGD generated by leaving the tracing region and clearing FilterEn will contain the target IP. This means that IPs from outside the configured range can be exposed in the trace, as long as they are within context.

When FilterEn is 0, control flow packets are not generated (e.g., TNT, TIP). However, some packets, such as PIP, MTC, and PSB, may still be generated while FilterEn is clear. For details on packet enable dependencies, see Section 34.4.1.

---

1. Trace packets generation is disabled in a production enclave, see Section 34.2.9.5. See the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D, about differences between a production enclave and a debug enclave.

After TraceEn is set, FilterEn is set to 1 at all times if there is no IP filter range configured by software (IA32_RTIT_CTL.ADDRn_CFG != 1, for all n), or if the processor does not support IP filtering (i.e., CPUID.(EAX=14H, ECX=0):EBX[bit 2] = 0). FilterEn will toggle only when TraceEn=1 and ContextEn=1, and when at least one range is configured for IP filtering.

34.2.7 Trace Output

Intel PT output should be viewed independently from trace content and filtering mechanisms. The options available for trace output can vary across processor generations and platforms.

Trace output is written out using one of the following output schemes, as configured by the ToPA and FabricEn bit fields of IA32_RTIT_CTL (see Section 34.2.8.2):

- A single, contiguous region of physical address space.
- A collection of variable-sized regions of physical memory. These regions are linked together by tables of pointers to those regions, referred to as Table of Physical Addresses (**ToPA**). The trace output stores bypass the caches and the TLBs, but are not serializing. This is intended to minimize the performance impact of the output.
- A platform-specific trace transport subsystem.

Regardless of the output scheme chosen, Intel PT stores bypass the processor caches by default. This ensures that they don't consume precious cache space, but they do not have the serializing aspects associated with un-cacheable (UC) stores. Software should avoid using MTRRs to mark any portion of the Intel PT output region as UC, as this may override the behavior described above and force Intel PT stores to UC, thereby incurring severe performance impact.

There is no guarantee that a packet will be written to memory or other trace endpoint after some fixed number of cycles after a packet-producing instruction executes. The only way to assure that all packets generated have reached their endpoint is to clear TraceEn and follow that with a store, fence, or serializing instruction; doing so ensures that all buffered packets are flushed out of the processor.

34.2.7.1 Single Range Output

When IA32_RTIT_CTL.ToPA and IA32_RTIT_CTL.FabricEn bits are clear, trace packet output is sent to a single, contiguous memory (or MMIO if DRAM is not available) range defined by a base address in IA32_RTIT_OUTPUT_BASE (Section 34.2.8.7) and mask value in IA32_RTIT_OUTPUT_MASK_PTRS (Section 34.2.8.8). The current write pointer in this range is also stored in IA32_RTIT_OUTPUT_MASK_PTRS. This output range is circular, meaning that when the writes wrap around the end of the buffer they begin again at the base address.

This output method is best suited for cases where Intel PT output is either:

- Configured to be directed to a sufficiently large contiguous region of DRAM.
- Configured to go to an MMIO debug port, in order to route Intel PT output to a platform-specific trace endpoint (e.g., JTAG). In this scenario, a specific range of addresses is written in a circular manner, and SoC will intercept these writes and direct them to the proper device. Repeated writes to the same address do not overwrite each other, but are accumulated by the debugger, and hence no data is lost by the circular nature of the buffer.

The processor will determine the address to which to write the next trace packet output byte as follows:

```
OutputBase[63:0] := IA32_RTIT_OUTPUT_BASE[63:0]

OutputMask[63:0] := ZeroExtend64(IA32_RTIT_OUTPUT_MASK_PTRS[31:0])

OutputOffset[63:0] := ZeroExtend64(IA32_RTIT_OUTPUT_MASK_PTRS[63:32])

trace_store_phys_addr := (OutputBase & ~OutputMask) + (OutputOffset & OutputMask)
```

Single-Range Output Errors

If the output base and mask are not properly configured by software, an operational error (see Section 34.3.10) will be signaled, and tracing disabled. Error scenarios with single-range output are:

- Mask value is non-contiguous.

  IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTablePointer value has a 0 in a less significant bit position than the most significant bit containing a 1.

- Base address and Mask are mis-aligned, and have overlapping bits set.

  IA32_RTIT_OUTPUT_BASE && IA32_RTIT_OUTPUT_MASK_PTRS[31:0] > 0.

- Illegal Output Offset

  IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset is greater than the mask value IA32_RTIT_OUTPUT_MASK_PTRS[31:0].

Also note that errors can be signaled due to trace packet output overlapping with restricted memory, see Section 34.2.7.4.

34.2.7.2 Table of Physical Addresses (ToPA)

When IA32_RTIT_CTL.ToPA is set and IA32_RTIT_CTL.FabricEn is clear, the ToPA output mechanism is utilized. The ToPA mechanism uses a linked list of tables; see Figure 34-1 for an illustrative example. Each entry in the table contains some attribute bits, a pointer to an output region, and the size of the region. The last entry in the table may hold a pointer to the next table. This pointer can either point to the top of the current table (for circular array) or to the base of another table. The table size is not fixed, since the link to the next table can exist at any entry.

The processor treats the various output regions referenced by the ToPA table(s) as a unified buffer. This means that a single packet may span the boundary between one output region and the next.

The ToPA mechanism is controlled by three values maintained by the processor:

- **proc_trace_table_base.**
  This is the physical address of the base of the current ToPA table. When tracing is enabled, the processor loads this value from the IA32_RTIT_OUTPUT_BASE MSR. While tracing is enabled, the processor updates the IA32_RTIT_OUTPUT_BASE MSR with changes to proc_trace_table_base, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_table_base.

- **proc_trace_table_offset.**
  This indicates the entry of the current table that is currently in use. (This entry contains the address of the current output region.) When tracing is enabled, the processor loads the value from bits 31:7 (MaskOrTableOffset) of the IA32_RTIT_OUTPUT_MASK_PTRS into bits 27:3 of proc_trace_table_offset. While tracing is enabled, the processor updates IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTableOffset with changes to proc_trace_table_offset, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_table_offset.

- **proc_trace_output_offset.**
  This a pointer into the current output region and indicates the location of the next write. When tracing is enabled, the processor loads this value from bits 63:32 (OutputOffset) of the IA32_RTIT_OUTPUT_MASK_PTRS. While tracing is enabled, the processor updates IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset with changes to proc_trace_output_offset, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_output_offset.

Figure 34-1 provides an illustration (not to scale) of the table and associated pointers.

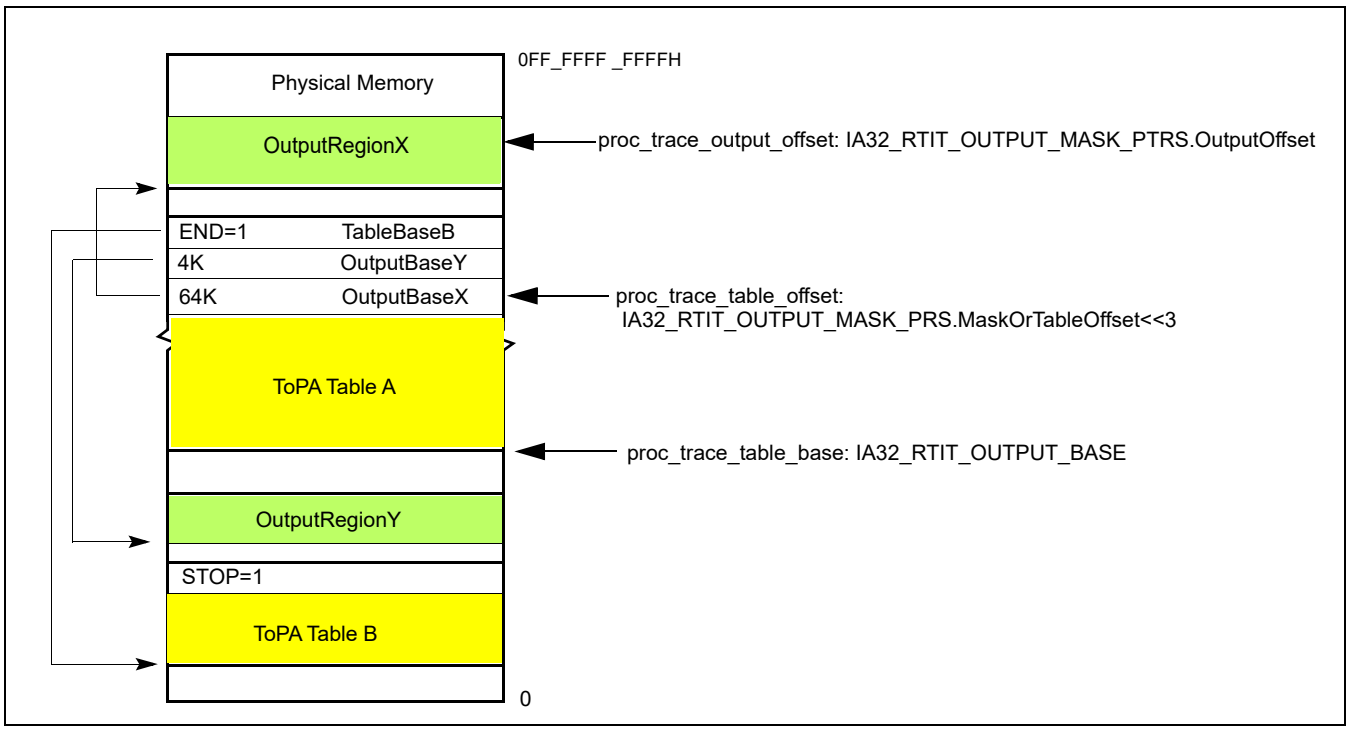

Figure 34-1. ToPA Memory Illustration

With the ToPA mechanism, the processor writes packets to the current output region (identified by proc_trace_table_base and the proc_trace_table_offset). The offset within that region to which the next byte will be written is identified by proc_trace_output_offset. When that region is filled with packet output (thus proc_trace_output_offset = RegionSize–1), proc_trace_table_offset is moved to the next ToPA entry, proc_trace_output_offset is set to 0, and packet writes begin filling the new output region specified by proc_trace_table_offset.

As packets are written out, each store derives its physical address as follows:

```
trace_store_phys_addr := Base address from current ToPA table entry +
proc_trace_output_offset
```

Eventually, the regions represented by all entries in the table may become full, and the final entry of the table is reached. An entry can be identified as the final entry because it has either the END or STOP attribute. The END attribute indicates that the address in the entry does not point to another output region, but rather to another ToPA table. The STOP attribute indicates that tracing will be disabled once the corresponding region is filled. See Table 33-3 and the section that follows for details on STOP.

When an END entry is reached, the processor loads proc_trace_table_base with the base address held in this END entry, thereby moving the current table pointer to this new table. The proc_trace_table_offset is reset to 0, as is the proc_trace_output_offset, and packet writes will resume at the base address indicated in the first entry.

If the table has no STOP or END entry, and trace-packet generation remains enabled, eventually the maximum table size will be reached (proc_trace_table_offset = 0FFFFFF8H). In this case, the proc_trace_table_offset and proc_trace_output_offset are reset to 0 (wrapping back to the beginning of the current table) once the last output region is filled.

It is important to note that processor updates to the IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS MSRs are asynchronous to instruction execution. Thus, reads of these MSRs while Intel PT is enabled may return stale values. Like all IA32_RTIT_* MSRs, the values of these MSRs should not be trusted or saved unless trace packet generation is first disabled by clearing IA32_RTIT_CTL.TraceEn. This ensures that the output MSR values account for all packets generated to that point, after which the processor will cease updating the output MSR values until tracing resumes. [1]

The processor may cache internally any number of entries from the current table or from tables that it references (directly or indirectly). If tracing is enabled, the processor may ignore or delay detection of modifications to these tables. To ensure that table changes are detected by the processor in a predictable manner, software should clear TraceEn before modifying the current table (or tables that it references) and only then re-enable packet generation.

Single Output Region ToPA Implementation

The first processor generation to implement Intel PT supports only ToPA configurations with a single ToPA entry followed by an END entry that points back to the first entry (creating one circular output buffer). Such processors enumerate CPUID.(EAX=14H,ECX=0):ECX.MENTRY[bit 1] = 0 and CPUID.(EAX=14H,ECX=0):ECX.TOPAOUT[bit 0] = 1.

If CPUID.(EAX=14H,ECX=0):ECX.MENTRY[bit 1] = 0, ToPA tables can hold only one output entry, which must be followed by an END=1 entry which points back to the base of the table. Hence only one contiguous block can be used as output.

The lone output entry can have INT or STOP set, but nonetheless must be followed by an END entry as described above. Note that, if INT=1, the PMI will actually be delivered before the region is filled.

ToPA Table Entry Format

The format of ToPA table entries is shown in Figure 34-2. The size of the address field is determined by the processor's physical-address width (MAXPHYADDR) in bits, as reported in CPUID.80000008H:EAX[7:0].

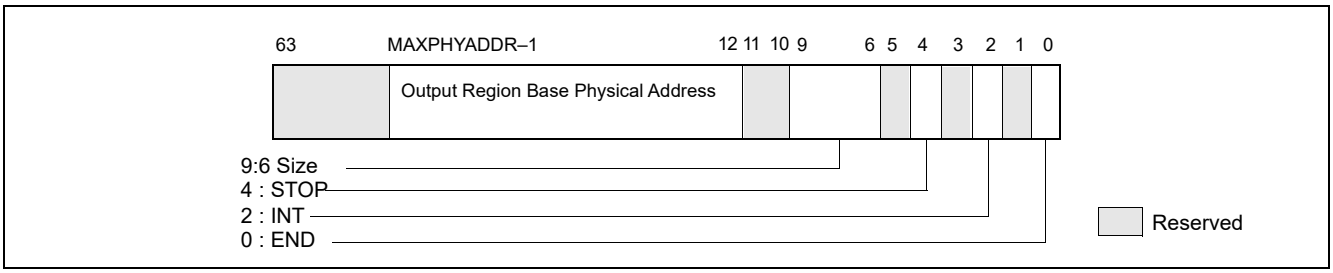

Figure 34-2. Layout of ToPA Table Entry

Table 33-3 describes the details of the ToPA table entry fields. If reserved bits are set to 1, an error is signaled.

Table 33-3. ToPA Table Entry Fields

ToPA Entry Field	Description
Output Region Base Physical Address	If END=0, this is the base physical address of the output region specified by this entry. Note that all regions must be aligned based on their size. Thus a 2M region must have bits 20:12 clear. If the region is not properly aligned, an operational error will be signaled when the entry is reached. If END=1, this is the 4K-aligned base physical address of the next ToPA table (which may be the base of the current table, or the first table in the linked list if a circular buffer is desired). If the processor supports only a single ToPA output region (see above), this address must be the value currently in the IA32_RTIT_OUTPUT_BASE MSR.

1. Although WRMSR is a serializing instruction, the execution of WRMSR that forces packet writes by clearing TraceEn does not itself cause these writes to be globally observed.

Table 33-3. ToPA Table Entry Fields (Contd.)

ToPA Entry Field	Description
Size	Indicates the size of the associated output region. Encodings are: 0: 4K, 1: 8K, 2: 16K, 3: 32K, 4: 64K, 5: 128K, 6: 256K, 7: 512K, 8: 1M, 9: 2M, 10: 4M, 11: 8M, 12: 16M, 13: 32M, 14: 64M, 15: 128M This field is ignored if END=1.
STOP	When the output region indicated by this entry is filled, software should disable packet generation. This will be accomplished by setting IA32_RTIT_STATUS.Stopped, which clears TriggerEn. This bit must be 0 if END=1; otherwise it is treated as reserved bit violation (see ToPA Errors).
INT	When the output region indicated by this entry is filled, signal Perfmon LVT interrupt. Note that if both INT and STOP are set in the same entry, the STOP will happen before the INT. Thus the interrupt handler should expect that the IA32_RTIT_STATUS.Stopped bit will be set, and will need to be reset before tracing can be resumed. This bit must be 0 if END=1; otherwise it is treated as reserved bit violation (see ToPA Errors).
END	If set, indicates that this is an END entry, and thus the address field points to a table base rather than an output region base. If END=1, INT and STOP must be set to 0; otherwise it is treated as reserved bit violation (see ToPA Errors). The Size field is ignored in this case. If the processor supports only a single ToPA output region (see above), END must be set in the second table entry.

ToPA STOP

Each ToPA entry has a STOP bit. If this bit is set, the processor will set the IA32_RTIT_STATUS.Stopped bit when the corresponding trace output region is filled. This will clear TriggerEn and thereby cease packet generation. See Section 34.2.8.4 for details on IA32_RTIT_STATUS.Stopped. This sequence is known as "ToPA Stop".

No TIP.PGD packet will be seen in the output when the ToPA stop occurs, since the disable happens only when the region is already full. When this occurs, output ceases after the last byte of the region is filled, which may mean that a packet is cut off in the middle. Any packets remaining in internal buffers are lost and cannot be recovered.

When ToPA stop occurs, the IA32_RTIT_OUTPUT_BASE MSR will hold the base address of the table whose entry had STOP=1. IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTableOffset will hold the index value for that entry, and the IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset should be set to the size of the region minus one.

Note that this means the offset pointer is pointing to the next byte after the end of the region, a configuration that would produce an operational error if the configuration remained when tracing is re-enabled with IA32_RTIT_STATUS.Stopped cleared.

ToPA PMI

Each ToPA entry has an INT bit. If this bit is set, the processor will signal a performance-monitoring interrupt (PMI) when the corresponding trace output region is filled. This interrupt is not precise, and it is thus likely that writes to the next region will occur by the time the interrupt is taken.

The following steps should be taken to configure this interrupt:

1. Enable PMI via the LVT Performance Monitor register (at MMIO offset 340H in xAPIC mode; via MSR 834H in x2APIC mode). See the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B, for more details on this register. For ToPA PMI, set all fields to 0, save for the interrupt vector, which can be selected by software.
2. Set up an interrupt handler to service the interrupt vector that a ToPA PMI can raise.
3. Set the interrupt flag by executing STI.
4. Set the INT bit in the ToPA entry of interest and enable packet generation, using the ToPA output option. Thus, TraceEn=ToPA=1 in the IA32_RTIT_CTL MSR.

Once the INT region has been filled with packet output data, the interrupt will be signaled. This PMI can be distinguished from others by checking bit 55 (Trace_ToPA_PMI) of the IA32_PERF_GLOBAL_STATUS MSR (MSR 38EH). Once the ToPA PMI handler has serviced the relevant buffer, writing 1 to bit 55 of the MSR at 390H (IA32_GLOBAL_STATUS_RESET) clears IA32_PERF_GLOBAL_STATUS.Trace_ToPA_PMI.

Intel PT is not frozen on PMI, and thus the interrupt handler will be traced (though filtering can prevent this). The Freeze_Perfmon_on_PMI and Freeze_LBRs_on_PMI settings in IA32_DEBUGCTL will be applied on ToPA PMI just as on other PMIs, and hence Perfmon counters are frozen.

Assuming the PMI handler wishes to read any buffered packets for persistent output, or wishes to modify any Intel PT MSRs, software should first disable packet generation by clearing TraceEn. This ensures that all buffered packets are written to memory and avoids tracing of the PMI handler. The configuration MSRs can then be used to determine where tracing has stopped. If packet generation is disabled by the handler, it should then be manually re-enabled before the IRET if continued tracing is desired.

In rare cases, it may be possible to trigger a second ToPA PMI before the first is handled. This can happen if another ToPA region with INT=1 is filled before, or shortly after, the first PMI is taken, perhaps due to EFLAGS.IF being cleared for an extended period of time. This can manifest in two ways: either the second PMI is triggered before the first is taken, and hence only one PMI is taken, or the second is triggered after the first is taken, and thus will be taken when the handler for the first completes. Software can minimize the likelihood of the second case by clearing TraceEn at the beginning of the PMI handler. Further, it can detect such cases by then checking the Interrupt Request Register (IRR) for PMI pending, and checking the ToPA table base and off-set pointers (in IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS) to see if multiple entries with INT=1 have been filled.

PMI Preservation

In some cases a ToPA PMI may be taken after completion of an XSAVES instruction that saves Intel PT state, and in such cases any modification of Intel PT MSRs within the PMI handler will not persist when the saved Intel PT context is later restored with XRSTORS. To account for such a scenario, the PMI Preservation feature has been added. Support for this feature is indicated by CPUID.(EAX=14H, ECX=0):EBX[bit 6].

When IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1, PMI preservation is enabled. When a ToPA region with INT=1 is filled, a PMI is pended and the new IA32_RTIT_STATUS.PendToPAPMI[7] is set to 1. If this bit is set when Intel PT is enabled, such that IA32_RTIT_CTL.TraceEn[0] transitions from 0 to 1, a ToPA PMI is pended. This behavior ensures that any ToPA PMI that is pended during XSAVES, and hence can't be properly handled, will be re-pended when the saved PT state is restored.

When this feature is enabled, the PMI handler should take the following actions:

1. Ignore ToPA PMIs that are taken when TraceEn = 0. This indicates that the PMI was pended during Intel PT disable, and the PendToPAPMI flag will ensure that the PMI is re-pended once Intel PT is re-enabled in the same context. For this reason, the PendToPAPMI bit should be left set to 1.
2. If TraceEn=1 and the PMI can be properly handled, clear the new PendTopaPMI bit. This will ensure that additional, spurious ToPA PMIs are not taken. It is required that PendToPAPMI is cleared before the PMI LVT mask is cleared in the APIC, and before any clearing of either LBRS_FROZEN or COUNTERS_FROZEN in IA32_PERF_GLOBAL_STATUS.

ToPA PMI and Single Output Region ToPA Implementation

A processor that supports only a single ToPA output region implementation (such that only one output region is supported; see above) will attempt to signal a ToPA PMI interrupt before the output wraps and overwrites the top of the buffer. To support this functionality, the PMI handler should disable packet generation as soon as possible.

Due to PMI skid, it is possible that, in rare cases, the wrap will have occurred before the PMI is delivered. Software can avoid this by setting the STOP bit in the ToPA entry (see Table 33-3); this will disable tracing once the region is filled, and no wrap will occur. This approach has the downside of disabling packet generation so that some of the instructions that led up to the PMI will not be traced. If the PMI skid is significant enough to cause the region to fill and tracing to be disabled, the PMI handler will need to clear the IA32_RTIT_STATUS.Stopped indication before tracing can resume.

ToPA PMI and XSAVES/XRSTORS State Handling

In some cases the ToPA PMI may be taken after completion of an XSAVES instruction that switches Intel PT state, and in such cases any modification of Intel PT MSRs within the PMI handler will not persist when the saved Intel PT context is later restored with XRSTORS. To account for such a scenario, it is recommended that the Intel PT output configuration be modified by altering the ToPA tables themselves, rather than the Intel PT output MSRs. On processors that support PMI preservation (CPUID.(EAX=14H, ECX=0):EBX[bit 6] = 1), setting IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1 will ensure that a PMI that is pending at the time PT is disabled will be recorded by setting IA32_RTIT_STATUS.PendTopaPMI[7] = 1. A PMI will then be pended when the saved PT context is later restored.

Table 33-4 depicts a recommended PMI handler algorithm for managing multi-region ToPA output and handling ToPA PMIs that may arrive between XSAVES and XRSTORS, if PMI preservation is not in use. This algorithm is flexible to allow software to choose between adding entries to the current ToPA table, adding a new ToPA table, or using the current ToPA table as a circular buffer. It assumes that the ToPA entry that triggers the PMI is not the last entry in the table, which is the recommended treatment.

Table 33-4. Algorithm to Manage Intel PT ToPA PMI and XSAVES/XRSTORS

Pseudo Code Flow

```
IF (IA32_PERF_GLOBAL_STATUS.ToPA)
    Save IA32_RTIT_CTL value;
    IF ( IA32_RTIT_CTL.TraceEN )
        Disable Intel PT by clearing TraceEn;
    FI;
    IF ( there is space available to grow the current ToPA table )
        Add one or more ToPA entries after the last entry in the ToPA table;
        Point new ToPA entry address field(s) to new output region base(s);
    ELSE
        Modify an upcoming ToPA entry in the current table to have END=1;
        IF (output should transition to a new ToPA table )
            Point the address of the "END=1" entry of the current table to the new table base;
        ELSE
            /* Continue to use the current ToPA table, make a circular. */
            Point the address of the "END=1"l entry to the base of the current table;
            Modify the ToPA entry address fields for filled output regions to point to new, unused output regions;
            /* Filled regions are those with index in the range of 0 to (IA32_RTIT_MASK_PTRS.MaskOrTableOffset -1). */
        FI;
      FI;
      Restore saved IA32_RTIT_CTL.value;
FI;
```

ToPA Errors

When a malformed ToPA entry is found, an **operational error** results (see Section 34.3.10). A malformed entry can be any of the following:

1. **ToPA entry reserved bit violation**.
   This describes cases where a bit marked as reserved in Section 34.2.7.2 above is set to 1.
2. **ToPA alignment violation**.
   This includes cases where illegal ToPA entry base address bits are set to 1:
   a. ToPA table base address is not 4KB-aligned. The table base can be from a WRMSR to IA32_RTIT_OUTPUT_BASE, or from a ToPA entry with END=1.
   b. ToPA entry base address is not aligned to the ToPA entry size (e.g., a 2MB region with base address[20:12] not equal to 0), for ToPA entries with END=0.
   c. ToPA entry base address sets upper physical address bits not supported by the processor.

3. **Illegal ToPA Output Offset**.
   IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset is greater than or equal to the size of the current ToPA output region size.
4. **ToPA rules violations**.
   These are similar to ToPA entry reserved bit violations; they are cases when a ToPA entry is encountered with illegal field combinations. They include the following:
   a. Setting the STOP or INT bit on an entry with END=1.
   b. Setting the END bit in entry 0 of a ToPA table.
   c. On processors that support only a single ToPA entry (see above), two additional illegal settings apply:
      i) ToPA table entry 1 with END=0.
      ii) ToPA table entry 1 with base address not matching the table base.

In all cases, the error will be logged by setting IA32_RTIT_STATUS.Error, thereby disabling tracing when the problematic ToPA entry is reached (when proc_trace_table_offset points to the entry containing the error). Any packet bytes that are internally buffered when the error is detected may be lost.

Note that operational errors may also be signaled due to attempts to access restricted memory. See Section 34.2.7.4 for details.

A tracing software have a range of flexibility using ToPA to manage the interaction of Intel PT with application buffers, see Section 34.4.2.26.

34.2.7.3 Trace Transport Subsystem

When IA32_RTIT_CTL.FabricEn is set, the IA32_RTIT_CTL.ToPA bit is ignored, and trace output is written to the trace transport subsystem. The endpoints of this transport are platform-specific, and details of configuration options should refer to the specific platform documentation. The FabricEn bit is available to be set if CPUID(EAX=14H,ECX=0):EBX[bit 3] = 1.

34.2.7.4 Restricted Memory Access

Packet output cannot be directed to any regions of memory that are restricted by the platform. In particular, all memory accesses on behalf of packet output are checked against the SMRR regions. If there is any overlap with these regions, trace data collection will not function properly. Exact processor behavior is implementation-dependent; Table 33-5 summarizes several scenarios.

Table 33-5. Behavior on Restricted Memory Access

Scenario	Description
ToPA output region overlaps with SMRR	Stores to the restricted memory region will be dropped, and that packet data will be lost. Any attempt to read from that restricted region will return all 1s. The processor also may signal an error (Section 34.3.10) and disable tracing when the output pointer reaches the restricted region. If packet generation remains enabled, then packet output may continue once stores are no longer directed to restricted memory (on wrap, or if the output region is larger than the restricted memory region).
ToPA table overlaps with SMRR	The processor will signal an error (Section 34.3.10) and disable tracing when the ToPA write pointer (IA32_RTIT_OUTPUT_BASE + proc_trace_table_offset) enters the restricted region.

It should also be noted that packet output should not be routed to the 4KB APIC MMIO region, as defined by the IA32_APIC_BASE MSR. For details about the APIC, refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A. No error is signaled for this case.

Modifications to Restricted Memory Regions

It is recommended that software disable packet generation before modifying the SMRRs to change the scope of the SMRR regions. This is because the processor reserves the right to cache any number of ToPA table entries internally, after checking them against restricted memory ranges. Once cached, the entries will not be checked again, meaning one could potentially route packet output to a newly restricted region. Software can ensure that any cached entries are written to memory by clearing IA32_RTIT_CTL.TraceEn.

34.2.8 Enabling and Configuration MSRs

34.2.8.1 General Considerations

Trace packet generation is enabled and configured by a collection of model-specific registers (MSRs), which are detailed below. Some notes on the configuration MSR behavior:

- If Intel Processor Trace is not supported by the processor (see Section 34.3.1), RDMSR or WRMSR of the IA32_RTIT_* MSRs will cause #GP.
- A WRMSR to any of the IA32_RTIT_* configuration MSRs while packet generation is enabled (IA32_RTIT_CTL.TraceEn=1) will generate a #GP exception. Packet generation must be disabled before the configuration MSRs can be changed.

  Note: Software may write the same value back to IA32_RTIT_CTL without #GP, even if TraceEn=1.
- All configuration MSRs for Intel PT are duplicated per logical processor
- For each configuration MSR, any MSR write that attempts to change bits marked reserved, or utilize encodings marked reserved, will cause a #GP fault.
- All configuration MSRs for Intel PT are cleared on a warm or cold RESET.
  - If CPUID.(EAX=14H, ECX=0):EBX[bit 2] = 1, only the TraceEn bit is cleared on warm RESET; though this may have the impact of clearing other bits in IA32_RTIT_STATUS. Other MSR values of the trace configuration MSRs are preserved on warm RESET.
- The semantics of MSR writes to trace configuration MSRs in this chapter generally apply to explicit WRMSR to these registers, using VMexit or VM entry MSR load list to these MSRs, XRSTORS with requested feature bit map including XSAVE map component of state_8 (corresponding to IA32_XSS[bit 8]), and the write to IA32_RTIT_CTL.TraceEn by XSAVES (Section 34.3.5.2).

34.2.8.2 IA32_RTIT_CTL MSR

IA32_RTIT_CTL, at address 570H, is the primary enable and control MSR for trace packet generation. Bit positions are listed in Table 33-6.

Table 33-6. IA32_RTIT_CTL MSR

Position	Bit Name	At Reset	Bit Description
0	TraceEn	0	If 1, enables tracing; else tracing is disabled. When this bit transitions from 1 to 0, all buffered packets are flushed out of internal buffers. A further store, fence, or architecturally serializing instruction may be required to ensure that packet data can be observed at the trace endpoint. See Section 34.2.8.3 for details of enabling and disabling packet generation. Note that the processor will clear this bit on #SMI (Section 34.2.9.3) and warm reset. Other MSR bits of IA32_RTIT_CTL (and other trace configuration MSRs) are not impacted by these events.
1	CYCEn	0	0: Disables CYC Packet (see Section 34.4.2.14). 1: Enables CYC Packet. This bit is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 1] = 0.
2	OS	0	0: Packet generation is disabled when CPL = 0. 1: Packet generation may be enabled when CPL = 0.
3	User	0	0: Packet generation is disabled when CPL > 0. 1: Packet generation may be enabled when CPL > 0.
4	PwrEvtEn	0	0: Power Event Trace packets are disabled. 1: Power Event Trace packets are enabled (see Section 34.2.3, “Power Event Tracing”).

Table 33-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
5	FUPonPTW	0	0: PTW packets are not followed by FUPs. 1: PTW packets are followed by FUPs. This bit is reserved when CPUID.(EAX=14H, ECX=0):EBX[bit 4] ("PTWRITE Supported") is 0.
6	FabricEn	0	0: Trace output is directed to the memory subsystem, mechanism depends on IA32_RTIT_CTL.ToPA. 1: Trace output is directed to the trace transport subsystem, IA32_RTIT_CTL.ToPA is ignored. This bit is reserved if CPUID.(EAX=14H, ECX=0):ECX[bit 3] = 0.
7	CR3Filter	0	0: Disables CR3 filtering. 1: Enables CR3 filtering. This bit is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 0] ("CR3 Filtering Support") is 0.
8	ToPA	0	0: Single-range output scheme enabled if CPUID.(EAX=14H, ECX=0):ECX.SNGLRGNOUT[bit 2] = 1 and IA32_RTIT_CTL.FabricEn=0. 1: ToPA output scheme enabled (see Section 34.2.7.2) if CPUID.(EAX=14H, ECX=0):ECX.TOPA[bit 0] = 1, and IA32_RTIT_CTL.FabricEn=0. Note: WRMSR to IA32_RTIT_CTL that sets TraceEn but clears this bit and FabricEn would cause #GP, if CPUID.(EAX=14H, ECX=0):ECX.SNGLRGNOUT[bit 2] = 0. WRMSR to IA32_RTIT_CTL that sets this bit causes #GP, if CPUID.(EAX=14H, ECX=0):ECX.TOPA[bit 0] = 0.
9	MTCEn	0	0: Disables MTC Packet (see Section 34.4.2.16). 1: Enables MTC Packet. This bit is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 3] = 0.
10	TSCEn	0	0: Disable TSC packets. 1: Enable TSC packets (see Section 34.4.2.11).
11	DisRETC	0	0: Enable RET compression. 1: Disable RET compression (see Section 34.2.1.2).
12	PTWEn	0	0: PTWRITE packet generation disabled. 1: PTWRITE packet generation enabled (see Table 33-40 "PTW Packet Definition"). This bit is reserved when CPUID.(EAX=14H, ECX=0):EBX[bit 4] ("PTWRITE Supported") is 0.
13	BranchEn	0	0: Disable COFI-based packets. 1: Enable COFI-based packets: FUP, TIP, TIP.PGE, TIP.PGD, TNT, MODE.Exec, MODE.TSX. See Section 34.2.6.4 for details on BranchEn.
17:14	MTCFreq	0	Defines MTC packet Frequency, which is based on the core crystal clock, or Always Running Timer (ART). MTC will be sent each time the selected ART bit toggles. The following Encodings are defined: 0: ART(0), 1: ART(1), 2: ART(2), 3: ART(3), 4: ART(4), 5: ART(5), 6: ART(6), 7: ART(7), 8: ART(8), 9: ART(9), 10: ART(10), 11: ART(11), 12: ART(12), 13: ART(13), 14: ART(14), 15: ART(15) Software must use CPUID to query the supported encodings in the processor, see Section 34.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 3] = 0.
18	Reserved	0	Must be 0.

Table 33-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
22:19	CycThresh	0	CYC packet threshold, see Section 34.3.6 for details. CYC packets will be sent with the first eligible packet after N cycles have passed since the last CYC packet. If CycThresh is 0 then N=0, otherwise N is defined as $2^{(CycThresh-1)}$. The following Encodings are defined: 0: 0, 1: 1, 2: 2, 3: 4, 4: 8, 5: 16, 6: 32, 7: 64, 8: 128, 9: 256, 10: 512, 11: 1024, 12: 2048, 13: 4096, 14: 8192, 15: 16384 Software must use CPUID to query the supported encodings in the processor, see Section 34.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 1] = 0.
23	Reserved	0	Must be 0.
27:24	PSBFreq	0	Indicates the frequency of PSB packets. PSB packet frequency is based on the number of Intel PT packet bytes output, so this field allows the user to determine the increment of IA32_IA32_RTIT_STATUS.PacketByteCnt that should cause a PSB to be generated. Note that PSB insertion is not precise, but the average output bytes per PSB should approximate the SW selected period. The following Encodings are defined: 0: 2K, 1: 4K, 2: 8K, 3: 16K, 4: 32K, 5: 64K, 6: 128K, 7: 256K, 8: 512K, 9: 1M, 10: 2M, 11: 4M, 12: 8M, 13: 16M, 14: 32M, 15: 64M Software must use CPUID to query the supported encodings in the processor, see Section 34.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 1] = 0.
30:28	Reserved	0	Must be 0.
31	EventEn	0	0: Event Trace packets are disabled. 1: Event Trace packets are enabled. This bit is reserved when CPUID.(EAX=14H, ECX=0):EBX[bit 7] ("Event Trace Supported") is 0.
35:32	ADDR0_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR0_A/B based on the following encodings: 0: ADDR0 range unused. 1: The [IA32_RTIT_ADDR0_A..IA32_RTIT_ADDR0_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 34.2.5.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR0_A..IA32_RTIT_ADDR0_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See 4.2.8 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.(EAX=14H, ECX=1):EBX.RANGECNT[2:0] < 1.
39:36	ADDR1_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR1_A/B based on the following encodings: 0: ADDR1 range unused. 1: The [IA32_RTIT_ADDR1_A..IA32_RTIT_ADDR1_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 34.2.5.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR1_A..IA32_RTIT_ADDR1_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 34.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.(EAX=14H, ECX=1):EBX.RANGECNT[2:0] < 2.

Table 33-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
43:40	ADDR2_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR2_A/B based on the following encodings: 0: ADDR2 range unused. 1: The [IA32_RTIT_ADDR2_A..IA32_RTIT_ADDR2_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 34.2.5.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR2_A..IA32_RTIT_ADDR2_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 34.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.(EAX=14H, ECX=1):EBX.RANGECNT[2:0] < 3.
47:44	ADDR3_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR3_A/B based on the following encodings: 0: ADDR3 range unused. 1: The [IA32_RTIT_ADDR3_A..IA32_RTIT_ADDR3_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 34.2.5.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR3_A..IA32_RTIT_ADDR3_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 34.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.(EAX=14H, ECX=1):EBX.RANGECNT[2:0] < 4.
54:48	Reserved	0	Reserved only for future trace content enables, or address filtering configuration enables. Must be 0.
55	DisTNT	0	0: Include TNT packets in control flow trace. 1: Omit TNT packets from control flow trace. This bit is reserved when CPUID.(EAX=14H, ECX=0):EBX[bit 8] ("TNT Disable Supported") is 0. SeeSection 34.3.9 for details.
56	InjectPsbPmiOnEnable	0	1: Enables use of IA32_RTIT_STATUS bits PendPSB[6] and PendTopaPMI[7], see Section 34.2.8.4, "IA32_RTIT_STATUS MSR," for behavior of these bits. 0: IA32_RTIT_STATUS bits 6 and 7 are ignored. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 6] = 0.
59:57	Reserved	0	Reserved only for future trace content enables, or address filtering configuration enables. Must be 0.
63:60	Reserved	0	Must be 0.

34.2.8.3 Enabling and Disabling Packet Generation with TraceEn

When TraceEn transitions from 0 to 1, Intel Processor Trace is enabled, and a series of packets may be generated. These packets help ensure that the decoder is aware of the state of the processor when the trace begins, and that it can keep track of any timing or state changes that may have occurred while packet generation was disabled. A full PSB+ (see Section 34.4.2.17) will be generated if IA32_RTIT_STATUS.PacketByteCnt=0, and may be generated in other cases as well. Otherwise, timing packets will be generated, including TSC, TMA, and CBR (see Section 34.4.1.1).

In addition to the packets discussed above, if and when PacketEn (Section 34.2.6.1) transitions from 0 to 1 (which may happen immediately, depending on filtering settings), a TIP.PGE packet (Section 34.4.2.3) will be generated.

When TraceEn is set, the processor may read ToPA entries from memory and cache them internally. For this reason, software should disable packet generation before making modifications to the ToPA tables (or changing the config-

uration of restricted memory regions). See Section 34.7 for more details of packets that may be generated with modifications to TraceEn.

Disabling Packet Generation

Clearing TraceEn causes any packet data buffered within the logical processor to be flushed out, after which the output MSRs (IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS) will have stable values. When output is directed to memory, a store, fence, or architecturally serializing instruction may be required to ensure that the packet data is globally observed. No special packets are generated by disabling packet generation, though a TIP.PGD may result if PacketEn=1 at the time of disable.

Other Writes to IA32_RTIT_CTL

Any attempt to modify IA32_RTIT_CTL while TraceEn is set will result in a general-protection fault (#GP) unless the same write also clears TraceEn. However, writes to IA32_RTIT_CTL that do not modify any bits will not cause a #GP, even if TraceEn remains set.

34.2.8.4 IA32_RTIT_STATUS MSR

The IA32_RTIT_STATUS MSR is readable and writable by software, though some fields cannot be modified by software. See Table 33-7 for details. The WRMSR instruction ignores these bits in the source operand (attempts to modify these bits are ignored and do not cause WRMSR to fault).

This MSR can only be written when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). The processor does not modify the value of this MSR while TraceEn is 0 (software can modify it with WRMSR).

Table 33-7. IA32_RTIT_STATUS MSR

Position	Bit Name	At Reset	Bit Description
0	FilterEn	0	This bit is written by the processor, and indicates that tracing is allowed for the current IP, see Section 34.2.6.5. Writes are ignored.
1	ContextEn	0	The processor sets this bit to indicate that tracing is allowed for the current context. See Section 34.2.6.3. Writes are ignored.
2	TriggerEn	0	The processor sets this bit to indicate that tracing is enabled. See Section 34.2.6.2. Writes are ignored.
3	Reserved	0	Must be 0.
4	Error	0	The processor sets this bit to indicate that an operational error has been encountered. When this bit is set, TriggerEn is cleared to 0 and packet generation is disabled. For details, see "ToPA Errors" in Section 34.2.7.2. When TraceEn is cleared, software can write this bit. Once it is set, only software can clear it. It is not recommended that software ever set this bit, except in cases where it is restoring a prior saved state.
5	Stopped	0	The processor sets this bit to indicate that a ToPA Stop condition has been encountered. When this bit is set, TriggerEn is cleared to 0 and packet generation is disabled. For details, see "ToPA STOP" in Section 34.2.7.2. When TraceEn is cleared, software can write this bit. Once it is set, only software can clear it. It is not recommended that software ever set this bit, except in cases where it is restoring a prior saved state.
6	PendPSB	0	If IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1, the processor sets this bit when the threshold for a PSB+ to be inserted has been reached. The processor will clear this bit when the PSB+ has been inserted into the trace. If PendPSB = 1 and InjectPsbPmiOnEnable = 1 when IA32_RTIT_CTL.TraceEn[0] transitions from 0 to 1, a PSB+ will be inserted into the trace. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 6] = 0.

Table 33-7. IA32_RTIT_STATUS MSR

Position	Bit Name	At Reset	Bit Description
7	PendTopaPMI	0	If IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1, the processor sets this bit when the threshold for a ToPA PMI to be inserted has been reached. Software should clear this bit once the ToPA PMI has been handled, see "ToPA PMI" for details. If PendTopaPMI = 1 and InjectPsbPmiOnEnable = 1 when IA32_RTIT_CTL.TraceEn[0] transitions from 0 to 1, a PMI will be pended. This field is reserved if CPUID.(EAX=14H, ECX=0):EBX[bit 6] = 0.
31:8	Reserved	0	Must be 0.
48:32	PacketByteCnt	0	This field is written by the processor, and holds a count of packet bytes that have been sent out. The processor also uses this field to determine when the next PSB packet should be inserted. Note that the processor may clear or modify this field at any time while IA32_RTIT_CTL.TraceEn=1. It will have a stable value when IA32_RTIT_CTL.TraceEn=0. See Section 34.4.2.17 for details. This field is reserved when CPUID.(EAX=14H,ECX=0):EBX[bit 1] ("Configurable PSB and CycleAccurate Mode Supported") is 0.
63:49	Reserved	0	Must be 0.

34.2.8.5 IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B MSRs

The role of the IA32_RTIT_ADDRn_A/B register pairs, for each n, is determined by the corresponding ADDRn_CFG fields in IA32_RTIT_CTL (see Section 34.2.8.2). The number of these register pairs is enumerated by CPUID.(EAX=14H, ECX=1):EAX.RANGECNT[2:0].

- Processors that enumerate support for 1 range support:
  - IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
- Processors that enumerate support for 2 ranges support:
  - IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
  - IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B
- Processors that enumerate support for 3 ranges support:
  - IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
  - IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B
  - IA32_RTIT_ADDR2_A, IA32_RTIT_ADDR2_B
- Processors that enumerate support for 4 ranges support:
  - IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
  - IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B
  - IA32_RTIT_ADDR2_A, IA32_RTIT_ADDR2_B
  - IA32_RTIT_ADDR3_A, IA32_RTIT_ADDR3_B

Each register has a single 64-bit field that holds a linear address value. Writes must ensure that the address is in canonical form, otherwise a general-protection fault (#GP) fault will result.

Each MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

34.2.8.6 IA32_RTIT_CR3_MATCH MSR

The IA32_RTIT_CR3_MATCH register is compared against CR3 when IA32_RTIT_CTL.CR3Filter is 1. Bits 63:5 hold the CR3 address value to match, bits 4:0 are reserved to 0. For more details on CR3 filtering and the treatment of this register, see Section 34.2.5.2.

This MSR is accessible if CPUID.(EAX=14H, ECX=0):EBX[bit 0], "CR3 Filtering Support", is 1. This MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). IA32_RTIT_CR3_MATCH[4:0] are reserved and must be 0; an attempt to set those bits using WRMSR causes a #GP.

34.2.8.7 IA32_RTIT_OUTPUT_BASE MSR

This MSR is used to configure the trace output destination, when output is directed to memory (IA32_RTIT_CTL.FabricEn = 0). The size of the address field is determined by the maximum physical address width (MAXPHYADDR), as reported by CPUID.80000008H:EAX[7:0].

When the ToPA output scheme is used, the processor may update this MSR when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32_RTIT_CTL.TraceEn = 0).

Accesses to this MSR are supported only if Intel PT output to memory is supported, hence when either CPUID.(EAX=14H, ECX=0):ECX[bit 0] or CPUID.(EAX=14H, ECX=0):ECX[bit 2] are set. Otherwise WRMSR or RDMSR cause a general-protection fault (#GP). If supported, this MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

Table 33-8. IA32_RTIT_OUTPUT_BASE MSR

Position	Bit Name	At Reset	Bit Description
6:0	Reserved	0	Must be 0.
MAXPHYADDR-1:7	BasePhysAddr	0	The base physical address. How this address is used depends on the value of IA32_RTIT_CTL.ToPA: 0: This is the base physical address of a single, contiguous physical output region. This could be mapped to DRAM or to MMIO, depending on the value. The base address should be aligned with the size of the region, such that none of the 1s in the mask value(Section 34.2.8.8) overlap with 1s in the base address. If the base is not aligned, an operational error will result (see Section 34.3.10). 1: The base physical address of the current ToPA table. The address must be 4K aligned. Writing an address in which bits 11:7 are non-zero will not cause a #GP, but an operational error will be signaled once TraceEn is set. See "ToPA Errors" in Section 34.2.7.2, as well as Section 34.3.10.
63:MAXPHYADDR	Reserved	0	Must be 0.

34.2.8.8 IA32_RTIT_OUTPUT_MASK_PTRS MSR

This MSR holds any mask or pointer values needed to indicate where the next byte of trace output should be written. The meaning of the values held in this MSR depend on whether the ToPA output mechanism is in use. See Section 34.2.7.2 for details.

The processor updates this MSR while when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32_RTIT_CTL.TraceEn = 0).

Accesses to this MSR are supported only if Intel PT output to memory is supported, hence when either CPUID.(EAX=14H, ECX=0):ECX[bit 0] or CPUID.(EAX=14H, ECX=0):ECX[bit 2] are set. Otherwise WRMSR or RDMSR cause a general-protection fault (#GP). If supported, this MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

Table 33-9. IA32_RTIT_OUTPUT_MASK_PTRS MSR

Position	Bit Name	At Reset	Bit Description
6:0	LowerMask	7FH	Forced to 1, writes are ignored.
31:7	MaskOrTableOffset	0	The use of this field depends on the value of IA32_RTIT_CTL.ToPA: 0: This field holds bits 31:7 of the mask value for the single, contiguous physical output region. The size of this field indicates that regions can be of size 128B up to 4GB. This value (combined with the lower 7 bits, which are reserved to 1) will be ANDed with the OutputOffset field to determine the next write address. All 1s in this field should be consecutive and starting at bit 7, otherwise the region will not be contiguous, and an operational error (Section 34.3.10) will be signaled when TraceEn is set. 1: This field holds bits 27:3 of the offset pointer into the current ToPA table. This value can be added to the IA32_RTIT_OUTPUT_BASE value to produce a pointer to the current ToPA table entry, which itself is a pointer to the current output region. In this scenario, the lower 7 reserved bits are ignored. This field supports tables up to 256 MBytes in size.
63:32	OutputOffset	0	The use of this field depends on the value of IA32_RTIT_CTL.ToPA: 0: This is bits 31:0 of the offset pointer into the single, contiguous physical output region. This value will be added to the IA32_RTIT_OUTPUT_BASE value to form the physical address at which the next byte of packet output data will be written. This value must be less than or equal to the MaskOrTableOffset field, otherwise an operational error (Section 34.3.10) will be signaled when TraceEn is set. 1: This field holds bits 31:0 of the offset pointer into the current ToPA output region. This value will be added to the output region base field, found in the current ToPA table entry, to form the physical address at which the next byte of trace output data will be written. This value must be less than the ToPA entry size, otherwise an operational error (Section 34.3.10) will be signaled when TraceEn is set.

34.2.9 Interaction of Intel® Processor Trace and Other Processor Features

34.2.9.1 Intel® Transactional Synchronization Extensions (Intel® TSX)

The operation of Intel TSX is described in Chapter 14 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1. For tracing purpose, packet generation does not distinguish between hardware lock elision (HLE) and restricted transactional memory (RTM), but speculative execution does have impacts on the trace output. Specifically, packets are generated as instructions complete, even for instructions in a transactional region that is later aborted. For this reason, debugging software will need indication of the beginning and end of a transactional region; this will allow software to understand when instructions are part of a transactional region and whether that region has been committed.

To enable this, TSX information is included in a MODE packet leaf. The mode bits in the leaf are:

- **InTX**: Set to 1 on an TSX transaction begin, and cleared on transaction commit or abort.
- **TXAbort**: Set to 1 only when InTX transitions from 1 to 0 on an abort. Cleared otherwise.

If BranchEn=1, this MODE packet will be sent each time the transaction status changes. See Table 33-10 for details.

Table 33-10. TSX Packet Scenarios with BranchEn=1

TSX Event	Instruction	Packets
Transaction Begin	Either XBEGIN or XACQUIRE lock (the latter if executed transactionally)	MODE(TXAbort=0, InTX=1), FUP(CurrentIP)
Transaction Commit	Either XEND or XRELEASE lock, if transactional execution ends. This happens only on the outermost commit	MODE(TXAbort=0, InTX=0), FUP(CurrentIP)

Table 33-10. TSX Packet Scenarios with BranchEn=1

TSX Event	Instruction	Packets
Transaction Abort	XABORT or other transactional abort	MODE(TXAbort=1, InTX=0), FUP(CurrentIP), TIP(TargetIP)
Other	One of the following: ▪ Nested XBEGIN or XACQUIRE lock ▪ An outer XACQUIRE lock that doesn't begin a transaction (InTX not set) ▪ Non-outermost XEND or XRELEASE lock	None. No change to TSX mode bits for these cases.

The CurrentIP listed above is the IP of the associated instruction. The TargetIP is the IP of the next instruction to be executed; for HLE, this is the XACQUIRE lock; for RTM, this is the fallback handler.

Intel PT stores are non-transactional, and thus packet writes are not rolled back on TSX abort.

34.2.9.2 TSX and IP Filtering

A complication with tracking transactions is handling transactions that start or end outside of the tracing region. Transactions can't span across a change in ContextEn, because CPL changes and CR3 changes each cause aborts. But a transaction can start within the IP filter region and end outside it.

To assist the decoder handling this situation, MODE.TSX packets can be sent even if FilterEn=0, though there will be no FUP attached. Instead, they will merely serve to indicate to the decoder when transactions are active and when they are not. When tracing resumes (due to PacketEn=1), the last MODE.TSX preceding the TIP.PGE will indicate the current transaction status.

34.2.9.3 System Management Mode (SMM)

SMM code has special privileges that non-SMM code does not have. Intel Processor Trace can be used to trace SMM code, but special care is taken to ensure that SMM handler context is not exposed in any non-SMM trace collection. Additionally, packet output from tracing non-SMM code cannot be written into memory space that is either protected by SMRR or used by the SMM handler.

SMM is entered via a system management interrupt (SMI). SMI delivery saves the value of IA32_RTIT_CTL.TraceEn into SMRAM and then clears it, thereby disabling packet generation.

The saving and clearing of IA32_RTIT_CTL.TraceEn ensures two things:

1. All internally buffered packet data is flushed before entering SMM (see Section 34.2.8.2).
2. Packet generation ceases before entering SMM, so any tracing that was configured outside SMM does not continue into SMM. No SMM instruction pointers or other state will be exposed in the non-SMM trace.

When the RSM instruction is executed to return from SMM, the TraceEn value that was saved by SMI delivery is restored, allowing tracing to be resumed. As is done any time packet generation is enabled, ContextEn is re-evaluated, based on the values of CPL, CR3, etc., established by RSM.

Like other interrupts, delivery of an SMI produces a FUP containing the IP of the next instruction to execute. By toggling TraceEn, SMI and RSM can produce TIP.PGD and TIP.PGE packets, respectively, indicating that tracing was disabled or re-enabled. See Table 34.7 for more information about packets entering and leaving SMM.

Although #SMI and RSM change CR3, PIP packets are not generated in these cases. With #SMI tracing is disabled before the CR3 change; with RSM TraceEn is restored after CR3 is written.

TraceEn must be cleared before executing RSM, otherwise it will cause a shutdown. Further, on processors that restrict use of Intel PT with LBRs (see Section 34.3.1.2), any RSM that results in enabling of both will cause a shutdown.

Intel PT can support tracing of System Transfer Monitor operating in SMM, see Section 34.6.

34.2.9.4 Virtual-Machine Extensions (VMX)

Initial implementations of Intel Processor Trace do not support tracing in VMX operation. Such processors indicate this by returning 0 for IA32_VMX_MISC[bit 14]. On these processors, execution of the VMXON instruction clears IA32_RTIT_CTL.TraceEn and any attempt to write IA32_RTIT_CTL in VMX operation causes a general-protection exception (#GP).

Processors that support Intel Processor Trace in VMX operation return 1 for IA32_VMX_MISC[bit 14]. Details of tracing in VMX operation are described in Section 34.4.2.26.

34.2.9.5 Intel® Software Guard Extensions (Intel® SGX)

Intel SGX provides an application with the ability to instantiate a protective container (an enclave) with confidentiality and integrity (see the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D). On a processor with both Intel PT and Intel SGX enabled, when executing code within a production enclave, no control flow packets are produced by Intel PT. An enclave entry will clear ContextEn, thereby blocking control flow packet generation. A TIP.PGD packet will be generated if PacketEn=1 at the time of the entry.

Upon enclave exit, ContextEn will no longer be forced to 0. If other enables are set at the time, a TIP.PGE may be generated to indicate that tracing is resumed.

During the enclave execution, Intel PT remains enabled, and periodic or timing packets such as PSB, TSC, MTC, or CBR can still be generated. No IPs or other architectural state will be exposed.

For packet generation examples on enclave entry or exit, see Section 34.7.

Debug Enclaves

Intel SGX allows an enclave to be configured with relaxed protection of confidentiality for debug purposes, see the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D. In a debug enclave, Intel PT continues to function normally. Specifically, ContextEn is not impacted by an enclave entry or exit. Hence, the generation of ContextEn-dependent packets within a debug enclave is allowed.

34.2.9.6 SENTER/ENTERACCS and ACM

GETSEC[SENTER] and GETSEC[ENTERACCS] instructions clear TraceEn, and it is not restored when those instruction complete. SENTER also causes TraceEn to be cleared on other logical processors when they rendezvous and enter the SENTER sleep state. In these two cases, the disabling of packet generation is not guaranteed to flush internally buffered packets. Some packets may be dropped.

When executing an authenticated code module (ACM), packet generation is silently disabled during ACRAM setup. TraceEn will be cleared, but no TIP.PGD packet is generated. After completion of the module, the TraceEn value will be restored. There will be no TIP.PGE packet, but timing packets, like TSC and CBR, may be produced.

34.2.9.7 Intel® Memory Protection Extensions (Intel® MPX)

Bounds exceptions (#BR) caused by Intel MPX are treated like other exceptions, producing FUP and TIP packets that indicate the source and destination IPs.

34.3 CONFIGURATION AND PROGRAMMING GUIDELINE

34.3.1 Detection of Intel Processor Trace and Capability Enumeration

Processor support for Intel Processor Trace is indicated by CPUID.(EAX=07H,ECX=0H):EBX[bit 25] = 1. CPUID function 14H is dedicated to enumerate the resource and capability of processors that report CPUID.(EAX=07H,ECX=0H):EBX[bit 25] = 1. Different processor generations may have architecturally-defined variation in capabilities. Table 33-11 describes details of the enumerable capabilities that software must use across generations of processors that support Intel Processor Trace.

Table 33-11. CPUID Leaf 14H Enumeration of Intel Processor Trace Capabilities

CPUID.(EAX=14H,ECX=0)		Name	Description Behavior
Register	Bits		
EAX	31:0	Maximum valid sub-leaf Index	Specifies the index of the maximum valid sub-leaf for this CPUID leaf.
EBX	0	CR3 Filtering Support	1: Indicates that IA32_RTIT_CTL.CR3Filter can be set to 1, and that IA32_RTIT_CR3_MATCH MSR can be accessed. See Section 34.2.8. 0: Indicates that writes that set IA32_RTIT_CTL.CR3Filter to 1, or any access to IA32_RTIT_CR3_MATCH, will generate a #GP exception.
	1	Configurable PSB and Cycle-Accurate Mode Supported	1: (a) IA32_RTIT_CTL.PSBFreq can be set to a non-zero value, in order to select the preferred PSB frequency (see below for allowed values). (b) IA32_RTIT_STATUS.PacketByteCnt can be set to a non-zero value, and will be incremented by the processor when tracing to indicate progress towards the next PSB. If trace packet generation is enabled by setting TraceEn, a PSB will only be generated if PacketByteCnt=0. (c) IA32_RTIT_CTL.CYCEn can be set to 1 to enable Cycle-Accurate Mode. See Section 34.2.8. 0: (a) Any attempt to write a non-zero value to IA32_RTIT_CTL.PSBFreq or IA32_RTIT_STATUS.PacketByteCnt will generate a #GP exception. (b) If trace packet generation is enabled by setting TraceEn, a PSB is always generated. (c) Any attempt to write a non-zero value to IA32_RTIT_CTL.CYCEn or IA32_RTIT_CTL.CycThresh will generate a #GP exception.
	2	IP Filtering and TraceStop supported, and Preserve Intel PT MSRs across warm reset	1: (a) IA32_RTIT_CTL provides at one or more ADDRn_CFG field to configure the corresponding address range MSRs for IP Filtering or IP TraceStop. Each ADDRn_CFG field accepts a value in the range of 0:2 inclusive. The number of ADDRn_CFG fields is reported by CPUID.(EAX=14H, ECX=1):EAX.RANGECNT[2:0]. (b) At least one register pair IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B are provided to configure address ranges for IP filtering or IP TraceStop. (c) On warm reset, all Intel PT MSRs will retain their pre-reset values, though IA32_RTIT_CTL.TraceEn will be cleared. The Intel PT MSRs are listed in Section 34.2.8. 0: (a) An Attempt to write IA32_RTIT_CTL.ADDRn_CFG with non-zero encoding values will cause #GP. (b) Any access to IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B, will generate a #GP exception. (c) On warm reset, all Intel PT MSRs will be cleared.
	3	MTC Supported	1: IA32_RTIT_CTL.MTCEn can be set to 1, and MTC packets will be generated. See Section 34.2.8. 0: An attempt to set IA32_RTIT_CTL.MTCEn or IA32_RTIT_CTL.MTCFreq to a non-zero value will generate a #GP exception.
	4	PTWRITE Supported	1: Writes can set IA32_RTIT_CTL[12] (PTWEn) and IA32_RTIT_CTL[5] (FUPonPTW), and PTWRITE can generate packets. 0: Writes that set IA32_RTIT_CTL[12] or IA32_RTIT_CTL[5] will generate a #GP exception, and PTWRITE will #UD fault.
	5	Power Event Trace Supported	1: Writes can set IA32_RTIT_CTL[4] (PwrEvtEn), enabling Power Event Trace packet generation. 0: Writes that set IA32_RTIT_CTL[4] will generate a #GP exception.

Table 33-11. CPUID Leaf 14H Enumeration of Intel Processor Trace Capabilities (Contd.)

CPUID.(EAX=14H,ECX=0)		Name	Description Behavior
Register	Bits		
	6	PSB and PMI Preservation Supported	1: Writes can set IA32_RTIT_CTL[56] (InjectPsbPmiOnEnable), enabling the processor to set IA32_RTIT_STATUS[7] (PendTopaPMI) and/or IA32_RTIT_STATUS[6] (PendPSB) in order to preserve ToPA PMIs and/or PSBs otherwise lost due to Intel PT disable. Writes can also set PendToPAPMI and PendPSB. 0: Writes that set IA32_RTIT_CTL[56], IA32_RTIT_STATUS[7], or IA32_RTIT_STATUS[6] will generate a #GP exception.
	7	Event Trace Supported	1: Writes can set IA32_RTIT_CTL[31] (EventEn), enabling Event Trace packet generation. 0: Writes that set IA32_RTIT_CTL[31] will generate a #GP exception.
	8	TNT Disable Supported	1: Writes can set IA32_RTIT_CTL[55] (DisTNT), disabling TNT packet generation. 0: Writes that set IA32_RTIT_CTL[55] will generate a #GP exception.
	31:9	Reserved	
ECX	0	ToPA Output Supported	1: Tracing can be enabled with IA32_RTIT_CTL.ToPA = 1, hence utilizing the ToPA output scheme (Section 34.2.7.2) IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS MSRs can be accessed. 0: Unless CPUID.(EAX=14H, ECX=0):ECX.SNGLRNGOUT[bit 2] = 1. writes to IA32_RTIT_OUTPUT_BASE or IA32_RTIT_OUTPUT_MASK_PTRS. MSRs will generate a #GP exception.
	1	ToPA Tables Allow Multiple Output Entries	1: ToPA tables can hold any number of output entries, up to the maximum allowed by the MaskOrTableOffset field of IA32_RTIT_OUTPUT_MASK_PTRS. 0: ToPA tables can hold only one output entry, which must be followed by an END=1 entry which points back to the base of the table. Further, ToPA PMIs will be delivered before the region is filled. See ToPA PMI in Section 34.2.7.2. If there is more than one output entry before the END entry, or if the END entry has the wrong base address, an operational error will be signaled (see "ToPA Errors" in Section 34.2.7.2).
	2	Single-Range Output Supported	1: Enabling tracing (TraceEn=1) with IA32_RTIT_CTL.ToPA=0 is supported. 0: Unless CPUID.(EAX=14H, ECX=0):ECX.TOPAOUT[bit 0] = 1. writes to IA32_RTIT_OUTPUT_BASE or IA32_RTIT_OUTPUT_MASK_PTRS. MSRs will generate a #GP exception.
	3	Output to Trace Transport Subsystem Supported	1: Setting IA32_RTIT_CTL.FabricEn to 1 is supported. 0: IA32_RTIT_CTL.FabricEn is reserved. Write 1 to IA32_RTIT_CTL.FabricEn will generate a #GP exception.
	30:4	Reserved	
	31	IP Payloads are LIP	1: Generated packets which contain IP payloads have LIP values, which include the CS base component. 0: Generated packets which contain IP payloads have RIP values, which are the offset from CS base.
EDX	31:0	Reserved	

If CPUID.(EAX=14H, ECX=0):EAX reports a non-zero value, additional capabilities of Intel Processor Trace are described in the sub-leaves of CPUID leaf 14H.

Table 33-12. CPUID Leaf 14H, sub-leaf 1H Enumeration of Intel Processor Trace Capabilities

CPUID.(EAX=14H,ECX=1)		Name	Description Behavior
Register	Bits		
EAX	2:0	Number of Address Ranges	A non-zero value specifies the number ADDRn_CFG field supported in IA32_RTIT_CTL and the number of register pair IA32_RTIT_ADDRn_A/IA32_RTIT_ADDRn_B supported for IP filtering and IP TraceStop. **NOTE:** Currently, no processors support more than 4 address ranges.
	15:3	Reserved	
	31:16	Bitmap of supported MTC Period Encodings	The non-zero bits indicate the map of supported encoding values for the IA32_RTIT_CTL.MTCFreq field. This applies only if CPUID.(EAX=14H, ECX=0):EBX[bit 3] = 1 (MTC Packet generation is supported), otherwise the MTCFreq field is reserved to 0. Each bit position in this field represents 1 encoding value in the 4-bit MTCFreq field (ie, bit 0 is associated with encoding value 0). For each bit: 1: MTCFreq can be assigned the associated encoding value. 0: MTCFreq cannot be assigned to the associated encoding value. A write to IA32_RTIT_CTLMTCFreq with unsupported encoding will cause #GP fault.
EBX	15:0	Bitmap of supported Cycle Threshold values	The non-zero bits indicate the map of supported encoding values for the IA32_RTIT_CTL.CycThresh field. This applies only if CPUID.(EAX=14H, ECX=0):EBX[bit 1] = 1 (Cycle-Accurate Mode is Supported), otherwise the CycThresh field is reserved to 0. See Section 34.2.8. Each bit position in this field represents 1 encoding value in the 4-bit CycThresh field (ie, bit 0 is associated with encoding value 0). For each bit: 1: CycThresh can be assigned the associated encoding value. 0: CycThresh cannot be assigned to the associated encoding value. A write to CycThresh with unsupported encoding will cause #GP fault.
	31:16	Bitmap of supported Configurable PSB Frequency encoding	The non-zero bits indicate the map of supported encoding values for the IA32_RTIT_CTL.PSBFreq field. This applies only if CPUID.(EAX=14H, ECX=0):EBX[bit 1] = 1 (Configurable PSB is supported), otherwise the PSBFreq field is reserved to 0. See Section 34.2.8. Each bit position in this field represents 1 encoding value in the 4-bit PSBFreq field (ie, bit 0 is associated with encoding value 0). For each bit: 1: PSBFreq can be assigned the associated encoding value. 0: PSBFreq cannot be assigned to the associated encoding value. A write to PSBFreq with unsupported encoding will cause #GP fault.
ECX	31:0	Reserved	
EDX	31:0	Reserved	

34.3.1.1 Packet Decoding of RIP versus LIP

FUP, TIP, TIP.PGE, and TIP.PGE packets can contain an instruction pointer (IP) payload. On some processor generations, this payload will be an effective address (RIP), while on others this will be a linear address (LIP). In the former case, the payload is the offset from the current CS base address, while in the latter it is the sum of the offset and the CS base address (Note that in real mode, the CS base address is the value of CS<<4, while in protected mode the CS base address is the base linear address of the segment indicated by the CS register.). Which IP type is in use is indicated by enumeration (see CPUID.(EAX=14H, ECX=0):ECX.LIP[bit 31] in Table 33-11).

For software that executes while the CS base address is 0 (including all software executing in 64-bit mode), the difference is indistinguishable. A trace decoder must account for cases where the CS base address is not 0 and the resolved LIP will not be evident in a trace generated on a CPU that enumerates use of RIP. This is likely to cause problems when attempting to link the trace with the associated binaries.

Note that IP comparison logic, for IP filtering and TraceStop range calculation, is based on the same IP type as these IP packets. For processors that output RIP, the IP comparison mechanism is also based on RIP, and hence on those processors RIP values should be written to IA32_RTIT_ADDRn_[AB] MSRs. This can produce differing behavior if the same trace configuration setting is run on processors reporting different IP types, i.e., CPUID.(EAX=14H, ECX=0):ECX.LIP[bit 31]. Care should be taken to check CPUID when configuring IP filters.

34.3.1.2 Model Specific Capability Restrictions

Some processor generations impose restrictions that prevent use of LBRs/BTS/BTM/LERs when software has enabled tracing with Intel Processor Trace. On these processors, when TraceEn is set, updates of LBR, BTS, BTM, LERs are suspended but the states of the corresponding IA32_DEBUGCTL control fields remained unchanged as if it were still enabled. When TraceEn is cleared, the LBR array is reset, and LBR/BTS/BTM/LERs updates will resume. Further, reads of these registers will return 0, and writes will be dropped.

The list of MSRs whose updates/accesses are restricted follows.

- MSR_LASTBRANCH_x_TO_IP, MSR_LASTBRANCH_x_FROM_IP, MSR_LBR_INFO_x, MSR_LASTBRANCH_TOS
- MSR_LER_FROM_LIP, MSR_LER_TO_LIP
- MSR_LBR_SELECT

For processors with CPUID DisplayFamily_DisplayModel signatures of 06_3DH, 06_47H, 06_4EH, 06_4FH, 06_56H, and 06_5EH, the use of Intel PT and LBRs are mutually exclusive.

34.3.2 Enabling and Configuration of Trace Packet Generation

To configure trace packets, enable packet generation, and capture packets, software starts with using CPUID instruction to detect its feature flag, CPUID.(EAX=07H,ECX=0H):EBX[bit 25] = 1; followed by enumerating the capabilities described in Section 34.3.1.

Based on the capability queried from Section 34.3.1, software must configure a number of model-specific registers. This section describes programming considerations related to those MSRs.

34.3.2.1 Enabling Packet Generation

When configuring and enabling packet generation, the IA32_RTIT_CTL MSR should be written after any other Intel PT MSRs have been written, since writes to the other configuration MSRs cause a general-protection fault (#GP) if TraceEn = 1. If a prior trace collection context is not being restored, then software should first clear IA32_RTIT_STATUS. This is important since the Stopped, and Error fields are writable; clearing the MSR clears any values that may have persisted from prior trace packet collection contexts. See Section 34.2.8.2 for details of packets generated by setting TraceEn to 1.

If setting TraceEn to 1 causes an operational error (see Section 34.3.10), there may be a delay after the WRMSR completes before the error is signaled in the IA32_RTIT_STATUS MSR.

While packet generation is enabled, the values of some configuration MSRs (e.g., IA32_RTIT_STATUS and IA32_RTIT_OUTPUT_*) are transient, and reads may return values that are out of date. Only after packet generation is disabled (by clearing TraceEn) do reads of these MSRs return reliable values.

34.3.2.2 Disabling Packet Generation

After disabling packet generation by clearing IA32_RTIT_CTL, it is advisable to read the IA32_RTIT_STATUS MSR (Section 34.2.8.4):

- If the Error bit is set, an operational error was encountered, and the trace is most likely compromised. Software should check the source of the error (by examining the output MSR values), correct the source of the problem, and then attempt to gather the trace again. For details on operational errors, see Section 34.3.10. Software should clear IA32_RTIT_STATUS.Error before re-enabling packet generation.
- If the Stopped bit is set, software execution encountered an IP TraceStop (see Section 34.2.5.3) or the ToPA Stop condition (see "ToPA STOP" in Section 34.2.7.2) before packet generation was disabled.

34.3.3 Flushing Trace Output

Packets are first buffered internally and then written out asynchronously. To collect packet output for post-processing, a collector needs first to ensure that all packet data has been flushed from internal buffers. Software can ensure this by stopping packet generation by clearing IA32_RTIT_CTL.TraceEn (see "Disabling Packet Generation" in Section 34.2.8.2).

When software clears IA32_RTIT_CTL.TraceEn to flush out internally buffered packets, the logical processor issues an SFENCE operation which ensures that WC trace output stores will be ordered with respect to the next store, or serializing operation. A subsequent read from the same logical processor will see the flushed trace data, while a read from another logical processor should be preceded by a store, fence, or architecturally serializing operation on the tracing logical processor.

When the flush operations complete, the IA32_RTIT_OUTPUT_* MSR values indicate where the trace ended. While TraceEn is set, these MSRs may hold stale values. Further, if a ToPA region with INT=1 is filled, meaning a ToPA PMI has been triggered, IA32_PERF_GLOBAL_STATUS.Trace_ToPA_PMI[55] will be set by the time the flush completes.

34.3.4 Warm Reset

The MSRs software uses to program Intel Processor Trace are cleared after a power-on RESET (or cold RESET). On a warm RESET, the contents of those MSRs can retain their values from before the warm RESET with the exception that IA32_RTIT_CTL.TraceEn will be cleared (which may have the side effect of clearing some bits in IA32_RTIT_STATUS).

34.3.5 Context Switch Consideration

To facilitate construction of instruction execution traces at the granularity of a software process or thread context, software can save and restore the states of the trace configuration MSRs across the process or thread context switch boundary. The principle is the same as saving and restoring the typical architectural processor states across context switches.

34.3.5.1 Manual Trace Configuration Context Switch

The configuration can be saved and restored through a sequence of instructions of RDMSR, management of MSR content and WRMSR. To stop tracing and to ensure that all configuration MSRs contain stable values, software must clear IA32_RTIT_CTL.TraceEn before reading any other trace configuration MSRs. The recommended method for saving trace configuration context manually follows:

1. RDMSR IA32_RTIT_CTL, save value to memory
2. WRMSR IA32_RTIT_CTL with saved value from RDMSR above and TraceEn cleared
3. RDMSR all other configuration MSRs whose values had changed from previous saved value, save changed values to memory

When restoring the trace configuration context, IA32_RTIT_CTL should be restored last:

1. Read saved configuration MSR values, aside from IA32_RTIT_CTL, from memory, and restore them with WRMSR
2. Read saved IA32_RTIT_CTL value from memory, and restore with WRMSR.

34.3.5.2 Trace Configuration Context Switch Using XSAVES/XRSTORS

On processors whose XSAVE feature set supports XSAVES and XRSTORS, the Trace configuration state can be saved using XSAVES and restored by XRSTORS, in conjunction with the bit field associated with supervisory state component in IA32_XSS. See Chapter 13, "Managing State Using the XSAVE Feature Set," of Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1.

34.3.6 Cycle-Accurate Mode

Intel PT can be run in a cycle-accurate mode which enables CYC packets (see Section 34.4.2.14) that provide low-level information in the processor core clock domain. This cycle counter data in CYC packets can be used to compute IPC (Instructions Per Cycle), or to track wall-clock time on a fine-grain level.

To enable cycle-accurate mode packet generation, software should set IA32_RTIT_CTL.CYCEn=1. It is recommended that software also set TSCEn=1 anytime cycle-accurate mode is in use. With this, all CYC-eligible packets will be preceded by a CYC packet, the payload of which indicates the number of core clock cycles since the last CYC packet. In cases where multiple CYC-eligible packets are generated in a single cycle, only a single CYC will be generated before the CYC-eligible packets, otherwise each CYC-eligible packet will be preceded by its own CYC. The CYC-eligible packets are:

- TNT, TIP, TIP.PGE, TIP.PGD, MODE.EXEC, MODE.TSX, PIP, VMCS, OVF, MTC, TSC, PTWRITE, EXSTOP

TSC packets are generated when there is insufficient information to reconstruct wall-clock time, due to tracing being disabled (TriggerEn=0), or power down scenarios like a transition to a deep-sleep MWAIT C-state. In this case, the CYC that is generated along with the TSC will indicate the number of cycles actively tracing (those powered up, with TriggerEn=1) executed between the last CYC packet and the TSC packet. And hence the amount of time spent while tracing is inactive can be inferred from the difference in time between that expected based on the CYC value, and the actual time indicated by the TSC.

Additional CYC packets may be sent stand-alone, so that the processor can ensure that the decoder is aware of the number of cycles that have passed before the internal hardware counter wraps, or is reset due to other micro-architectural condition. There is no guarantee at what intervals these standalone CYC packets will be sent, except that they will be sent before the wrap occurs. An illustration is given below.

Example 34-1. An Illustrative CYC Packet Example

Time (cycles)	Instruction Snapshot	Generated Packets	Comment
x	call %eax	CYC(?), TIP	?Elapsed cycles from the previous CYC unknown
x + 2	call %ebx	CYC(2), TIP	1 byte CYC packet; 2 cycles elapsed from the previous CYC
x + 8	jnz Foo (not taken)	CYC(6)	1 byte CYC packet
x + 9	ret (compressed)		
x + 12	jnz Bar (taken)		
x + 16	ret (uncompressed)	TNT, CYC(8), TIP	1 byte CYC packet
x + 4111		CYC(4095)	2 byte CYC packet
x + 12305		CYC(8194)	3 byte CYC packet
x + 16332	mov cr3, %ebx	CYC(4027), PIP	2 byte CYC packet

34.3.6.1 Cycle Counter

The cycle counter is implemented in hardware (independent of the time stamp counter or performance monitoring counters), and is a simple incrementing counter that does not saturate, but rather wraps. The size of the counter is implementation specific.

The cycle counter is reset to zero any time that TriggerEn is cleared, and when a CYC packet is sent. The cycle counter will continue to count when ContextEn or FilterEn are cleared, and cycle packets will still be generated. It will not count during sleep states that result in Intel PT logic being powered-down, but will count up to the point where clocks are disabled, and resume counting once they are re-enabled.

34.3.6.2 Cycle Packet Semantics

Cycle-accurate mode adheres to the following protocol:

- All packets that precede a CYC packet represent instructions or events that took place before the CYC time.
- All packets that follow a CYC packet represent instructions or events that took place at the same time as, or after, the CYC time.
- The CYC-eligible packet that immediately follows a CYC packet represents an instruction or event that took place at the same time as the CYC time.

These items above give the decoder a means to apply CYC packets to a specific instruction in the assembly stream. Most packets represent a single instruction or event, and hence the CYC packet that precedes each of those packets represents the retirement time of that instruction or event. In the case of TNT packets, up to 6 conditional branches and/or compressed RETs may be contained in the packet. In this case, the preceding CYC packet provides the retirement time of the first branch in the packet. It is possible that multiple branches retired in the same cycle as that first branch in the TNT, but the protocol will not make that obvious. Also note that a MTC packet could be generated in the same cycle as the first JCC in the TNT packet. In this case, the CYC would precede both the MTC and the TNT, and apply to both.

Note that there are times when the cycle counter will stop counting, though cycle-accurate mode is enabled. After any such scenario, a CYC packet followed by TSC packet will be sent. See Section 34.8.3.2 to understand how to interpret the payload values

Multi-packet Instructions or Events

Some operations, such as interrupts or task switches, generate multiple packets. In these cases, multiple CYC packets may be sent for the operation, preceding each CYC-eligible packet in the operation. An example, using a task switch on a software interrupt, is shown below.

Example 34-2. An Example of CYC in the Presence of Multi-Packet Operations

Time (cycles)	Instruction Snapshot	Generated Packets
x	jnz Foo (not taken)	CYC(?)
x + 2	ret (compressed)	
x + 8	jnz Bar (taken)	
x + 9	jmp %eax	TNT, CYC(9), TIP
x + 12	jnz Bar (not taken)	CYC(3)
x + 32	int3 (task gate)	TNT, FUP, CYC(10), PIP, CYC(20), MODE.Exec, TIP

34.3.6.3 Cycle Thresholds

Software can opt to reduce the frequency of cycle packets, a trade-off to save bandwidth and intrusion at the expense of precision. This is done by utilizing a cycle threshold (see Section 34.2.8.2).

IA32_RTIT_CTL.CycThresh indicates to the processor the minimum number of cycles that must pass before the next CYC packet should be sent. If this value is 0, no threshold is used, and CYC packets can be sent every cycle in which a CYC-eligible packet is generated. If this value is greater than 0, the hardware will wait until the associated

number of cycles have passed since the last CYC packet before sending another. CPUID provides the threshold options for CycThresh, see Section 34.3.1.

Note that the cycle threshold does not dictate how frequently a CYC packet will be posted, it merely assigns the maximum frequency. If the cycle threshold is 16, a CYC packet can be posted no more frequently than every 16 cycles. However, once that threshold of 16 cycles has passed, it still requires a new CYC-eligible packet to be generated before a CYC will be inserted. Table 33-13 illustrates the threshold behavior.

Table 33-13. An Illustrative CYC Packet Example

Time (cycles)	Instruction Snapshot	Threshold			
		0	16	32	64
x	jmp %eax	CYC, TIP	CYC, TIP	CYC, TIP	CYC, TIP
x + 9	call %ebx	CYC, TIP	TIP	TIP	TIP
x + 15	call %ecx	CYC, TIP	TIP	TIP	TIP
x + 30	jmp %edx	CYC, TIP	CYC, TIP	TIP	TIP
x + 38	mov cr3, %eax	CYC, PIP	PIP	CYC, PIP	PIP
x + 46	jmp [%eax]	CYC, TIP	CYC, TIP	TIP	TIP
x + 64	call %edx	CYC, TIP	CYC, TIP	TIP	CYC,TIP
x + 71	jmp %edx	CYC, TIP	TIP	CYC,TIP	TIP

34.3.7 Decoder Synchronization (PSB+)

The PSB packet (Section 34.4.2.17) serves as a synchronization point for a trace-packet decoder. It is a pattern in the trace log for which the decoder can quickly scan to align packet boundaries. No legal packet combination can result in such a byte sequence. As such, it serves as the starting point for packet decode. To decode a trace log properly, the decoder needs more than simply to be aligned: it needs to know some state and potentially some timing information as well. The decoder should never need to retain any information (e.g., LastIP, call stack, compound packet event) across a PSB; all compound packet events will be completed before a PSB, and any compression state will be reset.

When a PSB packet is generated, it is followed by a PSBEND packet (Section 34.4.2.18). One or more packets may be generated in between those two packets, and these inform the decoder of the current state of the processor. These packets, known collectively as PSB+, should be interpreted as "status only", since they do not imply any change of state at the time of the PSB, nor are they associated directly with any instruction or event. Thus, the normal binding and ordering rules that apply to these packets outside of PSB+ can be ignored when these packets are between a PSB and PSBEND. They inform the decoder of the state of the processor at the time of the PSB.

PSB+ can include:

- Timestamp (TSC), if IA32_RTIT_CTL.TSCEn=1.
- Timestamp-MTC Align (TMA), if IA32_RTIT_CTL.TSCEn=1 && IA32_RTIT_CTL.MTCEn=1.
- Paging Information Packet (PIP), if ContextEn=1 and IA32_RTIT_CTL.OS=1. The non-root bit (NR) is set if the logical processor is in VMX non-root operation and the "conceal VMX from PT" VM-execution control is 0.
- VMCS packet, if either the logical is in VMX root operation or the logical processor is in VMX non-root operation and the "conceal VMX from PT" VM-execution control is 0.
- Core Bus Ratio (CBR).
- MODE.TSX, if ContextEn=1 and BranchEn = 1.
- MODE.Exec, if PacketEn=1 or (ContextEn=1 and IA32_RTIT_CTL.EventEn=1).
- Flow Update Packet (FUP), if PacketEn=1.

PSB is generated only when TriggerEn=1; hence PSB+ has the same dependencies. The ordering of packets within PSB+ is not fixed. Timing packets such as CYC and MTC may be generated between PSB and PSBEND, and their meanings are the same as outside PSB+.

A PSB+ can be lost in some scenarios. If IA32_RTIT_STATUS.TriggerEn is cleared just as the PSB threshold is reached, e.g., due to TraceEn being cleared, the PSB+ may not be generated. On processors that support PSB preservation (CPUID.(EAX=14H, ECX=0):EBX[bit 6] = 1), setting IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1 will ensure that a PSB+ that is pending at the time PT is disabled will be recorded by setting IA32_RTIT_STATUS.PendPSB[6] = 1. A PSB will be inserted, and PendPSB cleared, when PT is later re-enabled while PendPSB = 1.

Note that an overflow can occur during PSB+, and this could cause the PSBEND packet to be lost. For this reason, the OVF packet should also be viewed as terminating PSB+. If IA32_RTIT_STATUS.TriggerEn is cleared just as the PSB threshold is reached, the PSB+ may not be generated. TriggerEn can be cleared by a WRMSR that clears IA32_RTIT_CTL.TraceEn, a VM exit that clears IA32_RTIT_CTL.TraceEn, an #SMI, or any time that either IA32_RTIT_STATUS.Stopped is set (e.g., by a TraceStop or ToPA stop condition) or IA32_RTIT_STATUS.Error is set (e.g., by an Intel PT output error). On processors that support PSB preservation (CPUID.(EAX=14H, ECX=0):EBX[bit 6] = 1), setting IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1 will ensure that a PSB+ that is pending at the time PT is disabled will be recorded by setting IA32_RTIT_STATUS.PendPSB[6] = 1. A PSB will then be pended when the saved PT context is later restored.

34.3.8 Internal Buffer Overflow

In the rare circumstances when new packets need to be generated but the processor's dedicated internal buffers are all full, an "internal buffer overflow" occurs. On such an overflow packet generation ceases (as packets would need to enter the processor's internal buffer) until the overflow resolves. Once resolved, packet generation resumes.

When the buffer overflow is cleared, an OVF packet (Section 34.4.2.16) is generated, and the processor ensures that packets which follow the OVF are not compressed (IP compression or RET compression) against packets that were lost.

If IA32_RTIT_CTL.BranchEn = 1, the OVF packet will be followed by a FUP if the overflow resolves while PacketEn=1. If the overflow resolves while PacketEn = 0 no packet is generated, but a TIP.PGE will naturally be generated later, once PacketEn = 1. The payload of the FUP or TIP.PGE will be the Current IP of the first instruction upon which tracing resumes after the overflow is cleared. If the overflow resolves while PacketEn=1, only timing packets may come between the OVF and the FUP. If the overflow resolves while PacketEn=0, any other packets that are not dependent on PacketEn may come between the OVF and the TIP.PGE.

34.3.8.1 Overflow Impact on Enables

The address comparisons to ADDRn ranges, for IP filtering and TraceStop (Section 34.2.5.3), continue during a buffer overflow, and TriggerEn, ContextEn, and FilterEn may change during a buffer overflow. Like other packets, however, any TIP.PGE or TIP.PGD packets that would have been generated will be lost. Further, IA32_RTIT_STATUS.PacketByteCnt will not increment, since it is only incremented when packets are generated.

If a TraceStop event occurs during the buffer overflow, IA32_RTIT_STATUS.Stopped will still be set, tracing will cease as a result. However, the TraceStop packet, and any TIP.PGD that result from the TraceStop, may be dropped.

34.3.8.2 Overflow Impact on Timing Packets

Any timing packets that are generated during a buffer overflow will be dropped. If only a few MTC packets are dropped, a decoder should be able to detect this by noticing that the time value in the first MTC packet after the buffer overflow incremented by more than one. If the buffer overflow lasted long enough that 256 MTC packets are lost (and thus the MTC packet 'wraps' its 8-bit CTC value), then the decoder may be unable to properly understand the trace. This is not an expected scenario. No CYC packets are generated during overflow, even if the cycle counter wraps.

Note that, if cycle-accurate mode is enabled, the OVF packet will generate a CYC packet. Because the cycle counter counts during overflows, this CYC packet can provide the duration of the overflow. However, there is a risk that the cycle counter wrapped during the overflow, which could render this CYC misleading.

34.3.9 TNT Disable

Software can opt to omit TNT packets from control flow trace (BranchEn=1) by setting IA32_RTIT_CTL.DisTNT[bit 55]. This can dramatically reduce trace size. Results will vary by workload, but trace size reductions of 40-75% are typical, which will have a corresponding reduction in performance overhead and memory bandwidth consumption from Intel PT. However, omitting TNT packets means the decoder is not able to follow the full control flow trace, since conditional branch and compressed RET results won't be known. Thus, TNT Disable should be employed only for usages that do not depend on full control flow trace.

NOTE

To avoid loss of RET results with TNT Disable, software may wish to disable RET compression by setting IA32_RTIT_CTL.DisRETC[bit 11].

34.3.10 Operational Errors

Errors are detected as a result of packet output configuration problems, which can include output alignment issues, ToPA reserved bit violations, or overlapping packet output with restricted memory. See "ToPA Errors" in Section 34.2.7.2 for details on ToPA errors, and Section 34.2.7.4 for details on restricted memory errors. Operational errors are only detected and signaled when TraceEn=1.

When an operational error is detected, tracing is disabled and the error is logged. Specifically, IA32_RTIT_STATUS.Error is set, which will cause IA32_RTIT_STATUS.TriggerEn to be 0. This will disable generation of all packets. Some causes of operational errors may lead to packet bytes being dropped.

It should be noted that the timing of error detection may not be predictable. Errors are signaled when the processor encounters the problematic configuration. This could be as soon as packet generation is enabled but could also be later when the problematic entry or field needs to be used.

Once an error is signaled, software should disable packet generation by clearing TraceEn, diagnose and fix the error condition, and clear IA32_RTIT_STATUS.Error. At this point, packet generation can be re-enabled.

34.4 TRACE PACKETS AND DATA TYPES

This section details the data packets generated by Intel Processor Trace. It is useful for developers writing the interpretation code that will decode the data packets and apply it to the traced source code.

34.4.1 Packet Relationships and Ordering

This section introduces the concept of packet "binding", which involves determining the IP in a binary disassembly at which the change indicated by a given packet applies. Some packets have the associated IP as the payload (FUP, TIP), while for others the decoder need only search for the next instance of a particular instruction (or instructions) to bind the packet (TNT). However, in many cases, the decoder will need to consider the relationship between packets, and to use this packet context to determine how to bind the packet.

Section 34.4.1.1 below provides detailed descriptions of the packets, including how packets bind to IPs in the disassembly, to other packets, or to nothing at all. Many packets listed are simple to bind, because they are generated in only a few scenarios. Those that require more consideration are typically part of "compound packet events", such as interrupts, exceptions, and some instructions, where multiple packets are generated by a single operation (instruction or event). These compound packet events frequently begin with a FUP to indicate the source address (if it is not clear from the disassembly), and are concluded by a TIP or TIP.PGD packet that indicates the destination address (if one is provided). In this scenario, the FUP is said to be "coupled" with the TIP packet.

Other packets could be in between the coupled FUP and TIP packet. Timing packets, such as TSC, MTC, CYC, or CBR, could arrive at any time, and hence could intercede in a compound packet event. If an operation changes CR3 or the processor's mode of execution, a state update packet (i.e., PIP or MODE) is generated. The state changes indicated by these intermediate packets should be applied at the IP of the TIP* packet. A summary of compound packet events is provided in Table 33-14; see Section 34.4.1.1 for more per-packet details and Section 34.7 for more detailed packet generation examples.

Table 33-14. Compound Packet Event Summary

Event Type	Beginning	Middle	End	Comment
Unconditional, uncompressed control-flow transfer	FUP or none	Any combination of PIP, VMCS, MODE.Exec, or none	TIP or TIP.PGD	FUP only for asynchronous events. Order of middle packets may vary. PIP/VMCS/MODE only if the operation modifies the state tracked by these respective packets.
TSX Update	MODE.TSX, and (FUP or none)	None	TIP, TIP.PGD, or none	FUP TIP/TIP.PGD only for TSX abort cases.
Overflow	OVF	PSB, PSBEND, or none	FUP or TIP.PGE	FUP if overflow resolves while ContextEn=1, else TIP.PGE.

34.4.1.1 Packet Blocks

Packet blocks are a means to dump one or more groups of state values. Packet blocks begin with a Block Begin Packet (BBP), which indicates what type of state is held within the block. Following each BBP there may be one or more Block Item Packets (BIPs), which contain the state values. The block is terminated by either a Block End Packet (BEP) or another BBP indicating the start of a new block.

The BIP packet includes an ID value that, when combined with the Type field from the BBP that preceded it, uniquely identifies the state value held in the BIP payload. The size of each BIP packet payload is provided by the Size field in the preceding BBP packet.

Each block type can have up to 32 items defined for it. There is no guarantee, however, that each block of that type will hold all 32 items. For more details on which items to expect, see documentation on the specific block type of interest.

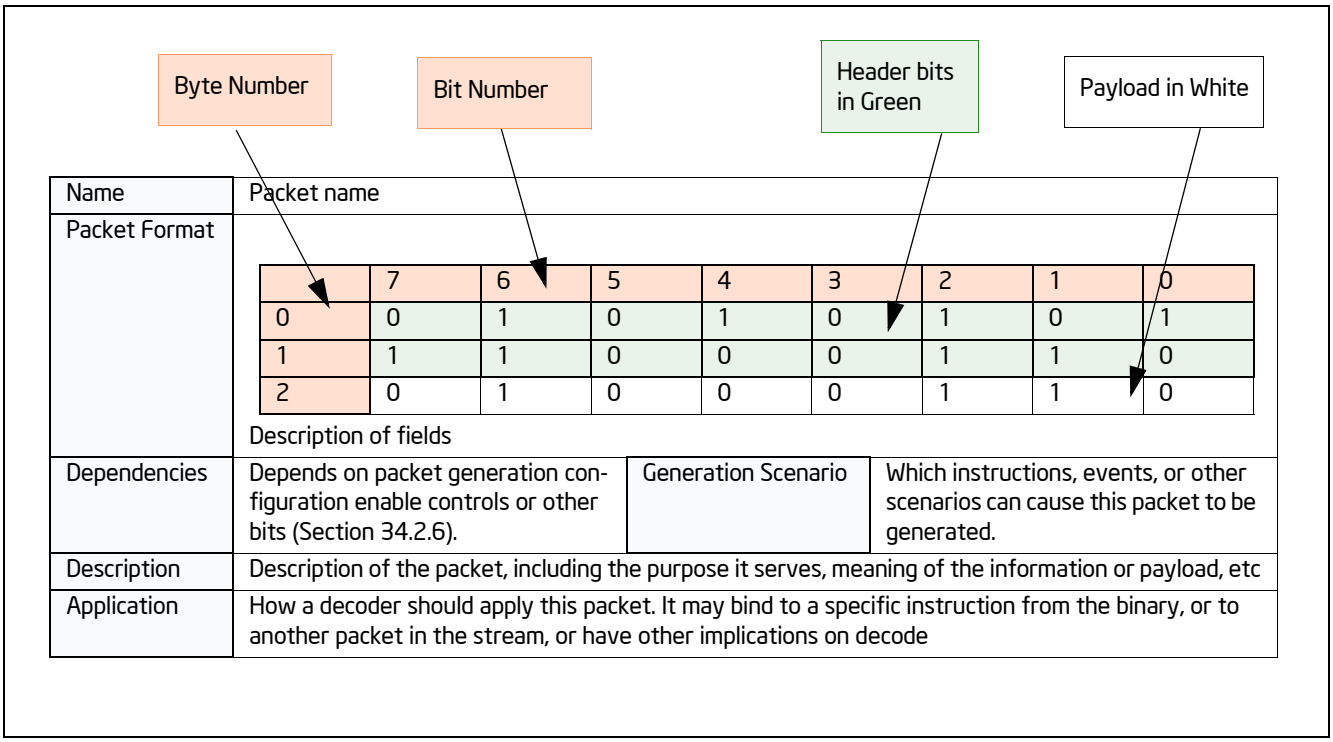
See the BBP packet description (Section 34.4.2.26) for details on packet block generation scenarios.

Packet blocks are entirely generated within an instruction or between instructions, which dictates the types of packets (aside from BIPs) that may be seen within a packet block. Packets that indicate control flow changes, or other indication of instruction completion, cannot be generated within a block. These are listed in the following table. Other packets, including timing packets, may occur between BBP and BEP.

Table 33-15. Packets Forbidden Between BBP and BEP

TNT
TIP, TIP.PGE, TIP.PGD
MODE.Exec, MODE.TSX
PIP, VMCS
TraceStop
PSB, PSBEND
PTW
MWAIT

It is possible to encounter an internal buffer overflow in the middle of a block. In such a case, it is guaranteed that packet generation will not resume in the middle of a block, and hence the OVF packet terminates the current block. Depending on the duration of the overflow, subsequent blocks may also be lost.



Decoder Implications

When a Block Begin Packet (BBP) is encountered, the decoder will need to decode some packets within the block differently from those outside a block. The Block Item Packet (BIP) header byte has the same encoding as a TNT packet outside of a block, but must be treated as a BIP header (with following payload) within one.

When an OVF packet is encountered, the decoder should treat that as a block ending condition. Packet generation will not resume within a block.

34.4.2 Packet Definitions

The following description of packet definitions are in tabular format. Figure 34-3 explains how to interpret them. Packet bits listed as "RSVD" are not guaranteed to be 0.

Name	Packet name		
Packet Format			

	7	6	5	4	3	2	1	0
0	0	1	0	1	0	1	0	1
1	1	1	0	0	0	1	1	0
2	0	1	0	0	0	1	1	0

Description of fields

Dependencies	Depends on packet generation configuration enable controls or other bits (Section 34.2.6).	Generation Scenario	Which instructions, events, or other scenarios can cause this packet to be generated.
Description	Description of the packet, including the purpose it serves, meaning of the information or payload, etc		
Application	How a decoder should apply this packet. It may bind to a specific instruction from the binary, or to another packet in the stream, or have other implications on decode		

Figure 34-3. Interpreting Tabular Definition of Packet Format

34.4.2.1 Taken/Not-taken (TNT) Packet

Table 33-16. TNT Packet Definition

</table>

Table 33-16. TNT Packet Definition (Contd.)

Description	Provides the taken/not-taken results for the last 1..6 (Short TNT) or 1..47 (Long TNT) conditional branches (Jcc, J*CXZ, or LOOP) or compressed RETs (Section 34.4.2.2). The TNT payload bits should be interpreted as follows: ▪ 1 indicates a taken conditional branch, or a compressed RET ▪ 0 indicates a not-taken conditional branch TNT payload bits are stored internal to the processor in a TNT buffer, until either the buffer is filled or another packet is to be generated. In either case a TNT packet holding the buffered bits will be emitted, and the TNT buffer will be marked as empty.
Application	Each valid payload bit (that is, bits between the header bits and the trailing Stop bit) applies to an upcoming conditional branch or RET instruction. Once a decoder consumes a TNT packet with N valid payload bits, these bits should be applied to (and hence provide the destination for) the next N conditional branches or RETs.

34.4.2.2 Target IP (TIP) Packet

Table 33-17. TIP Packet Definition

Name	Target IP (TIP) Packet		
Packet Format			
Dependencies	PacketEn	Generation Scenario	Indirect branch (including un-compressed RET), far branch, interrupt, exception, INIT, SIPI, VM exit, VM entry, TSX abort, EENTER, EEXIT, ERESUME, AEX[1].
Description	Provides the target for some control flow transfers		
Application	Anytime a TIP is encountered, it indicates that control was transferred to the IP provided in the payload.		
	The source of this control flow change, and hence the IP or instruction to which it binds, depends on the packets that precede the TIP. If a TIP is encountered and all preceding packets have already been bound, then the TIP will apply to the upcoming indirect branch, far branch, or VMRESUME. However, if there was a preceding FUP that remains unbound, it will bind to the TIP. Here, the TIP provides the target of an asynchronous event or TSX abort that occurred at the IP given in the FUP payload. Note that there may be other packets, in addition to the FUP, which will bind to the TIP packet. See the packet application descriptions for other packets for details.		

NOTES:

1. EENTER, EEXIT, ERESUME, AEX would be possible only for a debug enclave.

IP Compression

The IP payload in a TIP. FUP, TIP.PGE, or TIP.PGD packet can vary in size, based on the mode of execution, and the use of IP compression. IP compression is an optional compression technique the processor may choose to employ to reduce bandwidth. With IP compression, the IP to be represented in the payload is compared with the last IP sent out, via any of FUP, TIP, TIP.PGE, or TIP.PGD. If that previous IP had the same upper (most significant) address bytes, those matching bytes may be suppressed in the current packet. The processor maintains an internal state of the "Last IP" that was encoded in trace packets, thus the decoder will need to keep track of the "Last IP" state in

software, to match fidelity with packets generated by hardware. "Last IP" is initialized to zero, hence if the first IP in the trace may be compressed if the upper bytes are zeroes.

The "IPBytes" field of the IP packets (FUP, TIP, TIP.PGE, TIP.PGD) serves to indicate how many bytes of payload are provided, and how the decoder should fill in any suppressed bytes. The algorithm for reconstructing the IP for a TIP/FUP packet is shown in the table below.

Table 33-18. FUP/TIP IP Reconstruction

IPBytes	Uncompressed IP Value							
	63:56	55:48	47:40	39:32	31:24	23:16	15:8	7:0
000b	None, IP is out of context							
001b	Last IP[63:16]						IP Payload[15:0]	
010b	Last IP[63:32]				IP Payload[31:0]			
011b	IP Payload[47] extended		IP Payload[47:0]					
100b	Last IP [63:48]		IP Payload[47:0]					
101b	Reserved							
110b	IP Payload[63:0]							
111b	Reserved							

The processor-internal Last IP state is guaranteed to be reset to zero when a PSB is sent out. This means that the IP that follows the PSB with either be un-compressed (011b or 110b, see Table 33-18), or compressed against zero.

At times, "IPbytes" will have a value of 0. As shown above, this does not mean that the IP payload matches the full address of the last IP, but rather that the IP for this packet was suppressed. This is used for cases where the IP that applies to the packet is out of context. An example is the TIP.PGD sent on a SYSCALL, when tracing only USR code. In that case, no TargetIP will be included in the packet, since that would expose an instruction point at CPL = 0. When the IP payload is suppressed in this manner, Last IP is not cleared, and instead refers to the last IP packet with a non-zero IPBytes field.

On processors that support a maximum linear address size of 32 bits, IP payloads may never exceed 32 bits (IPBytes <= 010b).

Indirect Transfer Compression for Returns (RET)

In addition to IP compression, TIP packets for near return (RET) instructions can also be compressed. If the RET target matches the next IP of the corresponding CALL, then the TIP packet is unneeded, since the decoder can deduce the target IP by maintaining a CALL/RET stack of its own.

When a RET is compressed, a Taken indication is added to the TNT buffer. Because the RET generates no TIP packet, it also does not update the internal Last IP value, and thus the decoder should treat it the same way. If the RET is not compressed, it will generate a TIP packet (just like when RET compression is disabled, via IA32_RTIT_CTL.DisRETC).

A CALL/RET stack can be maintained by the decoder by doing the following:

1. Allocate space to store 64 RET targets.
2. For near CALLs, push the Next IP onto the stack. Once the stack is full, new CALLs will force the oldest entry off the end of the stack, such that only the youngest 64 entries are stored. Note that this excludes zero-length CALLs, which are direct near CALLs with displacement zero (to the next IP). These CALLs typically don't have matching RETs.
3. For near RETs, pop the top (youngest) entry off the stack. This will be the expected target of the RET.

In cases where a RET is compressed, the RET target is guaranteed to match the expected target from 3) above. If the target is not compressed, a TIP packet will be generated with the RET target, which may differ from the expected target in some cases.

The hardware ensures that packets read by the decoder will always have seen the CALL that corresponds to any compressed RET. The processor will never compress a RET across a PSB, a buffer overflow, or scenario where PacketEn=0. This means that a RET whose corresponding CALL executed while PacketEn=0, or before the last PSB, etc., will not be compressed.

If the CALL/RET stack is manipulated or corrupted by software, and thereby causes a RET to transfer control to a target that is inconsistent with the CALL/RET stack, then the RET will not be compressed, and will produce a TIP packet. This can happen, for example, if software executes a PUSH instruction to push a target onto the stack, and a later RET uses this target.

For processors that employ deferred TIPs (Section 34.4.2.3), an uncompressed RET will not be deferred, and hence will force out any accumulated TNTs or TIPs. This serves to avoid ambiguity, and make clear to the decoder whether the near RET was compressed, and hence a bit in the in-progress TNT should be consumed, or uncompressed, in which case there will be no in-progress TNT and thus a TIP should be consumed.

Note that in the unlikely case that a RET executes in a different execution mode than the associated CALL, the decoder will need to model the same behavior with its CALL stack. For instance, if a CALL executes in 64-bit mode, a 64-bit IP value will be pushed onto the software stack. If the corresponding RET executes in 32-bit mode, then only the lower 32 target bits will be popped off of the stack, which may mean that the RET does not go to the CALL's Next IP. This is architecturally correct behavior, and this RET could be compressed, thus the decoder should match this behavior.

34.4.2.3 Deferred TIPs

The processor may opt to defer sending out the TNT when TIPs are generated. Thus, rather than sending a partial TNT followed by a TIP, both packets will be deferred while the TNT accumulates more Jcc/RET results. Any number of TIP packets may be accumulated this way, such that only once the TNT is filled, or once another packet (e.g., FUP) is generated, the TNT will be sent, followed by all the deferred TIP packets, and finally terminated by the other packet(s) that forced out the TNT and TIP packets. Generation of many other packets (see list below) will force out the TNT and any accumulated TIP packets. This is an optional optimization in hardware to reduce the bandwidth consumption, and hence the performance impact, incurred by tracing.

Table 33-19. TNT Examples with Deferred TIPs

Code Flow	Packets, Non-Deferred TIPS	Packets, Deferred TIPS
0x1000 cmp %rcx, 0 0x1004 jnz Foo // not-taken 0x1008 jmp %rdx	TNT(0b0), TIP(0x1308)	
0x1308 cmp %rcx, 1 0x130c jnz Bar // not-taken 0x1310 cmp %rcx, 2 0x1314 jnz Baz // taken 0x1500 cmp %eax, 7 0x1504 jg Exit // not-taken 0x1508 jmp %r15	TNT(0b010), TIP(0x1100)	
0x1100 cmp %rbx, 1 0x1104 jg Start // not-taken 0x1108 add %rcx, %eax 0x110c ... // **an asynchronous Interrupt arrives** INThandler: 0xcc00 pop %rdx	TNT(0b0), FUP(0x110c), TIP(0xcc00)	TNT(0b00100), TIP(0x1308), TIP(0x1100), FUP(0x110c), TIP(0xcc00)

34.4.2.4 Packet Generation Enable (TIP.PGE) Packet

Table 33-20. TIP.PGE Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Target IP - Packet Generation Enable (TIP.PGE) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td colspan="3">IPBytes</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td colspan="8">TargetIP[7:0]</td></tr>
<tr><td>2</td><td colspan="8">TargetIP[15:8]</td></tr>
<tr><td>3</td><td colspan="8">TargetIP[23:16]</td></tr>
<tr><td>4</td><td colspan="8">TargetIP[31:24]</td></tr>

</td></tr>
<tr><td>Dependencies</td><td>PacketEn transitions to 1</td><td>Generation Scenario</td><td colspan="2">Any branch instruction, control flow transfer, or MOV CR3 that sets PacketEn, a WRMSR that enables packet generation and sets PacketEn</td></tr>
<tr><td>Description</td><td colspan="4">Indicates that PacketEn has transitioned to 1. It provides the IP at which the tracing begins.
This can occur due to any of the enables that comprise PacketEn transitioning from 0 to 1, as long as all the others are asserted. Examples:
▪ TriggerEn: This is set on software write to set IA32_RTIT_CTL.TraceEn as long as the Stopped and Error bits in IA32_RTIT_STATUS are clear. The IP payload will be the Next IP of the WRMSR.
▪ FilterEn: This is set when software jumps into the tracing region. This region is defined by enabling IP filtering in IA32_RTIT_CTL.ADDRn_CFG, and defining the range in IA32_RTIT_ADDRn_[AB], see. Section 34.2.5.3. The IP payload will be the target of the branch.
▪ ContextEn: This is set on a CPL change, a CR3 write or any other means of changing ContextEn. The IP payload will be the Next IP of the instruction that changes context if it is not a branch, otherwise it will be the target of the branch.</td></tr>
<tr><td>Application</td><td colspan="4">TIP.PGE packets bind to the instruction at the IP given in the payload.</td></tr>
</table>

34.4.2.5 Packet Generation Disable (TIP.PGD) Packet

Table 33-21. TIP.PGD Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Target IP - Packet Generation Disable (TIP.PGD) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td colspan="3">IPBytes</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td colspan="8">TargetIP[7:0]</td></tr>
<tr><td>2</td><td colspan="8">TargetIP[15:8]</td></tr>
<tr><td>3</td><td colspan="8">TargetIP[23:16]</td></tr>
<tr><td>4</td><td colspan="8">TargetIP[31:24]</td></tr>
<tr><td>5</td><td colspan="8">TargetIP[39:32]</td></tr>
<tr><td>6</td><td colspan="8">TargetIP[47:40]</td></tr>
<tr><td>7</td><td colspan="8">TargetIP[55:48]</td></tr>
<tr><td>8</td><td colspan="8">TargetIP[63:56]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>PacketEn transitions to 0</td><td>Generation Scenario</td><td colspan="2">Any branch instruction, control flow transfer, or MOV CR3 that clears PacketEn, a WRMSR that disables packet generation and clears PacketEn</td></tr>
<tr><td>Description</td><td colspan="4">Indicates that PacketEn has transitioned to 0. It will include the IP at which the tracing ends, unless ContextEn= 0 or TraceEn=0 at the conclusion of the instruction or event that cleared PacketEn.
PacketEn can be cleared due to any of the enables that comprise PacketEn transitioning from 1 to 0. Examples:
▪ TriggerEn: This is cleared on software write to clear IA32_RTIT_CTL.TraceEn, or when IA32_RTIT_STATUS.Stopped is set, or on operational error. The IP payload will be suppressed in this case, and the “IPBytes” field will have the value 0.
▪ FilterEn: This is cleared when software jumps out of the tracing region. This region is defined by enabling IP filtering in IA32_RTIT_CTL.ADDRn_CFG, and defining the range in IA32_RTIT_ADDRn_[AB], see. Section 34.2.5.3. The IP payload will depend on the type of the branch. For conditional branches, the payload is suppressed (IPBytes = 0), and in this case the destination can be inferred from the disassembly. For any other type of branch, the IP payload will be the target of the branch.
▪ ContextEn: This can happen on a CPL change, a CR3 write or any other means of changing ContextEn. See Section 34.2.5.3 for details. In this case, when ContextEn is cleared, there will be no IP payload. The “IPBytes” field will have value 0.
Note that, in cases where a branch that would normally produce a TIP packet (i.e., far transfer, indirect branch, interrupt, etc) or TNT update (conditional branch or compressed RT) causes PacketEn to transition from 1 to 0, the TIP or TNT bit will be replaced with TIP.PGD. The payload of the TIP.PGD will be the target of the branch, unless the result of the instruction causes TraceEn or ContextEn to be cleared (ie, SYSCALL when IA32_RTIT_CTL.OS=0, In the case where a conditional branch clears FilterEn and hence PacketEn, there will be no TNT bit for this branch, replaced instead by the TIP.PGD.</td></tr>
<tr><td>Application</td><td colspan="4">TIP.PGD can be produced by any branch instructions, as well as some non-branch instructions, that clear PacketEn. When produced by a branch, it replaces any TIP or TNT update that the branch would normally produce.
In cases where there is an unbound FUP preceding the TIP.PGD, then the TIP.PGD is part of compound operation (i.e., asynchronous event or TSX abort) which cleared PacketEn. For most such cases, the TIP.PGD is simply replacing a TIP, and should be treated the same way. The TIP.PGD may or may not have an IP payload, depending on whether the operation cleared ContextEn.
If there is not an associated FUP, the binding will depend on whether there is an IP payload. If there is an IP payload, then the TIP.PGD should be applied to either the next direct branch whose target matches the TIP.PGD payload, or the next branch that would normally generate a TIP or TNT packet. If there is no IP payload, then the TIP.PGD should apply to the next branch or MOV CR3 instruction.</td></tr>
</table>

34.4.2.6 Flow Update (FUP) Packet

Table 33-22. FUP Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Flow Update (FUP) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td colspan="3">IPBytes</td><td>1</td><td>1</td><td>1</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td colspan="8">IP[7:0]</td></tr>
<tr><td>2</td><td colspan="8">IP[15:8]</td></tr>
<tr><td>3</td><td colspan="8">IP[23:16]</td></tr>
<tr><td>4</td><td colspan="8">IP[31:24]</td></tr>
<tr><td>5</td><td colspan="8">IP[39:32]</td></tr>
<tr><td>6</td><td colspan="8">IP[47:40]</td></tr>
<tr><td>7</td><td colspan="8">IP[55:48]</td></tr>
<tr><td>8</td><td colspan="8">IP[63:56]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn. (Typically depends on BranchEn and FilterEn as well, see Section 34.2.5, Section 34.4.2.21, and Section 34.4.2.22 for details.)</td><td>Generation Scenario</td><td colspan="2">Asynchronous Events (interrupts, exceptions, INIT, SIPI, SMI, VM exit, #MC), PSB+, XBEGIN, XEND, XABORT, XACQUIRE, XRELEASE, EENTER, EEXIT, ERESUME, EEE, AEX,[1], INTO, INT1, INT3, INT n, a WRMSR that disables packet generation.</td></tr>
<tr><td>Description</td><td colspan="4">Provides the source address for asynchronous events, and some other instructions. Is never sent alone, always sent with an associated TIP or MODE packet, and potentially others.</td></tr>
<tr><td>Application</td><td colspan="4">FUP packets provide the IP to which they bind. However, they are never standalone, but are coupled with other packets.
In TSX cases, the FUP is immediately preceded by a MODE.TSX, which binds to the same IP. A TIP will follow only in the case of TSX aborts, see Section 34.4.2.8 for details.
Otherwise, FUPs are part of compound packet events (see Section 34.4.1). In these compound cases, the FUP provides the source IP for an instruction or event, while a following TIP (or TIP.PGD) packet will provide the destination IP. Other packets may be included in the compound event between the FUP and TIP.</td></tr>
</table>

NOTES:

1. EENTER, EEXIT, ERESUME, EEE, AEX apply only if Intel Software Guard Extensions is supported.

FUP IP Payload

Flow Update Packet gives the source address of an instruction when it is needed. In general, branch instructions do not need a FUP, because the source address is clear from the disassembly. For asynchronous events, however, the source address cannot be inferred from the source, and hence a FUP will be sent. Table 33-23 illustrates cases where FUPs are sent, and which IP can be expected in those cases.

Table 33-23. FUP Cases and IP Payload

Event	Flow Update IP	Comment
External Interrupt, NMI/SMI, Traps, Machine Check (trap-like), INIT/SIPI	Address of next instruction (Next IP) that would have been executed	Functionally, this matches the LBR FROM field value and also the EIP value which is saved onto the stack.
Exceptions/Faults, Machine check (fault-like)	Address of the instruction which took the exception/fault (Current IP)	This matches the similar functionality of LBR FROM field value and also the EIP value which is saved onto the stack.
Software Interrupt	Address of the software interrupt instruction (Current IP)	This matches the similar functionality of LBR FROM field value, but does not match the EIP value which is saved onto the stack (Next Linear Instruction Pointer - NLIP).
EENTER, EEXIT, ERESUME, Enclave Exiting Event (EEE), AEX[1]	Current IP of the instruction	This matches the LBR FROM field value and also the EIP value which is saved onto the stack.
XACQUIRE	Address of the X* instruction	
XRELEASE, XBEGIN, XEND, XABORT, other transactional abort	Current IP	
#SMI	IP that is saved into SMRAM	
WRMSR that clears TraceEn, PSB+	Current IP	

NOTES:

1. Information on EENTER, EEXIT, ERESUME, EEE, Asynchronous Enclave eXit (AEX) can be found in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D.

On a canonical fault due to sequentially fetching an instruction in non-canonical space (as opposed to jumping to non-canonical space), the IP of the fault (and thus the payload of the FUP) will be a non-canonical address. This is consistent with what is pushed on the stack for such faulting cases.

If there are post-commit task switch faults, the IP value of the FUP will be the original IP when the task switch started. This is the same value as would be seen in the LBR_FROM field. But it is a different value as is saved on the stack or VMCS.

34.4.2.7 Paging Information (PIP) Packet

Table 33-24. PIP Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Paging Information (PIP) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr>
<tr><td>2</td><td colspan="6">CR3[11:5] or 0</td><td>RSVD/NR</td></tr>
<tr><td>3</td><td colspan="7">CR3[19:12]</td></tr>
<tr><td>4</td><td colspan="7">CR3[27:20]</td></tr>
<tr><td>5</td><td colspan="7">CR3[35:28]</td></tr>
<tr><td>6</td><td colspan="7">CR3[43:36]</td></tr>
<tr><td>7</td><td colspan="7">CR3[51:44]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn && IA32_RTIT_CTL.OS</td><td>Generation Scenario</td><td colspan="2">MOV CR3, Task switch, INIT, SIPI, PSB+, VM exit, VM entry</td></tr>
<tr><td>Description</td><td colspan="4">The CR3 payload shown includes only the address portion of the CR3 value. For PAE paging, CR3[11:5] are thus included. For other paging modes (32-bit and 4-level paging[1]), these bits are 0.
This packet holds the CR3 address value. It will be generated on operations that modify CR3:
▪ MOV CR3 operation
▪ Task Switch
▪ INIT and SIPI
▪ VM exit, if “conceal VMX from PT” VM-exit control is 0 (see Section 34.5.1)
▪ VM entry, if “conceal VMX from PT” VM-entry control is 0
PIPs are not generated, despite changes to CR3, on SMI and RSM. This is due to the special behavior on these operations, see Section 34.2.9.3 for details. Note that, for some cases of task switch where CR3 is not modified, no PIP will be produced.
The purpose of the PIP is to indicate to the decoder which application is running, so that it can apply the proper binaries to the linear addresses that are being traced.
The PIP packet contains the new CR3 value when CR3 is written.
PIPs generated by VM entries set the NR bit. PIPs generated in VMX non-root operation set the NR bit if the “conceal VMX from PT” VM-execution control is 0 (see Section 34.5.1). All other PIPs clear the NR bit.</td></tr>
<tr><td>Application</td><td colspan="4">The purpose of the PIP packet is to help the decoder uniquely identify what software is running at any given time. When a PIP is encountered, a decoder should do the following:
1) If there was a prior unbound FUP (that is, a FUP not preceded by a packet such as MODE.TSX that consumes it, and it hence pairs with a TIP that has not yet been seen), then this PIP is part of a compound packet event (Section 34.4.1). Find the ending TIP and apply the new CR3/NR values to the TIP payload IP.
2) Otherwise, look for the next MOV CR3, far branch, or VMRESUME/VMLAUNCH in the disassembly, and apply the new CR3 to the next (or target) IP.
For examples of the packets generated by these flows, see Section 34.7.</td></tr>
</table>

NOTES:

1. Earlier versions of this manual used the term “IA-32e paging” to identify 4-level paging.

34.4.2.8 MODE Packets

MODE packets keep the decoder informed of various processor modes about which it needs to know in order to properly manage the packet output, or to properly disassemble the associated binaries. MODE packets include a header and a mode byte, as shown below.

Table 33-25. General Form of MODE Packets

	7	6	5	4	3	2	1	0
0	1	0	0	1	1	0	0	1
1	Leaf ID			Mode				

The MODE Leaf ID indicates which set of mode bits are held in the lower bits.

MODE.Exec Packet

Table 33-26. MODE.Exec Packet Definition

<table>
<tr><td>Name</td><td colspan="3">MODE.Exec Packet</td></tr>
<tr><td>Packet Format</td><td colspan="3">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td>0</td><td>0</td><td>0</td><td colspan="2">Reserved</td><td>IF</td><td>CS.D</td><td>(CS.L & LMA)</td></tr>
</table>
MODE Leaf ID is ‘000.
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn && FilterEn</td><td>Generation Scenario</td><td>Any operation that changes the CS.L, CS.D, or EFER.LMA, if IA32_RTIT_CTL.BranchEn=1.
Any operation that changes RFLAGS.IF, if IA32_RTIT_CTL.EventEn=1.
Any TIP.PGE scenario, such that any of the mode bits tracked may have changed since the last MODE.Exec.</td></tr>
<tr><td>Description</td><td colspan="3">Indicates whether software is in 16, 32, or 64-bit mode, by providing the CS.D and (CS.L & IA32_EFER.LMA) values. Essential for the decoder to properly disassemble the associated binary. Further, if CPUID.14H.0.EBX[bit 7]=1 (“Event Trace Support”), it indicates when interrupts are masked by providing the RFLAGS.IF value.

MODE.Exec is sent at the time of a mode change, if dependencies are met at the time, otherwise it is sent when tracing resumes. In the former case, the MODE.Exec packet is generated along with other packets that result from the operation that changes the mode, and is guaranteed to be followed by a TIP or TIP.PGE for branch operations, or a FUP for non-branch operations (CLI, STI, or POPF if EventEn=1). In cases where the mode changes while filtering dependencies are not met, the processor ensures that the decoder doesn’t lose track of the mode by sending any needed MODE.Exec once tracing resumes (preceding the TIP.PGE, if BranchEn=1). The processor may opt to suppress the MODE.Exec when tracing resumes if the mode matches that of the last MODE.Exec packet.
MODE.Exec packets are generated on CS.L, CS.D, or EFER.LMA changes only if control flow tracing is enabled (BranchEn=1). This is essential for the decoder to properly disassemble the associated binary.

<table>
<tr><td>CS.D</td><td>(CS.L & IA32_EFER.LMA)</td><td>Addressing Mode</td></tr>
<tr><td>1</td><td>1</td><td>N/A</td></tr>
<tr><td>0</td><td>1</td><td>64-bit mode</td></tr>
<tr><td>1</td><td>0</td><td>32-bit mode</td></tr>
<tr><td>0</td><td>0</td><td>16-bit mode</td></tr>
</table>

MODE.Exec packets are generated on interrupt flag (RFLAGS.IF) changes only if event tracing is enabled (EventEn=1).
The IF field in MODE.Exec packets is populated only if EventEn=1 (IF = EFLAGS.IF & EventEn).</td></tr>
<tr><td>Application</td><td colspan="3">MODE.Exec always precedes an IP packet (TIP, TIP.PGE, or FUP). The mode change applies to the IP address in the payload of the IP packet. When MODE.Exec is followed by a FUP, it is a stand-alone FUP and should be consumed by the MODE.Exec.</td></tr>
</table>

MODE.TSX Packet

Table 33-27. MODE.TSX Packet Definition

<table>
<tr><td>Name</td><td colspan="4">MODE.TSX Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>TXAbort</td><td>InTX</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn</td><td>Generation Scenario</td><td colspan="2">XBEGIN, XEND, XABORT, XACQUIRE, XRELEASE, if InTX changes, Asynchronous TSX Abort, PSB+</td></tr>
<tr><td>Description</td><td colspan="4">Indicates when a TSX transaction (either HLE or RTM) begins, commits, or aborts. Instructions executed transactionally will be “rolled back” if the transaction is aborted.
<table>
<tr><td>TXAbort</td><td>InTX</td><td>Implication</td></tr>
<tr><td>1</td><td>1</td><td>N/A</td></tr>
<tr><td>0</td><td>1</td><td>Transaction begins, or executing transactionally</td></tr>
<tr><td>1</td><td>0</td><td>Transaction aborted</td></tr>
<tr><td>0</td><td>0</td><td>Transaction committed, or not executing transactionally</td></tr>
</table>
</td></tr>
<tr><td>Application</td><td colspan="4">If PacketEn=1, MODE.TSX always immediately precedes a FUP. If the TXAbort bit is zero, then the mode change applies to the IP address in the payload of the FUP. If TXAbort=1, then the FUP will be followed by a TIP, and the mode change will apply to the IP address in the payload of the TIP.
MODE.TSX packets may be generated when PacketEn=0, due to FilterEn=0. In this case, only the last MODE.TSX generated before TIP.PGE need be applied.</td></tr>
</table>

34.4.2.9 TraceStop Packet

Table 33-28. TraceStop Packet Definition

<table>
<tr><td>Name</td><td colspan="4">TraceStop Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4"><table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr>
</table></td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn</td><td>Generation Scenario</td><td colspan="2">Taken branch with target in TraceStop IP region, MOV CR3 in TraceStop IP region, or WRMSR that sets TraceEn in TraceStop IP region.</td></tr>
<tr><td>Description</td><td colspan="4">Indicates when software has entered a user-configured TraceStop region.
When the IP matches a TraceStop range while ContextEn and TriggerEn are set, a TraceStop action occurs. This disables tracing by setting IA32_RTIT_STATUS.Stopped, thereby clearing TriggerEn, and causes a TraceStop packet to be generated.
The TraceStop action also forces FilterEn to 0. Note that TraceStop may not force a flush of internally buffered packets, and thus trace packet generation should still be manually disabled by clearing IA32_RTIT_CTL.TraceEn before examining output. See Section 34.2.5.3 for more details.</td></tr>
<tr><td>Application</td><td colspan="4">If TraceStop follows a TIP.PGD (before the next TIP.PGE), then it was triggered either by the instruction that cleared PacketEn, or it was triggered by some later instruction that executed while FilterEn=0. In either case, the TraceStop can be applied at the IP of the TIP.PGD (if any).
If TraceStop follows a TIP.PGE (before the next TIP.PGD), it should be applied at the last known IP.</td></tr>
</table>

34.4.2.10 Core:Bus Ratio (CBR) Packet

Table 33-29. CBR Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Core:Bus Ratio (CBR) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4"><table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr>
<tr><td>2</td><td colspan="7">Core:Bus Ratio</td></tr>
<tr><td>3</td><td colspan="7">Reserved</td></tr>
</table></td></tr>
<tr><td>Dependencies</td><td>TriggerEn</td><td>Generation Scenario</td><td colspan="2">After any frequency change, on C-state wake up, PSB+, and after enabling trace packet generation.</td></tr>
<tr><td>Description</td><td colspan="4">Indicates the core:bus ratio of the processor core. Useful for correlating wall-clock time and cycle time.</td></tr>
<tr><td>Application</td><td colspan="4">The CBR packet indicates the point in the trace when a frequency transition has occurred. On some implementations, software execution will continue during transitions to a new frequency, while on others software execution ceases during frequency transitions. There is not a precise IP provided, to which to bind the CBR packet.</td></tr>
</table>

34.4.2.11 Timestamp Counter (TSC) Packet

Table 33-30. TSC Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Timestamp Counter (TSC) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr>

<tr><td>3</td><td colspan="8">SW TSC[23:16]</td></tr>
<tr><td>4</td><td colspan="8">SW TSC[31:24]</td></tr>
<tr><td>5</td><td colspan="8">SW TSC[39:32]</td></tr>
<tr><td>6</td><td colspan="8">SW TSC[47:40]</td></tr>
<tr><td>7</td><td colspan="8">SW TSC[55:48]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>IA32_RTIT_CTL.TSCEn && TriggerEn</td><td>Generation Scenario</td><td colspan="2">Sent after any event that causes the processor clocks or Intel PT timing packets (such as MTC or CYC) to stop, This may include P-state changes, wake from C-state, or clock modulation. Also on transition of TraceEn from 0 to 1.</td></tr>
<tr><td>Description</td><td colspan="4">When enabled by software, a TSC packet provides the lower 7 bytes of the current TSC value, as returned by the RDTSC instruction. This may be useful for tracking wall-clock time, and synchronizing the packets in the log with other timestamped logs.</td></tr>
<tr><td>Application</td><td colspan="4">TSC packet provides a wall-clock proxy of the event which generated it (packet generation enable, sleep state wake, etc). In all cases, TSC does not precisely indicate the time of any control flow packets; however, all preceding packets represent instructions that executed before the indicated TSC time, and all subsequent packets represent instructions that executed after it. There is not a precise IP to which to bind the TSC packet.</td></tr>
</table>

34.4.2.12 Mini Time Counter (MTC) Packet

Table 33-31. MTC Packet Definition

<table>
<tr><td>Name</td><td colspan="3">Mini time Counter (MTC) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="3">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr>
<tr><td>1</td><td colspan="8">CTC[N+7:N]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>IA32_RTIT_CTL.MTCEn && TriggerEn</td><td>Generation Scenario</td><td>Periodic, based on the core crystal clock, or Always Running Timer (ART).</td></tr>
<tr><td>Description</td><td colspan="3">When enabled by software, an MTC packet provides a periodic indication of wall-clock time. The 8-bit CTC (Common Timestamp Copy) payload value is set to (ART >> N) & FFH. The frequency of the ART is related to the Maximum Non-Turbo frequency, and the ratio can be determined from CPUID leaf 15H, as described in Section 34.8.3.
Software can select the threshold N, which determines the MTC frequency by setting the IA32_RTIT_CTL.MTCFreq field (see Section 34.2.8.2) to a supported value using the lookup enumerated by CPUID (see Section 34.3.1).
See Section 34.8.3 for details on how to use the MTC payload to track TSC time.
MTC provides 8 bits from the ART, starting with the bit selected by MTCFreq to dictate the frequency of the packet. Whenever that 8-bit range being watched changes, an MTC packet will be sent out with the new value of that 8-bit range. This allows the decoder to keep track of how much wall-clock time has elapsed since the last TSC packet was sent, by keeping track of how many MTC packets were sent and what their value was. The decoder can infer the truncated bits, CTC[N-1:0], are 0 at the time of the MTC packet.
There are cases in which MTC packet can be dropped, due to overflow or other micro-architectural conditions. The decoder should be able to recover from such cases by checking the 8-bit payload of the next MTC packet, to determine how many MTC packets were dropped. It is not expected that >256 consecutive MTC packets should ever be dropped.</td></tr>
<tr><td>Application</td><td colspan="3">MTC does not precisely indicate the time of any other packet, nor does it bind to any IP. However, all preceding packets represent instructions or events that executed before the indicated ART time, and all subsequent packets represent instructions that executed after, or at the same time as, the ART time.</td></tr>
</table>

34.4.2.13 TSC/MTC Alignment (TMA) Packet

Table 33-32. TMA Packet Definition

<table>
<tr><td>Name</td><td colspan="4">TSC/MTC Alignment (TMA) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>0</td><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td></tr>
<tr><td>2</td><td colspan="8">CTC[7:0]</td></tr>
<tr><td>3</td><td colspan="8">CTC[15:8]</td></tr>
<tr><td>4</td><td colspan="7">Reserved</td><td>0</td></tr>
<tr><td>5</td><td colspan="8">FastCounter[7:0]</td></tr>
<tr><td>6</td><td colspan="7">Reserved</td><td>FC[8]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>IA32_RTIT_CTL.MTCEn && IA32_RTIT_CTL.TSCEn && TriggerEn</td><td>Generation Scenario</td><td colspan="2">Sent with any TSC packet.</td></tr>
<tr><td>Description</td><td colspan="4">The TMA packet serves to provide the information needed to allow the decoder to correlate MTC packets with TSC packets. With this packet, when a MTC packet is encountered, the decoder can determine how many timestamp counter ticks have passed since the last TSC or MTC packet. See Section 34.8.3.2 for details on how to make this calculation.</td></tr>
<tr><td>Application</td><td colspan="4">TMA is always sent immediately following a TSC packet, and the payload values are consistent with the TSC payload value. Thus the application of TMA matches that of TSC.</td></tr>
</table>

34.4.2.14 Cycle Count (CYC) Packet

Table 33-33. Cycle Count Packet Definition

<table>
<tr><td>Name</td><td colspan="4">Cycle Count (CYC) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td colspan="5">Cycle Counter[4:0]</td><td>Exp</td><td>1</td><td>1</td></tr>
<tr><td>1</td><td colspan="7">Cycle Counter[11:5]</td><td>Exp</td></tr>
<tr><td>2</td><td colspan="7">Cycle Counter[18:12]</td><td>Exp</td></tr>
<tr><td>...</td><td colspan="8">... (if Exp = 1 in the previous byte)</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>IA32_RTIT_CTL.CYCEn && TriggerEn</td><td>Generation Scenario</td><td colspan="2">Can be sent at any time, though a maximum of one CYC packet is sent per core clock cycle. See Section 34.3.6 for CYC-eligible packets.</td></tr>
<tr><td>Description</td><td colspan="4">The Cycle Counter field increments at the same rate as the processor core clock ticks, but with a variable length format (using a trailing EXP bit field) and a range-capped byte length.
If the CYC value is less than 32, a 1-byte CYC will be generated, with Exp=0. If the CYC value is between 32 and 4095 inclusive, a 2-byte CYC will be generated, with byte 0 Exp=1 and byte 1 Exp=0. And so on.
CYC provides the number of core clocks that have passed since the last CYC packet. CYC can be configured to be sent in every cycle in which an eligible packet is generated, or software can opt to use a threshold to limit the number of CYC packets, at the expense of some precision. These settings are configured using the IA32_RTIT_CTL.CycThresh field (see Section 34.2.8.2). For details on Cycle-Accurate Mode, IPC calculation, etc, see Section 34.3.6.
When CycThresh=0, and hence no threshold is in use, then a CYC packet will be generated in any cycle in which any CYC-eligible packet is generated. The CYC packet will precede the other packets generated in the cycle, and provides the precise cycle time of the packets that follow.
In addition to these CYC packets generated with other packets, CYC packets can be sent stand-alone. These packets serve simply to update the decoder with the number of cycles passed, and are used to ensure that a wrap of the processor's internal cycle counter doesn't cause cycle information to be lost. These stand-alone CYC packets do not indicate the cycle time of any other packet or operation, and will be followed by another CYC packet before any other CYC-eligible packet is seen.
When CycThresh>0, CYC packets are generated only after a minimum number of cycles have passed since the last CYC packet. Once this threshold has passed, the behavior above resumes, where CYC will either be sent in the next cycle that produces other CYC-eligible packets, or could be sent stand-alone.
When using CYC thresholds, only the cycle time of the operation (instruction or event) that generates the CYC packet is truly known. Other operations simply have their execution time bounded: they completed at or after the last CYC time, and before the next CYC time.</td></tr>
<tr><td>Application</td><td colspan="4">CYC provides the offset cycle time (since the last CYC packet) for the CYC-eligible packet that follows. If another CYC is encountered before the next CYC-eligible packet, the cycle values should be accumulated and applied to the next CYC-eligible packet.
If a CYC packet is generated by a TNT, note that the cycle time provided by the CYC packet applies to the first branch in the TNT packet.</td></tr>
</table>

34.4.2.15 VMCS Packet

Table 33-34. VMCS Packet Definition

<table>
<tr><td>Name</td><td colspan="4">VMCS Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>

<tr><td>2</td><td colspan="8">VMCS pointer [19:12]</td></tr>
<tr><td>3</td><td colspan="8">VMCS pointer [27:20]</td></tr>
<tr><td>4</td><td colspan="8">VMCS pointer [35:28]</td></tr>
<tr><td>5</td><td colspan="8">VMCS pointer [43:36]</td></tr>
<tr><td>6</td><td colspan="8">VMCS pointer [51:44]</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn; Also in VMX operation.</td><td>Generation Scenario</td><td colspan="2">Generated on successful VMPTRLD, and optionally on PSB+, SMM VM exits, and VM entries that return from SMM (see Section 33-53).</td></tr>
<tr><td>Description</td><td colspan="4">The VMCS packet provides a VMCS pointer for a decoder to determine the transition of code contexts:
• On a successful VMPTRLD (i.e., a VMPTRLD that doesn't fault, fail, or VM exit), the VMCS packet contains the logical processor's VMCS pointer established by VMPTRLD (for subsequent execution of a VM guest context).
• An SMM VM exit loads the logical processor's VMCS pointer with the SMM-transfer VMCS pointer. If the "conceal VMX from PT" VM-exit control is 0 (see Section 34.5.1), a VMCS packet provides this pointer. See Section 34.6 on tracing inside and outside STM.
• A VM entry that returns from SMM loads the logical processor's VMCS pointer from a field in the SMM-transfer VMCS. If the "conceal VMX from PT" VM-entry control is 0, a VMCS packet provides this pointer. Whether the VM entry is to VMX root operation or VMX non-root operation is indicated by the PIP.NR bit.
A VMCS packet generated before a VMCS pointer has been loaded, or after the VMCS pointer has been cleared will set all 64 bits in the VMCS pointer field.
VMCS packets will not be seen on processors with IA32_VMX_MISC[bit 14]=0, as these processors do not allow TraceEn to be set in VMX operation.</td></tr>
<tr><td>Application</td><td colspan="4">The purpose of the VMCS packet is to help the decoder uniquely identify changes in the executing software context in situations that CR3 may not be unique.
When a VMCS packet is encountered, a decoder should do the following:
▪ If there was a prior unbound FUP (that is, a FUP not preceded by a packet such as MODE.TSX that consumes it, and it hence pairs with a TIP that has not yet been seen), then this VMCS is part of a compound packet event (Section 34.4.1). Find the ending TIP and apply the new VMCS base pointer value to the TIP payload IP.
▪ Otherwise, look for the next VMPTRLD, VMRESUME, or VMLAUNCH in the disassembly, and apply the new VMCS base pointer on the next VM entry.
For examples of the packets generated by these flows, see Section 34.7.</td></tr>
</table>

34.4.2.16 Overflow (OVF) Packet

Table 33-35. OVF Packet Definition

<table>
<tr><td>Name</td><td colspan="3">Overflow (OVF) Packet</td></tr>
<tr><td>Packet Format</td><td colspan="3"><table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td></tr>
</table></td></tr>
<tr><td>Dependencies</td><td>TriggerEn</td><td>Generation Scenario</td><td>On resolution of internal buffer overflow</td></tr>
<tr><td>Description</td><td colspan="3">OVF simply indicates to the decoder that an internal buffer overflow occurred, and packets were likely lost. If BranchEN= 1, OVF is followed by a FUP or TIP.PGE which will provide the IP at which packet generation resumes. See Section 34.3.8.</td></tr>
<tr><td>Application</td><td colspan="3">When an OVF packet is encountered, the decoder should skip to the IP given in the subsequent FUP or TIP.PGE. The cycle counter for the CYC packet will be reset at the time the OVF packet is sent.
Software should reset its call stack depth on overflow, since no RET compression is allowed across an overflow. Similarly, any IP compression that follows the OVF is guaranteed to use as a reference LastIP the IP payload of an IP packet that preceded the overflow.</td></tr>
</table>

34.4.2.17 Packet Stream Boundary (PSB) Packet

</table>

Table 33-36. PSB Packet Definition (Contd.)

Dependencies	TriggerEn	Generation Scenario	Periodic, based on the number of output bytes generated while tracing. PSB is sent when IA32_RTIT_STATUS.PacketByteCnt=0, and each time it crosses the software selected threshold after that. May be sent for other micro-architectural conditions as well.
Description	PSB is a unique pattern in the packet output log, and hence serves as a sync point for the decoder. It is a pattern that the decoder can search for in order to get aligned on packet boundaries. This packet is periodic, based on the number of output bytes, as indicated by IA32_RTIT_STATUS.PacketByteCnt. The period is chosen by software, via IA32_RTIT_CTL.PSBFreq (see Section 34.2.8.2). Note, however, that the PSB period is not precise, it simply reflects the average number of output bytes that should pass between PSBs. The processor will make a best effort to insert PSB as quickly after the selected threshold is reached as possible. The processor also may send extra PSB packets for some micro-architectural conditions. PSB also serves as the leading packet for a set of "status-only" packets collectively known as PSB+ (Section 34.3.7).		
Application	When a PSB is seen, the decoder should interpret all following packets as "status only", until either a PSBEND or OVF packet is encountered. "Status only" implies that the binding and ordering rules to which these packets normally adhere are ignored, and the state they carry can instead be applied to the IP payload in the FUP packet that is included.		

34.4.2.18 PSBEND Packet

Table 33-37. PSBEND Packet Definition

Name	PSBEND Packet		
Packet Format			
Dependencies	TriggerEn	Generation Scenario	Always follows PSB packet, separated by PSB+ packets
Description	PSBEND is simply a terminator for the series of "status only" (PSB+) packets that follow PSB (Section 34.3.7).		
Application	When a PSBEND packet is seen, the decoder should cease to treat packets as "status only".		

34.4.2.19 Maintenance (MNT) Packet

Table 33-38. MNT Packet Definition

Name	Maintenance (MNT) Packet		
Packet Format	<table><tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr><tr><td>2</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td></tr><tr><td>3</td><td colspan="8">Payload[7:0]</td></tr><tr><td>4</td><td colspan="8">Payload[15:8]</td></tr><tr><td>5</td><td colspan="8">Payload[23:16]</td></tr><tr><td>6</td><td colspan="8">Payload[31:24]</td></tr><tr><td>7</td><td colspan="8">Payload[39:32]</td></tr><tr><td>8</td><td colspan="8">Payload[47:40]</td></tr><tr><td>9</td><td colspan="8">Payload[55:48]</td></tr><tr><td>10</td><td colspan="8">Payload[63:56]</td></tr></table>		
Dependencies	TriggerEn	Generation Scenario	Implementation specific.
Description	This packet is generated by hardware, the payload meaning is model-specific.		
Application	Unless a decoder has been extended for a particular family/model/stepping to interpret MNT packet payloads, this packet should simply be ignored. It does not bind to any IP.		

34.4.2.20 PAD Packet

Table 33-39. PAD Packet Definition

Name	PAD Packet		
Packet Format	<table><tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr></table>		
Dependencies	TriggerEn	Generation Scenario	Implementation specific
Description	PAD is simply a NOP packet. Processor implementations may choose to add pad packets to improve packet alignment or for implementation-specific reasons.		
Application	Ignore PAD packets.		

34.4.2.21 PTWRITE (PTW) Packet

Table 33-40. PTW Packet Definition

<tr><td>9</td><td colspan="8">Payload[63:56]</td></tr>
</table>
</td></tr>
<tr><td></td><td colspan="4">The PayloadBytes field indicates the number of bytes of payload that follow the header bytes. Encodings are as follows:
<table>
<tr><th>PayloadBytes</th><th>Bytes of Payload</th></tr>
<tr><td>‘00</td><td>4</td></tr>
<tr><td>‘01</td><td>8</td></tr>
<tr><td>‘10</td><td>Reserved</td></tr>
<tr><td>‘11</td><td>Reserved</td></tr>
</table>
IP bit indicates if a FUP, whose payload will be the IP of the PTWRITE instruction, will follow.</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && ContextEn && FilterEn && PTWEn</td><td>Generation Scenario</td><td colspan="2">PTWRITE Instruction</td></tr>
<tr><td>Description</td><td colspan="4">Contains the value held in the PTWRITE operand.
This packet is CYC-eligible, and hence will generate a CYC packet if IA32_RTIT_CTL.CYCEn=1 and any CYC Threshold has been reached.</td></tr>
<tr><td>Application</td><td colspan="4">Binds to the associated PTWRITE instruction. The IP of the PTWRITE will be provided by a following FUP, when PTW.IP=1.</td></tr>
</table>

34.4.2.22 Execution Stop (EXSTOP) Packet

Table 33-41. EXSTOP Packet Definition

<table>
<tr><td>Name</td><td colspan="4">EXSTOP Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>IP</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
</table>
IP bit indicates if a FUP will follow.
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && PwrEvtEn</td><td>Generation Scenario</td><td colspan="2">C-state entry, P-state change, or other processor clock power-down. Includes :
▪ Entry to C-state deeper than C0.0
▪ TM1/2
▪ STPCLK#
▪ Frequency change due to IA32_CLOCK_MODULATION, Turbo</td></tr>
<tr><td>Description</td><td colspan="4">This packet indicates that software execution has stopped due to processor clock powerdown. Later packets will indicate when execution resumes.
If EXSTOP is generated while ContextEn is set, the IP bit will be set, and EXSTOP will be followed by a FUP packet containing the IP at which execution stopped. More precisely, this will be the IP of the oldest instruction that has not yet completed.
This packet is CYC-eligible, and hence will generate a CYC packet if IA32_RTIT_CTL.CYCEn=1 and any CYC Threshold has been reached.</td></tr>
<tr><td>Application</td><td colspan="4">If a FUP follows EXSTOP (hence IP bit set), the EXSTOP can be bound to the FUP IP. Otherwise the IP is not known. Time of powerdown can be inferred from the preceding CYC, if CYCEn=1. Combined with the TSC at the time of wake (if TSCEn=1), this can be used to determine the duration of the powerdown.</td></tr>
</table>

34.4.2.23 MWAIT Packet

Table 33-42. MWAIT Packet Definition

<table>
<tr><td>Name</td><td colspan="4">MWAIT Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>2</td><td colspan="8">MWAIT Hints[7:0]</td></tr>

<tr><td>7</td><td colspan="8">Reserved</td></tr>
<tr><td>8</td><td colspan="8">Reserved</td></tr>
<tr><td>9</td><td colspan="8">Reserved</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && PwrEvtEn && ContextEn</td><td>Generation Scenario</td><td colspan="2">MWAIT, UMWAIT, or TPAUSE instructions, or I/O redirection to MWAIT, that complete without fault or VMexit.</td></tr>
<tr><td>Description</td><td colspan="4">Indicates that an MWAIT operation to C-state deeper than C0.0 completed. The MWAIT hints and extensions passed in by software are exposed in the payload. For UMWAIT and TPAUSE, the EXT field holds the input register value that determines the optimized state requested.
For entry to some highly optimized C0 sub-C-states, such as C0.1, no MWAIT packet is generated.
This packet is CYC-eligible, and hence will generate a CYC packet if IA32_RTIT_CTL.CYCEn=1 and any CYC Threshold has been reached.</td></tr>
<tr><td>Application</td><td colspan="4">The binding for the upcoming EXSTOP packet also applies to the MWAIT packet. See Section 34.4.2.22.</td></tr>
</table>

34.4.2.24 Power Entry (PWRE) Packet

Table 33-43. PWRE Packet Definition

<table>
<tr><td>Name</td><td colspan="4">PWRE Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>2</td><td>HW</td><td colspan="6">Reserved</td></tr>
<tr><td>3</td><td colspan="4">Resolved Thread C-State</td><td colspan="4">Resolved Thread Sub C-State</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && PwrEvtEn</td><td>Generation Scenario</td><td colspan="2">Transition to a C-state deeper than C0.0.</td></tr>
<tr><td>Description</td><td colspan="4">Indicates processor entry to the resolved thread C-state and sub C-state indicated. The processor will remain in this C-state until either another PWRE indicates the processor has moved to a C-state deeper than C0.0, or a PWRX packet indicates a return to C0.0.
For entry to some highly optimized C0 sub-C-states, such as C0.1, no PWRE packet is generated.
Note that some CPUs may allow MWAIT to request a deeper C-state than is supported by the core. These deeper C-states may have platform-level implications that differentiate them. However, the PWRE packet will provide only the resolved thread C-state, which will not exceed that supported by the core.
If the C-state entry was initiated by hardware, rather than a direct software request (such as MWAIT, UMWAIT, TPAUSE, HLT, or shutdown), the HW bit will be set to indicate this. Hardware Duty Cycling (see Section 16.5, "Hardware Duty Cycling (HDC)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B) is an example of such a case.</td></tr>
<tr><td>Application</td><td colspan="4">When transitioning from C0.0 to a deeper C-state, the PWRE packet will be followed by an EXSTOP. If that EXSTOP packet has the IP bit set, then the following FUP will provide the IP at which the C-state entry occurred. Subsequent PWRE packets generated before the next PWRX should bind to the same IP.</td></tr>
</table>

34.4.2.25 Power Exit (PWRX) Packet

Table 33-44. PWRX Packet Definition

<table>
<tr><td>Name</td><td colspan="4">PWRX Packet</td></tr>
<tr><td>Packet Format</td><td colspan="4">
<table>
<tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>1</td><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr>
<tr><td>2</td><td colspan="4">Last Core C-State</td><td colspan="4">Deepest Core C-State</td></tr>

<tr><td>4</td><td colspan="8">Reserved</td></tr>
<tr><td>5</td><td colspan="8">Reserved</td></tr>
<tr><td>6</td><td colspan="8">Reserved</td></tr>
</table>
</td></tr>
<tr><td>Dependencies</td><td>TriggerEn && PwrEvtEn</td><td>Generation Scenario</td><td colspan="2">Transition from a C-state deeper than C0.0 to C0.</td></tr>
<tr><td>Description</td><td colspan="4">Indicates processor return to thread C0 from a C-state deeper than C0.0.
For return from some highly optimized C0 sub-C-states, such as C0.1, no PWRX packet is generated.
The Last Core C-State field provides the MWAIT encoding for the core C-state at the time of the wake. The Deepest Core C-State provides the MWAIT encoding for the deepest core C-state achieved during the sleep session, or since leaving thread C0. MWAIT encodings for C-states can be found in Table 4-11 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B. Note that these values reflect only the core C-state, and hence will not exceed the maximum supported core C-state, even if deeper C-states can be requested.
The Wake Reason field is one-hot, encoded as follows:
<table>
<tr><th>Bit</th><th>Field</th><th>Meaning</th></tr>
<tr><td>0</td><td>Interrupt</td><td>Wake due to external interrupt received.</td></tr>
<tr><td>1</td><td>Timer Deadline</td><td>Wake due to timer expiration, such as UMWAIT/TPAUSE TSC-quanta.</td></tr>
<tr><td>2</td><td>Store to Monitored Address</td><td>Wake due to store to monitored address.</td></tr>
<tr><td>3</td><td>HW Wake</td><td>Wake due to hardware autonomous condition, such as HDC.</td></tr>
</table>
</td></tr>
<tr><td>Application</td><td colspan="4">PWRX will always apply to the same IP as the PWRE. The time of wake can be discerned from (optional) timing packets that precede PWRX.</td></tr>
</table>

34.4.2.26 Block Begin Packet (BBP)

VM entry, if “Conceal VMX in PT” VMCS entry control is 0.
TSX Abort.</td></tr>
<tr><td>Description</td><td colspan="4">This packet indicates that an asynchronous event or related event (see list above) has occurred. The type of event is provided in the packet (see Table 33-50 below), and, if the IP bit is set, the IP at which the event occurred is provided in a stand-alone FUP packet that follows. Further, in the case of an interrupt or exception, the vector field provides the vector of the event.
The IP bit will be set only when ContextEn=1 before the event is taken, and either BranchEn=0 or else no FUP is generated for this event by BranchEn=1. There are some cases, such as SIPI and RSM, where no FUP is generated. Note that events that are not delivered to software, such as nested events or events which cause a VM exit, do not generate CFE packets.</td></tr>
<tr><td>Application</td><td colspan="4">If the IP bit is set, a FUP will follow that is stand-alone (not part of a compound packet event), and the CFE consumes the FUP. If the IP bit is not set, the CFE binds to the next FUP if PacketEn=1 (hence the CFE comes after a TIP.PGE but before the next TIP.PGD), and is stand-alone if PacketEn=0.</td></tr>
</table>

CFE Packet Type and Vector Fields

Every CFE has a Type field, which provides the type of event which generated the packet. For a subset of CFE Types, the CFE.Vector field may be valid. Details on these fields, as well as the IP to be expected in any following FUP packet, are provided in the table below.

Table 33-50. CFE Packet Type and Vector Fields Details

CFE Subtype	Type	Vector	FUP IP	Details
INTR	0x1	Event Vector	Varies	Used for interrupts (external and software), Exceptions, Faults, and NMI. FUP contains that address of the instruction that has not completed (NLIP for trap events, CLIP for fault events).
IRET	0x2	Invalid	CLIP	
SMI	0x3	Invalid	NLIP	
RSM	0x4	Invalid	None	
SIPI	0x5	SIPI Vector	None	
INIT	0x6	Invalid	NLIP	
VMENTRY	0x7	Invalid	CLIP	FUP contains IP of VMLAUNCH/VMRESUME.

Table 33-50. CFE Packet Type and Vector Fields Details (Contd.)

CFE Subtype	Type	Vector	FUP IP	Details
VMEXIT	0x8	Invalid	Varies	FUP IP varies depending on type of VM exit, but will be the address of the instruction that has not completed. Will be consistent with Guest IP saved in VMCS.
VMEXIT_INTR	0x9	Event Vector	Varies	Sent in cases where VM exit was caused by an INTR event (interrupt, exception, fault, or NMI). Vector provided is for the event which caused the VM exit. FUP IP behavior matches that of INTR type above.
SHUTDOWN	0xa	Invalid	Varies	FUP IP varies depending on the type of event that caused shutdown, but will be the address of the instruction that has not completed.
Reserved	0xb	N/A	N/A	
UINTR	0xc	User Interrupt Vector	NLIP	User interrupt delivered.
UIRET	0xd	Invalid	CLIP	Exiting from user interrupt routine.
Reserved	0xe...0x1f	N/A	N/A	Reserved

</table>

34.5 TRACING IN VMX OPERATION

On processors that IA32_VMX_MISC[bit 14] reports 1, TraceEn can be set in VMX operation. The VMM can configure specific VMX controls to control what virtualization-specific data is included within the trace packets (see Section 34.5.1 for details). The VMM can also configure the VMCS to limit tracing to non-root operation, or to trace across both root and non-root operation. The VMCS controls exist to simplify virtualization of Intel PT for guest use, including the “Clear IA32_RTIT_CTL” exit control (See Section 26.7.1), “Load IA32_RTIT_CTL” entry control (See Section 26.8.1), and “Intel PT uses guest physical addresses” execution control (See Section 27.5.3).

For older processors that do not support these VMCS controls, the MSR-load areas used by VMX transitions can be employed by the VMM to restrict tracing to the desired context. See Section 34.5.2 for details. Tracing with SMM Transfer Monitor is described in Section 34.6.

34.5.1 VMX-Specific Packets and VMCS Controls

In all of the usages of VMX and Intel PT, a decoder in the host or VMM context can identify the occurrences of VMX transitions with the aid of VMX-specific packets. There are four kinds of packets relevant to VMX:

- **VMCS packet.** The VMX transitions of individual VMs can be distinguished by a decoder using the VMCS-pointer field in a VMCS packet. A VMCS packet is sent on a successful execution of VMPTRLD, and its VMCS-pointer field stores the VMCS pointer loaded by that execution. See Section 34.4.2.15 for details.
- **The NR (non-root) bit in a PIP packet.** Normally, the NR bit is set in any PIP packet generated in VMX non-root operation. In addition, PIP packets are generated with each VM entry and VM exit. Thus a transition of the NR bit from 0 to 1 indicates the occurrence of a VM entry, and a transition of 1 to 0 indicates the occurrence of a VM exit.
- **CFE packet.** Identifies VM exit and VM entry operations.
- **EVD packet.** Provides the exit reason and exit qualification for VM exits.

There are VMX controls that a VMM can set to conceal some of this VMX-specific information (by suppressing its recording) and thereby prevent it from leaking across virtualization boundaries. There is one of these controls (each of which is called "conceal VMX from PT") of each type of VMX control.

Table 33-52. VMX Controls For Intel Processor Trace

Type of VMX Control	Bit Position[1]	Value	Behavior
Secondary processor-based VM-execution control	19	0	Each PIP generated in VM non-root operation will set the NR bit. PSB+ in VMX non-root operation will include the VMCS packet, to ensure that the decoder knows which guest is currently in use.
		1	Each PIP generated in VMX non-root operation will clear the NR bit. PSB+ in VMX non-root operation will not include the VMCS packet.
VM-exit control	24	0	Each VM exit generates a PIP in which the NR bit is clear, and a CFE/EVD if Event Trace is enabled. In addition, SMM VM exits generate VMCS packets.
		1	VM exits do not generate PIPs, CFEs, or EVDs, and no VMCS packets are generated on SMM VM exits.
VM-entry control	17	0	Each VM entry generates a PIP in which the NR bit is set (except VM entries that return from SMM to VMX root operation), and a CFE if Event Trace is enabled. In addition, VM entries that return from SMM generate VMCS packets.
		1	VM entries do not generate PIPs or CFEs, and no VMCS packets are generated on VM entries that return from SMM.

NOTES:

1. These are the positions of the control bits in the relevant VMX control fields.

The 0-settings of these VMX controls enable all VMX-specific packet information. The scenarios that would use these default settings also do not require the VMM to use VMX MSR-load areas to enable and disable trace-packet generation across VMX transitions.

If IA32_VMX_MISC[bit 14] reports 0, the 1-settings of the VMX controls in Table 33-52 are not supported, and VM entry will fail on any attempt to set them.

34.5.2 Managing Trace Packet Generation Across VMX Transitions

In tracing scenarios that collect packets for both VMX root operation and VMX non-root operation, a host executive can manage the MSRs associated with trace packet generation directly. The states of these MSRs need not be modified across VMX transitions.

For tracing scenarios that collect packets only within VMX root operation or only within VMX non-root operation, the VMM can toggle IA32_RTIT_CTL.TraceEn on VMX transitions.

34.5.2.1 System-Wide Tracing

When a host or VMM configures Intel PT to collect trace packets of the entire system, it can leave the relevant VMX controls clear to allow VMX-specific packets to provide information across VMX transitions.

The decoder will desire to identify the occurrence of VMX transitions. The packets of interests to a decoder are shown in Table 33-53.

Table 33-53. Packets on VMX Transitions (System-Wide Tracing)

Event	Packets	Enable	Description
VM exit	EVD.VMXR, EVD.VMXQ, CFE.VMEXIT*	EventEn	The CFE identifies the transfer as a VM exit, while the associated EVDs provide the exit reason and exit qualification.
	FUP(GuestIP)	BranchEn or EventEn	The FUP indicates at which point in the guest flow the VM exit occurred. This is important, since VM exit can be an asynchronous event. The IP will match that written into the VMCS.
	PIP(HostCR3, NR=0)		The PIP packet provides the new host CR3 value, as well as indication that the logical processor is entering VMX root operation. This allows the decoder to identify the change of executing context from guest to host and load the appropriate set of binaries to continue decode.
	TIP(HostIP)	BranchEn	The TIP indicates the destination IP, the IP of the first instruction to be executed in VMX root operation. Note, this packet could be preceded by a MODE.Exec packet (Section 34.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition.
VM entry	CFEVMENTRY, FUP(CLIP)	EventEn	The CFE identifies the transfer as a VM entry, while the FUP identifies the VMLAUNCH/VMRESUME IP.
	PIP(GuestCR3, NR=1)	BranchEn	The PIP packet provides the new guest CR3 value, as well as indication that the logical processor is entering VMX non-root operation. This allows the decoder to identify the change of executing context from host to guest and load the appropriate set of binaries to continue decode.
	TIP(GuestIP)	BranchEn	The TIP indicates the destination IP, the IP of the first instruction to be executed in VMX non-root operation. This should match the RIP loaded from the VMCS. Note, this packet could be preceded by a MODE.Exec packet (Section 34.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition.

Since the VMX controls that suppress packet generation are cleared, a VMCS packet will be included in all PSB+ for this usage scenario. Additionally, VMPTRLD will generate such a packet. Thus the decoder can distinguish the execution context of different VMs.

When the host VMM configures a system to collect trace packets in this scenario, it should emulate CPUID to report CPUID.(EAX=07H, ECX=0):EBX[bit 26] as 0 to guests, indicating to guests that Intel PT is not available.

VMX TSC Manipulation

The TSC packets generated while in VMX non-root operation will include any changes resulting from the use of a VMM's use of the TSC offsetting or TSC scaling VMX controls (see Chapter 27, "VMX Non-Root Operation"). In this system-wide usage model, the decoder may need to account for the effect of per-VM adjustments in the TSC packets generated in VMX non-root operation and the absence of TSC adjustments in TSC packets generated in VMX root operation. The VMM can supply this information to the decoder.

34.5.2.2 Guest-Only Tracing

A VMM can configure trace-packet generation while in VMX non-root operation for guests executing normally. This is accomplished by utilizing VMCS controls to manipulate the guest IA32_RTIT_CTL value on VMX transitions. For

older processors that do not support these VMCS controls, a VMM can use the VMX MSR-load areas on VM exits (see Section 26.7.2, "VM-Exit Controls for MSRs") and VM entries (see Section 26.8.2, "VM-Entry Controls for MSRs") to limit trace-packet generation to the guest environment.

For this usage, VM entry is programmed to enable trace packet generation, while VM exit is programmed to clear IA32_RTIT_CTL.TraceEn so as to disable trace-packet generation in the host. Further, if it is preferred that the guest packet stream contain no indication that execution was in VMX non-root operation, the VMM should set to 1 all the VMX controls enumerated in Table 33-52.

34.5.2.3 Emulation of Intel PT Traced State

If a VMM emulates an element of processor state by taking a VM exit on reads and/or writes to that piece of state, and the state element impacts Intel PT packet generation or values, it may be incumbent upon the VMM to insert or modify the output trace data.

If a VM exit is taken on a guest write to CR3 (including "MOV CR3" as well as task switches), the PIP packet normally generated on the CR3 write will be missing.

To avoid decoder confusion when the guest trace is decoded, the VMM should emulate the missing PIP by writing it into the guest output buffer. If the guest CR3 value is manipulated, the VMM may also need to manipulate the IA32_RTIT_CR3_MATCH value, in order to ensure the trace behavior matches the guest's expectation.

Similarly, if a VMM emulates the TSC value by taking a VM exit on RDTSC, the TSC packets generated in the trace may mismatch the TSC values returned by the VMM on RDTSC. To ensure that the trace can be properly aligned with software logs based on RDTSC, the VMM should either make corresponding modifications to the TSC packet values in the guest trace, or use mechanisms such as TSC offsetting or TSC scaling in place of exiting.

34.5.2.4 TSC Scaling

When TSC scaling is enabled for a guest using Intel PT, the VMM should ensure that the value of Maximum Non-Turbo Ratio[15:8] in MSR_PLATFORM_INFO (MSR 0CEH) and the TSC/"core crystal clock" ratio (EBX/EAX) in CPUID leaf 15H are set in a manner consistent with the resulting TSC rate that will be visible to the VM. This will allow the decoder to properly apply TSC packets, MTC packets (based on the core crystal clock or ART, whose frequency is indicated by CPUID leaf 15H), and CBR packets (which indicate the ratio of the processor frequency to the Max Non-Turbo frequency). Absent this, or separate indication of the scaling factor, the decoder will be unable to properly track time in the trace. See Section 34.8.3 for details on tracking time within an Intel PT trace.

34.5.2.5 Failed VM Entry

The packets generated by a failed VM entry depend both on the VMCS configuration, as well as on the type of failure. The results to expect are summarized in the table below. Note that packets in *italics* may or may not be generated, depending on implementation choice, and the point of failure.

Table 33-54. Packets on a Failed VM Entry

Usage Model	Entry Configuration	Early Failure (fall through to next IP)	Late Failure (VM exit like)
System-Wide	No use of "Load IA32_RTIT_CTL" entry control or VM-entry MSR-load area	TIP (NextIP)	*CFE.VMENTRY, FUP(CLIP) if EventEn=1* *PIP(Guest CR3, NR=1), TraceEn 0⟶1 Packets (See Section 34.2.8.3),* PIP(HostCR3, NR=0), TIP(HostIP)
VMM Only	"Load IA32_RTIT_CTL" entry control or VM-entry MSR-load area used to clear TraceEn	TIP (NextIP)	*TraceEn 0⟶1 Packets (See Section 34.2.8.3),* TIP(HostIP)
VM Only	"Load IA32_RTIT_CTL" entry control or VM-entry MSR-load area used to set TraceEn	None	None

34.5.2.6 VMX Abort

VMX abort conditions take the processor into a shutdown state. On a VM exit that leads to VMX abort, some packets (FUP, PIP) may be generated, but any expected TIP, TIP.PGE, or TIP.PGD may be dropped.

34.6 TRACING AND SMM TRANSFER MONITOR (STM)

The SMM-transfer monitor (STM) is a VMM that operates inside SMM while in VMX root operation. An STM operates in conjunction with an executive monitor. The latter operates outside SMM and in VMX root operation. Transitions from the executive monitor or its VMs to the STM are called SMM VM exits. The STM returns from SMM via a VM entry to the VM in VMX non-root operation or the executive monitor in VMX root operation.

Intel PT supports tracing in an STM similar to tracing support for VMX operation as described above in Section 34.5. As a result, on a SMM VM exit resulting from #SMI, TraceEn is neither saved nor cleared by default. Software can save the state of the trace configuration MSRs and clear TraceEn using the MSR load/save lists.

Within Event Trace, SMM VM exits generate packets indicating both an #SMI and a VM exit. Similarly, VM entries that return from SMM generate packets that indicate both an RSM and a VM entry. SMM VM exits initiated by the VMCALL instruction do not generate any CFE packet, though the subsequent VM entry returning from SMM will generate a CFE.RSM.

34.7 PACKET GENERATION SCENARIOS

The following tables provides examples of packet generation for various operations. The following acronyms are used in the packet examples below:

- CLIP - Current LIP
- NLIP - Next Sequential LIP
- BLIP - Branch Target LIP

Table 33-55 illustrates the packets generated by a series of example operations, assuming that PacketEn (TriggerEn && ContextEn && FilterEn && BranchEn) is set before and after the operation.

Table 33-55. Packet Generation under Different Example Operations

Case	Operation	Details	Packets
1	Normal non-jump operation		None
2	Conditional branch	6th branch in internal TNT buffer	TNT
3	Conditional branch	1st..5th branch in internal TNT buffer	None
4	Near indirect JMP or CALL		TIP(BLIP)
5	Direct near JMP or CALL		None
6	Near RET	Uncompressed	TIP(BLIP)
7	Near RET	Compressed, 6th branch in internal TNT buffer	TNT
8	Far Branch	Assumes no update to CR3, CS.L, or CS.D	TIP(BLIP)
9	Far Branch	Assumes update to CR3	PIP(NewCR3), TIP(BLIP)
10	Far Branch	Assumes update to CR3 and CS.D/CS.L	PIP(NewCR3), MODE.Exec, TIP(BLIP)
11	External Interrupt or NMI	Assumes no update to CR3, CS.D, or CS.L	FUP(NLIP), TIP(BLIP)
12	External Interrupt or NMI	Assumes update to CR3 and CS.D/CS.L	FUP(NLIP), PIP(NewCR3), MODE.Exec, TIP(BLIP)
13	Exception/Fault or Software Interrupt	Assumes no update to CR3, CS.D, or CS.L	FUP(CLIP), TIP(BLIP)
14	MOV to CR3		PIP(NewCR3, NR)

Table 33-55. Packet Generation under Different Example Operations

Case	Operation	Details	Packets
15	VM exit	Assumes system-wide tracing, see Section 34.5.2.1	See Table 33-53
16	VM entry	Assumes system-wide tracing, see Section 34.5.2.1	See Table 33-53
17	ENCLU[EENTER] / ENCLU[ERESUME] / ENCLU[EEXIT] / AEX/EEE	Only debug enclaves allow PacketEn to be set during enclave execution. Assumes no change to CS.L or CS.D.	FUP(CLIP), TIP(BLIP)
18	XBEGIN/XACQUIRE/XEND/XRELEASE	Does not begin/end transactional execution	None
19	XBEGIN/XACQUIRE	Assumes beginning of transactional execution	MODE.TSX(InTX=1, TXAbort=0), FUP(CLIP)
20	XEND/XRELEASE	Completes transaction	MODE.TSX(InTX=0, TXAbort=0), FUP(CLIP)
21	XABORT or Asynchronous Abort	Aborts transactional execution	MODE.TSX(InTX=0, TXAbort=1), FUP(CLIP), TIP(BLIP)
22	INIT	On BSP. Assumes no CR3, CS.D, or CS.L update.	FUP(NLIP), TIP(ResetLIP)
23	INIT	On AP, goes to wait-for-SIPI. Assumes no CR3 update.	FUP(NLIP)
24	SIPI	Assumes no CS.D or CS.L update	TIP.PGE(SIPI.LIP)
25	Wake from state deeper than C0.1, P-state change, or other scenario where timing packets (MTC, CYC) may have ceased.	TSC if TSCEn=1 TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR
26	UINTR	User interrupt handler entry.	FUP(NLIP)
27	UIRET	Exiting from user interrupt handler.	FUP(NLIP)

Table 33-56 illustrates the packets generated in example scenarios where the operation alters the value of PacketEn. Note that insertion of PSB+ is not included here, though it can be coincident with initial enabling of Intel PT. See Section 34.3.7 for details.

Table 33-56. Packet Generation with Operations That Alter the Value of PacketEn

Case	Operation	PktEn Before	PktEn After	CntxEn After	Details	Packets
1	WRMSR/XRSTORS that changes TraceEn 0 ⟶ 1	0	1	0	TSC if TSCEn=1; TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR, MODE.Exec
2	WRMSR/XRSTORS that changes TraceEn 0 ⟶ 1	0	1	1	TSC if TSCEn=1; TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR, MODE.Exec, TIP.PGE(NLIP)
3	WRMSR that changes TraceEn 1 ⟶ 0	1	0	D.C.		FUP(CLIP), TIP.PGD()
4	Taken Branch	1	0	1	Source is in IP filter region. Target is outside IP filter region.	TIP.PGD(BLIP)
5	Taken Branch, Interrupt, EEXIT, etc.	0	1	1	Source is outside IP filter region. Target is in IP filter region.	TIP.PGE(BLIP)
6	Far Branch, Interrupt, EENTER, etc.	1	0	0	Requires change to CPL or CR3, or entry to opt-out enclave.	TIP.PGD()

Table 33-56. Packet Generation with Operations That Alter the Value of PacketEn (Contd.)

Case	Operation	PktEn Before	PktEn After	CntxEn After	Details	Packets
7	Trap-like event (external interrupt, NMI, VM exit/entry, etc.)	1	0	0	Requires change to CPL or CR3.	FUP(NLIP), TIP.PGD()
8	Fault-like event (exception/fault, software interrupt, VM exit/entry, etc.)	1	0	0	Requires change to CPL or CR3.	FUP(CLIP), TIP.PGD()
9	SMI, VM exit/entry	1	0	0	TraceEn is cleared.	FUP(NLIP), TIP.PGD()
10	RSM, VM exit/entry	0	1	1	TraceEn is set.	See Case 2 for packets on enable. FUP/TIP.PGE IP is the BLIP.
11	VM Exit	1	0	0	Assumes guest-only tracing, see Section 34.5.2.2. TraceEn is cleared.	FUP(VMCSg.RIP), TIP.PGD()
12	VM entry	0	1	1	Assumes guest-only tracing, see Section 34.5.2.2. TraceEn is set.	TIP.PGE(VMCSg.RIP)

Table 33-57 illustrates examples of PTWRITE, assuming TriggerEn && PTWEn is true.

Table 33-57. Examples of PTWRITE when TriggerEn && PTWEn is True

Case	Operation	ContextEn	Details	Packets
1	MWAIT/UMWAIT gets fault or VM exit.	D.C.		None. Other trace sources may generate packets on fault or VM exit.
2	MWAIT/UMWAIT requests C0, or monitor not armed, or VMX virtual-interrupt delivery.	D.C.		None.
3	MWAIT/UMWAIT enters C-state deeper than C0.1.	0		PWRE(Cx), EXSTOP
4	MWAIT/UMWAIT enters C-state deeper than C0.1.	1		MWAIT(Cy), PWRE(Cx), EXSTOP(IP), FUP(CLIP)
5	HLT, Triple-fault shutdown, other operation that enters C1.	1		PWRE(C1), EXSTOP(IP), FUP(CLIP)
6	Hardware Duty Cycling (HDC).	1	TSC if TSCEn=1 TMA if TSCEn=MTCEn=1	PWRE(HW, C6), EXSTOP(IP), FUP(NLIP), TSC?, TMA?, CBR, PWRX(CC6, CC6, 0x8)
7	Wake event during Cx (x > 0).	D.C.	TSC if TSCEn=1 TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR, PWRX(LCC, DCC, 0x1) Other trace sources may generate packets for the wake operation (e.g., interrupt).

22	STI/CLI/POPF	1	1	Assumes a change to RFLAGS.IF.	MODE.Exec, FUP(NLIP)

34.8 SOFTWARE CONSIDERATIONS

34.8.1 Tracing SMM Code

Nothing prevents an SMM handler from configuring and enabling packet generation for its own use. As described in Section Section 34.2.9.3, SMI will always clear TraceEn, so the SMM handler would have to set TraceEn in order to enable tracing. There are some unique aspects and guidelines involved with tracing SMM code, which follow:

1. SMM should save away the existing values of any configuration MSRs that SMM intends to modify for tracing. This will allow the non-SMM tracing context to be restored before RSM.
2. It is recommended that SMM wait until it sets CSbase to 0 before enabling packet generation, to avoid possible LIP vs RIP confusion.
3. Packet output cannot be directed to SMRR memory, even while tracing in SMM.
4. Before performing RSM, SMM should take care to restore modified configuration MSRs to the values they had immediately after #SMI. This involves first disabling packet generation by clearing TraceEn, then restoring any other configuration MSRs that were modified.
5. RSM
   - Software must ensure that TraceEn=0 at the time of RSM. Tracing RSM is not a supported usage model, and the packets generated by RSM are undefined.
   - For processors on which Intel PT and LBR use are mutually exclusive (see Section 34.3.1.2), any RSM during which TraceEn is restored to 1 will suspend any LBR or BTS logging.

34.8.2 Cooperative Transition of Multiple Trace Collection Agents

A third-party trace-collection tool should take into consideration the fact that it may be deployed on a processor that supports Intel PT but may run under any operating system.

In such a deployment scenario, Intel recommends that tool agents follow similar principles of cooperative transition of single-use hardware resources, similar to how performance monitoring tools handle performance monitoring hardware:

- Respect the "in-use" ownership of an agent who already configured the trace configuration MSRs, see architectural MSRs with the prefix "IA32_RTIT_" in Chapter 2, "Model-Specific Registers (MSRs)," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4, where "in-use" can be determined by reading the "enable bits" in the configuration MSRs.
- Relinquish ownership of the trace configuration MSRs by clearing the "enabled bits" of those configuration MSRs.

34.8.3 Tracking Time

This section describes the relationships of several clock counters whose update frequencies reside in different domains that feed into the timing packets. To track time, the decoder also needs to know the regularity or irregularity of the occurrences of various timing packets that store those clock counters.

Intel PT provides time information for three different but related domains:

- Processor timestamp counter

  This counter increments at the max non-turbo or P1 frequency, and its value is returned on a RDTSC. Its frequency is fixed. The TSC packet holds the lower 7 bytes of the timestamp counter value. The TSC packet occurs occasionally and are much less frequent than the frequency of the time stamp counter. The timestamp counter will continue to increment when the processor is in deep C-States, with the exception of processors reporting CPUID.80000007H:EDX.InvariantTSC[bit 8] =0.
- Core crystal clock

  The ratio of the core crystal clock to timestamp counter frequency is known as P, and can be calculated as CPUID.15H:EBX[31:0] / CPUID.15H:EAX[31:0]. The frequency of the core crystal clock is fixed and lower than that of the timestamp counter. The periodic MTC packet is generated based on software-selected multiples of the crystal clock frequency. The MTC packet is expected to occur more frequently than the TSC packet.
- Processor core clock

  The processor core clock frequency can vary due to P-state and thermal conditions. The CYC packet provides elapsed time as measured in processor core clock cycles relative to the last CYC packet.

A decoder can use all or some combination of these packets to track time at different resolutions throughout the trace packets.

34.8.3.1 Time Domain Relationships

The three domains are related by the following formula:

```
TimeStampValue = (CoreCrystalClockValue * P) + AdjustedProcessorCycles + Software_Offset;
```

The CoreCrystalClockValue, also known as the Always Running Timer (ART) value, can provide the coarse-grained component of the TSC value. P, or the TSC/ART ratio, can be derived from CPUID leaf 15H, as described in Section 34.8.3.

The AdjustedProcessorCycles component provides the fine-grained distance from the rising edge of the last core crystal clock. Specifically, it is a cycle count in the same frequency as the timestamp counter from the last crystal clock rising edge. The value is adjusted based on the ratio of the processor core clock frequency to the Maximum Non-Turbo (or P1) frequency.

The Software_Offsets component includes software offsets that are factored into the timestamp value, such as IA32_TSC_ADJUST.

34.8.3.2 Estimating TSC within Intel PT

For many usages, it may be useful to have an estimated timestamp value for all points in the trace. The formula provided in Section 34.8.3.1 above provides the framework for how such an estimate can be calculated from the various timing packets present in the trace.

The TSC packet provides the precise timestamp value at the time it is generated; however, TSC packets are infrequent, and estimates of the current timestamp value based purely on TSC packets are likely to be very inaccurate for this reason. In order to get more precise timing information between TSC packets, CYC packets and/or MTC packets should be enabled.

MTC packets provide incremental updates of the CoreCrystalClockValue. On processors that support CPUID leaf 15H, the frequency of the timestamp counter and the core crystal clock is fixed, thus MTC packets provide a means to update the running timestamp estimate. Between two MTC packets A and B, the number of crystal clock cycles passed is calculated from the 8-bit payloads of respective MTC packets:

(CTC_B - CTC_A), where CTC_i = MTC_i[15:8] << IA32_RTIT_CTL.MTCFreq and i = A, B.

The time from a TSC packet to the subsequent MTC packet can be calculated using the TMA packet that follows the TSC packet. The TMA packet provides both the crystal clock value (lower 16 bits, in the CTC field) and the AdjustedProcessorCycles value (in the FastCounter field) that can be used in the calculation of the corresponding core crystal clock value of the TSC packet.

When the next MTC after a pair of TSC/TMA is seen, the number of crystal clocks passed since the TSC packet can be calculated by subtracting the TMA.CTC value from the time indicated by the MTC_{Next} packet by

CTC_{Delta}[15:0] = (CTC_{Next}[15:0] - TMA.CTC[15:0]), where CTC_{Next} = $MTC_{Payload}$ << IA32_RTIT_CTL.MTCFreq.

The TMA.FastCounter field provides the number of AdjustedProcessorCycles since the last crystal clock rising edge, from which it can be determined the percentage of the next crystal clock cycle that had passed at the time of the TSC packet.

CYC packets can provide further precision of an estimated timestamp value to many non-timing packets, by providing an indication of the time passed between other timing packets (MTCs or TSCs).

When enabled, CYC packets are sent preceding each CYC-eligible packet, and provide the number of processor core clock cycles that have passed since the last CYC packet. Thus between MTCs and TSCs, the accumulated CYC values can be used to estimate the AdjustedProcessorCycles component of the timestamp value. The accumulated CPU cycles will have to be adjusted to account for the difference in frequency between the processor core clock and the P1 frequency. The necessary adjustment can be estimated using the core:bus ratio value given in the CBR packet, by multiplying the accumulated cycle count value by $P1/CBR_{payload}$.

Note that stand-alone TSC packets (that is, TSC packets that are not a part of a PSB+) are typically generated only when generation of other timing packets (MTCs and CYCs) has ceased for a period of time. Example scenarios include when Intel PT is re-enabled, or on wake after a sleep state. Thus any calculated estimate of the timestamp value leading up to a TSC packet will likely result in a discrepancy, which the TSC packet serves to correct.

A greater level of precision may be achieved by calculating the CPU clock frequency, see Section 34.8.3.4 below for a method to do so using Intel PT packets.

CYCs can be used to estimate time between TSCs even without MTCs, though this will likely result in a reduction in estimated TSC precision.

34.8.3.3 VMX TSC Manipulation

When software executes in non-Root operation, additional offset and scaling factors may be applied to the TSC value. These are optional, but may be enabled via VMCS controls on a per-VM basis. See Chapter 27, "VMX Non-Root Operation," for details on VMX TSC offsetting and TSC scaling.

Like the value returned by RDTSC, TSC packets will include these adjustments, but other timing packets (such as MTC, CYC, and CBR) are not impacted. In order to use the algorithm above to estimate the TSC value when TSC scaling is in use, it will be necessary for software to account for the scaling factor. See Section 34.5.2.4 for details.

34.8.3.4 Calculating Frequency with Intel PT

Because Intel PT can provide both wall-clock time and processor clock cycle time, it can be used to measure the processor core clock frequency. Either TSC or MTC packets can be used to track the wall-clock time. By using CYC packets to count the number of processor core cycles that pass in between a pair of wall-clock time packets, the ratio between processor core clock frequency and TSC frequency can be derived. If the P1 frequency is known, it can be applied to determine the CPU frequency. See Section 34.8.3.1 above for details on the relationship between TSC, MTC, and CYC.

26. Updates to Appendix C, Volume 3D

Change bars and violet text show changes to Appendix C of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D:* System Programming Guide, Part 4.

Changes to this chapter:

- Added new exit reasons for the MSR-list instructions and updated WRMSRNS.

APPENDIX C
VMX BASIC EXIT REASONS

Every VM exit writes a 32-bit exit reason to the VMCS (see Section 26.9.1). Certain VM-entry failures also do this (see Section 28.8). The low 16 bits of the exit-reason field form the basic exit reason which provides basic information about the cause of the VM exit or VM-entry failure.

Table C-1 lists values for basic exit reasons and explains their meaning. Entries apply to VM exits, unless otherwise noted.

Table C-1. Basic Exit Reasons

Basic Exit Reason	Description
0	**Exception or non-maskable interrupt (NMI).** Either: 1: Guest software caused an exception and the bit in the exception bitmap associated with exception's vector was 1. This case includes executions of BOUND that cause #BR, executions of INT1 (they cause #DB), executions of INT3 (they cause #BP), executions of INTO that cause #OF, and executions of UD0, UD1, and UD2 (they cause #UD). 2: An NMI was delivered to the logical processor and the "NMI exiting" VM-execution control was 1.
1	**External interrupt.** An external interrupt arrived and the "external-interrupt exiting" VM-execution control was 1.
2	**Triple fault.** The logical processor encountered an exception while attempting to call the double-fault handler and that exception did not itself cause a VM exit due to the exception bitmap.
3	**INIT signal.** An INIT signal arrived
4	**Start-up IPI (SIPI).** A SIPI arrived while the logical processor was in the "wait-for-SIPI" state.
5	**I/O system-management interrupt (SMI).** An SMI arrived immediately after retirement of an I/O instruction and caused an SMM VM exit (see Section 33.15.2).
6	**Other SMI.** An SMI arrived and caused an SMM VM exit (see Section 33.15.2) but not immediately after retirement of an I/O instruction.
7	**Interrupt window.** At the beginning of an instruction, RFLAGS.IF was 1; events were not blocked by STI or by MOV SS; and the "interrupt-window exiting" VM-execution control was 1.
8	**NMI window.** At the beginning of an instruction, there was no virtual-NMI blocking; events were not blocked by MOV SS; and the "NMI-window exiting" VM-execution control was 1.
9	**Task switch.** Guest software attempted a task switch.
10	**CPUID.** Guest software attempted to execute CPUID.
11	**GETSEC.** Guest software attempted to execute GETSEC.
12	**HLT.** Guest software attempted to execute HLT and the "HLT exiting" VM-execution control was 1.
13	**INVD.** Guest software attempted to execute INVD.
14	**INVLPG.** Guest software attempted to execute INVLPG and the "INVLPG exiting" VM-execution control was 1.
15	**RDPMC.** Guest software attempted to execute RDPMC and the "RDPMC exiting" VM-execution control was 1.
16	**RDTSC.** Guest software attempted to execute RDTSC and the "RDTSC exiting" VM-execution control was 1.
17	**RSM.** Guest software attempted to execute RSM in SMM.
18	**VMCALL.** VMCALL was executed either by guest software (causing an ordinary VM exit) or by the executive monitor (causing an SMM VM exit; see Section 33.15.2).
19	**VMCLEAR.** Guest software attempted to execute VMCLEAR.
20	**VMLAUNCH.** Guest software attempted to execute VMLAUNCH.
21	**VMPTRLD.** Guest software attempted to execute VMPTRLD.
22	**VMPTRST.** Guest software attempted to execute VMPTRST.

Table C-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
23	**VMREAD.** Guest software attempted to execute VMREAD.
24	**VMRESUME.** Guest software attempted to execute VMRESUME.
25	**VMWRITE.** Guest software attempted to execute VMWRITE.
26	**VMXOFF.** Guest software attempted to execute VMXOFF.
27	**VMXON.** Guest software attempted to execute VMXON.
28	**Control-register accesses.** Guest software attempted to access CR0, CR3, CR4, or CR8 using CLTS, LMSW, or MOV CR and the VM-execution control fields indicate that a VM exit should occur (see Section 27.1 for details). This basic exit reason is not used for trap-like VM exits following executions of the MOV to CR8 instruction when the "use TPR shadow" VM-execution control is 1. Such VM exits instead use basic exit reason 43.
29	**MOV DR.** Guest software attempted a MOV to or from a debug register and the "MOV-DR exiting" VM-execution control was 1.
30	**I/O instruction.** Guest software attempted to execute an I/O instruction and either: 1: The "use I/O bitmaps" VM-execution control was 0 and the "unconditional I/O exiting" VM-execution control was 1. 2: The "use I/O bitmaps" VM-execution control was 1 and a bit in the I/O bitmap associated with one of the ports accessed by the I/O instruction was 1.
31	**RDMSR.** Guest software attempted to execute RDMSR and one of the following holds: ▪ The "use MSR bitmaps" VM-execution control was 0. ▪ The value of RCX is neither in the range 00000000H – 00001FFFH nor in the range C0000000H – C0001FFFH. ▪ The value of RCX is in the range 00000000H – 00001FFFH and the nth bit in read bitmap for low MSRs is 1, where n is the value of RCX. ▪ The value of RCX is in the range C0000000H – C0001FFFH and the nth bit in read bitmap for high MSRs is 1, where n is the value of RCX & 00001FFFH.
32	**WRMSR or WRMSRNS.** Guest software attempted to execute either WRMSR or WRMSRNS and either: 1: The "use MSR bitmaps" VM-execution control was 0. 2: The value of RCX is neither in the range 00000000H – 00001FFFH nor in the range C0000000H – C0001FFFH. 3: The value of RCX is in the range 00000000H – 00001FFFH and the nth bit in write bitmap for low MSRs is 1, where n is the value of RCX. 4: The value of RCX is in the range C0000000H – C0001FFFH and the nth bit in write bitmap for high MSRs is 1, where n is the value of RCX & 00001FFFH.
33	**VM-entry failure due to invalid guest state.** A VM entry failed one of the checks identified in Section 28.3.1.
34	**VM-entry failure due to MSR loading.** A VM entry failed in an attempt to load MSRs. See Section 28.4.
36	**MWAIT.** Guest software attempted to execute MWAIT and the "MWAIT exiting" VM-execution control was 1.
37	**Monitor trap flag.** A VM exit occurred due to the 1-setting of the "monitor trap flag" VM-execution control (see Section 27.5.2) or VM entry injected a pending MTF VM exit as part of VM entry (see Section 28.6.2).
39	**MONITOR.** Guest software attempted to execute MONITOR and the "MONITOR exiting" VM-execution control was 1.
40	**PAUSE.** Either guest software attempted to execute PAUSE and the "PAUSE exiting" VM-execution control was 1 or the "PAUSE-loop exiting" VM-execution control was 1 and guest software executed a PAUSE loop with execution time exceeding PLE_Window (see Section 27.1.3).
41	**VM-entry failure due to machine-check event.** A machine-check event occurred during VM entry (see Section 28.9).
43	**TPR below threshold.** The logical processor determined that the value of bits 7:4 of the byte at offset 080H on the virtual-APIC page was below that of the TPR threshold VM-execution control field while the "use TPR shadow" VM-execution control was 1 either as part of TPR virtualization (Section 31.1.2) or VM entry (Section 28.7.7).
44	**APIC access.** Guest software attempted to access memory at a physical address on the APIC-access page and the "virtualize APIC accesses" VM-execution control was 1 (see Section 31.4).
45	**Virtualized EOI.** EOI virtualization was performed for a virtual interrupt whose vector indexed a bit set in the EOI-exit bitmap.

Table C-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
46	**Access to GDTR or IDTR.** Guest software attempted to execute LGDT, LIDT, SGDT, or SIDT and the "descriptor-table exiting" VM-execution control was 1.
47	**Access to LDTR or TR.** Guest software attempted to execute LLDT, LTR, SLDT, or STR and the "descriptor-table exiting" VM-execution control was 1.
48	**EPT violation.** An attempt to access memory with a guest-physical address was disallowed by the configuration of the EPT paging structures.
49	**EPT misconfiguration.** An attempt to access memory with a guest-physical address encountered a misconfigured EPT paging-structure entry.
50	**INVEPT.** Guest software attempted to execute INVEPT.
51	**RDTSCP.** Guest software attempted to execute RDTSCP and the "enable RDTSCP" and "RDTSC exiting" VM-execution controls were both 1.
52	**VMX-preemption timer expired.** The preemption timer counted down to zero.
53	**INVVPID.** Guest software attempted to execute INVVPID.
54	**WBINVD or WBNOINVD.** Guest software attempted to execute WBINVD or WBNOINVD and the "WBINVD exiting" VM-execution control was 1.
55	**XSETBV.** Guest software attempted to execute XSETBV.
56	**APIC write.** Guest software completed a write to the virtual-APIC page that must be virtualized by VMM software (see Section 31.4.3.3).
57	**RDRAND.** Guest software attempted to execute RDRAND and the "RDRAND exiting" VM-execution control was 1.
58	**INVPCID.** Guest software attempted to execute INVPCID and the "enable INVPCID" and "INVLPG exiting" VM-execution controls were both 1.
59	**VMFUNC.** Guest software invoked a VM function with the VMFUNC instruction and the VM function either was not enabled or generated a function-specific condition causing a VM exit.
60	**ENCLS.** Guest software attempted to execute ENCLS, "enable ENCLS exiting" VM-execution control was 1, and either (1) EAX < 63 and the corresponding bit in the ENCLS-exiting bitmap is 1; or (2) EAX ? 63 and bit 63 in the ENCLS-exiting bitmap is 1.
61	**RDSEED.** Guest software attempted to execute RDSEED and the "RDSEED exiting" VM-execution control was 1.
62	**Page-modification log full.** The processor attempted to create a page-modification log entry and the value of the PML index was not in the range 0–511.
63	**XSAVES.** Guest software attempted to execute XSAVES, the "enable XSAVES/XRSTORS" was 1, and a bit was set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap.
64	**XRSTORS.** Guest software attempted to execute XRSTORS, the "enable XSAVES/XRSTORS" was 1, and a bit was set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap.
65	**PCONFIG.** Guest software attempted to execute PCONFIG, "enable PCONFIG" VM-execution control was 1, and either (1) EAX < 63 and the corresponding bit in the PCONFIG-exiting bitmap is 1; or (2) EAX ? 63 and bit 63 in the PCONFIG-exiting bitmap is 1.
66	**SPP-related event.** The processor attempted to determine an access's sub-page write permission and encountered an SPP miss or an SPP misconfiguration. See Section 30.3.4.2.
67	**UMWAIT.** Guest software attempted to execute UMWAIT and the "enable user wait and pause" and "RDTSC exiting" VM-execution controls were both 1.
68	**TPAUSE.** Guest software attempted to execute TPAUSE and the "enable user wait and pause" and "RDTSC exiting" VM-execution controls were both 1.
69	**LOADIWKEY.** Guest software attempted to execute LOADIWKEY and the "LOADIWKEY exiting" VM-execution control was 1.

Table C-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
70	**ENCLV.** Guest software attempted to execute ENCLV, the "enable ENCLV exiting" VM-execution control was 1, and either (1) EAX < 63 and the corresponding bit in the ENCLV-exiting bitmap is 1; or (2) EAX ? 63 and bit 63 in the ENCLV-exiting bitmap is 1.
72	**ENQCMD PASID translation failure.** A VM exit occurred during PASID translation because the present bit was clear in a PASID-directory entry, the valid bit was clear in a PASID-table entry, or one of the entries set a reserved bit.
73	**ENQCMDS PASID translation failure.** A VM exit occurred during PASID translation because the present bit was clear in a PASID-directory entry, the valid bit was clear in a PASID-table entry, or one of the entries set a reserved bit.
74	**Bus lock.** The processor asserted a bus lock while the "bus-lock detection" VM-execution control was 1. (Such VM exits will also set bit 26 of the exit-reason field.)
75	**Instruction timeout.** The "instruction timeout" VM-execution control was 1 and certain operations prevented the processor from reaching an instruction boundary within the amount of time specified by the instruction-timeout control.
76	**SEAMCALL.** Guest software attempted to execute SEAMCALL.[1]
77	**TDCALL.** Guest software attempted to execute TDCALL.[1]
78	**RDMSRLIST.** Guest software attempted to execute RDMSRLIST and either the "use MSR bitmaps" VM-execution control was 0 or any of the following holds for the index an MSR being accessed: ▪ The index is neither in the range 00000000H – 00001FFFH nor in the range C0000000H – C0001FFFH. ▪ The index is in the range 00000000H – 00001FFFH and the nth bit in read bitmap for low MSRs is 1, where *n* is the index. ▪ The index is in the range C0000000H – C0001FFFH and the nth bit in read bitmap for high MSRs is 1, where *n* is the logical AND of the index and the value 00001FFFH.
79	**WRMSRLIST.** Guest software attempted to execute WRMSRLIST and either the "use MSR bitmaps" VM-execution control was 0 or any of the following holds for the index an MSR being accessed: ▪ The index is neither in the range 00000000H – 00001FFFH nor in the range C0000000H – C0001FFFH. ▪ The index is in the range 00000000H – 00001FFFH and the nth bit in write bitmap for low MSRs is 1, where *n* is the index. ▪ The index is in the range C0000000H – C0001FFFH and the nth bit in write bitmap for high MSRs is 1, where *n* is the logical AND of the index and the value 00001FFFH.

NOTES:

1. For more information on the SEAMCALL and TDCALL instructions, refer to the "Intel® Trust Domain CPU Architectural Extensions Specification," available here: https://cdrdv2.intel.com/v1/dl/getContent/733582.

27. Updates to Chapter 2, Volume 4

Change bars and violet text show changes to Chapter 2 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4:* Model-Specific Registers.

Changes to this chapter:

- Added the CPUID signature values of DisplayFamily and DisplayModel to Table 2-1 for the following processors:
  - Intel® Xeon® 6 P-core processors.
  - Intel® Xeon® 6 E-core processors.
  - Intel® Series 2 Core™ Ultra processors.
- Removed the IA32_PERF_GLOBAL_OVF_CTRL MSR (address 390H) from Table 2-2, "Architectural MSRs." This MSR is a misnamed duplicate of the IA32_PERF_GLOBAL_STATUS_RESET MSR (address 390H).
- Added the following architectural MSRs:
  - IA32_BARRIER (address 2FH)
  - IA32_MCU_ENUMERATION (address 7BH)
  - IA32_MCU_STATUS (address 7CH)
  - IA32_FZM_RANGE_INDEX (address 82H)
  - IA32_FZM_DOMAIN_CONFIG (address 83H)
  - IA32_FZM_RANGE_STARTADDR (address 84H)
  - IA32_FZM_RANGE_ENDADDR (address 85H)
  - IA32_FZM_RANGE_WRITESTATUS (address 86H)
  - IA32_MKTME_KEYID_PARTITIONING (address 87H)
  - IA32_SGXLEPUBKEYHASH4 (address 90H)
  - IA32_SGXLEPUBKEYHASH5 (address 91H)
  - IA32_PMC8 (address C9H)
  - IA32_PMC9 (address CAH)
  - IA32_PERFEVTSEL8 (address 18EH)
  - IA32_PERFEVTSEL9 (address 18FH)
  - IA32_INTEGRITY_STATUS (address 2DCH)
  - IA32_FIXED_CTR3 (address 30CH)
  - IA32_FIXED_CTR4 (address 30DH)
  - IA32_FIXED_CTR5 (address 30EH)
  - IA32_FIXED_CTR6 (address 30FH)
  - IA32_A_PMC8 (address 4C9H)
  - IA32_A_PMC9 (address 4CAH)
  - IA32_MCU_EXT_SERVICE (address 7A3H)
  - IA32_MCU_ROLLBACK_MIN_ID (address 7A4H)
  - IA32_MCU_STAGING_MBOX_ADDR (address 7A5H)
  - IA32_ROLLBACK_SIGN_ID_0 (address 7B0H)
  - IA32_ROLLBACK_SIGN_ID_1 (address 7B1H)
  - IA32_ROLLBACK_SIGN_ID_2 (address 7B2H)
  - IA32_ROLLBACK_SIGN_ID_3 (address 7B3H)
  - IA32_ROLLBACK_SIGN_ID_4 (address 7B4H)
  - IA32_ROLLBACK_SIGN_ID_5 (address 7B5H)
  - IA32_ROLLBACK_SIGN_ID_6 (address 7B6H)
  - IA32_ROLLBACK_SIGN_ID_7 (address 7B7H)

— IA32_ROLLBACK_SIGN_ID_8 (address 7B8H)
— IA32_ROLLBACK_SIGN_ID_9 (address 7B9H)
— IA32_ROLLBACK_SIGN_ID_10 (address 7BAH)
— IA32_ROLLBACK_SIGN_ID_11 (address 7BBH)
— IA32_ROLLBACK_SIGN_ID_12 (address 7BCH)
— IA32_ROLLBACK_SIGN_ID_13 (address 7BDH)
— IA32_ROLLBACK_SIGN_ID_14 (address 7BEH)
— IA32_ROLLBACK_SIGN_ID_15 (address 7BFH)
— IA32_RESOURCE_PRIORITY (address C88H)
— IA32_RESOURCE_PRIORITY_PKG (address C89H)
— IA32_L2_MASK_8 (address D18H)
— IA32_L2_MASK_9 (address D19H)
— IA32_L2_MASK_10 (address D1AH)
— IA32_L2_MASK_11 (address D1BH)
— IA32_L2_MASK_12 (address D1CH)
— IA32_L2_MASK_13 (address D1DH)
— IA32_L2_MASK_14 (address D1EH)
— IA32_L2_MASK_15 (address D1FH)
— IA32_L2_QOS_EXT_BW_THRTL_0 (address D50H)
— IA32_L2_QOS_EXT_BW_THRTL_1 (address D51H)
— IA32_L2_QOS_EXT_BW_THRTL_2 (address D52H)
— IA32_L2_QOS_EXT_BW_THRTL_3 (address D53H)
— IA32_L2_QOS_EXT_BW_THRTL_4 (address D54H)
— IA32_L2_QOS_EXT_BW_THRTL_5 (address D55H)
— IA32_L2_QOS_EXT_BW_THRTL_6 (address D56H)
— IA32_L2_QOS_EXT_BW_THRTL_7 (address D57H)
— IA32_L2_QOS_EXT_BW_THRTL_8 (address D58H)
— IA32_L2_QOS_EXT_BW_THRTL_9 (address D59H)
— IA32_L2_QOS_EXT_BW_THRTL_10 (address D5AH)
— IA32_L2_QOS_EXT_BW_THRTL_11 (address D5BH)
— IA32_L2_QOS_EXT_BW_THRTL_12 (address D5CH)
— IA32_L2_QOS_EXT_BW_THRTL_13 (address D5DH)
— IA32_L2_QOS_EXT_BW_THRTL_14 (address D5EH)
— IA32_QOS_CORE_BW_THRTL_0 (address E00H)
— IA32_QOS_CORE_BW_THRTL_1 (address E01H)
— IA32_SEAMRR_BASE (address 1400H)
— IA32_SEAMRR_MASK (address 1401H)
— IA32_PMC_GP0_CTR (address 1900H)
— IA32_PMC_GP0_CFG_A (address 1901H)
— IA32_PMC_GP0_CFG_C (address 1903H)
— IA32_PMC_GP1_CTR (address 1904H)
— IA32_PMC_GP1_CFG_A (address 1905H)
— IA32_PMC_GP1_CFG_C (address 1907H)
— IA32_PMC_GP2_CTR (address 1908H)
— IA32_PMC_GP2_CFG_A (address 1909H)
— IA32_PMC_GP2_CFG_B (address 190AH)

  - IA32_PMC_GP2_CFG_C (address 190BH)
  - IA32_PMC_GP3_CTR (address 190CH)
  - IA32_PMC_GP3_CFG_A (address 190DH)
  - IA32_PMC_GP3_CFG_B (address 190EH)
  - IA32_PMC_GP3_CFG_C (address 190FH)
  - IA32_PMC_GP4_CTR (address 1910H)
  - IA32_PMC_GP4_CFG_A (address 1911H)
  - IA32_PMC_GP4_CFG_B (address 1912H)
  - IA32_PMC_GP4_CFG_C (address 1913H)
  - IA32_PMC_GP5_CTR (address 1914H)
  - IA32_PMC_GP5_CFG_A (address 1915H)
  - IA32_PMC_GP5_CFG_B (address 1916H)
  - IA32_PMC_GP5_CFG_C (address 1917H)
  - IA32_PMC_GP6_CTR (address 1918H)
  - IA32_PMC_GP6_CFG_A (address 1919H)
  - IA32_PMC_GP6_CFG_B (address 191AH)
  - IA32_PMC_GP6_CFG_C (address 191BH)
  - IA32_PMC_GP7_CTR (address 191CH)
  - IA32_PMC_GP7_CFG_A (address 191DH)
  - IA32_PMC_GP7_CFG_B (address 191EH)
  - IA32_PMC_GP7_CFG_C (address 191FH)
  - IA32_PMC_GP8_CTR (address 1920H)
  - IA32_PMC_GP8_CFG_A (address 1921H)
  - IA32_PMC_GP9_CTR (address 1924H)
  - IA32_PMC_GP9_CFG_A (address 1925H)
  - IA32_PMC_FX0_CTR (address 1980H)
  - IA32_PMC_FX0_CFG_B (address 1982H)
  - IA32_PMC_FX0_CFG_C (address 1983H)
  - IA32_PMC_FX1_CTR (address 1984H)
  - IA32_PMC_FX1_CFG_B (address 1986H)
  - IA32_PMC_FX1_CFG_C (address 1987H)
  - IA32_PMC_FX2_CTR (address 1988H)
  - IA32_PMC_FX2_CFG_C (address 198BH)
  - IA32_PMC_FX3_CTR (address 198CH)
  - IA32_PMC_FX4_CTR (address 1990H)
  - IA32_PMC_FX4_CFG_C (address 1993H)
  - IA32_PMC_FX5_CTR (address 1994H)
  - IA32_PMC_FX5_CFG_C (address 1997H)
  - IA32_PMC_FX6_CTR (address 1998H)
  - IA32_PMC_FX6_CFG_C (address 199BH)
- Updated the following architectural MSRs:
  - IA32_FEATURE_ACTIVATION (address 7AH): added the definition for bit 0.
  - IA32_ARCH_CAPABILITIES (address 10AH): added the definitions for bit 16 and bit 22.
  - IA32_MISC_ENABLE MSR (address 1A0H): updated the definition for bit 22.
  - IA32_PERF_GLOBAL_INUSE MSR (address 392H): added support for more than three fixed counters.
  - IA32_MCG_EXT_CTL (address 4D0H): added the definition for bit 0.

  — IA32_TSC_DEADLINE (address 6E0H): added the definition.
- Added Section 2.17.10, “MSRs Introduced in the Intel® Xeon® 6 P-Core Processors.”
- Added Section 2.17.11, “MSRs Introduced in the Intel® Xeon® 6 E-Core Processors.”
- Added Section 2.17.12, “MSRs Introduced in the Intel® Series 2 Core™ Ultra Processor Supporting Performance Hybrid Architecture.”
- Typo corrections as needed.

CHAPTER 2
MODEL-SPECIFIC REGISTERS (MSRS)

This chapter lists MSRs across Intel processor families. All MSRs listed can be read with the RDMSR and written with the WRMSR instructions. The scope of an MSR defines the set of processors that access the same MSR with RDMSR and WRMSR. Thread-scope MSRs are unique to every logical processor. Core-scope MSRs are shared by the threads in the same core; similarly for module-scope, die-scope, and package-scope.

When a processor package contains a single die, die-scope and package-scope are synonymous. When a package contains multiple die, they are distinct.

NOTE

For information on hierarchical level types supported, refer to the CPUID Leaf 1FH definition for the actual level type numbers: "V2 Extended Topology Enumeration Leaf" in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A. Also see Section 10.9.1, "Hierarchical Mapping of Shared Resources," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

Register addresses are given in both hexadecimal and decimal. The register name is the mnemonic register name and the bit description describes individual bits in registers.

Model specific registers and its bit-fields may be supported for a finite range of processor families/models. To distinguish between different processor family and/or models, software must use CPUID.01H leaf function to query the combination of DisplayFamily and DisplayModel to determine model-specific availability of MSRs (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-L," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A). Table 2-1 lists the signature values of DisplayFamily and DisplayModel for various processor families or processor number series.

Table 2-1. CPUID Signature Values of DisplayFamily_DisplayModel

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_BDH	Intel® Series 2 Core™ Ultra processors supporting Lunar Lake performance hybrid architecture
06_ADH, 06_AEH	Intel® Xeon® 6 P-core processors based on Granite Rapids microarchitecture
06_AFH	Intel® Xeon® 6 E-core processors based on Sierra Forest microarchitecture
06_AAH	Intel® Core™ Ultra 7 processors supporting Meteor Lake performance hybrid architecture
06_CFH	5th generation Intel® Xeon® Scalable Processor Family based on Emerald Rapids microarchitecture
06_8FH	4th generation Intel® Xeon® Scalable Processor Family based on Sapphire Rapids microarchitecture
06_BAH, 06_B7H, 06_BFH	13th generation Intel® Core™ processors supporting Raptor Lake performance hybrid architecture
06_97H, 06_9AH	12th generation Intel® Core™ processors supporting Alder Lake performance hybrid architecture
06_8CH, 06_8DH	11th generation Intel® Core™ processors based on Tiger Lake microarchitecture
06_A7H	11th generation Intel® Core™ processors based on Rocket Lake microarchitecture
06_7DH, 06_7EH	10th generation Intel® Core™ processors based on Ice Lake microarchitecture
06_A5H, 06_A6H	10th generation Intel® Core™ processors based on Comet Lake microarchitecture
06_66H	Intel® Core™ processors based on Cannon Lake microarchitecture
06_8EH, 06_9EH	7th generation Intel® Core™ processors based on Kaby Lake microarchitecture, 8th and 9th generation Intel® Core™ processors based on Coffee Lake microarchitecture, Intel® Xeon® E processors based on Coffee Lake microarchitecture
06_6AH, 06_6CH	3rd generation Intel® Xeon® Scalable Processor Family based on Ice Lake microarchitecture

Table 2-1. CPUID Signature Values of DisplayFamily_DisplayModel (Contd.)

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_55H	Intel® Xeon® Scalable Processor Family based on Skylake microarchitecture, 2nd generation Intel® Xeon® Scalable Processor Family based on Cascade Lake product, and 3rd generation Intel® Xeon® Scalable Processor Family based on Cooper Lake product
06_4EH, 06_5EH	6th generation Intel Core processors and Intel Xeon processor E3-1500m v5 product family and E3-1200 v5 product family based on Skylake microarchitecture
06_85H	Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series based on Knights Mill microarchitecture
06_57H	Intel® Xeon Phi™ Processor 3200, 5200, 7200 Series based on Knights Landing microarchitecture
06_56H	Intel Xeon processor D-1500 product family based on Broadwell microarchitecture
06_4FH	Intel Xeon processor E5 v4 Family based on Broadwell microarchitecture, Intel Xeon processor E7 v4 Family, Intel Core i7-69xx Processor Extreme Edition
06_47H	5th generation Intel Core processors, Intel Xeon processor E3-1200 v4 product family based on Broadwell microarchitecture
06_3DH	Intel Core M-5xxx Processor, 5th generation Intel Core processors based on Broadwell microarchitecture
06_3FH	Intel Xeon processor E5-4600/2600/1600 v3 product families, Intel Xeon processor E7 v3 product families based on Haswell-E microarchitecture, Intel Core i7-59xx Processor Extreme Edition
06_3CH, 06_45H, 06_46H	4th Generation Intel Core processor and Intel Xeon processor E3-1200 v3 product family based on Haswell microarchitecture
06_3EH	Intel Xeon processor E7-8800/4800/2800 v2 product families based on Ivy Bridge-E microarchitecture
06_3EH	Intel Xeon processor E5-2600/1600 v2 product families and Intel Xeon processor E5-2400 v2 product family based on Ivy Bridge-E microarchitecture, Intel Core i7-49xx Processor Extreme Edition
06_3AH	3rd Generation Intel Core Processor and Intel Xeon processor E3-1200 v2 product family based on Ivy Bridge microarchitecture
06_2DH	Intel Xeon processor E5 Family based on Sandy Bridge microarchitecture, Intel Core i7-39xx Processor Extreme Edition
06_2FH	Intel Xeon Processor E7 Family
06_2AH	Intel Xeon processor E3-1200 product family; 2nd Generation Intel Core i7, i5, i3 Processors 2xxx Series
06_2EH	Intel Xeon processor 7500, 6500 series
06_25H, 06_2CH	Intel Xeon processors 3600, 5600 series, Intel Core i7, i5, and i3 Processors
06_1EH, 06_1FH	Intel Core i7 and i5 Processors
06_1AH	Intel Core i7 Processor, Intel Xeon processor 3400, 3500, 5500 series
06_1DH	Intel Xeon processor MP 7400 series
06_17H	Intel Xeon processor 3100, 3300, 5200, 5400 series, Intel Core 2 Quad processors 8000, 9000 series
06_0FH	Intel Xeon processor 3000, 3200, 5100, 5300, 7300 series, Intel Core 2 Quad processor 6000 series, Intel Core 2 Extreme 6000 series, Intel Core 2 Duo 4000, 5000, 6000, 7000 series processors, Intel Pentium dual-core processors
06_0EH	Intel Core Duo, Intel Core Solo processors
06_0DH	Intel Pentium M processor
06_86H, 06_96H, 06_9CH	Intel Atom® processors, Intel® Celeron® processors, Intel® Pentium® processors, and Intel® Pentium® Silver processors based on Tremont Microarchitecture
06_7AH	Intel Atom processors based on Goldmont Plus microarchitecture
06_5FH	Intel Atom processors based on Goldmont microarchitecture (Denverton)
06_5CH	Intel Atom processors based on Goldmont microarchitecture

Table 2-1. CPUID Signature Values of DisplayFamily_DisplayModel (Contd.)

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_4CH	Intel Atom processor X7-Z8000 and X5-Z8000 series based on Airmont microarchitecture
06_5DH	Intel Atom processor X3-C3000 based on Silvermont microarchitecture
06_5AH	Intel Atom processor Z3500 series
06_4AH	Intel Atom processor Z3400 series
06_37H	Intel Atom processor E3000 series, Z3600 series, Z3700 series
06_4DH	Intel Atom processor C2000 series
06_36H	Intel Atom processor S1000 Series
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	Intel Atom processor family, Intel Atom processor D2000, N2000, E2000, Z2000, C1000 series
0F_06H	Intel Xeon processor 7100, 5000 Series, Intel Xeon Processor MP, Intel Pentium 4, Pentium D processors
0F_03H, 0F_04H	Intel Xeon processor, Intel Xeon processor MP, Intel Pentium 4, Pentium D processors
06_09H	Intel Pentium M processor
0F_02H	Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors
0F_0H, 0F_01H	Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors
06_7H, 06_08H, 06_0AH, 06_0BH	Intel Pentium III Xeon processor, Intel Pentium III processor
06_03H, 06_05H	Intel Pentium II Xeon processor, Intel Pentium II processor
06_01H	Intel Pentium Pro processor
05_01H, 05_02H, 05_04H	Intel Pentium processor, Intel Pentium processor with MMX Technology

The Intel® Quark™ SoC X1000 processor can be identified by the signature of DisplayFamily_DisplayModel = 05_09H and SteppingID = 0

2.1 ARCHITECTURAL MSRS

Many MSRs have carried over from one generation of IA-32 processors to the next and to Intel 64 processors. A subset of MSRs and associated bit fields, which do not change on future processor generations, are now considered architectural MSRs. For historical reasons (beginning with the Pentium 4 processor), these "architectural MSRs" were given the prefix "IA32_". Table 2-2 lists the architectural MSRs, their addresses, their current names, their names in previous IA-32 processors, and bit fields that are considered architectural. MSR addresses outside Table 2-2 and certain bit fields in an MSR address that may overlap with architectural MSR addresses are model-specific. Code that accesses a model-specific MSR and that is executed on a processor that does not support that MSR will generate an exception.

Architectural MSR or individual bit fields in an architectural MSR may be introduced or transitioned at the granularity of certain processor family/model or the presence of certain CPUID feature flags. The right-most column of Table 2-2 provides information on the introduction of each architectural MSR or its individual fields. This information is expressed either as signature values of "DF_DM" (see Table 2-1) or via CPUID flags.

Certain bit field position may be related to the maximum physical address width, the value of which is expressed as "MAXPHYADDR" in Table 2-2. "MAXPHYADDR" is reported by CPUID.8000_0008H leaf.

MSR address range between 40000000H - 4000FFFFH is marked as a specially reserved range. All existing and future processors will not implement any features using any MSR in this range.

Table 2-2. IA-32 Architectural MSRs

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
Register Address: 0H, 0	IA32_P5_MC_ADDR (P5_MC_ADDR)	
See Section 2.23, "MSRs in Pentium Processors."		Pentium Processor (05_01H)
Register Address: 1H, 1	IA32_P5_MC_TYPE (P5_MC_TYPE)	
See Section 2.23, "MSRs in Pentium Processors."		DF_DM = 05_01H
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination."		0F_03H
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER (TSC)	
See Section 19.17, "Time-Stamp Counter."		05_01H
Register Address: 17H, 23	IA32_PLATFORM_ID (MSR_PLATFORM_ID)	
Platform ID (R/O) The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.		06_01H
49:0	Reserved.	
52:50	Platform ID (R/O) Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7	
63:53	Reserved.	
Register Address: 1BH, 27	IA32_APIC_BASE (APIC_BASE)	
This register holds the APIC base address, permitting the relocation of the APIC memory map. See Section 12.4.4, "Local APIC Status and Location," and Section 12.4.5, "Relocating the Local APIC Registers."		06_01H
7:0	Reserved.	
8	BSP Flag (R/W)	
9	Reserved.	
10	Enable x2APIC mode.	06_1AH
11	APIC Global Enable (R/W)	
(MAXPHYADDR -1):12	APIC Base (R/W)	
63: MAXPHYADDR	Reserved.	
Register Address: 2FH, 47	IA32_BARRIER	
IA32_BARRIER (R/O) The IA32_BARRIER MSR ensures ordered execution by acting like LFENCE, controlling the sequencing of subsequent MSR reads after prior MSR reads and instructions.		CPUID.07H.01H:EAX[27]=1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
31:0	DATA Reserved. Always 0.	
63:32	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W)		If any one enumeration condition for defined bit field holds.
0	Lock bit (R/WO): (1 = locked). When set, locks this MSR from being written; writes to this bit will result in GP(0). Note: Once the Lock bit is set, the contents of this register cannot be modified. Therefore the lock bit must be set after configuring support for Intel Virtualization Technology and prior to transferring control to an option ROM or the OS. Hence, once the Lock bit is set, the entire IA32_FEATURE_CONTROL contents are preserved across RESET when PWRGOOD is not deasserted.	If any one enumeration condition for defined bit field position greater than bit 0 holds.
1	Enable VMX inside SMX operation (R/WL) This bit enables a system executive to use VMX in conjunction with SMX to support Intel® Trusted Execution Technology. BIOS must set this bit only when the CPUID function 1 returns VMX feature flag and SMX feature flag set (ECX bits 5 and 6 respectively).	If CPUID.01H:ECX[5] = 1 && CPUID.01H:ECX[6] = 1
2	Enable VMX outside SMX operation (R/WL) This bit enables VMX for a system executive that does not require SMX. BIOS must set this bit only when the CPUID function 1 returns the VMX feature flag set (ECX bit 5).	If CPUID.01H:ECX[5] = 1
7:3	Reserved.	
14:8	SENTER Local Function Enables (R/WL) When set, each bit in the field represents an enable control for a corresponding SENTER function. This field is supported only if CPUID.1:ECX.[bit 6] is set.	If CPUID.01H:ECX[6] = 1
15	SENTER Global Enable (R/WL) This bit must be set to enable SENTER leaf functions. This bit is supported only if CPUID.1:ECX.[bit 6] is set.	If CPUID.01H:ECX[6] = 1
16	Reserved.	
17	SGX Launch Control Enable (R/WL) This bit must be set to enable runtime re-configuration of SGX Launch Control via the IA32_SGXLEPUBKEYHASHn MSR.	If CPUID.(EAX=07H, ECX=0H): ECX[30] = 1
18	SGX Global Enable (R/WL) This bit must be set to enable SGX leaf functions.	If CPUID.(EAX=07H, ECX=0H): EBX[2] = 1
19	Reserved.	
20	LMCE On (R/WL) When set, system software can program the MSRs associated with LMCE to configure delivery of some machine check exceptions to a single logical processor.	If IA32_MCG_CAP[27] = 1
63:21	Reserved.	
Register Address: 3BH, 59	IA32_TSC_ADJUST	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
Per Logical Processor TSC Adjust (R/Write to clear)		If CPUID.(EAX=07H, ECX=0H): EBX[1] = 1
63:0	THREAD_ADJUST Local offset value of the IA32_TSC for a logical processor. Reset value is zero. A write to IA32_TSC will modify the local offset in IA32_TSC_ADJUST and the content of IA32_TSC, but does not affect the internal invariant TSC hardware.	
Register Address: 48H, 72	IA32_SPEC_CTRL	
Speculation Control (R/W) The MSR bits are defined as logical processor scope. On some core implementations, the bits may impact sibling logical processors on the same core. This MSR has a value of 0 after reset and is unaffected by INIT# or SIPI#.		If any one of the enumeration conditions for defined bit field positions holds.
0	Indirect Branch Restricted Speculation (IBRS). Restricts speculation of indirect branch.	If CPUID.(EAX=07H, ECX=0):EDX[26]=1
1	Single Thread Indirect Branch Predictors (STIBP). Prevents indirect branch predictions on all logical processors on the core from being controlled by any sibling logical processor in the same core.	If CPUID.(EAX=07H, ECX=0):EDX[27]=1
2	Speculative Store Bypass Disable (SSBD) delays speculative execution of a load until the addresses for all older stores are known.	If CPUID.(EAX=07H, ECX=0):EDX[31]=1
3	IPRED_DIS_U If 1, enables IPRED_DIS control for CPL3.	If CPUID.(EAX=07H, ECX=2):EDX[1]=1
4	IPRED_DIS_S If 1, enables IPRED_DIS control for CPL0/1/2.	If CPUID.(EAX=07H, ECX=2):EDX[1]=1
5	RRSBA_DIS_U If 1, disables RRSBA behavior for CPL3.	If CPUID.(EAX=07H, ECX=2):EDX[2]=1
6	RRSBA_DIS_S If 1, disables RRSBA behavior for CPL0/1/2.	If CPUID.(EAX=07H, ECX=2):EDX[2]=1
7	PSFD If 1, disables Fast Store Forwarding Predictor. Note that setting bit 2 (SSBD) also disables this.	If CPUID.(EAX=07H, ECX=2):EDX[0]=1
8	DDPD_U If 1, disables the Data Dependent Prefetcher that examines data values in memory while CPL = 3. Note that setting bit 2 (SSBD) also disables this.	If CPUID.(EAX=07H, ECX=2):EDX[3]=1
9	Reserved.	
10	BHI_DIS_S When '1, enables BHI_DIS_S behavior.	If CPUID.(EAX=07H, ECX=2):EDX[4]=1
63:11	Reserved.	
Register Address: 49H, 73	IA32_PRED_CMD	
Prediction Command (WO) Gives software a way to issue commands that affect the state of predictors.		If any one of the enumeration conditions for defined bit field positions holds.

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
0	Indirect Branch Prediction Barrier (IBPB)	If CPUID.(EAX=07H, ECX=0):EDX[26]=1
63:1	Reserved.	
Register Address: 4EH, 78	IA32_PPIN_CTL	
Protected Processor Inventory Number Enable Control (R/W)		If CPUID.(EAX=07H, ECX=01H):EBX[0]=1[1]
0	LockOut (R/WO) If 0, indicates that further writes to IA32_PPIN_CTL is allowed. If 1, indicates that further writes to IA32_PPIN_CTL is disallowed. Writing 1 to this bit is only permitted if the Enable_PPIN bit is clear. The Privileged System Software Inventory Agent should read IA32_PPIN_CTL[bit 1] to determine if IA32_PPIN is accessible. The Privileged System Software Inventory Agent is not expected to write to this MSR.	
1	Enable_PPIN (R/W) If 1, indicates that IA32_PPIN is accessible using RDMSR. If 0, indicates that IA32_PPIN is inaccessible using RDMSR. Any attempt to read IA32_PPIN will cause #GP.	
63:2	Reserved.	
Register Address: 4FH, 79	IA32_PPIN	
Protected Processor Inventory Number (R/O)		If CPUID.(EAX=07H, ECX=01H):EBX[0]=1[1]
63:0	Protected Processor Inventory Number (R/O) A unique value within a given CPUID family/model/stepping signature that a privileged inventory initialization agent can access to identify each physical processor, when access to IA32_PPIN is enabled. Access to IA32_PPIN is permitted only if IA32_PPIN_CTL[bits 1:0] = '10b'.	
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG (BIOS_UPDT_TRIG)	
BIOS Update Trigger (W) Executing a WRMSR instruction to this MSR causes a microcode update to be loaded into the processor. See Section 11.11.6, "Microcode Update Loader." A processor may prevent writing to this MSR when loading guest states on VM entries or saving guest states on VM exits.		06_01H
Register Address: 7AH, 122	IA32_FEATURE_ACTIVATION	
Feature Activation (R/W) Implements Feature Activation command. WRMSR to this address activates all 'activatable' features on this thread.		
0	SE Secure Enclaves feature activation.	
1	KL Keylocker feature activation.	
63:2	Reserved.	
Register Address: 7BH, 123	IA32_MCU_ENUMERATION	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
IA32_MCU_ENUMERATION (R/O) Enumeration of architectural features.		
0	UNIFORM_MCU_AVAIL When set to 1, uniform microcode update is available, and UNIFORM_MCU_SCOPE (bits [10:8]) indicates the scope of writes to IA32_BIOS_UPDT_TRIG. When set to 0, uniform microcode update is not available, and writes to IA32_BIOS_UPDT_TRIG are core scoped.	
1	UNIFORM_MCU_CONFIG_REQD When set to 1, indicates that configuration is required to ensure that all MCU components are updated on WRMSR 79H, and UNIFORM_MCU_CONFIG_COMPLETE (bit 2) should be checked to determine whether the necessary configuration has been completed. When set to 0, indicates that no configuration is required, and UNIFORM_MCU_CONFIG_COMPLETE should be ignored.	
2	UNIFORM_MCU_CONFIG_COMPLETE If UNIFORM_MCU_CONFIG_REQD (bit 1) is 0, then this bit should be ignored. If UNIFORM_MCU_CONFIG_REQD is 1, then this bit indicates whether all necessary configurations have been completed to ensure that all MCU components will be updated on WRMSR 79H.	
3	ARCH_ROLLBACK_SVN_COMMIT When set to 1, indicates support for the MCU deferred SVN architecture, SVN reporting architecture, and MCU rollback architecture.	
4	MCU_STAGING When set to 1, indicates that the microcode update staging capability is supported by the processor. When supported, the use of the MCU staging capability is recommended to reduce the latency of the IA32_BIOS_UPDT_TRIG operation.	
7:5	Reserved for future use.	
15:8	UNIFORM_MCU_SCOPE Indicates the current* uniform microcode update scope: ▪ 0x02: Core Scoped ▪ 0x03: Module Scoped** ▪ 0x04: Tile Scoped** ▪ 0x05: Die Scoped** ▪ 0x80: Package Scoped ▪ 0xC0: Platform Scoped All others: Reserved for future use * The value of this field reflects the state of platform configuration and may change as the configuration changes during the boot process. Once configuration is complete, it is not expected to change during runtime. ** If these domains are enumerated by CPUID.1F, then this field may also report them as appropriate.	
63:16	Reserved for future use.	
Register Address: 7CH, 124	IA32_MCU_STATUS	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
MCU Status (R/O) Communicates results from the previous patch loads.		
0	MCU_PARTIAL_UPDATE When set to 1, indicates that the most recent write to IA32_BIOS_UPDT_TRIG resulted in a partial update. This means that microcode update components were only partially updated after some portion of the MCU had already been committed and the Revision ID had been updated.	
1	AUTH_FAIL_ON_MCU_COMPONENT When set to 1, indicates that an authentication failure occurred on some portion of the MCU after another portion of the MCU had already been committed and the Revision ID had already been updated on the most recent write to IA32_BIOS_UPDT_TRIG.	
2	Reserved for future use.	
3	POST_BIOS_MCU When set to 1, indicates that an update was successfully loaded via IA32_BIOS_UPDT_TRIG after bit 0 of MSR_BIOS_DONE (address 151H) was set to 1.	
63:4	Reserved for future use.	
Register Address: 82H, 130	IA32_FZM_RANGE_INDEX	
IA32_FZM_RANGE_INDEX (R/W) Index and Domain handle for a valid FZM region. Programmed by software and used by other FRM MSRs FZM Range Index register to R/W Domain Index.		
3:0	REGION_INDEX Holds the Index of domain.	
7:4	Reserved.	
12:8	DOMAIN_HANDLE Holds the Domain Handle.	
63:13	Reserved.	
Register Address: 83H, 131	IA32_FZM_DOMAIN_CONFIG	
IA32_FZM_DOMAIN_CONFIG (R/O) Bit mask of valid regions within the domain identified by FZM_RANGE_INDEX.		
63:0	REGION_BITMAP Bitmap of valid regions for a given domain.	
Register Address: 84H, 132	IA32_FZM_RANGE_STARTADDR	
IA32_FZM_RANGE_STARTADDR (R/O) Start address of the FZM range pointed to by FZM_RANGE_INDEX.		
51:0	START_ADDR Start address of the specified domain in FZM_RANGE_INDEX.	
63:52	Reserved.	
Register Address: 85H, 133	IA32_FZM_RANGE_ENDADDR	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
IA32_FZM_RANGE_ENDADDR (R/O) End address of the specified domain in FZM_RANGE_INDEX.		
51:0	END_ADDR End address of the specified domain in FZM_RANGE_INDEX.	
63:52	Reserved.	
Register Address: 86H, 134	IA32_FZM_RANGE_WRITESTATUS	
IA32_FZM_RANGE_WRITESTATUS (R/O) Write status of the FZM range pointed to by FZM_RANGE_INDEX.		
0	WRITE_STATUS Write status of the specified domain in FZM_RANGE_INDEX.	
1	READ_STATUS Read status of the specified domain in FZM_RANGE_INDEX.	
63:2	Reserved.	
Register Address: 87H, 135	IA32_MKTME_KEYID_PARTITIONING	
MKTME KEY ID Partitioning (R/O) Enumerates the number of activated KeyIDs for Intel TME-MK and Intel TDX.		
31:0	NUM_MKTME_KIDS Number of activated Intel TME-MK KeyIDs. This field is supported on all parts that enumerate support for Intel Total Memory Encryption - Multi-Key (Intel TME-MK). If IA32_TME_ACTIVATE.LOCK is 1, this field reports MAX_ACTIVATE_MKTME_HKIDS (KMK-1) else report 0. Intel TME-MK KIDs will always span the KID range [1 ... NUM_MKTME_KIDS].	
63:32	NUM_TDX_PRIV_KIDS Number of activated TDX private KeyIDs. This field is supported on all parts that enumerate support for SEAM mode. If IA32_TME_ACTIVATE.LOCK is 1, This field reports MAX_ACTIVATE_TDX_HKIDS (KTD) else report 0. TDX private KIDs will always span the range [NUM_MKTME_KIDS+1... (NUM_MKTME_KIDS + NUM_TDX_PRIV_KIDS)].	
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID (BIOS_SIGN/BBL_CR_D3)	
BIOS Update Signature (R/W) Returns the microcode update signature following the execution of CPUID.01H. A processor may prevent writing to this MSR when loading guest states on VM entries or saving guest states on VM exits.		06_01H
31:0	Reserved.	
63:32	PATCH_SIGN_ID It is recommended that this field be preloaded with zero prior to executing CPUID. If the field remains zero following the execution of CPUID, this indicates that no microcode update is loaded. Any non-zero value is the microcode update signature patch signature ID.	
Register Address: 8CH, 140	IA32_SGXLEPUBKEYHASH0	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
IA32_SGXLEPUBKEYHASH[63:0] (R/W) Bits 63:0 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Read permitted If CPUID.(EAX=12H,ECX=0H): EAX[0]=1 && CPUID.(EAX=07H, ECX=0H):ECX[30]=1. Write permitted if CPUID.(EAX=12H,ECX=0H): EAX[0]=1 && IA32_FEATURE_CONTROL[17] = 1 && IA32_FEATURE_CONTROL[0] = 1.
Register Address: 8DH, 141	IA32_SGXLEPUBKEYHASH1	
IA32_SGXLEPUBKEYHASH[127:64] (R/W) Bits 127:64 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 8EH, 142	IA32_SGXLEPUBKEYHASH2	
IA32_SGXLEPUBKEYHASH[191:128] (R/W) Bits 191:128 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 8FH, 143	IA32_SGXLEPUBKEYHASH3	
IA32_SGXLEPUBKEYHASH[255:192] (R/W) Bits 255:192 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 90H, 144	IA32_SGXLEPUBKEYHASH4	
IA32_SGXLEPUBKEYHASH[319:256] (R/W) Bits 319:256 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 91H, 145	IA32_SGXLEPUBKEYHASH5	
IA32_SGXLEPUBKEYHASH[383:320] (R/W) Bits 383:320 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 9BH, 155	IA32_SMM_MONITOR_CTL	
SMM Monitor Configuration (R/W)		If CPUID.01H: ECX[5]=1 || CPUID.01H: ECX[6] = 1
0	Valid (R/W)	
1	Reserved.	
2	Controls SMI unblocking by VMXOFF (see Section 33.14.4).	If IA32_VMX_MISC[28]
11:3	Reserved.	
31:12	MSEG Base (R/W)	
63:32	Reserved.	
Register Address: 9EH, 158	IA32_SMBASE	
Base address of the logical processor's SMRAM image (R/O, SMM only).		If IA32_VMX_MISC[15]
Register Address: BCH, 188	IA32_MISC_PACKAGE_CTLS	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
Power Filtering Control (R/W) This MSR has a value of 0 after reset and is unaffected by INIT# or SIPI#.		If IA32_ARCH_CAPABILITIES [10] = 1
0	ENERGY_FILTERING_ENABLE (R/W) If set, RAPL MSRs report filtered processor power consumption data. This bit can be changed from 0 to 1, but cannot be changed from 1 to 0. After setting, all attempts to clear it are ignored until the next processor reset.	If IA32_ARCH_CAPABILITIES [11] = 1
63:1	Reserved.	
Register Address: BDH, 189	IA32_XAPIC_DISABLE_STATUS	
xAPIC Disable Status (R/O)		If CPUID.(EAX-07H, ECX=0):EDX[29]=1 and IA32_ARCH_CAPABILITIES [21] = 1
0	LEGACY_XAPIC_DISABLED When set, indicates that the local APIC is in x2APIC mode (IA32_APIC_BASE.EXTD = 1) and that attempts to clear IA32_APIC_BASE.EXTD will fail (e.g., WRMSR will #GP).	
63:1	Reserved.	
Register Address: C1H, 193	IA32_PMC0 (PERFCTR0)	
General Performance Counter 0 (R/W)		If CPUID.0AH: EAX[15:8] > 0
Register Address: C2H, 194	IA32_PMC1 (PERFCTR1)	
General Performance Counter 1 (R/W)		If CPUID.0AH: EAX[15:8] > 1
Register Address: C3H, 195	IA32_PMC2	
General Performance Counter 2 (R/W)		If CPUID.0AH: EAX[15:8] > 2
Register Address: C4H, 196	IA32_PMC3	
General Performance Counter 3 (R/W)		If CPUID.0AH: EAX[15:8] > 3
Register Address: C5H, 197	IA32_PMC4	
General Performance Counter 4 (R/W)		If CPUID.0AH: EAX[15:8] > 4
Register Address: C6H, 198	IA32_PMC5	
General Performance Counter 5 (R/W)		If CPUID.0AH: EAX[15:8] > 5
Register Address: C7H, 199	IA32_PMC6	
General Performance Counter 6 (R/W)		If CPUID.0AH: EAX[15:8] > 6
Register Address: C8H, 200	IA32_PMC7	
General Performance Counter 7 (R/W)		If CPUID.0AH: EAX[15:8] > 7
Register Address: C9H, 201	IA32_PMC8	
General Performance Counter 8 (R/W)		If CPUID.0AH: EAX[15:8] > 8
Register Address: CAH, 202	IA32_PMC9	
General Performance Counter 9 (R/W)		If CPUID.0AH: EAX[15:8] > 9
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
IA32 Core Capabilities Register		If CPUID.(EAX=07H, ECX=0):EDX[30] = 1
63:0	Reserved.	No architecturally defined bits.
Register Address: E1H, 225	IA32_UMWAIT_CONTROL	
UMWAIT Control (R/W)		
0	C0.2 is not allowed by the OS. Value of "1" means all C0.2 requests revert to C0.1.	
1	Reserved.	
31:2	Determines the maximum time in TSC-quanta that the processor can reside in either C0.1 or C0.2. A zero value indicates no maximum time. The maximum time value is a 32-bit value where the upper 30 bits come from this field and the lower two bits are zero.	
Register Address: E7H, 231	IA32_MPERF	
TSC Frequency Clock Counter (R/Write to clear)		If CPUID.06H: ECX[0] = 1
63:0	C0_MCNT: C0 TSC Frequency Clock Count Increments at fixed interval (relative to TSC freq.) when the logical processor is in C0. Cleared upon overflow / wrap-around of IA32_APERF.	
Register Address: E8H, 232	IA32_APERF	
Actual Performance Clock Counter (R/Write to clear)		If CPUID.06H: ECX[0] = 1
63:0	C0_ACNT: C0 Actual Frequency Clock Count Accumulates core clock counts at the coordinated clock frequency, when the logical processor is in C0. Cleared upon overflow / wrap-around of IA32_MPERF.	
Register Address: FEH, 254	IA32_MTRRCAP (MTRRcap)	
MTRR Capability (R/O) See Section 13.11.2.1, "IA32_MTRR_DEF_TYPE MSR."		06_01H
7:0	VCNT: The number of variable memory type ranges in the processor.	
8	Fixed range MTRRs are supported when set.	
9	Reserved.	
10	WC Supported when set.	
11	SMRR Supported when set.	
12	PRMRR supported when set.	
63:13	Reserved.	
Register Address: 10AH, 266	IA32_ARCH_CAPABILITIES	
Enumeration of Architectural Features (R/O)		If CPUID.(EAX=07H, ECX=0):EDX[29]=1
0	RDCL_NO: The processor is not susceptible to Rogue Data Cache Load (RDCL).	
1	IBRS_ALL: The processor supports enhanced IBRS.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
2	RSBA: The processor supports RSB Alternate. Alternative branch predictors may be used by RET instructions when the RSB is empty. SW using retpoline may be affected by this behavior.	
3	SKIP_L1DFL_VMENTRY: A value of 1 indicates the hypervisor need not flush the L1D on VM entry.	
4	SSB_NO: Processor is not susceptible to Speculative Store Bypass.	
5	MDS_NO: Processor is not susceptible to Microarchitectural Data Sampling (MDS).	
6	IF_PSCHANGE_MC_NO: The processor is not susceptible to a machine check error due to modifying the size of a code page without TLB invalidation.	
7	TSX_CTRL: If 1, indicates presence of IA32_TSX_CTRL MSR.	
8	TAA_NO: If 1, processor is not affected by TAA.	
9	MCU_CONTROL: If 1, the processor supports the IA32_MCU_CONTROL MSR.	
10	MISC_PACKAGE_CTLS: The processor supports IA32_MISC_PACKAGE_CTLS MSR.	
11	ENERGY_FILTERING_CTL: The processor supports setting and reading the IA32_MISC_PACKAGE_CTLS[0] (ENERGY_FILTERING_ENABLE) bit.	
12	DOITM: If 1, the processor supports Data Operand Independent Timing Mode.	
13	SBDR_SSDP_NO: The processor is not affected by either the Shared Buffers Data Read (SBDR) vulnerability or the Sideband Stale Data Propagator (SSDP).	
14	FBSDP_NO: The processor is not affected by the Fill Buffer Stale Data Propagator (FBSDP).	
15	PSDP_NO: The processor is not affected by vulnerabilities involving the Primary Stale Data Propagator (PSDP).	
16	MCU_ENUMERATION: If 1, the processor supports the IA32_MCU_ENUMERATION and IA32_MCU_STATUS MSRs.	
17	FB_CLEAR: If 1, the processor supports overwrite of fill buffer values as part of MD_CLEAR operations with the VERW instruction.	
18	FB_CLEAR_CTRL: If 1, the processor supports the IA32_MCU_OPT_CTRL MSR and allows software to set bit 3 of that MSR (FB_CLEAR_DIS).	
19	RRSBA: A value of 1 indicates the processor may have the RRSBA alternate prediction behavior, if not disabled by RRSBA_DIS_U or RRSBA_DIS_S.	
20	BHI_NO: A value of 1 indicates BHI_NO branch prediction behavior, regardless of the value of IA32_SPEC_CTRL[BHI_DIS_S] MSR bit.	
21	XAPIC_DISABLE_STATUS: Enumerates that the IA32_XAPIC_DISABLE_STATUS MSR exists, and that bit 0 specifies whether the legacy xAPIC is disabled and APIC state is locked to x2APIC.	
22	MCU_EXTENDED_SERVICE: If 1, the processor supports MCU Extended servicing - IA32_MCU_EXT_SERVICE MSR.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
23	OVERCLOCKING_STATUS: If set, the IA32_OVERCLOCKING_STATUS MSR exists.	
24	PBRSB_NO: If 1, the processor is not affected by issues related to Post-Barrier Return Stack Buffer Predictions.	
25	GDS_CTRL: If 1, the processor supports the GDS_MITG_DIS and GDS_MITG_LOCK bits of the IA32_MCU_OPT_CTRL MSR.	
26	GDS_NO: If 1, the processor is not affected by Gather Data Sampling.	
27	RFDS_NO: If 1, the processor is not affected by Register File Data Sampling.	
28	RFDS_CLEAR: If 1, when VERW is executed the processor will clear stale data from register files affected by Register File Data Sampling.	
29	IGN_UMONITOR_SUPPORT If 0, IA32_MCU_OPT_CTRL bit 6 (IGN_UMONITOR) is not supported. If 1, it indicates support of IA32_MCU_OPT_CTRL bit 6 (IGN_UMONITOR).	
30	MON_UMON_MITG_SUPPORT If 0, IA32_MCU_OPT_CTRL bit 7 (MON_UMON_MITG) is not supported. If 1, it indicates support of IA32_MCU_OPT_CTRL bit 7 (MON_UMON_MITG).	
63:31	Reserved.	
Register Address: 10BH, 267	IA32_FLUSH_CMD	
Flush Command (WO) Gives software a way to invalidate structures with finer granularity than other architectural methods.		If any one of the enumeration conditions for defined bit field positions holds.
0	L1D_FLUSH Writeback and invalidate the L1 data cache.	If CPUID.(EAX=07H, ECX=0):EDX[28]=1
63:1	Reserved.	
Register Address: 10FH, 271	IA32_TSX_FORCE_ABORT	
TSX Force Abort		If CPUID.(EAX=07H, ECX=0):EDX[13]=1
0	RTM_FORCE_ABORT If 1, all RTM transactions abort with EAX code 0.	R/W, Default: 0 If CPUID.(EAX=07H,ECX=0): EDX[11]=1, bit 0 is always 1 and writes to change it are ignored. If SDV_ENABLE_RTM is 1, bit 0 is always 0 and writes to change it are ignored.
1	TSX_CPUID_CLEAR When set, CPUID.(EAX=07H,ECX=0):EBX[11]=0 and CPUID.(EAX=07H,ECX=0):EBX[4]=0.	R/W, Default: 0 Can be set only if CPUID.(EAX=07H,ECX=0): EDX[11]=1 or if SDV_ENABLE_RTM is 1.

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
2	SDV_ENABLE_RTM When set, CPUID.(EAX=07H,ECX=0):EDX[11]=0 and the processor may not force abort RTM. This unsupported mode should only be used for software development and not for production usage.	R/W, Default: 0 If 0, can be set only if CPUID.(EAX=07H,ECX=0): EDX[11]=1.
63:3	Reserved.	
Register Address: 122H, 290	IA32_TSX_CTRL	
IA32_TSX_CTRL (R/W)		Thread scope. Not architecturally serializing. Available when CPUID.ARCH_CAP(EAX=7H, ECX = 0):EDX[29] = 1 and IA32_ARCH_CAPABILITIES.bit 7 = 1.
0	RTM_DISABLE When set to 1, XBEGIN will always abort with EAX code 0.	
1	TSX_CPUID_CLEAR When set to 1, CPUID.07H.EBX.RTM [bit 11] and CPUID.07H.EBX.HLE [bit 4] report 0. When set to 0 and the SKU supports TSX, these bits will return 1.	
63:2	Reserved.	
Register Address: 123H, 291	IA32_MCU_OPT_CTRL	
Microcode Update Option Control (R/W)		If CPUID.(EAX=07H, ECX=0):EDX[9]=1 or IA32_ARCH_CAPABILITIES [18] = 1 or IA32_ARCH_CAPABILITIES. FB_CLEAR_CTRL=1
0	RNGDS_MITG_DIS (R/W) If 0 (default), SRBDS mitigation is enabled for RDRAND and RDSEED. If 1, SRBDS mitigation is disabled for RDRAND and RDSEED executed outside of Intel SGX enclaves.	If CPUID.(EAX=07H, ECX=0):EDX[9]=1
1	RTM_ALLOW If 0, XBEGIN will always abort with EAX code 0. If 1, XBEGIN behavior depends on the value of IA32_TSX_CTRL[RTM_DISABLE].	Read/Write Setting RTM_LOCKED prevents writes to this bit.
2	RTM_LOCKED When 1, RTM_ALLOW is locked at zero, writes to RTM_ALLOW will be ignored.	Read-Only status bit.
3	FB_CLEAR_DIS If 1, prevents the VERW instruction from performing an FB_CLEAR action.	If IA32_ARCH_CAPABILITIES. FB_CLEAR_CTRL=1
4	GDS_MITG_DIS If 0, the Gather Data Sampling mitigation is enabled (patch load time default). If 1 on all threads for a given core, the Gather Data Sampling mitigation is disabled.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
5	GDS_MITG_LOCK If 0, not locked, and GDS_MITG_DIS is under OS control. If 1, locked and GDS_MITG_DIS is forced to 0 (writes are ignored).	
6	IGN_UMONITOR If 0, enable CPL0-3 software to use the UMONITOR/UMWAIT instructions. If 1 (default), disable UMONITOR functionality. CPL0-3 software will be able to call the UMONITOR instruction without causing a fault, however the address monitoring hardware will not be armed. When UMWAIT is called, it will not enter an implementation-dependent optimized state.	
7	MON_UMON_MITG If 0 (default), disabled. If 1, enable: Flush the thread's previously monitored address from the CPU caches as part of the (U)MONITOR instruction. Additionally, for every 4th (U)MONITOR instruction within a core, flush the peer hyperthread's monitored address from the CPU caches as well. This will increase the latency of the instruction. This may have a minor impact on workloads using the (U)MONITOR instruction.	
63:8	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS	
SYSENTER_CS_MSR (R/W)		06_01H
15:0	CS Selector.	
31:16	Not used.	Can be read and written.
63:32	Not used.	Writes ignored; reads return zero.
Register Address: 175H, 373	IA32_SYSENTER_ESP	
SYSENTER_ESP_MSR (R/W)		06_01H
Register Address: 176H, 374	IA32_SYSENTER_EIP	
SYSENTER_EIP_MSR (R/W)		06_01H
Register Address: 179H, 377	IA32_MCG_CAP (MCG_CAP)	
Global Machine Check Capability (R/O)		06_01H
7:0	Count: Number of reporting banks.	
8	MCG_CTL_P: IA32_MCG_CTL is present if this bit is set.	
9	MCG_EXT_P: Extended machine check state registers are present if this bit is set.	
10	MCP_CMCI_P: Support for corrected MC error event is present.	06_01H
11	MCG_TES_P: Threshold-based error status register are present if this bit is set.	
15:12	Reserved.	
23:16	MCG_EXT_CNT: Number of extended machine check state registers present.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
24	MCG_SER_P: The processor supports software error recovery if this bit is set.	
25	Reserved.	
26	MCG_ELOG_P: Indicates that the processor allows platform firmware to be invoked when an error is detected so that it may provide additional platform specific information in an ACPI format "Generic Error Data Entry" that augments the data included in machine check bank registers.	06_3EH
27	MCG_LMCE_P: Indicates that the processor supports extended state in IA32_MCG_STATUS and associated MSR necessary to configure Local Machine Check Exception (LMCE).	06_3EH
63:28	Reserved.	
Register Address: 17AH, 378	IA32_MCG_STATUS (MCG_STATUS)	
Global Machine Check Status (R/W)		06_01H
0	RIPV. Restart IP valid.	06_01H
1	EIPV. Error IP valid.	06_01H
2	MCIP. Machine check in progress.	06_01H
3	LMCE_S.	If IA32_MCG_CAP.LMCE_P[27] =1
63:4	Reserved.	
Register Address: 17BH, 379	IA32_MCG_CTL (MCG_CTL)	
Global Machine Check Control (R/W)		If IA32_MCG_CAP.CTL_P[8] =1
Register Address: 180H–185H, 384–389	N/A	
Reserved		06_0EH[2]
Register Address: 186H, 390	IA32_PERFEVTSEL0 (PERFEVTSEL0)	
Performance Event Select Register 0 (R/W)		If CPUID.0AH: EAX[15:8] > 0
7:0	Event Select: Selects a performance event logic unit.	
15:8	UMask: Qualifies the microarchitectural condition to detect on the selected event logic.	
16	USR: Counts while in privilege level is not ring 0.	
17	OS: Counts while in privilege level is ring 0.	
18	Edge: Enables edge detection if set.	
19	PC: Enables pin control.	
20	INT: Enables interrupt on counter overflow.	
21	AnyThread: When set to 1, it enables counting the associated event conditions occurring across all logical processors sharing a processor core. When set to 0, the counter only increments the associated event conditions occurring in the logical processor which programmed the MSR.	
22	EN: Enables the corresponding performance counter to commence counting when this bit is set.	
23	INV: Invert the CMASK.	
31:24	CMASK: When CMASK is not zero, the corresponding performance counter increments each cycle if the event count is greater than or equal to the CMASK.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
Thermal Status Information (R/O) Contains status information about the processor's thermal sensor and automatic thermal monitoring facilities. See Section 16.8.2, "Thermal Monitor."		If CPUID.01H:EDX[22] = 1
0	Thermal Status (R/O)	If CPUID.01H:EDX[22] = 1
1	Thermal Status Log (R/W)	If CPUID.01H:EDX[22] = 1
2	PROCHOT # or FORCEPR# event (R/O)	If CPUID.01H:EDX[22] = 1
3	PROCHOT # or FORCEPR# log (R/WC0)	If CPUID.01H:EDX[22] = 1
4	Critical Temperature Status (R/O)	If CPUID.01H:EDX[22] = 1
5	Critical Temperature Status log (R/WC0)	If CPUID.01H:EDX[22] = 1
6	Thermal Threshold #1 Status (R/O)	If CPUID.01H:ECX[8] = 1
7	Thermal Threshold #1 log (R/WC0)	If CPUID.01H:ECX[8] = 1
8	Thermal Threshold #2 Status (R/O)	If CPUID.01H:ECX[8] = 1
9	Thermal Threshold #2 log (R/WC0)	If CPUID.01H:ECX[8] = 1
10	Power Limitation Status (R/O)	If CPUID.06H:EAX[4] = 1
11	Power Limitation log (R/WC0)	If CPUID.06H:EAX[4] = 1
12	Current Limit Status (R/O)	If CPUID.06H:EAX[7] = 1
13	Current Limit log (R/WC0)	If CPUID.06H:EAX[7] = 1
14	Cross Domain Limit Status (R/O)	If CPUID.06H:EAX[7] = 1
15	Cross Domain Limit log (R/WC0)	If CPUID.06H:EAX[7] = 1
22:16	Digital Readout (R/O)	If CPUID.06H:EAX[0] = 1
26:23	Reserved.	
30:27	Resolution in Degrees Celsius (R/O)	If CPUID.06H:EAX[0] = 1
31	Reading Valid (R/O)	If CPUID.06H:EAX[0] = 1
63:32	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
0	Fast-Strings Enable When set, the fast-strings feature (for REP MOVS and REP STORS) is enabled (default). When clear, fast-strings are disabled.	0F_0H
2:1	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
3	Automatic Thermal Control Circuit Enable (R/W) 1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows the processor to automatically reduce power consumption in response to TCC activation. 0 = Disabled. Note: In some products clearing this bit might be ignored in critical thermal conditions, and TM1, TM2, and adaptive thermal throttling will still be activated. The default value of this field varies with product. See respective tables where default value is listed.	0F_0H
6:4	Reserved.	
7	Performance Monitoring Available (R) 1 = Performance monitoring enabled. 0 = Performance monitoring disabled.	0F_0H
10:8	Reserved.	
11	Branch Trace Storage Unavailable (R/O) 1 = Processor doesn't support branch trace storage (BTS). 0 = BTS is supported.	0F_0H
12	Processor Event Based Sampling (PEBS) Unavailable (R/O) 1 = PEBS is not supported. 0 = PEBS is supported.	06_0FH
15:13	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) 0= Enhanced Intel SpeedStep Technology disabled. 1 = Enhanced Intel SpeedStep Technology enabled.	If CPUID.01H: ECX[7] =1
17	Reserved.	
18	ENABLE MONITOR FSM (R/W) When this bit is set to 0, the MONITOR feature flag is not set (CPUID.01H:ECX[bit 3] = 0). This indicates that MONITOR/MWAIT are not supported. Software attempts to execute MONITOR/MWAIT will cause #UD when this bit is 0. When this bit is set to 1 (default), MONITOR/MWAIT are supported (CPUID.01H:ECX[bit 3] = 1). If the SSE3 feature flag ECX[0] is not set (CPUID.01H:ECX[bit 0] = 0), the OS must not attempt to alter this bit. BIOS must leave it in the default state. Writing this bit when the SSE3 feature flag is set to 0 may generate a #GP exception.	0F_03H
21:19	Reserved.	
22	Limit CPUID Maxval (R/W) When this bit is set to 1, CPUID.00H returns a maximum value in EAX[7:0] of 2.	CPUID.0H:EAX > 2 and CPUID.(EAX = 07H, ECX = 1):EBX. CPUIDMAXVAL_LIM_RMV [bit 3] = 0

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
23	xTPR Message Disable (R/W) When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority.	If CPUID.01H:ECX[14] = 1
63:24	Reserved. Note: Some older processors defined one of these bits as a disable for the execute-disable feature of paging. If a processor supports this bit, this information is provided in the model-specific tables. See Table 2-3 for the definition of this bit.	
Register Address: 1B0H, 432	IA32_ENERGY_PERF_BIAS	
Performance Energy Bias Hint (R/W)		If CPUID.6H:ECX[3] = 1
3:0	Power Policy Preference: 0 indicates preference to highest performance. 15 indicates preference to maximize energy saving.	
63:4	Reserved.	
Register Address: 1B1H, 433	IA32_PACKAGE_THERM_STATUS	
Package Thermal Status Information (R/O) Contains status information about the package's thermal sensor. See Section 16.9, "Package Level Thermal Management."		If CPUID.06H: EAX[6] = 1

63:26	Reserved.	
Register Address: 1C4H, 452	IA32_XFD	
Extended Feature Disable Control (R/W) Controls which XSAVE-enabled features are temporarily disabled. See Section 13.14 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1.		If CPUID.(EAX=0DH,ECX=1): EAX[4] = 1
Register Address: 1C5H, 453	IA32_XFD_ERR	
Extended Feature Disable Error Code (R/W) Reports which XSAVE-enabled features caused a fault due to being disabled. See Section 13.14 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1.		If CPUID.(EAX=0DH,ECX=1): EAX[4] = 1
Register Address: 1D9H, 473	IA32_DEBUGCTL (MSR_DEBUGCTLA, MSR_DEBUGCTLB)	
Trace/Profile Resource Control (R/W)		06_0EH
0	LBR: Setting this bit to 1 enables the processor to record a running trace of the most recent branches taken by the processor in the LBR stack.	06_01H
1	BTF: Setting this bit to 1 enables the processor to treat EFLAGS.TF as single-step on branches instead of single-step on instructions.	06_01H
2	BLD: Enable OS bus-lock detection. See Section 19.3.1.6 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B.	If (CPUID.(EAX=07H, ECX=0):ECX[24] = 1)
5:3	Reserved.	
6	TR: Setting this bit to 1 enables branch trace messages to be sent.	06_0EH
7	BTS: Setting this bit enables branch trace messages (BTMs) to be logged in a BTS buffer.	06_0EH
8	BTINT: When clear, BTMs are logged in a BTS buffer in circular fashion. When this bit is set, an interrupt is generated by the BTS facility when the BTS buffer is full.	06_0EH
9	1: BTS_OFF_OS: When set, BTS or BTM is skipped if CPL = 0.	06_0FH
10	BTS_OFF_USR: When set, BTS or BTM is skipped if CPL > 0.	06_0FH

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
11	FREEZE_LBRS_ON_PMI: When set, the LBR stack is frozen on a PMI request.	If CPUID.01H: ECX[15] = 1 && CPUID.0AH: EAX[7:0] > 1
12	FREEZE_PERFMON_ON_PMI: When set, each ENABLE bit of the global counter control MSR are frozen (address 38FH) on a PMI request.	If CPUID.01H: ECX[15] = 1 && CPUID.0AH: EAX[7:0] > 1
13	ENABLE_UNCORE_PMI: When set, enables the logical processor to receive and generate PMI on behalf of the uncore.	06_1AH
14	FREEZE_WHILE_SMM: When set, freezes perfmon and trace messages while in SMM.	If IA32_PERF_CAPABILITIES[12] = 1
15	RTM_DEBUG: When set, enables DR7 debug bit on XBEGIN.	If (CPUID.(EAX=07H, ECX=0):EBX[11] = 1)
63:16	Reserved.	
Register Address: 1DDH, 477	IA32_LER_FROM_IP	
Last Event Record Source IP Register (R/W)		
63:0	FROM_IP The source IP of the recorded branch or event, in canonical form.	Reset Value: 0
Register Address: 1DEH, 478	IA32_LER_TO_IP	
Last Event Record Destination IP Register (R/W)		
63:0	TO_IP The destination IP of the recorded branch or event, in canonical form.	Reset Value: 0
Register Address: 1E0H, 480	IA32_LER_INFO	
Last Event Record Info Register (R/W)		
55:0	Undefined, may be zero or non-zero. Writes of non- zero values do not fault, but reads may return a different value.	Reset Value: 0
59:56	BR_TYPE The branch type recorded by this LBR. Encodings match those of IA32_LBR_x_INFO.	Reset Value: 0
60	Undefined, may be zero or non-zero. Writes of non- zero values do not fault, but reads may return a different value.	Reset Value: 0
61	TSX_ABORT This LBR record is a TSX abort. On processors that do not support Intel® TSX (CPUID.07H.EBX.HLE[bit 4]=0 and CPUID.07H.EBX.RTM[bit 11]=0), this bit is undefined.	Reset Value: 0
62	IN_TSX This LBR record records a branch that retired during a TSX transaction. On processors that do not support Intel® TSX (CPUID.07H.EBX.HLE[bit 4]=0 and CPUID.07H.EBX.RTM[bit 11]=0), this bit is undefined.	Reset Value: 0
63	MISPRED The recorded branch taken/not-taken resolution (for conditional branches) or target (for any indirect branch, including RETs) was mispredicted.	Reset Value: 0
Register Address: 1F2H, 498	IA32_SMRR_PHYSBASE	
SMRR Base Address (Writeable only in SMM) Base address of SMM memory range.		If IA32_MTRRCAP.SMRR[11] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**

Register Address: 600H, 1536	IA32_DS_AREA	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
DS Save Area (R/W) Points to the linear address of the first byte of the DS buffer management area, which is used to manage the BTS and PEBS buffers. See Section 21.6.3.4, "Debug Store (DS) Mechanism."		If(CPUID.01H:EDX.DS[21] = 1
63:0	The linear address of the first byte of the DS buffer management area, if IA-32e mode is active.	
31:0	The linear address of the first byte of the DS buffer management area, if not in IA-32e mode.	
63:32	Reserved if not in IA-32e mode.	
Register Address: 6A0H, 1696	IA32_U_CET	
Configure User Mode CET (R/W)		Bits 1:0 are defined if CPUID.(EAX=07H, ECX=0H):ECX.CET_SS[07] = 1. Bits 5:2 and bits 63:10 are defined if CPUID.(EAX=07H, ECX=0H):EDX.CET_IBT[20] = 1.
0	SH_STK_EN: When set to 1, enable shadow stacks at CPL3.	
1	WR_SHSTK_EN: When set to 1, enables the WRSSD/WRSSQ instructions.	
2	ENDBR_EN: When set to 1, enables indirect branch tracking.	
3	LEG_IW_EN: Enable legacy compatibility treatment for indirect branch tracking.	
4	NO_TRACK_EN: When set to 1, enables use of no-track prefix for indirect branch tracking.	
5	SUPPRESS_DIS: When set to 1, disables suppression of CET indirect branch tracking on legacy compatibility.	
9:6	Reserved; must be zero.	
10	SUPPRESS: When set to 1, indirect branch tracking is suppressed. This bit can be written to 1 only if TRACKER is written as IDLE.	
11	TRACKER: Value of the indirect branch tracking state machine. Values: IDLE (0), WAIT_FOR_ENDBRANCH(1).	
63:12	EB_LEG_BITMAP_BASE: Linear address bits 63:12 of a legacy code page bitmap used for legacy compatibility when indirect branch tracking is enabled. If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are used.	
Register Address: 6A2H, 1698	IA32_S_CET	
Configure Supervisor Mode CET (R/W)		See IA32_U_CET (6A0H) for reference; similar format.
Register Address: 6A4H, 1700	IA32_PL0_SSP	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
Linear address to be loaded into SSP on transition to privilege level 0. (R/W) If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are loaded. Bits 1:0 of the MSR must be 0. Transitions to privilege level 0 will check that bit 2 is also 0.		If CPUID.(EAX=07H, ECX=0H):ECX.CET_SS[07] = 1
Register Address: 6A5H, 1701	IA32_PL1_SSP	
Linear address to be loaded into SSP on transition to privilege level 1. (R/W) If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are loaded. Bits 1:0 of the MSR must be 0. Transitions to privilege level 1 from a higher privilege level will check that bit 2 is also 0.		If CPUID.(EAX=07H, ECX=0H):ECX.CET_SS[07] = 1
Register Address: 6A6H, 1702	IA32_PL2_SSP	
Linear address to be loaded into SSP on transition to privilege level 2. (R/W) If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are loaded. Bits 1:0 of the MSR must be 0. Transitions to privilege level 2 from a higher privilege level will check that bit 2 is also 0.		If CPUID.(EAX=07H, ECX=0H):ECX.CET_SS[07] = 1
Register Address: 6A7H, 1703	IA32_PL3_SSP	
Linear address to be loaded into SSP on transition to privilege level 3. (R/W) If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are loaded. Bits 1:0 of the MSR must be 0.		If CPUID.(EAX=07H, ECX=0H):ECX.CET_SS[07] = 1
Register Address: 6A8H, 1704	IA32_INTERRUPT_SSP_TABLE_ADDR	
Linear address of a table of seven shadow stack pointers that are selected in IA-32e mode using the IST index (when not 0) from the interrupt gate descriptor. (R/W) This MSR is not present on processors that do not support Intel 64 architecture. This field cannot represent a non-canonical address.		If CPUID.(EAX=07H, ECX=0H):ECX.CET_SS[07] = 1
Register Address: 6E0H, 1760	IA32_TSC_DEADLINE	
TSC Target of Local APIC's TSC Deadline Mode (R/W)		If CPUID.01H:ECX.[24] = 1
63:0	REGISTER_VALUE TSC-deadline value.	
Register Address: 6E1H, 1761	IA32_PKRS	
Specifies the PK permissions associated with each protection domain for supervisor pages (R/W)		If CPUID.(EAX=07H, ECX=0H):ECX.PKS [31] = 1
31:0	For domain i (i between 0 and 15), bits 2i and 2i+1 contain the AD and WD permissions, respectively.	
63:32	Reserved.	
Register Address: 770H, 1904	IA32_PM_ENABLE	
Enable/disable HWP (R/W)		If CPUID.06H:EAX.[7] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
0	HWP_ENABLE (R/W) Note this bit can only be enabled once from the default value. Once set, writes to the HWP_ENABLE bit are ignored. Only RESET will clear this bit. Default = 0. See Section 16.4.2, "Enabling HWP."	If CPUID.06H:EAX.[7] = 1
63:1	Reserved.	
Register Address: 771H, 1905	IA32_HWP_CAPABILITIES	
HWP Performance Range Enumeration (R/O)		If CPUID.06H:EAX.[7] = 1
7:0	Highest_Performance See Section 16.4.3, "HWP Performance Range and Dynamic Capabilities."	If CPUID.06H:EAX.[7] = 1
15:8	Guaranteed_Performance See Section 16.4.3, "HWP Performance Range and Dynamic Capabilities."	If CPUID.06H:EAX.[7] = 1

63:43	Reserved.	
Register Address: 775H, 1909	IA32_PECI_HWP_REQUEST_INFO	
IA32_PECI_HWP_REQUEST_INFO		
7:0	Minimum Performance (MINIMUM_PERFORMANCE): Used by OS to read the latest value of PECI minimum performance input. Default value is 0.	
15:8	Maximum Performance (MAXIMUM_PERFORMANCE): Used by OS to read the latest value of PECI maximum performance input. Default value is 0.	
23:16	Reserved.	
31:24	Energy Performance Preference (ENERGY_PERFORMANCE_PREFERENCE): Used by OS to read the latest value of PECI Energy Performance Preference input. Default value is 0.	
59:32	Reserved.	
60	EPP PECI Override (EPP_PECI_OVERRIDE): Indicates whether PECI is currently overriding the Energy Performance Preference input. If set to '1', PECI is overriding the Energy Performance Preference input. If clear (0), OS has control over Energy Performance Preference input. Default value is 0.	
61	Reserved.	
62	Max PECI Override (MAX_PECI_OVERRIDE): Indicates whether PECI is currently overriding the Maximum Performance input. If set to '1', PECI is overriding the Maximum Performance input. If clear (0), OS has control over Maximum Performance input. Default value is 0.	
63	Min PECI Override (MIN_PECI_OVERRIDE): Indicates whether PECI is currently overriding the Minimum Performance input. If set to '1', PECI is overriding the Minimum Performance input. If clear (0), OS has control over Minimum Performance input. Default value is 0.	
Register Address: 776H, 1910	IA32_HWP_CTL	
IA32_HWP_CTL		If CPUID.06H:EAX.[22] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
0	PKG_CTL_POLARITY Defines which HWP Request MSR is used whether Thread level or package level. When package MSR is used, the thread MSR valid bits define which thread MSR fields override the package. Default value is 0.	If CPUID.06H:EAX.[22] = 1
63:1	Reserved.	
Register Address: 777H, 1911	IA32_HWP_STATUS	
Log bits indicating changes to Guaranteed & excursions to Minimum (R/W)		If CPUID.06H:EAX.[7] = 1
0	Guaranteed_Performance_Change (R/WC0) See Section 16.4.5, "HWP Feedback."	If CPUID.06H:EAX.[7] = 1
1	Reserved.	
2	Excursion_To_Minimum (R/WC0) See Section 16.4.5, "HWP Feedback."	If CPUID.06H:EAX.[7] = 1
63:3	Reserved.	
Register Address: 7A3H, 1955	IA32_MCU_EXT_SERVICE	
MCU Extended Service (R/O)		If IA32_ARCH_CAPABILITIES[22] = 1
3:0	ALLOWED_PERIODS Value indicates the allowed periods for extended servicing. Value x means that all extended servicing periods are allowed till period x.	
63:4	Reserved.	
Register Address: 7A4H, 1956	IA32_MCU_ROLLBACK_MIN_ID	
Minimal MCU Revision ID (R/O) Minimal MCU Revision ID that software can rollback to per boot.		If IA32_MCU_ENUMERATION[3] = 1
31:0	REVISION_ID Minimal MCU revision ID for rollback.	
63:32	Reserved for future use.	
Register Address: 7A5H, 1957	IA32_MCU_STAGING_MBOX_ADDR	
IA32_MCU_STAGING_MBOX_ADDR (R/O) Reports MMIO address of MCU staging DOE mailbox.		
63:0	ADDR MMIO address base of MCU staging DOE mailbox.	
Register Address: 7B0H, 1968	IA32_ROLLBACK_SIGN_ID_0	
Rollback ID 0 (R/O) Holds the Revision ID and SVN of a supported rollback target or 0 if none.		If IA32_MCU_ENUMERATION[3] = 1
31:0	MCU_ROLLBACK_ID MCU supported Rollback ID.	
47:32	ROLLBACK_MCU_SVN MCU SVN corresponding to the reported MCU Rollback ID.	
63:48	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)

Register Address: 83EH, 2110	IA32_X2APIC_DIV_CONF	
x2APIC Divide Configuration Register (R/W)		If CPUID.01H:ECX.[21] = 1 && IA32_APIC_BASE.[10] = 1
Register Address: 83FH, 2111	IA32_X2APIC_SELF_IPI	
x2APIC Self IPI Register (W/O)		If CPUID.01H:ECX.[21] = 1 && IA32_APIC_BASE.[10] = 1
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
Memory Encryption Capability MSR		If CPUID.07H:ECX.[13] = 1
0	Support for AES-XTS 128-bit encryption algorithm. (NIST standard)	
1	Support for AES-XTS 128-bit encryption with integrity algorithm.	
2	Support for AES-XTS 256-bit encryption algorithm.	
29:3	Reserved.	
30	SUPPORT_IA32_TME_CLEAR_SAVED_KEY Support for the IA32_TME_CLEAR_SAVED_KEY MSR.	
31	TME encryption bypass supported.	
35:32	MK_TME_MAX_KEYID_BITS Number of bits which can be allocated for usage as key identifiers for multi-key memory encryption. 4 bits allow for a maximum value of 15, which could address 32K keys. Zero if TME-MK is not supported.	
50:36	MK_TME_MAX_KEYS Indicates the maximum number of keys which are available for usage. This value may not be a power of 2. KeyID 0 is specially reserved and is not accounted for in this field.	
63:51	Reserved.	
Register Address: 982H, 2434	IA32_TME_ACTIVATE	
Memory Encryption Activation MSR This MSR is used to lock the MSRs listed below. Any write to the following MSRs will be ignored after they are locked. The lock is reset when CPU is reset. ▪ IA32_TME_ACTIVATE ▪ IA32_TME_EXCLUDE_MASK ▪ IA32_TME_EXCLUDE_BASE Note that IA32_TME_EXCLUDE_MASK and IA32_TME_EXCLUDE_BASE must be configured before IA32_TME_ACTIVATE.		If CPUID.07H:ECX.[13] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
0	Lock R/O – Will be set upon successful WRMSR (or first SMI); written value ignored.	
1	Hardware Encryption Enable This bit also enables TME-MK; TME-MK cannot be enabled without enabling encryption hardware.	
2	Key Select 0: Create a new TME key (expected cold/warm boot). 1: Restore the TME key from storage (Expected when resume from standby).	
3	Save TME Key for Standby Save key into storage to be used when resume from standby. Note: This may not be supported in all processors.	
7:4	TME Policy/Encryption Algorithm Only algorithms enumerated in IA32_TME_CAPABILITY are allowed. For example: 0000 – AES-XTS-128. 0001 – AES-XTS-128 with integrity. 0010 – AES-XTS-256. Other values are invalid.	
30:8	Reserved.	
31	TME Encryption Bypass Enable When encryption hardware is enabled: ▪ Total Memory Encryption is enabled using a CPU generated ephemeral key based on a hardware random number generator when this bit is set to 0. ▪ Total Memory Encryption is bypassed (no encryption/decryption for KeyID0) when this bit is set to 1. Software must inspect Hardware Encryption Enable (bit 1) and TME encryption bypass Enable (bit 31) to determine if TME encryption is enabled.	
35:32	MK_TME_KEYID_BITS Reserved if TME-MK is not enumerated, otherwise: The number of key identifier bits to allocate to TME-MK usage. Similar to enumeration, this is an encoded value. Writing a value greater than MK_TME_MAX_KEYID_BITS will result in #GP. Writing a non-zero value to this field will #GP if bit 1 of EAX (Hardware Encryption Enable) is not also set to '1, as encryption hardware must be enabled to use TME-MK. Example: To support 255 keys, this field would be set to a value of 8.	
47:36	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
63:48	MK_TME_CRYPTO_ALGS Reserved if TME-MK is not enumerated, otherwise: Bit 48: AES-XTS 128. Bit 49: AES-XTS 128 with integrity. Bit 50: AES-XTS 256. Bit 63:51: Reserved (#GP) Bitmask for BIOS to set which encryption algorithms are allowed for TME-MK, would be later enforced by the key loading ISA ('1 = allowed).	
Register Address: 983H, 2435	IA32_TME_EXCLUDE_MASK	
Memory Encryption Exclude Mask		If CPUID.07H:ECX.[13] = 1
10:0	Reserved.	
11	Enable: When set to '1', then TME_EXCLUDE_BASE and TME_EXCLUDE_MASK are used to define an exclusion region for TME/TME-MK (for KeyID=0).	
MAXPHYADDR-1:12	TMEEMASK: This field indicates the bits that must match TMEEBASE in order to qualify as a TME/TME-MK (for KeyID=0) exclusion memory range access.	
63:MAXPHYADDR	Reserved; must be zero.	
Register Address: 984H, 2436	IA32_TME_EXCLUDE_BASE	
Memory Encryption Exclude Base		IF CPUID.07H:ECX.[13] = 1
11:0	Reserved.	
MAXPHYADDR-1:12	TMEEBASE: Base physical address to be excluded for TME/TME-MK (for KeyID=0) encryption.	
63:MAXPHYADDR	Reserved; must be zero.	
Register Address: 985H, 2437	IA32_UINTR_RR	
User Interrupt Request Register (R/W)		IF CPUID.07H.01H:EDX[13]=1
63:0	UIRR Bitmap of requested user interrupt vectors.	
Register Address: 986H, 2438	IA32_UINTR_HANDLER	
User Interrupt Handler Address (R/W)		IF CPUID.07H.01H:EDX[13]=1
63:0	UIHANDLER User interrupt handler linear address.	
Register Address: 987H, 2439	IA32_UINTR_STACKADJUST	
User Interrupt Stack Adjustment (R/W)		IF CPUID.07H.01H:EDX[13]=1
0	LOAD_RSP User interrupt stack mode.	
2:1	Reserved.	
63:3	STACK_ADJUST Stack adjust value.	
Register Address: 988H, 2440	IA32_UINTR_MISC	
User-Interrupt Target-Table Size and Notification Vector (R/W)		If CPUID.07H.01H:EDX[13]=1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
31:0	UITTSZ The highest index of a valid entry in the user-interrupt target table. Valid entries are indices 0..UITTSZ (inclusive).	
39:32	UINV User-interrupt notification vector.	
63:40	Reserved.	
Register Address: 989H, 2441	IA32_UINTR_PD	
User Interrupt PID Address (R/W)		If CPUID.07H.01H:EDX[13]=1
5:0	Reserved.	
63:6	UPIDADDR User-interrupt notification processing accesses a UPID at this linear address.	
Register Address: 98AH, 2442	IA32_UINTR_TT	
User-Interrupt Target Table (R/W)		If CPUID.07H.01H:EDX[13]=1
0	SENDUIPI_ENABLE User-interrupt target table is valid.	
3:1	Reserved.	
63:4	UITTADDR User-interrupt target table base linear address.	
Register Address: 990H, 2448	IA32_COPY_STATUS[5]	
Status of Most Recent Platform to Local or Local to Platform Copies (R/O)		If ((CPUID.19H:EBX[4] = 1) && (CPUID.(07H,0).ECX[23] = 1))
0	IWKEY_COPY_SUCCESSFUL Status of most recent copy to or from IWKeyBackup.	If ((CPUID.19H:EBX[4] = 1) && (CPUID.(07H,0).ECX[23] = 1))
63:1	Reserved.	
Register Address: 991H, 2449	IA32_IWKEYBACKUP_STATUS[5]	
Information about IWKeyBackup Register (R/O)		If ((CPUID.19H:EBX[4] = 1) && (CPUID.(07H,0).ECX[23] =1))
0	Backup/Restore Valid Cleared when a write to IWKeyBackup is initiated, and then set when the latest write of IWKeyBackup has been written to storage that persists across S3/S4 sleep state. If S3/S4 is entered between when an IWKeyBackup write occurs and when this bit is set, then IWKeyBackup may not be recovered after S3/S4 exit. During S3/S4 sleep state exit (system wake up), this bit is cleared. It is set again when IWKeyBackup is restored from persistent storage and thus available to be copied to IWKey using IA32_COPY_PLATFORM_TO_LOCAL MSR. Another write to IWKeyBackup (via IA32_COPY_LOCAL_TO_PLATFORM MSR) may fail if a previous write has not yet set this bit.	IF ((CPUID.19H:EBX[4] = 1) && (CPUID.(07H,0).ECX[23] =1))
1	Reserved.	
2	Backup Key Storage Read/Write Error Updated prior to backup/restore valid being set. Set when an error is encountered while backing up or restoring a key to persistent storage.	IF ((CPUID.19H:EBX[4] = 1) && (CPUID.(07H,0).ECX[23] =1))

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
3	IWKeyBackup Consumed Set after the previous backup operation has been consumed by the platform. This does not indicate that the system is ready for a second IWKeyBackup write as the previous IWKeyBackup write may still need to set Backup/restore valid.	IF ((CPUID.19H:EBX[4] = 1) && (CPUID.(07H,0).ECX[23] =1))
63:4	Reserved.	
Register Address: 9FBH, 2555	IA32_TME_CLEAR_SAVED_KEY	
IA32_TME_CLEAR_SAVED_KEY (W/O)		
0	TME_CLEAR_SAVED_KEY Clear saved TME keys.	
63:1	Reserved.	
Register Address: C80H, 3200	IA32_DEBUG_INTERFACE	
Silicon Debug Feature Control (R/W)		If CPUID.01H:ECX.[11] = 1
0	Enable (R/W) BIOS set 1 to enable Silicon debug features. Default is 0.	If CPUID.01H:ECX.[11] = 1
29:1	Reserved.	
30	Lock (R/W): If 1, locks any further change to the MSR. The lock bit is set automatically on the first SMI assertion even if not explicitly set by BIOS. Default is 0.	If CPUID.01H:ECX.[11] = 1
31	Debug Occurred (R/O): This "sticky bit" is set by hardware to indicate the status of bit 0. Default is 0.	If CPUID.01H:ECX.[11] = 1
63:32	Reserved.	
Register Address: C81H, 3201	IA32_L3_QOS_CFG	
L3 QOS Configuration (R/W)		If (CPUID.(EAX=10H, ECX=1):ECX.[2] = 1)
0	Enable (R/W) Set 1 to enable L3 CAT masks and CLOS to operate in Code and Data Prioritization (CDP) mode.	
63:1	Reserved. Attempts to write to reserved bits result in a #GP(0).	
Register Address: C82H, 3202	IA32_L2_QOS_CFG	
L2 QOS Configuration (R/W)		If (CPUID.(EAX=10H, ECX=2):ECX.[2] = 1)
0	Enable (R/W) Set 1 to enable L2 CAT masks and CLOS to operate in Code and Data Prioritization (CDP) mode.	
63:1	Reserved. Attempts to write to reserved bits result in a #GP(0).	
Register Address: C83H, 3203	IA32_L3_IO_QOS_CFG	
L3 I/O QOS Configuration (R/W) This MSR is used to enable the I/O RDT features.		If (CPUID.(EAX=0FH, ECX=1):EAX.[10:9] = 1)
0	L3 I/O RDT Allocation Enable.	
1	L3 I/O RDT Monitoring Enable.

Register Address: 1200H–121FH, 4608–4639	IA32_LBR_x_INFO	
Last Branch Record Entry X Info Register (R/W) An attempt to read or write IA32_LBR_x_INFO such that x ≥ IA32_LBR_DEPTH.DEPTH will #GP.		
15:0	CYC_CNT The elapsed CPU cycles (saturating) since the last LBR was recorded. See Section 18.1.3.3.	Reset Value: 0
55:16	Undefined, may be zero or non-zero. Writes of non- zero values do not fault, but reads may return a different value.	Reset Value: 0

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
59:56	BR_TYPE The branch type recorded by this LBR. Encodings: 0000B: COND 0001B: JMP Indirect 0010B: JMP Direct 0011B: CALL Indirect 0100B: CALL Direct 0101B: RET 011xB: Reserved 1xxxB: Other Branch	Reset Value: 0
60	CYC_CNT_VALID CYC_CNT value is valid. See Section 20.1.3.3.	Reset Value: 0
61	TSX_ABORT This LBR record is a TSX abort. On processors that do not support Intel TSX (CPUID.07H.EBX.HLE[bit 4]=0 and CPUID.07H.EBX.RTM[bit 11]=0), this bit is undefined.	Reset Value: 0
62	IN_TSX This LBR record records a branch that retired during a TSX transaction. On processors that do not support Intel TSX (CPUID.07H.EBX.HLE[bit 4]=0 and CPUID.07H.EBX.RTM[bit 11]=0), this bit is undefined.	Reset Value: 0
63	MISPRED The recorded branch direction (conditional branch) or target (indirect branch) was mispredicted.	Reset Value: 0
Register Address: 1400H, 5120	IA32_SEAMRR_BASE	
SEAM Memory Range Register for TDX - Base Address (R/W)		
2:0	Reserved.	
3	CONFIGURED Set to 1 by BIOS if range is configured.	
24:4	Reserved.	
51:25	BASE SEAM Range Register BASE address.	
63:52	Reserved.	
Register Address: 1401H, 5121	IA32_SEAMRR_MASK	
SEAM Memory Range Register for TDX (R/W)		
9:0	Reserved.	
10	LOCK Set by BIOS to indicate range is configured and locked.	
24:11	Reserved.	
51:25	MASK Mask value for SEAMRR matching. Lowest granularity is 32M.	
63:52	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
Register Address: 1406H, 5126	IA32_MCU_CONTROL	
MCU Control (R/W) Controls the behavior of the Microcode Update Trigger MSR, IA32_BIOS_UPDT_TRIG.		If CPUID.07H.0H:EDX[29]=1 && IA32_ARCH_CAPABILITIES.MCU_CONTROL=1
0	LOCK Once set, further writes to this MSR will cause a #GP(0) fault. Bypassed during SMM if EN_SMM_BYPASS (bit 2) is set.	
1	DIS_MCU_LOAD If this bit is set on a given logical processor, then any subsequent attempts to load a microcode update by that logical processor will be silently dropped (WRMSR 0x79 has no effect).	
2	EN_SMM_BYPASS If set, then writes to IA32_MCU_CONTROL are allowed during SMM regardless of the LOCK bit. This enables BIOS to Opt-In to the SMM Bypass functionality.	
63:3	Reserved.	
Register Address: 14CEH, 5326	IA32_LBR_CTL	
Last Branch Record Enabling and Configuration Register (R/W)		
0	LBREn When set, enables LBR recording.	Reset Value: 0
1	OS When set, allows LBR recording when CPL == 0.	Reset Value: 0
2	USR When set, allows LBR recording when CPL != 0.	Reset Value: 0
3	CALL_STACK When set, records branches in call-stack mode. See Section 20.1.2.4.	Reset Value: 0
15:4	Reserved.	Reset Value: 0
16	COND When set, records taken conditional branches. See Section 20.1.2.3.	
17	NEAR_REL_JMP When set, records near relative JMPs. See Section 20.1.2.3.	
18	NEAR_IND_JMP When set, records near indirect JMPs. See Section 20.1.2.3.	
19	NEAR_REL_CALL When set, records near relative CALLs. See Section 20.1.2.3.	
20	NEAR_IND_CALL When set, records near indirect CALLs. See Section 20.1.2.3.	
21	NEAR_RET When set, records near RETs. See Section 20.1.2.3.	
22	OTHER_BRANCH When set, records other branches. See Section 20.1.2.3.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
63:23	Reserved.	
Register Address: 14CFH, 5327	IA32_LBR_DEPTH	
Last Branch Record Maximum Stack Depth Register (R/W)		
N:0	DEPTH The number of LBRs to be used for recording. Supported values are indicated by the bitmap in CPUID.(EAX=01CH,ECX=0):EAX[7:0]. The reset value will match the maximum supported by the CPU. Writes of unsupported values will #GP fault.	Reset Value: Varies
63:N+1	Reserved.	Reset Value: 0
Register Address: 1500H—151FH, 5376—5407	IA32_LBR_x_FROM_IP	
Last Branch Record entry X source IP register (R/W). An attempt to read or write IA32_LBR_x_FROM_IP such that x ≥ IA32_LBR_DEPTH.DEPTH will #GP.		
63:0	FROM_IP The source IP of the recorded branch or event, in canonical form. Writes to bits above MAXLINADDR-1 are ignored.	Reset Value: 0
Register Address: 1600H—161FH, 5632—5663	IA32_LBR_x_TO_IP	
Last Branch Record Entry X Destination IP Register (R/W) An attempt to read or write IA32_LBR_x_TO_IP such that x ≥ IA32_LBR_DEPTH.DEPTH will #GP.		
63:0	TO_IP The destination IP of the recorded branch or event, in canonical form. Writes to bits above MAXLINADDR-1 are ignored.	Reset Value: 0
Register Address: 17D0H, 6096	IA32_HW_FEEDBACK_PTR	
Hardware Feedback Interface Pointer		If CPUID.06H:EAX.[19] = 1
0	Valid (R/W) When set to 1, indicates a valid pointer is programmed into the ADDR field of the MSR.	
11:1	Reserved.	
(MAXPHYADDR-1):12	ADDR (R/W) Physical address of the page frame of the first page of the hardware feedback interface structure.	
63:MAXPHYADDR	Reserved.	
Register Address: 17D1H, 6097	IA32_HW_FEEDBACK_CONFIG	
Hardware Feedback Interface Configuration		If CPUID.06H:EAX.[19] = 1
0	Enable (R/W) When set to 1, enables the hardware feedback interface.	
63:1	Reserved.	
Register Address: 17D2H, 6098	IA32_THREAD_FEEDBACK_CHAR	
Thread Feedback Characteristics (R/O)		If CPUID.06H:EAX.[23] = 1
7:0	Application Class ID, pointing into the Intel Thread Director structure.	
62:8	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
63	Valid bit. When set to 1 the OS Scheduler can use the Class ID (in bits 7:0) for its scheduling decisions. If this bit is 0, the Class ID field should be ignored. It is recommended that the OS uses the last known Class ID of the software thread for its scheduling decisions.	
Register Address: 17D4H, 6100	IA32_HW_FEEDBACK_THREAD_CONFIG	
Hardware Feedback Thread Configuration (R/W)		
0	Enables Intel Thread Director. When set to 1, logical processor scope Intel Thread Director is enabled. Default is 0 (disabled).	
63:1	Reserved.	
Register Address: 17DAH, 6106	IA32_HRESET_ENABLE	
History Reset Enable (R/W)		
0	Enable reset of the Intel Thread Director history.	
31:1	Reserved for other capabilities that can be reset by the HRESET instruction.	
63:32	Reserved.	
Register Address: 1900H, 6400	IA32_PMC_GP0_CTR	
Full Width Writable General Performance Counter 0 (R/W)		If CPUID.0AH:EAX[15:8] > 0 and IA32_PERF_CAPABILITIES[13] =1
47:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:48	Reserved.	
Register Address: 1901H, 6401	IA32_PMC_GP0_CFG_A	
IA32_PMC_GP0_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 0.		If CPUID.0AH:EAX[15:8] > 0
7:0	EVENT_SELECT Selects a performance event logic unit.	
15:8	UMASK Qualifies the microarchitectural condition to detect on the selected event logic.	
16	USR When set, events are counted only when the processor is operating at privilege levels 1, 2 or 3. This flag can be used in conjunction with the OS flag.	
17	OS When set, events are counted only when the processor is operating at privilege level 0. This flag can be used in conjunction with the USER flag.	
18	EDGE When set, enables edge detection of events.	
19	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
20	INT When set, the processor generates an exception through its local APIC on counter overflow for this counter's thread.	
21	ANYTHREAD If CPUID.A0H.EDX[15] is 1, then this bit is deprecated. When set to 1, it enables counting the associated event conditions occurring across all logical processors sharing a processor core. When set to 0, the counter only increments the associated event conditions occurring in the logical processor which programmed the MSR.	
22	ENABLE When set, performance counting is enabled in the performance-monitoring counter; when clear, the counter is disabled.	
23	INVERT Inverts the result of the counter-mask (CMASK) comparison when set, so that both greater than equal to and less than comparisons can be made. 0: The comparison is: threshold is greater than or equal to the event 1: The comparison is inverted: threshold is less than event.	
31:24	CMASK When CMASK is not zero, the corresponding performance counter increments by 1 each cycle if the event count is >= CMASK. This mask enables counting cycles in which multiple occurrences happen (for example, two or more instructions retired per clock).	
34:32	Reserved.	
35	EN_LBR_LOG When set enables updating LBRs with that counters event occurrences, if selected event is precise.	
36	EQUAL When EQ flag is set and the INV flag is clear, the comparison evaluates to true if the selected performance monitoring event (the event) is equal to the specified Counter Mask value (CMask). When EQ flag is set and INV flag is set, the comparison evaluates to true if the event is less-than the CMask value and the event is not zero. Note if CMask is zero, the EQ flag is ignored.	
39:37	Reserved.	
47:40	UMASK2 Unit mask 2 (UMASK2) field (bits 40 through 47) - These bits qualify the condition that the selected event logic unit detects. Valid UMASK2 values for each event logic unit are specific to the unit. The new UMASK2 field may also be used in conjunction with UMASK.	
63:48	Reserved.	
Register Address: 1903H, 6403	IA32_PMC_GP0_CFG_C	
IA32_PMC_GP0_CFG_C (R/W) Extended Perf event selector for GP counter 0.		

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 1904H, 6404	IA32_PMC_GP1_CTR	
Full Width Writable General Performance Counter 1 (R/W) See IA32_PMC_GP0_CTR (1900H) for reference; similar format.		If CPUID.0AH:EAX[15:8] > 1 and IA32_PERF_CAPABILITIES[13]=1
Register Address: 1905H, 6405	IA32_PMC_GP1_CFG_A	
IA32_PMC_GP1_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 1. See IA32_PMC_GP0_CFG_A (1901H) for reference; similar format.		If CPUID.0AH:EAX[15:8] > 1
Register Address: 1907H, 6407	IA32_PMC_GP1_CFG_C	
IA32_PMC_GP1_CFG_C (R/W) Extended Perf event selector for GP counter 1. See IA32_PMC_GP0_CFG_C (1903H) for reference; similar format.		
Register Address: 1908H, 6408	IA32_PMC_GP2_CTR	
Full Width Writable General Performance Counter 2 (R/W) See IA32_PMC_GP0_CTR (1900H) for reference; similar format.		If CPUID.0AH:EAX[15:8] > 2 and IA32_PERF_CAPABILITIES[13]=1
Register Address: 1909H, 6409	IA32_PMC_GP2_CFG_A	
IA32_PMC_GP2_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 2. See IA32_PMC_GP0_CFG_A (1901H) for reference; similar format.		If CPUID.0AH:EAX[15:8] > 2
Register Address: 190AH, 6410	IA32_PMC_GP2_CFG_B	
IA32_PMC_GP2_CFG_B (R/W) GP counter reload configuration register.		
1:0	Reserved.	
2	RELOAD_PMC2 Reload GP2 when GP2 overflows.	
3	RELOAD_PMC3 Reload GP2 when GP3 overflows.	
4	RELOAD_PMC4 Reload GP2 when GP4 overflows.	
5	RELOAD_PMC5 Reload GP2 when GP5 overflows.	
6	RELOAD_PMC6 Reload GP2 when GP6 overflows.

Bit Fields	**MSR/Bit Description**	**Comment**
Fixed-Function Performance Counter 4 (R/W) Top-down bad speculation.		If CPUID.0AH:EDX[4:0] >4
47:0	FIXED_COUNTER Top-down bad speculation counter.	
63:48	Reserved.	
Register Address: 1993H, 6547	IA32_PMC_FX4_CFG_C	
Extended Perf Event Selector for Fixed-Function Counter 4 (R/W)		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 1994H, 6548	IA32_PMC_FX5_CTR	
Fixed-Function Performance Counter 5 (R/W) Top-down frontend bound.		If CPUID.0AH:EDX[4:0] >5
47:0	FIXED_COUNTER Top-down frontend-bound counter.	
63:48	Reserved.	
Register Address: 1997H, 6551	IA32_PMC_FX5_CFG_C	
Extended Perf Event Selector for Fixed-Function Counter 5 (R/W)		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 1998H, 6552	IA32_PMC_FX6_CTR	
Fixed-Function Performance Counter 6 (R/W) Top-down retiring.		If CPUID.0AH:EDX[4:0] >6
47:0	FIXED_COUNTER Top-down retiring counter.	
63:48	Reserved.	
Register Address: 199BH, 6555	IA32_PMC_FX6_CFG_C	
Extended Perf Event Selector for Fixed-Function Counter 6 (R/W)		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 1B01H, 6913	IA32_UARCH_MISC_CTL	
IA32_UARCH_MISC_CTL (R/W)		If IA32_ARCH_CAPABILITIES[12]=1
0	Data Operand Independent Timing Mode (DOITM).	If IA32_ARCH_CAPABILITIES[12]=1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal	Architectural MSR Name (Former MSR Name)	
Bit Fields	**MSR/Bit Description**	**Comment**
63:1	Reserved.	
Register Address: 4000_0000H—4000_00FFH	Reserved MSR Address Space	
All existing and future processors will not implement MSRs in this range.		
Register Address: C000_0080H	IA32_EFER	
Extended Feature Enables		If (CPUID.80000001H:EDX.[20] || CPUID.80000001H:EDX.[29])
0	SYSCALL Enable: IA32_EFER.SCE (R/W) Enables SYSCALL/SYSRET instructions in 64-bit mode.	
7:1	Reserved.	
8	IA-32e Mode Enable: IA32_EFER.LME (R/W) Enables IA-32e mode operation.	
9	Reserved.	
10	IA-32e Mode Active: IA32_EFER.LMA (R) Indicates IA-32e mode is active when set.	
11	Execute Disable Bit Enable: IA32_EFER.NXE (R/W)	
63:12	Reserved.	
Register Address: C000_0081H	IA32_STAR	
System Call Target Address (R/W)		If CPUID.80000001:EDX.[29] = 1
Register Address: C000_0082H	IA32_LSTAR	
IA-32e Mode System Call Target Address (R/W) Target RIP for the called procedure when SYSCALL is executed in 64-bit mode.		If CPUID.80000001:EDX.[29] = 1
Register Address: C000_0083H	IA32_CSTAR	
IA-32e Mode System Call Target Address (R/W) Not used, as the SYSCALL instruction is not recognized in compatibility mode.		If CPUID.80000001:EDX.[29] = 1
Register Address: C000_0084H	IA32_FMASK	
System Call Flag Mask (R/W)		If CPUID.80000001:EDX.[29] = 1
Register Address: C000_0100H	IA32_FS_BASE	
Map of BASE Address of FS (R/W)		If CPUID.80000001:EDX.[29] = 1
Register Address: C000_0101H	IA32_GS_BASE	
Map of BASE Address of GS (R/W)		If CPUID.80000001:EDX.[29] = 1
Register Address: C000_0102H	IA32_KERNEL_GS_BASE	
Swap Target of BASE Address of GS (R/W)		If CPUID.80000001:EDX.[29] = 1
Register Address: C000_0103H	IA32_TSC_AUX	
Auxiliary TSC (R/W)		If CPUID.80000001H: EDX[27] = 1 or CPUID.(EAX=7,ECX=0):ECX[bit 22] = 1
31:0	AUX: Auxiliary signature of TSC.	
63:32	Reserved.	

NOTES:

1. Some older processors may have supported this MSR as model-specific and do not enumerate it with CPUID.
2. In processors based on Intel NetBurst® microarchitecture, MSR addresses 180H-197H are supported, software must treat them as model-specific. Starting with Intel Core Duo processors, MSR addresses 180H-185H, 188H-197H are reserved.
3. The *_ADDR MSRs may or may not be present; this depends on flag settings in IA32_MC*i*_STATUS. See Section 17.3.2.3 and Section 17.3.2.4 for more information.
4. MAXPHYADDR is reported by CPUID.80000008H:EAX[7:0].
5. Further details on Key Locker and usage of this MSR can be found here:
   https://software.intel.com/content/www/us/en/develop/download/intel-key-locker-specification.html.

2.2 MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY

Table 2-3 lists model-specific registers (MSRs) for the Intel Core 2 processor family and for Intel Xeon processors based on Intel Core microarchitecture, architectural MSR addresses are also included in Table 2-3. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_0FH, see Table 2-1.

MSRs listed in Table 2-2 and Table 2-3 are also supported by processors based on the Enhanced Intel Core microarchitecture. Processors based on the Enhanced Intel Core microarchitecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_17H.

The column "Shared/Unique" applies to multi-core processors based on Intel Core microarchitecture. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors."		Unique
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors."		Unique
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Unique
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and Table 2-2.		Unique
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2.		Shared
Register Address: 17H, 23	MSR_PLATFORM_ID	
Model Specific Platform ID (R)		Shared
7:0	Reserved.	
12:8	Maximum Qualified Ratio (R) The maximum allowed bus ratio.	
49:13	Reserved.	
52:50	See Table 2-2.	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
63:53	Reserved.	
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Unique
Register Address: 2AH, 42	MSR_EBL_CR_POWERON	
Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.		Shared
0	Reserved.	
1	Data Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processors implement R/W.	
2	Response Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
3	MCERR# Drive Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processors implement R/W.	
4	Address Parity Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processors implement R/W.	
5	Reserved.	
6	Reserved.	
7	BINIT# Driver Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processors implement R/W.	
8	Output Tri-state Enabled (R/O) 1 = Enabled; 0 = Disabled.	
9	Execute BIST (R/O) 1 = Enabled; 0 = Disabled.	
10	MCERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled.	
11	Intel TXT Capable Chipset. (R/O) 1 = Present; 0 = Not Present.	
12	BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled.	
13	Reserved.	
14	1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes.	
15	Reserved.	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
17:16	APIC Cluster ID (R/O)	
18	N/2 Non-Integer Bus Ratio (R/O) 0 = Integer ratio; 1 = Non-integer ratio.	
19	Reserved.	
21: 20	Symmetric Arbitration ID (R/O)	
26:22	Integer Bus Frequency Ratio (R/O)	
Register Address: 3AH, 58	MSR_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Unique
3	SMRR Enable (R/WL) When this bit is set and the lock bit is set, this makes the SMRR_PHYS_BASE and SMRR_PHYS_MASK registers read visible and writeable while in SMM.	Unique
Register Address: 40H, 64	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of four pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ Section 19.5.		Unique
Register Address: 41H, 65	MSR_LASTBRANCH_1_FROM_IP	
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 42H, 66	MSR_LASTBRANCH_2_FROM_IP	
Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 43H, 67	MSR_LASTBRANCH_3_FROM_IP	
Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 60H, 96	MSR_LASTBRANCH_0_TO_IP	
Last Branch Record 0 To IP (R/W) One of four pairs of last branch record registers on the last branch record stack. This To_IP part of the stack contains pointers to the destination instruction.		Unique
Register Address: 61H, 97	MSR_LASTBRANCH_1_TO_IP	
Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 62H, 98	MSR_LASTBRANCH_2_TO_IP	
Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 63H, 99	MSR_LASTBRANCH_3_TO_IP	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Unique
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Unique
Register Address: A0H, 160	MSR_SMRR_PHYSBASE	
System Management Mode Base Address register (WO in SMM) Model-specific implementation of SMRR-like interface, read visible and write only in SMM.		Unique
11:0	Reserved.	
31:12	PhysBase: SMRR physical Base Address.	
63:32	Reserved.	
Register Address: A1H, 161	MSR_SMRR_PHYSMASK	
System Management Mode Physical Address Mask register (WO in SMM) Model-specific implementation of SMRR-like interface, read visible and write only in SMM.		Unique
10:0	Reserved.	
11	Valid: Physical address base and range mask are valid.	
31:12	PhysMask: SMRR physical address range mask.	
63:32	Reserved.	
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Unique
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Unique
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Intel Core microarchitecture.		Shared
2:0	▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) ▪ 010B: 200 MHz (FSB 800) ▪ 000B: 267 MHz (FSB 1067) ▪ 100B: 333 MHz (FSB 1333)	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
	133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B. 266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 000B. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 100B.	
63:3	Reserved.	
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Enhanced Intel Core microarchitecture.		Shared
2:0	▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) ▪ 010B: 200 MHz (FSB 800) ▪ 000B: 267 MHz (FSB 1067) ▪ 100B: 333 MHz (FSB 1333) ▪ 110B: 400 MHz (FSB 1600) 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B. 266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 110B. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 111B.	
63:3	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: FEH, 254	IA32_MTRRCAP	
See Table 2-2.		Unique
11	SMRR Capability Using MSR 0A0H and 0A1H (R)	Unique
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Unique
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Unique

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Unique
Register Address: 179H, 377	IA32_MCG_CAP	
See Table 2-2.		Unique
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Unique
0	RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.	
1	EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved.	
Register Address: 186H, 390	IA32_PERFEVTSEL0	
See Table 2-2.		Unique
Register Address: 187H, 391	IA32_PERFEVTSEL1	
See Table 2-2.		Unique
Register Address: 198H, 408	IA32_PERF_STATUS	
See Table 2-2.		Shared
Register Address: 198H, 408	MSR_PERF_STATUS	
Current performance status. See Section 16.1.1, "Software Interface For Initiating Performance State Transitions."		Shared
15:0	Current Performance State Value	
30:16	Reserved.	
31	XE Operation (R/O). If set, XE operation is enabled. Default is cleared.	
39:32	Reserved.	
44:40	Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.	
45	Reserved.	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
46	Non-Integer Bus Ratio (R/O) Indicates non-integer bus ratio is enabled. Applies processors based on Enhanced Intel Core microarchitecture.	
63:47	Reserved.	
Register Address: 199H, 409	IA32_PERF_CTL	
See Table 2-2.		Unique
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.		Unique
Register Address: 19BH, 411	IA32_THERM_INTERRUPT	
Thermal Interrupt Control (R/W) See Table 2-2.		Unique
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Unique
Register Address: 19DH, 413	MSR_THERM2_CTL	
Thermal Monitor 2 Control		Unique
15:0	Reserved.	
16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle). 1 = Thermal Monitor 2 (thermally-initiated frequency transitions). If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 are enabled.	
63:16	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
0	Fast-Strings Enable See Table 2-2.	
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2.	Unique
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Shared

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
8	Reserved.	
9	Hardware Prefetcher Disable (R/W) When set, disables the hardware prefetcher operation on streams of data. When clear (default), enables the prefetch queue. Disabling of the hardware prefetcher may impact processor performance.	
10	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor. 0 = Indicates compatible FERR# signaling behavior. This bit must be set to 1 to support XAPIC interrupt model usage.	Shared
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Shared
12	Processor Event Based Sampling Unavailable (R/O) See Table 2-2.	Shared
13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.1:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.	Shared
15:14	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.	Shared
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Shared
19	Adjacent Cache Line Prefetch Disable (R/W) When set to 1, the processor fetches the cache line that contains data currently required by the processor. When set to 0, the processor fetches cache lines that comprise a cache line pair (128 bytes). Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit.	Shared

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
20	Enhanced Intel SpeedStep Technology Select Lock (R/WO) When set, this bit causes the following bits to become read-only: ▪ Enhanced Intel SpeedStep Technology Select Lock (this bit). ▪ Enhanced Intel SpeedStep Technology Enable bit. The bit must be set before an Enhanced Intel SpeedStep Technology transition is requested. This bit is cleared on reset.	Shared
21	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2.	Shared
23	xTPR Message Disable (R/W) See Table 2-2.	Shared
33:24	Reserved.	
34	XD Bit Disable (R/W) When set to 1, the Execute Disable Bit feature (XD Bit) is disabled and the XD Bit extended feature flag will be clear (CPUID.80000001H: EDX[20]=0). When set to a 0 (default), the Execute Disable Bit feature (if available) allows the OS to enable PAE paging and take advantage of data only pages. BIOS must not alter the contents of this bit location if XD bit is not supported. Writing this bit to 1 when the XD Bit extended feature flag is set to 0 may generate a #GP exception.	Unique
36:35	Reserved.	
37	DCU Prefetcher Disable (R/W) When set to 1, the DCU L1 data cache prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature. The DCU prefetcher is an L1 data cache prefetcher. When the DCU prefetcher detects multiple loads from the same line done within a time limit, the DCU prefetcher assumes the next line will be required. The next line is prefetched in to the L1 data cache from memory or L2.	Unique
38	IDA Disable (R/W) When set to 1 on processors that support IDA, the Intel Dynamic Acceleration feature (IDA) is disabled and the IDA_Enable feature flag will be cleared (CPUID.06H: EAX[1]=0). When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of IDA is enabled. Note: The power-on default value is used by BIOS to detect hardware support of IDA. If the power-on default value is 1, IDA is available in the processor. If the power-on default value is 0, IDA is not available.	Shared

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
39	IP Prefetcher Disable (R/W) When set to 1, the IP prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature. The IP prefetcher is an L1 data cache prefetcher. The IP prefetcher looks for sequential load history to determine whether to prefetch the next expected data into the L1 cache from memory or L2.	Unique
63:40	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).		Unique
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W) See Table 2-2.		Unique
Register Address: 1DDH, 477	MSR_LER_FROM_LIP	
Last Exception Record From Linear IP (R/W) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 1DEH, 478	MSR_LER_TO_LIP	
Last Exception Record To Linear IP (R/W) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 200H, 512	IA32_MTRR_PHYSBASE0	
See Table 2-2.		Unique
Register Address: 201H, 513	IA32_MTRR_PHYSMASK0	
See Table 2-2.		Unique
Register Address: 202H, 514	IA32_MTRR_PHYSBASE1	
See Table 2-2.		Unique
Register Address: 203H, 515	IA32_MTRR_PHYSMASK1	
See Table 2-2.		Unique
Register Address: 204H, 516	IA32_MTRR_PHYSBASE2	
See Table 2-2.		Unique
Register Address: 205H, 517	IA32_MTRR_PHYSMASK2	
See Table 2-2.		Unique
Register Address: 206H, 518	IA32_MTRR_PHYSBASE3	
See Table 2-2.		Unique
Register Address: 207H, 519	IA32_MTRR_PHYSMASK3	
See Table 2-2.		Unique

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 390H, 912	IA32_PERF_GLOBAL_OVF_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 390H, 912	MSR_PERF_GLOBAL_OVF_CTRL	
See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)	
See Table 2-2. See Section 21.6.2.4, "Processor Event Based Sampling (PEBS)."		Unique
0	Enable PEBS on IA32_PMC0. (R/W)	
Register Address: 400H, 1024	IA32_MC0_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Unique
Register Address: 401H, 1025	IA32_MC0_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 402H, 1026	IA32_MC0_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 404H, 1028	IA32_MC1_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Unique
Register Address: 405H, 1029	IA32_MC1_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 406H, 1030	IA32_MC1_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 408H, 1032	IA32_MC2_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Unique
Register Address: 409H, 1033	IA32_MC2_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 40AH, 1034	IA32_MC2_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 40CH, 1036	IA32_MC4_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Unique
Register Address: 40DH, 1037	IA32_MC4_STATUS	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 40EH, 1038	IA32_MC4_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 410H, 1040	IA32_MC3_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		
Register Address: 411H, 1041	IA32_MC3_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		
Register Address: 412H, 1042	IA32_MC3_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 413H, 1043	IA32_MC3_MISC	
Machine Check Error Reporting Register: Contains additional information describing the machine-check error if the MISCV flag in the IA32_MCi_STATUS register is set.		Unique
Register Address: 414H, 1044	IA32_MC5_CTL	
Machine Check Error Reporting Register: Controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).		Unique
Register Address: 415H, 1045	IA32_MC5_STATUS	
Machine Check Error Reporting Register: Contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.		Unique
Register Address: 416H, 1046	IA32_MC5_ADDR	
Machine Check Error Reporting Register: Contains the address of the code or data memory location that produced the machine-check error if the ADDRV flag in the IA32_MCi_STATUS register is set.		Unique
Register Address: 417H, 1047	IA32_MC5_MISC	
Machine Check Error Reporting Register: Contains additional information describing the machine-check error if the MISCV flag in the IA32_MCi_STATUS register is set.		Unique
Register Address: 419H, 1045	IA32_MC6_STATUS	
Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 25.		Unique
Register Address: 480H, 1152	IA32_VMX_BASIC	
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information."		Unique
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTLS	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2. See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTLS	
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 483H, 1155	IA32_VMX_EXIT_CTLS	
Capability Reporting Register of VM-Exit Controls (R/O) See Table 2-2. See Appendix A.4, "VM-Exit Controls."		Unique
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTLS	
Capability Reporting Register of VM-Entry Controls (R/O) See Table 2-2. See Appendix A.5, "VM-Entry Controls."		Unique
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2. See Appendix A.6, "Miscellaneous Data."		Unique
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Unique
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Unique
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Unique
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Unique
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2. See Appendix A.9, "VMCS Enumeration."		Unique
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLS2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 600H, 1536	IA32_DS_AREA	
DS Save Area (R/W) See Table 2-2. See Section 21.6.3.4, "Debug Store (DS) Mechanism."		Unique
Register Address: 107CCH, 67532	MSR_EMON_L3_CTR_CTL0	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
GBUSQ Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107CDH, 67533	MSR_EMON_L3_CTR_CTL1	
GBUSQ Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107CEH, 67534	MSR_EMON_L3_CTR_CTL2	
GSNPQ Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107CFH, 67535	MSR_EMON_L3_CTR_CTL3	
GSNPQ Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D0H, 67536	MSR_EMON_L3_CTR_CTL4	
FSB Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D1H, 67537	MSR_EMON_L3_CTR_CTL5	
FSB Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D2H, 67538	MSR_EMON_L3_CTR_CTL6	
FSB Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D3H, 67539	MSR_EMON_L3_CTR_CTL7	
FSB Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D8H, 67544	MSR_EMON_L3_GL_CTL	
L3/FSB Common Control Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: C000_0080H	IA32_EFER	
Extended Feature Enables See Table 2-2.		Unique
Register Address: C000_0081H	IA32_STAR	
System Call Target Address (R/W) See Table 2-2.		Unique
Register Address: C000_0082H	IA32_LSTAR	
IA-32e Mode System Call Target Address (R/W) See Table 2-2.		Unique
Register Address: C000_0084H	IA32_FMASK	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
System Call Flag Mask (R/W) See Table 2-2.		Unique
Register Address: C000_0100H	IA32_FS_BASE	
Map of BASE Address of FS (R/W) See Table 2-2.		Unique
Register Address: C000_0101H	IA32_GS_BASE	
Map of BASE Address of GS (R/W) See Table 2-2.		Unique
Register Address: C000_0102H	IA32_KERNEL_GS_BASE	
Swap Target of BASE Address of GS (R/W) See Table 2-2.		Unique

2.3 MSRS IN THE 45 NM AND 32 NM INTEL ATOM® PROCESSOR FAMILY

Table 2-4 lists model-specific registers (MSRs) for 45 nm and 32 nm Intel Atom processors, architectural MSR addresses are also included in Table 2-4. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_1CH, 06_26H, 06_27H, 06_35H, or 06_36H; see Table 2-1.

The column "Shared/Unique" applies to logical processors sharing the same core in processors based on the Intel Atom microarchitecture. "Unique" means each logical processor has a separate MSR, or a bit field in an MSR governs only a logical processor. "Shared" means the MSR or the bit field in an MSR address governs the operation of both logical processors in the same core.

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors."		Shared
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors."		Shared
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Unique
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and see Table 2-2.		Unique
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2.		Shared
Register Address: 17H, 23	MSR_PLATFORM_ID	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Model Specific Platform ID (R)		Shared
7:0	Reserved.	
12:8	Maximum Qualified Ratio (R) The maximum allowed bus ratio.	
63:13	Reserved.	
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Unique
Register Address: 2AH, 42	MSR_EBL_CR_POWERON	
Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.		Shared
0	Reserved.	
1	Data Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
2	Response Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
3	AERR# Drive Enable (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
4	BERR# Enable for initiator bus requests (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
5	Reserved.	
6	Reserved.	
7	BINIT# Driver Enable (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
8	Reserved.	
9	Execute BIST (R/O) 1 = Enabled; 0 = Disabled.	
10	AERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled. Always 0.	
11	Reserved.	
12	BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled. Always 0.	
13	Reserved.	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
14	1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes.	
15	Reserved.	
17:16	APIC Cluster ID (R/O) Always 00B.	
19: 18	Reserved.	
21: 20	Symmetric Arbitration ID (R/O) Always 00B.	
26:22	Integer Bus Frequency Ratio (R/O)	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64Processor (R/W) See Table 2-2.		Unique
Register Address: 40H, 64	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ Section 19.5.		Unique
Register Address: 41H, 65	MSR_LASTBRANCH_1_FROM_IP	
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 42H, 66	MSR_LASTBRANCH_2_FROM_IP	
Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 43H, 67	MSR_LASTBRANCH_3_FROM_IP	
Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 44H, 68	MSR_LASTBRANCH_4_FROM_IP	
Last Branch Record 4 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 45H, 69	MSR_LASTBRANCH_5_FROM_IP	
Last Branch Record 5 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 46H, 70	MSR_LASTBRANCH_6_FROM_IP	
Last Branch Record 6 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 47H, 71	MSR_LASTBRANCH_7_FROM_IP	
Last Branch Record 7 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 60H, 96	MSR_LASTBRANCH_0_TO_IP	
Last Branch Record 0 To IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.		Unique
Register Address: 61H, 97	MSR_LASTBRANCH_1_TO_IP	
Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 62H, 98	MSR_LASTBRANCH_2_TO_IP	
Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 63H, 99	MSR_LASTBRANCH_3_TO_IP	
Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 64H, 100	MSR_LASTBRANCH_4_TO_IP	
Last Branch Record 4 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 65H, 101	MSR_LASTBRANCH_5_TO_IP	
Last Branch Record 5 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 66H, 102	MSR_LASTBRANCH_6_TO_IP	
Last Branch Record 6 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 67H, 103	MSR_LASTBRANCH_7_TO_IP	
Last Branch Record 7 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Shared
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Unique
Register Address: C1H, 193	IA32_PMC0	
Performance counter register See Table 2-2.		Unique
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Unique
Register Address: CDH, 205	MSR_FSB_FREQ	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Intel Atom microarchitecture.		Shared
2:0	▪ 111B: 083 MHz (FSB 333) ▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.	
63:3	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: FEH, 254	IA32_MTRRCAP	
Memory Type Range Register (R) See Table 2-2.		Shared
Register Address: 11EH, 281	MSR_BBL_CR_CTL3	
Control Register 3 Used to configure the L2 Cache.		Shared
0	L2 Hardware Enabled (R/O) 1 = Indicates the L2 is hardware-enabled. 0 = Indicates the L2 is hardware-disabled.	
7:1	Reserved.	
8	L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set, the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.	
22:9	Reserved.	
23	L2 Not Present (R/O) 0 = L2 Present. 1 = L2 Not Present.	
63:24	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Unique
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Unique

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Unique
Register Address: 179H, 377	IA32_MCG_CAP	
See Table 2-2.		Unique
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Unique
0	RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.	
1	EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved.	
Register Address: 186H, 390	IA32_PERFEVTSEL0	
See Table 2-2.		Unique
Register Address: 187H, 391	IA32_PERFEVTSEL1	
See Table 2-2.		Unique
Register Address: 198H, 408	IA32_PERF_STATUS	
See Table 2-2.		Shared
Register Address: 198H, 408	MSR_PERF_STATUS	
Performance Status		Shared
15:0	Current Performance State Value.	
39:16	Reserved.	
44:40	Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.	
63:45	Reserved.	
Register Address: 199H, 409	IA32_PERF_CTL	
See Table 2-2.		Unique
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.		Unique

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 19BH, 411	IA32_THERM_INTERRUPT	
Thermal Interrupt Control (R/W) See Table 2-2.		Unique
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Unique
Register Address: 19DH, 413	MSR_THERM2_CTL	
Thermal Monitor 2 Control		Shared
15:0	Reserved.	
16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle). 1 = Thermal Monitor 2 (thermally-initiated frequency transitions). If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 are enabled.	
63:17	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		Unique
0	Fast-Strings Enable See Table 2-2.	
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2. Default value is 0.	Unique
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Shared
8	Reserved.	
9	Reserved.	
10	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor. 0 = Indicates compatible FERR# signaling behavior. This bit must be set to 1 to support XAPIC interrupt model usage.	Shared
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Shared
12	Processor Event Based Sampling Unavailable (R/O) See Table 2-2.	Shared

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is cleared (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.1:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.	Shared
15:14	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.	Shared
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Shared
19	Reserved.	
20	Enhanced Intel SpeedStep Technology Select Lock (R/WO) When set, this bit causes the following bits to become read-only: ▪ Enhanced Intel SpeedStep Technology Select Lock (this bit). ▪ Enhanced Intel SpeedStep Technology Enable bit. The bit must be set before an Enhanced Intel SpeedStep Technology transition is requested. This bit is cleared on reset.	Shared
21	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2.	Unique
23	xTPR Message Disable (R/W) See Table 2-2.	Shared
33:24	Reserved.	
34	XD Bit Disable (R/W) See Table 2-3.	Unique
63:35	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-2) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).		Unique
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W) See Table 2-2.		Unique

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 1DDH, 477	MSR_LER_FROM_LIP	
Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 1DEH, 478	MSR_LER_TO_LIP	
Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 200H, 512	IA32_MTRR_PHYSBASE0	
See Table 2-2.		Shared
Register Address: 201H, 513	IA32_MTRR_PHYSMASK0	
See Table 2-2.		Shared
Register Address: 202H, 514	IA32_MTRR_PHYSBASE1	
See Table 2-2.		Shared
Register Address: 203H, 515	IA32_MTRR_PHYSMASK1	
See Table 2-2.		Shared
Register Address: 204H, 516	IA32_MTRR_PHYSBASE2	
See Table 2-2.		Shared
Register Address: 205H, 517	IA32_MTRR_PHYSMASK2	
See Table 2-2.		Shared

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 38DH, 909	IA32_FIXED_CTR_CTRL	
Fixed-Function-Counter Control Register (R/W) See Table 2-2.		Unique
Register Address: 38EH, 910	IA32_PERF_GLOBAL_STATUS	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 38FH, 911	IA32_PERF_GLOBAL_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 390H, 912	IA32_PERF_GLOBAL_OVF_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)	
See Table 2-2. See Section 21.6.2.4, "Processor Event Based Sampling (PEBS)."		Unique
0	Enable PEBS on IA32_PMC0 (R/W)	
Register Address: 400H, 1024	IA32_MC0_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Shared
Register Address: 401H, 1025	IA32_MC0_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Shared
Register Address: 402H, 1026	IA32_MC0_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Shared
Register Address: 404H, 1028	IA32_MC1_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Shared
Register Address: 405H, 1029	IA32_MC1_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Shared
Register Address: 408H, 1032	IA32_MC2_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Shared
Register Address: 409H, 1033	IA32_MC2_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Shared
Register Address: 40AH, 1034	IA32_MC2_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Shared
Register Address: 40CH, 1036	IA32_MC3_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Shared
Register Address: 40DH, 1037	IA32_MC3_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Shared

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 40EH, 1038	IA32_MC3_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Shared
Register Address: 410H, 1040	IA32_MC4_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Shared
Register Address: 411H, 1041	IA32_MC4_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Shared
Register Address: 412H, 1042	IA32_MC4_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Shared
Register Address: 480H, 1152	IA32_VMX_BASIC	
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information."		Unique
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTLS	
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2. See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTLS	
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 483H, 1155	IA32_VMX_EXIT_CTLS	
Capability Reporting Register of VM-Exit Controls (R/O) See Table 2-2. See Appendix A.4, "VM-Exit Controls."		Unique
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTLS	
Capability Reporting Register of VM-Entry Controls (R/O) See Table 2-2. See Appendix A.5, "VM-Entry Controls."		Unique
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2. See Appendix A.6, "Miscellaneous Data."		Unique
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Unique
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Unique
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Unique
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Unique
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2. See Appendix A.9, "VMCS Enumeration."		Unique
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLS2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 600H, 1536	IA32_DS_AREA	
DS Save Area (R/W) See Table 2-2. See Section 21.6.3.4, "Debug Store (DS) Mechanism."		Unique
Register Address: C000_0080H	IA32_EFER	
Extended Feature Enables See Table 2-2.		Unique
Register Address: C000_0081H	IA32_STAR	
System Call Target Address (R/W) See Table 2-2.		Unique
Register Address: C000_0082H	IA32_LSTAR	
IA-32e Mode System Call Target Address (R/W) See Table 2-2.		Unique
Register Address: C000_0084H	IA32_FMASK	
System Call Flag Mask (R/W) See Table 2-2.		Unique
Register Address: C000_0100H	IA32_FS_BASE	
Map of BASE Address of FS (R/W) See Table 2-2.		Unique
Register Address: C000_0101H	IA32_GS_BASE	
Map of BASE Address of GS (R/W) See Table 2-2.		Unique
Register Address: C000_0102H	IA32_KERNEL_GS_BASE	
Swap Target of BASE Address of GS (R/W) See Table 2-2.		Unique

Table 2-5 lists model-specific registers (MSRs) that are specific to Intel Atom® processor with a CPUID Signature DisplayFamily_DisplayModel value of 06_27H.

Table 2-5. MSRs Supported by Intel Atom® Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_27H

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 3F8H, 1016	MSR_PKG_C2_RESIDENCY	
Package C2 Residency Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C2 Residency Counter (R/O) Time that this package is in processor-specific C2 states since last reset. Counts at 1 Mhz frequency.	Package
Register Address: 3F9H, 1017	MSR_PKG_C4_RESIDENCY	
Package C4 Residency Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C4 Residency Counter. (R/O) Time that this package is in processor-specific C4 states since last reset. Counts at 1 Mhz frequency.	Package
Register Address: 3FAH, 1018	MSR_PKG_C6_RESIDENCY	
Package C6 Residency Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C6 Residency Counter. (R/O) Time that this package is in processor-specific C6 states since last reset. Counts at 1 Mhz frequency.	Package

2.4 MSRS IN INTEL PROCESSORS BASED ON SILVERMONT MICROARCHITECTURE

Table 2-6 lists model-specific registers (MSRs) common to Intel processors based on the Silvermont microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_37H, 06_4AH, 06_4DH, 06_5AH, or 06_5DH; see Table 2-1. The MSRs listed in Table 2-6 are also common to processors based on the Airmont microarchitecture and newer microarchitectures for next generation Intel Atom processors.

Table 2-7 lists MSRs common to processors based on the Silvermont and Airmont microarchitectures, but not newer microarchitectures.

Table 2-8, Table 2-9, and Table 2-10 lists MSRs that are model-specific across processors based on the Silvermont microarchitecture.

In the Silvermont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Silvermont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID leaf 04H enumeration can be used to figure out which processors are in the same module. "Package" means all processor cores in the physical package share the same MSR or bit interface.

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors."		Module
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors."		Module
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Core
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and Table 2-2.		Core
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Core
Register Address: 2AH, 42	MSR_EBL_CR_POWERON	
Processor Hard Power-On Configuration (R/W) Writes ignored.		Module
63:0	Reserved.	
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/O)		Core
31:0	SMI Count (R/O) Running count of SMI events since last RESET.	
63:32	Reserved.	
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Core
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Core
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Core
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Core
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Redirection in C-state (R/W) See http://biosbits.org.		Module

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
15:0	LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 100b - C4 is the max C-State to include 110b - C6 is the max C-State to include 111b - C7 is the max C-State to include	
63:19	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Core
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Core
Register Address: FEH, 254	IA32_MTRRCAP	
Memory Type Range Register (R) See Table 2-2.		Core
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction sets availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note: AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Core
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Core
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Core
Register Address: 179H, 377	IA32_MCG_CAP	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Table 2-2.		Core
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Core
0	RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.	
1	EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved.	
Register Address: 186H, 390	IA32_PERFEVTSEL0	
See Table 2-2.		Core
7:0	Event Select	
15:8	UMask	
16	USR	
17	OS	
18	Edge	
19	PC	
20	INT	
21	Reserved.	
22	EN	
23	INV	
31:24	CMASK	
63:32	Reserved.	
Register Address: 187H, 391	IA32_PERFEVTSEL1	
See Table 2-2.		Core
Register Address: 198H, 408	IA32_PERF_STATUS	
See Table 2-2.		Module
Register Address: 199H, 409	IA32_PERF_CTL	
See Table 2-2.		Core
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Clock Modulation (R/W) See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.		Core
Register Address: 19BH, 411	IA32_THERM_INTERRUPT	
Thermal Interrupt Control (R/W) See Table 2-2.		Core
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Core
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target		Package
15:0	Reserved.	
23:16	Temperature Target (R) The default thermal throttling or PROCHOT# activation temperature in degrees C. The effective temperature for thermal throttling or PROCHOT# activation is "Temperature Target" + "Target Offset".	
29:24	Target Offset (R/W) Specifies an offset in degrees C to adjust the throttling and PROCHOT# activation temperature from the default target specified in TEMPERATURE_TARGET (bits 23:16).	
63:30	Reserved.	
Register Address: 1A6H, 422	MSR_OFFCORE_RSP_0	
Offcore Response Event Select Register (R/W)		Module
Register Address: 1A7H, 423	MSR_OFFCORE_RSP_1	
Offcore Response Event Select Register (R/W)		Module
Register Address: 1B0H, 432	IA32_ENERGY_PERF_BIAS	
See Table 2-2.		Core
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W) See Table 2-2.		Core
Register Address: 1DDH, 477	MSR_LER_FROM_LIP	
Last Exception Record From Linear IP (R/W) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Core
Register Address: 1DEH, 478	MSR_LER_TO_LIP	
Last Exception Record To Linear IP (R/W) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Core
Register Address: 1F2H, 498	IA32_SMRR_PHYSBASE	
See Table 2-2.		Core

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 1F3H, 499	IA32_SMRR_PHYSMASK	
See Table 2-2.		Core
Register Address: 200H, 512	IA32_MTRR_PHYSBASE0	
See Table 2-2.		Core
Register Address: 201H, 513	IA32_MTRR_PHYSMASK0	
See Table 2-2.		Core
Register Address: 202H, 514	IA32_MTRR_PHYSBASE1	
See Table 2-2.		Core
Register Address: 203H, 515	IA32_MTRR_PHYSMASK1	
See Table 2-2.		Core
Register Address: 204H, 516	IA32_MTRR_PHYSBASE2	
See Table 2-2.		Core
Register Address: 205H, 517	IA32_MTRR_PHYSMASK2	
See Table 2-2.		Core
Register Address: 206H, 518	IA32_MTRR_PHYSBASE3	
See Table 2-2.		Core
Register Address: 207H, 519	IA32_MTRR_PHYSMASK3	
See Table 2-2.		Core
Register Address: 208H, 520	IA32_MTRR_PHYSBASE4	
See Table 2-2.		Core
Register Address: 209H, 521	IA32_MTRR_PHYSMASK4	
See Table 2-2.		Core
Register Address: 20AH, 522	IA32_MTRR_PHYSBASE5

Fixed-Function Performance Counter Register 1 (R/W) See Table 2-2.		Core
Register Address: 30BH, 779	IA32_FIXED_CTR2	
Fixed-Function Performance Counter Register 2 (R/W) See Table 2-2.		Core
Register Address: 345H, 837	IA32_PERF_CAPABILITIES	
See Table 2-2. See Section 19.4.1, "IA32_DEBUGCTL MSR."		Core
Register Address: 38DH, 909	IA32_FIXED_CTR_CTRL	
Fixed-Function-Counter Control Register (R/W) See Table 2-2.		Core

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 38FH, 911	IA32_PERF_GLOBAL_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Core
Register Address: 3FDH, 1021	MSR_CORE_C6_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C6 Residency Counter (R/O) Value since last reset that this core is in processor-specific C6 states. Counts at the TSC Frequency.	
Register Address: 400H, 1024	IA32_MC0_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Module
Register Address: 401H, 1025	IA32_MC0_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Module
Register Address: 402H, 1026	IA32_MC0_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Module
Register Address: 404H, 1028	IA32_MC1_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Module
Register Address: 405H, 1029	IA32_MC1_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Module
Register Address: 408H, 1032	IA32_MC2_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Module
Register Address: 409H, 1033	IA32_MC2_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Module
Register Address: 40AH, 1034	IA32_MC2_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Module
Register Address: 40CH, 1036	IA32_MC3_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Core
Register Address: 40DH, 1037	IA32_MC3_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Core
Register Address: 40EH, 1038	IA32_MC3_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Core
Register Address: 410H, 1040	IA32_MC4_CTL	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Core
Register Address: 411H, 1041	IA32_MC4_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Core
Register Address: 412H, 1042	IA32_MC4_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Core
Register Address: 414H, 1044	IA32_MC5_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 415H, 1045	IA32_MC5_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Package
Register Address: 416H, 1046	IA32_MC5_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Package
Register Address: 480H, 1152	IA32_VMX_BASIC	
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information."		Core
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTLS	
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2. See Appendix A.3, "VM-Execution Controls."		Core
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTLS	
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Core
Register Address: 483H, 1155	IA32_VMX_EXIT_CTLS	
Capability Reporting Register of VM-Exit Controls (R/O) See Table 2-2. See Appendix A.4, "VM-Exit Controls."		Core
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTLS	
Capability Reporting Register of VM-Entry Controls (R/O) See Table 2-2. See Appendix A.5, "VM-Entry Controls."		Core
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2. See Appendix A.6, "Miscellaneous Data."		Core

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Core
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Core
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Core
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Core
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2. See Appendix A.9, "VMCS Enumeration."		Core
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLS2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Core
Register Address: 48CH, 1164	IA32_VMX_EPT_VPID_ENUM	
Capability Reporting Register of EPT and VPID (R/O) See Table 2-2.		Core
Register Address: 48DH, 1165	IA32_VMX_TRUE_PINBASED_CTLS	
Capability Reporting Register of Pin-Based VM-Execution Flex Controls (R/O) See Table 2-2.		Core
Register Address: 48EH, 1166	IA32_VMX_TRUE_PROCBASED_CTLS	
Capability Reporting Register of Primary Processor-based VM-Execution Flex Controls (R/O) See Table 2-2.		Core
Register Address: 48FH, 1167	IA32_VMX_TRUE_EXIT_CTLS	
Capability Reporting Register of VM-Exit Flex Controls (R/O) See Table 2-2.		Core
Register Address: 490H, 1168	IA32_VMX_TRUE_ENTRY_CTLS	
Capability Reporting Register of VM-Entry Flex Controls (R/O) See Table 2-2.		Core
Register Address: 491H, 1169	IA32_VMX_FMFUNC	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2.		Core
Register Address: 4C1H, 1217	IA32_A_PMC0	
See Table 2-2.		Core
Register Address: 4C2H, 1218	IA32_A_PMC1	
See Table 2-2.		Core
Register Address: 600H, 1536	IA32_DS_AREA	
DS Save Area (R/W) See Table 2-2 and Section 21.6.3.4, "Debug Store (DS) Mechanism."		Core
Register Address: 660H, 1632	MSR_CORE_C1_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C1 Residency Counter. (R/O) Value since last reset that this core is in processor-specific C1 states. Counts at the TSC frequency.	
Register Address: 6E0H, 1760	IA32_TSC_DEADLINE	
TSC Target of Local APIC's TSC Deadline Mode (R/W) See Table 2-2.		Core
Register Address: C000_0080H	IA32_EFER	
Extended Feature Enables See Table 2-2.		Core
Register Address: C000_0081H	IA32_STAR	
System Call Target Address (R/W) See Table 2-2.		Core
Register Address: C000_0082H	IA32_LSTAR	
IA-32e Mode System Call Target Address (R/W) See Table 2-2.		Core
Register Address: C000_0084H	IA32_FMASK	
System Call Flag Mask (R/W) See Table 2-2.		Core
Register Address: C000_0100H	IA32_FS_BASE	
Map of BASE Address of FS (R/W) See Table 2-2.		Core
Register Address: C000_0101H	IA32_GS_BASE	
Map of BASE Address of GS (R/W) See Table 2-2.		Core
Register Address: C000_0102H	IA32_KERNEL_GS_BASE	
Swap Target of BASE Address of GS (R/W) See Table 2-2.		Core

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: C000_0103H	IA32_TSC_AUX	
AUXILIARY TSC Signature (R/W) See Table 2-2.		Core

Table 2-7 lists model-specific registers (MSRs) that are common to Intel Atom® processors based on the Silvermont and Airmont microarchitectures but not newer microarchitectures.

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 17H, 23	MSR_PLATFORM_ID	
Model Specific Platform ID (R)		Module
7:0	Reserved.	
13:8	Maximum Qualified Ratio (R) The maximum allowed bus ratio.	
49:13	Reserved.	
52:50	See Table 2-2.	
63:33	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64Processor (R/W) See Table 2-2.		Core
0	Lock (R/WL)	
1	Reserved.	
2	Enable VMX outside SMX operation (R/WL)	
Register Address: 40H, 64	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ Section 19.5 and record format in Section 19.4.8.1.		Core
Register Address: 41H, 65	MSR_LASTBRANCH_1_FROM_IP	
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 42H, 66	MSR_LASTBRANCH_2_FROM_IP	
Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 43H, 67	MSR_LASTBRANCH_3_FROM_IP	
Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 44H, 68	MSR_LASTBRANCH_4_FROM_IP	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Last Branch Record 4 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 45H, 69	MSR_LASTBRANCH_5_FROM_IP	
Last Branch Record 5 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 46H, 70	MSR_LASTBRANCH_6_FROM_IP	
Last Branch Record 6 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 47H, 71	MSR_LASTBRANCH_7_FROM_IP	
Last Branch Record 7 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 60H, 96	MSR_LASTBRANCH_0_TO_IP	
Last Branch Record 0 To IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.		Core
Register Address: 61H, 97	MSR_LASTBRANCH_1_TO_IP	
Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 62H, 98	MSR_LASTBRANCH_2_TO_IP	
Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 63H, 99	MSR_LASTBRANCH_3_TO_IP	
Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 64H, 100	MSR_LASTBRANCH_4_TO_IP	
Last Branch Record 4 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 65H, 101	MSR_LASTBRANCH_5_TO_IP	
Last Branch Record 5 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 66H, 102	MSR_LASTBRANCH_6_TO_IP	
Last Branch Record 6 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 67H, 103	MSR_LASTBRANCH_7_TO_IP	
Last Branch Record 7 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information: Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the maximum frequency that does not require turbo. Frequency = ratio * Scalable Bus Frequency.	Package
63:16	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.		Module
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-sate support) 001b: C1 (Behavior is the same as 000b) 100b: C4 110b: C6 111b: C7 (Silvermont only)	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
63:16	Reserved.	
Register Address: 11EH, 281	MSR_BBL_CR_CTL3	
Control Register 3 Used to configure the L2 Cache.		Module
0	L2 Hardware Enabled (R/O) 1 = If the L2 is hardware-enabled. 0 = Indicates if the L2 is hardware-disabled.	
7:1	Reserved.	
8	L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.	
22:9	Reserved.	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
23	L2 Not Present (R/O) 0 = L2 Present. 1 = L2 Not Present.	
63:24	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
0	Fast-Strings Enable See Table 2-2.	Core
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2. Default value is 0.	Module
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Core
10:8	Reserved.	
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Core
12	Processor Event Based Sampling Unavailable (R/O) See Table 2-2.	Core
15:13	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.	Module
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Core
21:19	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2.	Core
23	xTPR Message Disable (R/W) See Table 2-2.	Module
33:24	Reserved.	
34	XD Bit Disable (R/W) See Table 2-3.	Core
37:35	Reserved.	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
38	Turbo Mode Disable (R/W) When set to 1 on processors that support Intel Turbo Boost Technology, the turbo mode feature is disabled and the IDA_Enable feature flag will be cleared (CPUID.06H: EAX[1]=0). When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of turbo mode is enabled. Note: The power-on default value is used by BIOS to detect hardware support of turbo mode. If the power-on default value is 1, turbo mode is available in the processor. If the power-on default value is 0, turbo mode is not available.	Module
63:39	Reserved.	
Register Address: 1C8H, 456	MSR_LBR_SELECT	
Last Branch Record Filtering Select Register (R/W) See Section 19.9.2, "Filtering of Last Branch Records."		Core
0	CPL_EQ_0	
1	CPL_NEQ_0	
2	JCC	
3	NEAR_REL_CALL	
4	NEAR_IND_CALL	
5	NEAR_RET	
6	NEAR_IND_JMP	
7	NEAR_REL_JMP	
8	FAR_BRANCH	
63:9	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-2) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 38EH, 910	IA32_PERF_GLOBAL_STATUS	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Core
Register Address: 390H, 912	IA32_PERF_GLOBAL_OVF_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Core
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)	
See Table 2-2. See Section 21.6.2.4, "Processor Event Based Sampling (PEBS)."		Core
0	Enable PEBS for precise event on IA32_PMC0 (R/W)	
Register Address: 3FAH, 1018	MSR_PKG_C6_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C6 Residency Counter (R/O) Value since last reset that this package is in processor-specific C6 states. Counts at the TSC Frequency.	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 664H, 1636	MSR_MC6_RESIDENCY_COUNTER	
Module C6 Residency Counter (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Module
63:0	Time that this module is in module-specific C6 states since last reset. Counts at 1 Mhz frequency.	

2.4.1 MSRs with Model-Specific Behavior in the Silvermont Microarchitecture

Table 2-8 lists MSRs that are specific to the Intel Atom® processor E3000 Series (CPUID Signature DisplayFamily_DisplayModel value of 06_37H) and Intel Atom processors (CPUID Signature DisplayFamily_DisplayModel value of 06_4AH, 06_5AH, or 06_5DH).

Table 2-8. Specific MSRs Supported by Intel Atom® Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_37H, 06_4AH, 06_5AH, or 06_5DH

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Silvermont microarchitecture.		Module
2:0	▪ 100B: 080.0 MHz ▪ 000B: 083.3 MHz ▪ 001B: 100.0 MHz ▪ 010B: 133.3 MHz ▪ 011B: 116.7 MHz	
63:3	Reserved.	
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
	Unit Multipliers used in RAPL Interfaces (R/O) See Section 16.10.1, "RAPL Interfaces."	Package
3:0	Power Units Power related information (in milliWatts) is based on the multiplier, 2^PU; where PU is an unsigned integer represented by bits 3:0. Default value is 0101b, indicating power unit is in 32 milliWatts increment.	
7:4	Reserved.	
12:8	Energy Status Units Energy related information (in microJoules) is based on the multiplier, 2^ESU; where ESU is an unsigned integer represented by bits 12:8. Default value is 00101b, indicating energy unit is in 32 microJoules increment.	
15:13	Reserved.	
19:16	Time Unit The value is 0000b, indicating time unit is in one second.	
63:20	Reserved.	
Register Address: 610H, 1552	MSR_PKG_POWER_LIMIT	
PKG RAPL Power Limit Control (R/W)		Package

Table 2-8. Specific MSRs Supported by Intel Atom® Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_37H, 06_4AH, 06_5AH, or 06_5DH (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
14:0	Package Power Limit #1 (R/W) See Section 16.10.3, "Package RAPL Domain," and MSR_RAPL_POWER_UNIT in Table 2-8.	
15	Enable Power Limit #1 (R/W) See Section 16.10.3, "Package RAPL Domain."	
16	Package Clamping Limitation #1 (R/W) See Section 16.10.3, "Package RAPL Domain."	
23:17	Time Window for Power Limit #1 (R/W) In unit of second. If 0 is specified in bits [23:17], defaults to 1 second window.	
63:24	Reserved.	
Register Address: 611H, 1553	MSR_PKG_ENERGY_STATUS	
PKG Energy Status (R/O) See Section 16.10.3, "Package RAPL Domain," and MSR_RAPL_POWER_UNIT in Table 2-8.		Package
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains," and MSR_RAPL_POWER_UNIT in Table 2-8.		Package

Table 2-9 lists model-specific registers (MSRs) that are specific to the Intel Atom® processor E3000 Series (CPUID Signature DisplayFamily_DisplayModel value of 06_37H).

Table 2-9. Specific MSRs Supported by the Intel Atom® Processor E3000 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_37H

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 668H, 1640	MSR_CC6_DEMOTION_POLICY_CONFIG	
Core C6 Demotion Policy Config MSR		Package
63:0	Controls per-core C6 demotion policy. Writing a value of 0 disables core level HW demotion policy.	
Register Address: 669H, 1641	MSR_MC6_DEMOTION_POLICY_CONFIG	
Module C6 Demotion Policy Config MSR		Package
63:0	Controls module (i.e., two cores sharing the second-level cache) C6 demotion policy. Writing a value of 0 disables module level HW demotion policy.	
Register Address: 664H, 1636	MSR_MC6_RESIDENCY_COUNTER	
Module C6 Residency Counter (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Module
63:0	Time that this module is in module-specific C6 states since last reset. Counts at 1 Mhz frequency.	

Table 2-10 lists model-specific registers (MSRs) that are specific to Intel Atom® processor C2000 Series (CPUID Signature DisplayFamily_DisplayModel value of 06_4DH).

Table 2-10. Specific MSRs Supported by Intel Atom® Processor C2000 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_4DH

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 1A4H, 420	MSR_MISC_FEATURE_CONTROL	
Miscellaneous Feature Control (R/W)		
0	L2 Hardware Prefetcher Disable (R/W) If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	Core
1	Reserved.	
2	DCU Hardware Prefetcher Disable (R/W) If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	Core
63:3	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode (R/W)		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.	Package
39:32	Maximum Ratio Limit for 5C Maximum turbo ratio limit of 5 core active.	Package
47:40	Maximum Ratio Limit for 6C Maximum turbo ratio limit of 6 core active.	Package
55:48	Maximum Ratio Limit for 7C Maximum turbo ratio limit of 7 core active.	Package
63:56	Maximum Ratio Limit for 8C Maximum turbo ratio limit of 8 core active.	Package
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers used in RAPL Interfaces (R/O) See Section 16.10.1, "RAPL Interfaces."		Package
3:0	Power Units Power related information (in milliWatts) is based on the multiplier, 2^PU; where PU is an unsigned integer represented by bits 3:0. Default value is 0101b, indicating power unit is in 32 milliWatts increment.	
7:4	Reserved.	

Table 2-10. Specific MSRs Supported by Intel Atom® Processor C2000 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_4DH (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
12:8	Energy Status Units. Energy related information (in microJoules) is based on the multiplier, 2^ESU; where ESU is an unsigned integer represented by bits 12:8. Default value is 00101b, indicating energy unit is in 32 microJoules increment.	
15:13	Reserved.	
19:16	Time Unit The value is 0000b, indicating time unit is in one second.	
63:20	Reserved.	
Register Address: 610H, 1552	MSR_PKG_POWER_LIMIT	
PKG RAPL Power Limit Control (R/W) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 66EH, 1646	MSR_PKG_POWER_INFO	
PKG RAPL Parameter (R/0)		Package
14:0	Thermal Spec Power (R/0) The unsigned integer value is the equivalent of the thermal specification power of the package domain. The unit of this field is specified by the "Power Units" field of MSR_RAPL_POWER_UNIT.	
63:15	Reserved.	

2.4.2 MSRs in Intel Atom® Processors Based on Airmont Microarchitecture

Intel Atom processor X7-Z8000 and X5-Z8000 series are based on the Airmont microarchitecture. These processors support MSRs listed in Table 2-6, Table 2-7, Table 2-8, and Table 2-11. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_4CH; see Table 2-1.

Table 2-11. MSRs in Intel Atom® Processors Based on Airmont Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/0) This field indicates the intended scalable bus clock speed for processors based on Airmont microarchitecture.		Module
3:0	▪ 0000B: 083.3 MHz ▪ 0001B: 100.0 MHz ▪ 0010B: 133.3 MHz ▪ 0011B: 116.7 MHz ▪ 0100B: 080.0 MHz ▪ 0101B: 093.3 MHz ▪ 0110B: 090.0 MHz ▪ 0111B: 088.9 MHz ▪ 1000B: 087.5 MHz	
63:5	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	

Table 2-11. MSRs in Intel Atom® Processors Based on Airmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.		Module
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: No limit 001b: C1 010b: C2 110b: C6 111b: C7	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
63:16	Reserved.	
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Redirection in C-state (R/W) See http://biosbits.org.		Module
15:0	LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include. 001b - Deep Power Down Technology is the max C-State. 010b - C7 is the max C-State to include.	
63:19	Reserved.	
Register Address: 638H, 1592	MSR_PP0_POWER_LIMIT	
PP0 RAPL Power Limit Control (R/W)		Package

Table 2-11. MSRs in Intel Atom® Processors Based on Airmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
14:0	PP0 Power Limit #1 (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains," and MSR_RAPL_POWER_UNIT in Table 2-8.	
15	Enable Power Limit #1 (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."	
16	Reserved.	
23:17	Time Window for Power Limit #1 (R/W) Specifies the time duration over which the average power must remain below PP0_POWER_LIMIT #1(14:0). Supported Encodings: 0x0: 1 second time duration. 0x1: 5 second time duration (Default). 0x2: 10 second time duration. 0x3: 15 second time duration. 0x4: 20 second time duration. 0x5: 25 second time duration. 0x6: 30 second time duration. 0x7: 35 second time duration. 0x8: 40 second time duration. 0x9: 45 second time duration. 0xA: 50 second time duration. 0xB-0x7F - reserved.	
63:24	Reserved.	

2.5 MSRS IN INTEL ATOM® PROCESSORS BASED ON GOLDMONT MICROARCHITECTURE

Intel Atom processors based on the Goldmont microarchitecture support MSRs listed in Table 2-6 and Table 2-12. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_5CH; see Table 2-1.

In the Goldmont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Goldmont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID leaf 04H enumeration can be used to figure out which processors are in the same module. "Package" means all processor cores in the physical package share the same MSR or bit interface.

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 17H, 23	MSR_PLATFORM_ID	
Model Specific Platform ID (R)		Module
49:0	Reserved.	
52:50	See Table 2-2.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
63:33	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Core
0	Lock (R/WL)	
1	Enable VMX inside SMX operation (R/WL)	
2	Enable VMX outside SMX operation (R/WL)	
14:8	SENTER local functions enables (R/WL)	
15	SENTER global functions enable (R/WL)	
18	SGX global functions enable (R/WL)	
63:19	Reserved.	
Register Address: 3BH, 59	IA32_TSC_ADJUST	
Per-Core TSC ADJUST (R/W) See Table 2-2.		Core
Register Address: C3H, 195	IA32_PMC2	
Performance Counter Register See Table 2-2.		Core
Register Address: C4H, 196	IA32_PMC3	
Performance Counter Register See Table 2-2.		Core
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the maximum frequency that does not require turbo. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
30	Programmable TJ OFFSET (R/O) When set to 1, indicates that MSR_TEMPERATURE_TARGET.[27:24] is valid and writable to specify a temperature offset.	Package
39:31	Reserved.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.		Core
3:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 0000b: No limit 0001b: C1 0010b: C3 0011b: C6 0100b: C7 0101b: C7S 0110b: C8 0111b: C9 1000b: C10	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
63:16	Reserved.	
Register Address: 17DH, 381	MSR_SMM_MCA_CAP	
Enhanced SMM Capabilities (SMM-RO) Reports SMM capability enhancement. Accessible only while in SMM.		Core
57:0	Reserved.	
58	SMM_Code_Access_Chk (SMM-RO) If set to 1 indicates that the SMM code access restriction is supported and the MSR_SMM_FEATURE_CONTROL is supported.	
59	Long_Flow_Indication (SMM-RO) If set to 1 indicates that the SMM long flow indicator is supported and the MSR_SMM_DELAYED is supported.	
63:60	Reserved.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 188H, 392	IA32_PERFEVTSEL2	
See Table 2-2.		Core
Register Address: 189H, 393	IA32_PERFEVTSEL3	
See Table 2-2.		Core
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
0	Fast-Strings Enable See Table 2-2.	Core
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2. Default value is 1.	Package
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Core
10:8	Reserved.	
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Core
12	Processor Event Based Sampling Unavailable (R/O) See Table 2-2.	Core
15:13	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.	Package
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Core
21:19	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2.	Core
23	xTPR Message Disable (R/W) See Table 2-2.	Package
33:24	Reserved.	
34	XD Bit Disable (R/W) See Table 2-3.	Core
37:35	Reserved.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
38	Turbo Mode Disable (R/W) When set to 1 on processors that support Intel Turbo Boost Technology, the turbo mode feature is disabled and the IDA_Enable feature flag will be clear (CPUID.06H: EAX[1]=0). When set to a 0 on processors that support IDA, CPUID.06H: EAX[1] reports the processor's support of turbo mode is enabled. Note: The power-on default value is used by BIOS to detect hardware support of turbo mode. If the power-on default value is 1, turbo mode is available in the processor. If the power-on default value is 0, turbo mode is not available.	Package
63:39	Reserved.	
Register Address: 1A4H, 420	MSR_MISC_FEATURE_CONTROL	
Miscellaneous Feature Control (R/W)		
0	L2 Hardware Prefetcher Disable (R/W) If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	Core
1	Reserved.	
2	DCU Hardware Prefetcher Disable (R/W) If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	Core
63:3	Reserved.	
Register Address: 1AAH, 426	MSR_MISC_PWR_MGMT	
Miscellaneous Power Management Control Various model specific features enumeration. See http://biosbits.org.		Package
0	EIST Hardware Coordination Disable (R/W) When 0, enables hardware coordination of Enhanced Intel Speedstep Technology request from processor cores. When 1, disables hardware coordination of Enhanced Intel Speedstep Technology requests.	
21:1	Reserved.	
22	Thermal Interrupt Coordination Enable (R/W) If set, then thermal interrupt on one core is routed to all cores.	
63:23	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode by Core Groups (R/W) Specifies Maximum Ratio Limit for each Core Group. Max ratio for groups with more cores must decrease monotonically. For groups with less than 4 cores, the max ratio must be 32 or less. For groups with 4-5 cores, the max ratio must be 22 or less. For groups with more than 5 cores, the max ratio must be 16 or less.		Package
7:0	Maximum Ratio Limit for Active Cores in Group 0 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 0 threshold.	Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
15:8	Maximum Ratio Limit for Active Cores in Group 1 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 1 threshold, and greater than the Group 0 threshold.	Package
23:16	Maximum Ratio Limit for Active Cores in Group 2 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 2 threshold, and greater than the Group 1 threshold.	Package
31:24	Maximum Ratio Limit for Active Cores in Group 3 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 3 threshold, and greater than the Group 2 threshold.	Package
39:32	Maximum Ratio Limit for Active Cores in Group 4 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 4 threshold, and greater than the Group 3 threshold.	Package
47:40	Maximum Ratio Limit for Active Cores in Group 5 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 5 threshold, and greater than the Group 4 threshold.	Package
55:48	Maximum Ratio Limit for Active Cores in Group 6 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 6 threshold, and greater than the Group 5 threshold.	Package
63:56	Maximum Ratio Limit for Active Cores in Group 7 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 7 threshold, and greater than the Group 6 threshold.	Package
Register Address: 1AEH, 430	MSR_TURBO_GROUP_CORECNT	
Group Size of Active Cores for Turbo Mode Operation (R/W) Writes of 0 threshold is ignored.		Package
7:0	Group 0 Core Count Threshold Maximum number of active cores to operate under the Group 0 Max Turbo Ratio limit.	Package
15:8	Group 1 Core Count Threshold Maximum number of active cores to operate under the Group 1 Max Turbo Ratio limit. Must be greater than the Group 0 Core Count.	Package
23:16	Group 2 Core Count Threshold Maximum number of active cores to operate under the Group 2 Max Turbo Ratio limit. Must be greater than the Group 1 Core Count.	Package
31:24	Group 3 Core Count Threshold Maximum number of active cores to operate under the Group 3 Max Turbo Ratio limit. Must be greater than the Group 2 Core Count.	Package
39:32	Group 4 Core Count Threshold Maximum number of active cores to operate under the Group 4 Max Turbo Ratio limit. Must be greater than the Group 3 Core Count.	Package
47:40	Group 5 Core Count Threshold Maximum number of active cores to operate under the Group 5 Max Turbo Ratio limit. Must be greater than the Group 4 Core Count.	Package

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
55:48	Group 6 Core Count Threshold Maximum number of active cores to operate under the Group 6 Max Turbo Ratio limit. Must be greater than the Group 5 Core Count.	Package
63:56	Group 7 Core Count Threshold Maximum number of active cores to operate under the Group 7 Max Turbo Ratio limit. Must be greater than the Group 6 Core Count, and not less than the total number of processor cores in the package. E.g., specify 255.	Package
Register Address: 1C8H, 456	MSR_LBR_SELECT	
Last Branch Record Filtering Select Register (R/W) See Section 19.9.2, "Filtering of Last Branch Records."		Core
0	CPL_EQ_0	
1	CPL_NEQ_0	
2	JCC	
3	NEAR_REL_CALL	
4	NEAR_IND_CALL	
5	NEAR_RET	
6	NEAR_IND_JMP	
7	NEAR_REL_JMP	
8	FAR_BRANCH	
9	EN_CALL_STACK	
63:10	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-4) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 1FCH, 508	MSR_POWER_CTL	
Power Control Register See http://biosbits.org.		Core
0	Reserved.	
1	C1E Enable (R/W) When set to '1', will enable the CPU to switch to the Minimum Enhanced Intel SpeedStep Technology operating point when all execution cores enter MWAIT (C1).	Package
63:2	Reserved.	
Register Address: 210H, 528	IA32_MTRR_PHYSBASE8	
See Table 2-2.		Core
Register Address: 211H, 529	IA32_MTRR_PHYSMASK8

Register Address: 392H, 914	IA32_PERF_GLOBAL_INUSE	
See Table 2-2.		Core
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)	
See Table 2-2 and Section 21.6.2.4, "Processor Event Based Sampling (PEBS)."		Core
0	Enable PEBS trigger and recording for the programmed event (precise or otherwise) on IA32_PMC0. (R/W)	
Register Address: 3F8H, 1016	MSR_PKG_C3_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C3 Residency Counter (R/O) Value since last reset that this package is in processor-specific C3 states. Count at the same frequency as the TSC.	
Register Address: 3F9H, 1017	MSR_PKG_C6_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C6 Residency Counter (R/O) Value since last reset that this package is in processor-specific C6 states. Count at the same frequency as the TSC.	
Register Address: 3FCH, 1020	MSR_CORE_C3_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C3 Residency Counter (R/O) Value since last reset that this core is in processor-specific C3 states. Count at the same frequency as the TSC.	
Register Address: 406H, 1030	IA32_MC1_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Module
Register Address: 418H, 1048	IA32_MC6_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 419H, 1049	IA32_MC6_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 41AH, 1050	IA32_MC6_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 4C3H, 1219	IA32_A_PMC2	
See Table 2-2.		Core
Register Address: 4C4H, 1220	IA32_A_PMC3	
See Table 2-2.		Core
Register Address: 4E0H, 1248	MSR_SMM_FEATURE_CONTROL	
Enhanced SMM Feature Control (SMM-RW) Reports SMM capability Enhancement. Accessible only while in SMM.		Package
0	Lock (SMM-RWO) When set to '1' locks this register from further changes.	
1	Reserved.	
2	SMM_Code_Chk_En (SMM-RW) This control bit is available only if MSR_SMM_MCA_CAP[58] == 1. When set to '0' (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set to '1' any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.	
63:3	Reserved.	
Register Address: 4E2H, 1250	MSR_SMM_DELAYED	
SMM Delayed (SMM-RO) Reports the interruptible state of all logical processors in the package. Available only while in SMM and MSR_SMM_MCA_CAP[LONG_FLOW_INDICATION] == 1.		Package
N-1:0	LOG_PROC_STATE (SMM-RO) Each bit represents a processor core of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: Microcode Update Load, C6, WBINVD, Ratio Change, Throttle. The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.	
63:N	Reserved.	
Register Address: 4E3H, 1251	MSR_SMM_BLOCKED	
SMM Blocked (SMM-RO) Reports the blocked state of all logical processors in the package. Available only while in SMM.		Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
N-1:0	LOG_PROC_STATE (SMM-RO) Each bit represents a processor core of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: Wait For SIPI or SENTER Sleep. The reset value of this field is 0FFFH. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.	
63:N	Reserved.	
Register Address: 500H, 1280	IA32_SGX_SVN_STATUS	
Status and SVN Threshold of SGX Support for ACM (R/O)		Core
0	Lock See Section 39.11.3, "Interactions with Authenticated Code Modules (ACMs)."	
15:1	Reserved.	
23:16	SGX_SVN_SINIT See Section 39.11.3, "Interactions with Authenticated Code Modules (ACMs)."	
63:24	Reserved.	
Register Address: 560H, 1376	IA32_RTIT_OUTPUT_BASE	
Trace Output Base Register (R/W) See Table 2-2.		Core
Register Address: 561H, 1377	IA32_RTIT_OUTPUT_MASK_PTRS	
Trace Output Mask Pointers Register (R/W) See Table 2-2.		Core

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers used in RAPL Interfaces (R/O) See Section 16.10.1, "RAPL Interfaces."		Package
3:0	Power Units Power related information (in Watts) is in unit of 1W/2^PU; where PU is an unsigned integer represented by bits 3:0. Default value is 1000b, indicating power unit is in 3.9 milliWatts increment.	
7:4	Reserved.	
12:8	Energy Status Units Energy related information (in Joules) is in unit of 1Joule/ (2^ESU); where ESU is an unsigned integer represented by bits 12:8. Default value is 01110b, indicating energy unit is in 61 microJoules.	
15:13	Reserved.	
19:16	Time Unit Time related information (in seconds) is in unit of 1S/2^TU; where TU is an unsigned integer represented by bits 19:16. Default value is 1010b, indicating power unit is in 0.977 millisecond.	
63:20	Reserved.	
Register Address: 60AH, 1546	MSR_PKGC3_IRTL	
Package C3 Interrupt Response Limit (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C3 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.	
63:16	Reserved.	
Register Address: 60BH, 1547	MSR_PKGC_IRTL1	
Package C6/C7S Interrupt Response Limit 1 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7S state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7S state.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.	
63:16	Reserved.	
Register Address: 60CH, 1548	MSR_PKGC_IRTL2	
Package C7 Interrupt Response Limit 2 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C7 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.	
63:16	Reserved.	
Register Address: 60DH, 1549	MSR_PKG_C2_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
63:0	Package C2 Residency Counter (R/O) Value since last reset that this package is in processor-specific C2 states. Count at the same frequency as the TSC.	
Register Address: 610H, 1552	MSR_PKG_POWER_LIMIT	
PKG RAPL Power Limit Control (R/W) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 611H, 1553	MSR_PKG_ENERGY_STATUS	
PKG Energy Status (R/O) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 613H, 1555	MSR_PKG_PERF_STATUS	
PKG Perf Status (R/O) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 614H, 1556	MSR_PKG_POWER_INFO	
PKG RAPL Parameters (R/W)		Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
14:0	Thermal Spec Power (R/W) See Section 16.10.3, "Package RAPL Domain."	
15	Reserved.	
30:16	Minimum Power (R/W) See Section 16.10.3, "Package RAPL Domain."	
31	Reserved.	
46:32	Maximum Power (R/W) See Section 16.10.3, "Package RAPL Domain."	
47	Reserved.	
54:48	Maximum Time Window (R/W) Specified by 2^Y * (1.0 + Z/4.0) * Time_Unit, where "Y" is the unsigned integer value represented by bits 52:48, "Z" is an unsigned integer represented by bits 54:53. "Time_Unit" is specified by the "Time Units" field of MSR_RAPL_POWER_UNIT.	
63:55	Reserved.	
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
DRAM RAPL Power Limit Control (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 632H, 1586	MSR_PKG_C10_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
63:0	Package C10 Residency Counter (R/O) Value since last reset that the entire SOC is in an S0i3 state. Count at the same frequency as the TSC.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 641H, 1601	MSR_PP1_ENERGY_STATUS	
PP1 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 64CH, 1612	MSR_TURBO_ACTIVATION_RATIO	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
ConfigTDP Control (R/W)		Package
7:0	MAX_NON_TURBO_RATIO (RW/L) System BIOS can program this field.	
30:8	Reserved.	
31	TURBO_ACTIVATION_RATIO_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
Register Address: 64FH, 1615	MSR_CORE_PERF_LIMIT_REASONS	
Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)		Package
0	PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.	
2	Package-Level Power Limiting PL1 Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL1.	
3	Package-Level PL2 Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL2.	
8:4	Reserved.	
9	Core Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to domain-level power limiting.	
10	VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.	
11	Max Turbo Limit Status (R0) When set, frequency is reduced below the operating system request due to multi-core turbo limits.	
12	Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).	
13	Turbo Transition Attenuation Status (R0) When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.	
14	Maximum Efficiency Frequency Status (R0) When set, frequency is reduced below the maximum efficiency frequency.	
15	Reserved.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
16	PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
18	Package-Level PL1 Power Limiting Log When set, indicates that the Package Level PL1 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19	Package-Level PL2 Power Limiting Log When set, indicates that the Package Level PL2 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
24:20	Reserved.	
25	Core Power Limiting Log When set, indicates that the Core Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
26	VR Therm Alert Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
27	Max Turbo Limit Log When set, indicates that the Max Turbo Limit Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
28	Electrical Design Point Log When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
29	Turbo Transition Attenuation Log When set, indicates that the Turbo Transition Attenuation Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
30	Maximum Efficiency Frequency Log When set, indicates that the Maximum Efficiency Frequency Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
63:31	Reserved.	
Register Address: 680H, 1664	MSR_LASTBRANCH_0_FROM_IP

See Table 2-6, and Table 2-12 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_5CH.		

2.6 MSRS IN INTEL ATOM® PROCESSORS BASED ON GOLDMONT PLUS MICROARCHITECTURE

Intel Atom processors based on the Goldmont Plus microarchitecture support MSRs listed in Table 2-6, Table 2-12, and Table 2-13. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_7AH; see Table 2-1. For an MSR listed in Table 2-13 that also appears in the model-specific tables of prior generations, Table 2-13 supersedes prior generation tables.

In the Goldmont Plus microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Goldmont Plus microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID leaf 04H enumeration can be used to figure out which processors are in the same module. "Package" means all processor cores in the physical package share the same MSR or bit interface.

Table 2-13. MSRs in Intel Atom® Processors Based on Goldmont Plus Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**

See Table 2-6, Table 2-12, and Table 2-13 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_7AH.		

2.7 MSRS IN INTEL ATOM® PROCESSORS BASED ON TREMONT MICROARCHITECTURE

Processors based on the Tremont microarchitecture support MSRs listed in Table 2-6, Table 2-12, Table 2-13, and Table 2-14. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_86H, 06_96H, or 06_9CH; see Table 2-1. For an MSR listed in Table 2-14 that also appears in the model-specific tables of prior generations, Table 2-14 supersedes prior generation tables.

In the Tremont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Tremont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID leaf 04H enumeration can be used to figure out which processors are in the same module. "Package" means all processor cores in the physical package share the same MSR or bit interface.

Table 2-14. MSRs in Intel Atom® Processors Based on Tremont Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register		Core
28:0	Reserved.	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
30	Reserved.	
31	Reserved.	
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	

Table 2-14. MSRs in Intel Atom® Processors Based on Tremont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
IA32 Core Capabilities Register If CPUID.(EAX=07H, ECX=0):EDX[30] = 1.		Core
4:0	Reserved.	
5	SPLIT_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 29 of MSR_MEMORY_CTRL (MSR address 33H).	
63:6	Reserved.	
Register Address: 2A0H, 672	MSR_PRMRR_BASE_0	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE: PRMRR BASE Memory Type.	
3	CONFIGURED: PRMRR BASE Configured.	
11:4	Reserved.	
51:12	BASE: PRMRR Base Address.	
63:52	Reserved.	
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)	
(R/W) See Table 2-2. See Section 21.6.2.4, "Processor Event Based Sampling (PEBS)."		Core
n:0	Enable PEBS trigger and recording for the programmed event (precise or otherwise) on IA32_PMCx. The maximum value n can be determined from CPUID.0AH:EAX[15:8].	
31:*n*+1	Reserved.	
32+*m*:32	Enable PEBS trigger and recording for IA32_FIXED_CTRx. The maximum value m can be determined from CPUID.0AH:EDX[4:0].	
59:33+*m*	Reserved.	
60	Pend a PerfMon Interrupt (PMI) after each PEBS event.	
62:61	Specifies PEBS output destination. Encodings: 00B: DS Save Area. 01B: Intel PT trace output. Supported if IA32_PERF_CAPABILITIES.PEBS_OUTPUT_PT_AVAIL[16] and CPUID.07H.0.EBX[25] are set. 10B: Reserved. 11B: Reserved.	
63	Reserved.	
Register Address: 1309H—130BH, 4873—4875	MSR_RELOAD_FIXED_CTRx	
Reload value for IA32_FIXED_CTRx (R/W)		
47:0	Value loaded into IA32_FIXED_CTRx when a PEBS record is generated while PEBS_EN_FIXEDx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and FIXED_CTRx is overflowed.	
63:48	Reserved.	
Register Address: 14C1H—14C4H, 5313—5316	MSR_RELOAD_PMCx

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Reload value for IA32_PMCx (R/W)		Core
47:0	Value loaded into IA32_PMCx when a PEBS record is generated while PEBS_EN_PMCx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and PMCx is overflowed.	
63:48	Reserved.	
See Table 2-6, Table 2-12, Table 2-13, and Table 2-14 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_86H.		

2.8 MSRS IN PROCESSORS BASED ON NEHALEM MICROARCHITECTURE

Table 2-15 lists model-specific registers (MSRs) that are common for Nehalem microarchitecture. These include the Intel Core i7 and i5 processor family. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_1AH, 06_1EH, 06_1FH, or 06_2EH; see Table 2-1. Additional MSRs specific to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_1AH, 06_1EH, or 06_1FH are listed in Table 2-16. Some MSRs listed in these tables are used by BIOS. More information about these MSR can be found at http://biosbits.org.

The column "Scope" represents the package/core/thread scope of individual bit field of an MSR. "Thread" means this bit field must be programmed on each logical processor independently. "Core" means the bit field must be programmed on each processor core independently, logical processors in the same core will be affected by change of this bit on the other logical processor in the same core. "Package" means the bit field must be programmed once for each physical package. Change of a bit filed with a package scope will affect all logical processors in that physical package.

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors."		Thread
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors."		Thread
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Thread
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and Table 2-2.		Thread
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2.		Package
Register Address: 17H, 23	MSR_PLATFORM_ID	
Model Specific Platform ID (R)		Package
49:0	Reserved.	
52:50	See Table 2-2.	
63:53	Reserved.	
Register Address: 1BH, 27	IA32_APIC_BASE	

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Thread
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/O)		Thread
31:0	SMI Count (R/O) Running count of SMI events since last RESET.	
63:32	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64Processor (R/W) See Table 2-2.		Thread
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Core
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Thread
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Thread
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Thread
Register Address: C3H, 195	IA32_PMC2	
Performance Counter Register See Table 2-2.		Thread
Register Address: C4H, 196	IA32_PMC3	
Performance Counter Register See Table 2-2.		Thread
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. The invariant TSC frequency can be computed by multiplying this ratio by 133.33 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
29	Programmable TDC-TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDC and TDP Limits for Turbo mode are programmable. When set to 0, indicates TDC and TDP Limits for Turbo mode are not programmable.	Package
39:30	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 133.33MHz.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.		Core
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-sate support) 001b: C1 (Behavior is the same as 000b) 010b: C3 011b: C6 100b: C7 101b and 110b: Reserved 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
23:16	Reserved.	
24	Interrupt filtering enable (R/W) When set, processor cores in a deep C-State will wake only when the event message is destined for that core. When 0, all processor cores in a deep C-State will wake for an event message.	
25	C3 state auto demotion enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
26	C1 state auto demotion enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	Enable C3 Undemotion (R/W)	
28	Enable C1 Undemotion (R/W)	
29	Package C State Demotion Enable (R/W)	
30	Package C State Undemotion Enable (R/W)	
63:31	Reserved.	
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Redirection in C-state (R/W) See http://biosbits.org.		Core
15:0	LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include. 001b - C6 is the max C-State to include. 010b - C7 is the max C-State to include.	
63:19	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: FEH, 254	IA32_MTRRCAP	
See Table 2-2.		Thread

34	Enable Load Latency on IA32_PMC2 (R/W)	
35	Enable Load Latency on IA32_PMC3 (R/W)	
63:36	Reserved.	
Register Address: 3F6H, 1014	MSR_PEBS_LD_LAT	
See Section 21.3.1.1.2, "Load Latency Performance Monitoring Facility."		Thread
15:0	Minimum threshold latency value of tagged load operation that will be counted. (R/W)	
63:36	Reserved.	
Register Address: 3F8H, 1016	MSR_PKG_C3_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C3 Residency Counter (R/O) Value since last reset that this package is in processor-specific C3 states. Count at the same frequency as the TSC.	
Register Address: 3F9H, 1017	MSR_PKG_C6_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
63:0	Package C6 Residency Counter (R/O) Value since last reset that this package is in processor-specific C6 states. Count at the same frequency as the TSC.	
Register Address: 3FAH, 1018	MSR_PKG_C7_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C7 Residency Counter (R/O) Value since last reset that this package is in processor-specific C7 states. Count at the same frequency as the TSC.	
Register Address: 3FCH, 1020	MSR_CORE_C3_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C3 Residency Counter (R/O) Value since last reset that this core is in processor-specific C3 states. Count at the same frequency as the TSC.	
Register Address: 3FDH, 1021	MSR_CORE_C6_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C6 Residency Counter (R/O) Value since last reset that this core is in processor-specific C6 states. Count at the same frequency as the TSC.	
Register Address: 400H, 1024	IA32_MC0_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 401H, 1025	IA32_MC0_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Package
Register Address: 402H, 1026	IA32_MC0_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Package
Register Address: 403H, 1027	IA32_MC0_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: 404H, 1028	IA32_MC1_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 405H, 1029	IA32_MC1_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Package
Register Address: 406H, 1030	IA32_MC1_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Package

See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 441H, 1089	IA32_MC16_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package

Table 2-17. Additional MSRs in the Intel® Xeon® Processor 7500 Series (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 442H, 1090	IA32_MC16_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 443H, 1091	IA32_MC16_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: 444H, 1092	IA32_MC17_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 445H, 1093	IA32_MC17_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 446H, 1094	IA32_MC17_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 447H, 1095	IA32_MC17_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: 448H, 1096	IA32_MC18_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 449H, 1097	IA32_MC18_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 44AH, 1098	IA32_MC18_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 44BH, 1099	IA32_MC18_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: 44CH, 1100	IA32_MC19_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 44DH, 1101	IA32_MC19_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 44EH, 1102	IA32_MC19_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 44FH, 1103	IA32_MC19_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: 450H, 1104	IA32_MC20_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 451H, 1105	IA32_MC20_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 452H, 1106	IA32_MC20_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 453H, 1107	IA32_MC20_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: 454H, 1108	IA32_MC21_CTL	

Table 2-17. Additional MSRs in the Intel® Xeon® Processor 7500 Series (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 455H, 1109	IA32_MC21_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 456H, 1110	IA32_MC21_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 457H, 1111	IA32_MC21_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: C00H, 3072	MSR_U_PMON_GLOBAL_CTRL	
Uncore U-box perfmon global control MSR.		Package
Register Address: C01H, 3073	MSR_U_PMON_GLOBAL_STATUS	
Uncore U-box perfmon global status MSR.		Package
Register Address: C02H, 3074	MSR_U_PMON_GLOBAL_OVF_CTRL	
Uncore U-box perfmon global overflow control MSR.		Package
Register Address: C10H, 3088	MSR_U_PMON_EVNT_SEL	
Uncore U-box perfmon event select MSR.		Package
Register Address: C11H, 3089	MSR_U_PMON_CTR	
Uncore U-box perfmon counter MSR.		Package
Register Address: C20H, 3104	MSR_B0_PMON_BOX_CTRL	
Uncore B-box 0 perfmon local box control MSR.		Package
Register Address: C21H, 3105	MSR_B0_PMON_BOX_STATUS	
Uncore B-box 0 perfmon local box status MSR.		Package
Register Address: C22H, 3106	MSR_B0_PMON_BOX_OVF_CTRL	
Uncore B-box 0 perfmon local box overflow control MSR.		Package
Register Address: C30H, 3120	MSR_B0_PMON_EVNT_SEL0	
Uncore B-box 0 perfmon event select MSR.		Package
Register Address: C31H, 3121	MSR_B0_PMON_CTR0	
Uncore B-box 0 perfmon counter MSR.		Package
Register Address: C32H, 3122	MSR_B0_PMON_EVNT_SEL1	
Uncore B-box 0 perfmon event select MSR.		Package
Register Address: C33H, 3123	MSR_B0_PMON_CTR1	
Uncore B-box 0 perfmon counter MSR.		Package
Register Address: C34H, 3124	MSR_B0_PMON_EVNT_SEL2	
Uncore B-box 0 perfmon event select MSR.		Package
Register Address: C35H, 3125	MSR_B0_PMON_CTR2	
Uncore B-box 0 perfmon counter MSR.		Package
Register Address: C36H, 3126	MSR_B0_PMON_EVNT_SEL3	
Uncore B-box 0 perfmon event select MSR.		Package

Table 2-17. Additional MSRs in the Intel® Xeon® Processor 7500 Series (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: C37H, 3127	MSR_B0_PMON_CTR3	
Uncore B-box 0 perfmon counter MSR.		Package
Register Address: C40H, 3136	MSR_S0_PMON_BOX_CTRL	
Uncore S-box 0 perfmon local box control MSR.		Package
Register Address: C41H, 3137	MSR_S0_PMON_BOX_STATUS	
Uncore S-box 0 perfmon local box status MSR.		Package
Register Address: C42H, 3138	MSR_S0_PMON_BOX_OVF_CTRL	
Uncore S-box 0 perfmon local box overflow control MSR.		Package
Register Address: C50H, 3152	MSR_S0_PMON_EVNT_SEL0	
Uncore S-box 0 perfmon event select MSR.		Package
Register Address: C51H, 3153	MSR_S0_PMON_CTR0	
Uncore S-box 0 perfmon counter MSR.		Package
Register Address: C52H, 3154	MSR_S0_PMON_EVNT_SEL1	
Uncore S-box 0 perfmon event select MSR.		Package
Register Address: C53H, 3155	MSR_S0_PMON_CTR1	
Uncore S-box 0 perfmon counter MSR.		Package
Register Address: C54H, 3156	MSR_S0_PMON_EVNT_SEL2	
Uncore S-box 0 perfmon event select MSR.		Package
Register Address: C55H, 3157	MSR_S0_PMON_CTR2	
Uncore S-box 0 perfmon counter MSR.		Package
Register Address: C56H, 3158	MSR_S0_PMON_EVNT_SEL3	
Uncore S-box 0 perfmon event select MSR.		Package
Register Address: C57H, 3159	MSR_S0_PMON_CTR3	
Uncore S-box 0 perfmon counter MSR.		Package
Register Address: C60H, 3168	MSR_B1_PMON_BOX_CTRL	
Uncore B-box 1 perfmon local box control MSR.		Package
Register Address: C61H, 3169	MSR_B1_PMON_BOX_STATUS	
Uncore B-box 1 perfmon local box status MSR.		Package
Register Address: C62H, 3170	MSR_B1_PMON_BOX_OVF_CTRL	
Uncore B-box 1 perfmon local box overflow control MSR.		Package
Register Address: C70H, 3184	MSR_B1_PMON_EVNT_SEL0	
Uncore B-box 1 perfmon event select MSR.		Package
Register Address: C71H, 3185	MSR_B1_PMON_CTR0	
Uncore B-box 1 perfmon counter MSR.		Package
Register Address: C72H, 3186	MSR_B1_PMON_EVNT_SEL1	
Uncore B-box 1 perfmon event select MSR.		Package
Register Address: C73H, 3187	MSR_B1_PMON_CTR1	

Table 2-17. Additional MSRs in the Intel® Xeon® Processor 7500 Series (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Uncore B-box 1 perfmon counter MSR.		Package
Register Address: C74H, 3188	MSR_B1_PMON_EVNT_SEL2	
Uncore B-box 1 perfmon event select MSR.		Package
Register Address: C75H, 3189	MSR_B1_PMON_CTR2	
Uncore B-box 1 perfmon counter MSR.		Package
Register Address: C76H, 3190	MSR_B1_PMON_EVNT_SEL3	
Uncore B-box 1vperfmon event select MSR.		Package
Register Address: C77H, 3191	MSR_B1_PMON_CTR3	
Uncore B-box 1 perfmon counter MSR.		Package
Register Address: C80H, 3120	MSR_W_PMON_BOX_CTRL	
Uncore W-box perfmon local box control MSR.		Package
Register Address: C81H, 3121	MSR_W_PMON_BOX_STATUS	
Uncore W-box perfmon local box status MSR.		Package
Register Address: C82H, 3122	MSR_W_PMON_BOX_OVF_CTRL	
Uncore W-box perfmon local box overflow control MSR.		Package
Register Address: C90H, 3136	MSR_W_PMON_EVNT_SEL0	
Uncore W-box perfmon event select MSR.		Package
Register Address: C91H, 3137	MSR_W_PMON_CTR0	
Uncore W-box perfmon counter MSR.		Package
Register Address: C92H, 3138	MSR_W_PMON_EVNT_SEL1	
Uncore W-box perfmon event select MSR.		Package
Register Address: C93H, 3139	MSR_W_PMON_CTR1	
Uncore W-box perfmon counter MSR.		Package
Register Address: C94H, 3140	MSR_W_PMON_EVNT_SEL2	
Uncore W-box perfmon event select MSR.		Package
Register Address: C95H, 3141	MSR_W_PMON_CTR2	
Uncore W-box perfmon counter MSR.		Package
Register Address: C96H, 3142	MSR_W_PMON_EVNT_SEL3	
Uncore W-box perfmon event select MSR.		Package
Register Address: C97H, 3143	MSR_W_PMON_CTR3	
Uncore W-box perfmon counter MSR.		Package
Register Address: CA0H, 3232	MSR_M0_PMON_BOX_CTRL	
Uncore M-box 0 perfmon local box control MSR.		Package
Register Address: CA1H, 3233	MSR_M0_PMON_BOX_STATUS	
Uncore M-box 0 perfmon local box status MSR.		Package
Register Address: CA2H, 3234	MSR_M0_PMON_BOX_OVF_CTRL	
Uncore M-box 0 perfmon local box overflow control MSR.		Package

Table 2-17. Additional MSRs in the Intel® Xeon® Processor 7500 Series (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: CA4H, 3236	MSR_M0_PMON_TIMESTAMP	
Uncore M-box 0 perfmon time stamp unit select MSR.		Package
Register Address: CA5H, 3237	MSR_M0_PMON_DSP	
Uncore M-box 0 perfmon DSP unit select MSR.		Package

2.9 MSRS IN THE INTEL® XEON® PROCESSOR 5600 SERIES BASED ON WESTMERE MICROARCHITECTURE

The Intel® Xeon® Processor 5600 Series is based on Westmere microarchitecture and supports the MSR interfaces listed in Table 2-15, Table 2-16, plus additional MSRs listed in Table 2-18. These MSRs apply to the Intel Core i7, i5, and i3 processor family with a CPUID Signature DisplayFamily_DisplayModel value of 06_25H or 06_2CH; see Table 2-1.

Table 2-18. Additional MSRs Supported by Intel® Processors Based on Westmere Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core

Table 2-18. Additional MSRs Supported by Intel® Processors Based on Westmere Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.	
Register Address: 1A7H, 423	MSR_OFFCORE_RSP_1	
Offcore Response Event Select Register (R/W)		Thread
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0. R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.	Package
39:32	Maximum Ratio Limit for 5C Maximum turbo ratio limit of 5 core active.	Package
47:40	Maximum Ratio Limit for 6C Maximum turbo ratio limit of 6 core active.	Package
63:48	Reserved.	
Register Address: 1B0H, 432	IA32_ENERGY_PERF_BIAS	
See Table 2-2.		Package

2.10 MSRS IN THE INTEL® XEON® PROCESSOR E7 FAMILY BASED ON WESTMERE MICROARCHITECTURE

The Intel® Xeon® Processor E7 Family is based on the Westmere microarchitecture and supports the MSR interfaces listed in Table 2-15 (except MSR address 1ADH), Table 2-16, plus additional MSRs listed in Table 2-19. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2FH.

Table 2-19. Additional MSRs Supported by the Intel® Xeon® Processor E7 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.	
Register Address: 1A7H, 423	MSR_OFFCORE_RSP_1	
Offcore Response Event Select Register (R/W)		Thread
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Reserved. Attempt to read/write will cause #UD.		Package
Register Address: 1B0H, 432	IA32_ENERGY_PERF_BIAS	
See Table 2-2.		Package
Register Address: F40H, 3904	MSR_C8_PMON_BOX_CTRL	
Uncore C-box 8 perfmon local box control MSR.		Package
Register Address: F41H, 3905	MSR_C8_PMON_BOX_STATUS	
Uncore C-box 8 perfmon local box status MSR.		Package
Register Address: F42H, 3906	MSR_C8_PMON_BOX_OVF_CTRL	
Uncore C-box 8 perfmon local box overflow control MSR.		Package
Register Address: F50H, 3920	MSR_C8_PMON_EVNT_SEL0	
Uncore C-box 8 perfmon event select MSR.		Package
Register Address: F51H, 3921	MSR_C8_PMON_CTR0	
Uncore C-box 8 perfmon counter MSR.		Package
Register Address: F52H, 3922	MSR_C8_PMON_EVNT_SEL1	
Uncore C-box 8 perfmon event select MSR.		Package
Register Address: F53H, 3923	MSR_C8_PMON_CTR1

Uncore C-box 9 perfmon counter MSR.		Package

2.11 MSRS IN THE INTEL® PROCESSOR FAMILY BASED ON SANDY BRIDGE MICROARCHITECTURE

Table 2-20 lists model-specific registers (MSRs) that are common to the Intel® processor family based on Sandy Bridge microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH or 06_2DH; see Table 2-1. Additional MSRs specific to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH are listed in Table 2-21.

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors."		Thread
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors."		Thread
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Thread
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and see Table 2-2.		Thread
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2.		Package
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Thread
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/O)		Thread
31:0	SMI Count (R/O) Count SMIs.	
63:32	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Thread
0	Lock (R/WL)	
1	Enable VMX Inside SMX Operation (R/WL)	
2	Enable VMX Outside SMX Operation (R/WL)	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
14:8	SENTER Local Functions Enables (R/WL)	
15	SENTER Global Functions Enable (R/WL)	
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Core
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Thread
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Thread
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Thread
Register Address: C3H, 195	IA32_PMC2	
Performance Counter Register See Table 2-2.		Thread
Register Address: C4H, 196	IA32_PMC3	
Performance Counter Register See Table 2-2.		Thread
Register Address: C5H, 197	IA32_PMC4	
Performance Counter Register (if core not shared by threads)		Core
Register Address: C6H, 198	IA32_PMC5	
Performance Counter Register (if core not shared by threads)		Core
Register Address: C7H, 199	IA32_PMC6	
Performance Counter Register (if core not shared by threads)		Core
Register Address: C8H, 200	IA32_PMC7	
Performance Counter Register (if core not shared by threads)		Core
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
39:30	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.		Core
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-sate support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit Note: This field cannot be used to limit package C-state to C3.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
24:16	Reserved.	
25	C3 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	
26	C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	Enable C3 Undemotion (R/W) When set, enables undemotion from demoted C3.	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
28	Enable C1 Undemotion (R/W) When set, enables undemotion from demoted C1.	
63:29	Reserved.	
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Redirection in C-state (R/W) See http://biosbits.org.		Core
15:0	LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	C-State Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]: 000b - C3 is the max C-State to include. 001b - C6 is the max C-State to include. 010b - C7 is the max C-State to include.	
63:19	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: FEH, 254	IA32_MTRRCAP	
See Table 2-2.		Thread
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Thread

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Thread
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Thread
Register Address: 179H, 377	IA32_MCG_CAP	
See Table 2-2.		Thread
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Thread
0	RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.	
1	EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved.	
Register Address: 186H, 390	IA32_PERFEVTSEL0	
See Table 2-2.		Thread
Register Address: 187H, 391	IA32_PERFEVTSEL1	
See Table 2-2.		Thread
Register Address: 188H, 392	IA32_PERFEVTSEL2	
See Table 2-2.		Thread
Register Address: 189H, 393	IA32_PERFEVTSEL3	
See Table 2-2.		Thread
Register Address: 18AH, 394	IA32_PERFEVTSEL4	
See Table 2-2. If CPUID.0AH:EAX[15:8] > 4.		Core
Register Address: 18BH, 395	IA32_PERFEVTSEL5	
See Table 2-2. If CPUID.0AH:EAX[15:8] > 5.		Core
Register Address: 18CH, 396	IA32_PERFEVTSEL6	
See Table 2-2. If CPUID.0AH:EAX[15:8] > 6.		Core
Register Address: 18DH, 397	IA32_PERFEVTSEL7	
See Table 2-2. If CPUID.0AH:EAX[15:8] > 7.		Core
Register Address: 198H, 408	IA32_PERF_STATUS	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Table 2-2.		Package
15:0	Current Performance State Value	
63:16	Reserved.	
Register Address: 198H, 408	MSR_PERF_STATUS	
Performance Status		Package
47:32	Core Voltage (R/O) P-state core voltage can be computed by MSR_PERF_STATUS[37:32] * (float) 1/(2^13).	
Register Address: 199H, 409	IA32_PERF_CTL	
See Table 2-2.		Thread
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.		Thread
3:0	On demand Clock Modulation Duty Cycle (R/W) In 6.25% increment.	
4	On demand Clock Modulation Enable (R/W)	
63:5	Reserved.	
Register Address: 19BH, 411	IA32_THERM_INTERRUPT	
Thermal Interrupt Control (R/W) See Table 2-2.		Core
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Core
0	Thermal Status (R/O) See Table 2-2.	
1	Thermal Status Log (R/WC0) See Table 2-2.	
2	PROTCHOT # or FORCEPR# Status (R/O) See Table 2-2.	
3	PROTCHOT # or FORCEPR# Log (R/WC0) See Table 2-2.	
4	Critical Temperature Status (R/O) See Table 2-2.	
5	Critical Temperature Status Log (R/WC0) See Table 2-2.	
6	Thermal Threshold #1 Status (R/O) See Table 2-2.	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)

Register Address: 60AH, 1546	MSR_PKGC3_IRTL	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Package C3 Interrupt Response Limit (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C3 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.	
63:16	Reserved.	
Register Address: 60BH, 1547	MSR_PKGC6_IRTL	
Package C6 Interrupt Response Limit (R/W) This MSR defines the budget allocated for the package to exit from a C6 to a C0 state, where an interrupt request can be delivered to the core and serviced. Additional core-exit latency may be applicable depending on the actual C-state the core is in. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
63:16	Reserved.	
Register Address: 60DH, 1549	MSR_PKG_C2_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C2 Residency Counter (R/O) Value since last reset that this package is in processor-specific C2 states. Count at the same frequency as the TSC.	
Register Address: 610H, 1552	MSR_PKG_POWER_LIMIT	
PKG RAPL Power Limit Control (R/W) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 611H, 1553	MSR_PKG_ENERGY_STATUS	
PKG Energy Status (R/O) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 614H, 1556	MSR_PKG_POWER_INFO	
PKG RAPL Parameters (R/W) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 638H, 1592	MSR_PP0_POWER_LIMIT	
PP0 RAPL Power Limit Control (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 680H, 1664	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of sixteen pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the source instruction. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ Section 19.9.1 and record format in Section 19.4.8.1.		Thread
Register Address: 681H, 1665	MSR_LASTBRANCH_1_FROM_IP	
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Thread
Register Address: 682H, 1666	MSR_LASTBRANCH_2_FROM_IP	
Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Thread

2.11.1 MSRs in the 2nd Generation Intel® Core™ Processor Family Based on Sandy Bridge Microarchitecture

Table 2-21 and Table 2-22 list model-specific registers (MSRs) that are specific to the 2nd generation Intel® Core™ processor family based on the Sandy Bridge microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH; see Table 2-1.

Table 2-21. MSRs Supported by the 2nd Generation Intel® Core™ Processors (Sandy Bridge Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0. R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.	Package
63:32	Reserved.	
Register Address: 60CH, 1548	MSR_PKGC7_IRTL	
Package C7 Interrupt Response Limit (R/W) This MSR defines the budget allocated for the package to exit from a C7 to a C0 state, where interrupt request can be delivered to the core and serviced. Additional core-exit latency may be applicable depending on the actual C-state the core is in. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C7 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.	
63:16	Reserved.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 63AH, 1594	MSR_PP0_POLICY	

Table 2-21. MSRs Supported by the 2nd Generation Intel® Core™ Processors (Sandy Bridge Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
PP0 Balance Policy (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 640H, 1600	MSR_PP1_POWER_LIMIT	
PP1 RAPL Power Limit Control (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 641H, 1601	MSR_PP1_ENERGY_STATUS	
PP1 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 642H, 1602	MSR_PP1_POLICY	
PP1 Balance Policy (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
See Table 2-20, Table 2-21, and Table 2-22 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH.		

Table 2-22 lists the MSRs of uncore PMU for Intel processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH.

Table 2-22. Uncore PMU MSRs Supported by 2nd Generation Intel® Core™ Processors

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 391H, 913	MSR_UNC_PERF_GLOBAL_CTRL	
Uncore PMU Global Control		Package
0	Slice 0 select.	
1	Slice 1 select.	
2	Slice 2 select.	
3	Slice 3 select.	
4	Slice 4 select.	
18:5	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: 392H, 914	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	

Table 2-22. Uncore PMU MSRs Supported by 2nd Generation Intel® Core™ Processors (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 394H, 916	MSR_UNC_PERF_FIXED_CTRL	
Uncore Fixed Counter Control (R/W)		Package
19:0	Reserved.	
20	Enable overflow propagation.	
21	Reserved.	
22	Enable counting.	
63:23	Reserved.	
Register Address: 395H, 917	MSR_UNC_PERF_FIXED_CTR	
Uncore Fixed Counter		Package
47:0	Current count.	
63:48	Reserved.	
Register Address: 396H, 918	MSR_UNC_CBO_CONFIG	
Uncore C-Box Configuration Information (R/O)		Package
3:0	Report the number of C-Box units with performance counters, including processor cores and processor graphics.	
63:4	Reserved.	
Register Address: 3B0H, 946	MSR_UNC_ARB_PERFCTR0	
Uncore Arb Unit, Performance Counter 0		Package
Register Address: 3B1H, 947	MSR_UNC_ARB_PERFCTR1	
Uncore Arb Unit, Performance Counter 1		Package
Register Address: 3B2H, 944	MSR_UNC_ARB_PERFEVTSEL0	
Uncore Arb Unit, Counter 0 Event Select MSR		Package
Register Address: 3B3H, 945	MSR_UNC_ARB_PERFEVTSEL1	
Uncore Arb unit, Counter 1 Event Select MSR		Package
Register Address: 700H, 1792	MSR_UNC_CBO_0_PERFEVTSEL0	
Uncore C-Box 0, Counter 0 Event Select MSR		Package
Register Address: 701H, 1793	MSR_UNC_CBO_0_PERFEVTSEL1	
Uncore C-Box 0, Counter 1 Event Select MSR		Package
Register Address: 702H, 1794	MSR_UNC_CBO_0_PERFEVTSEL2	
Uncore C-Box 0, Counter 2 Event Select MSR		Package
Register Address: 703H, 1795	MSR_UNC_CBO_0_PERFEVTSEL3	
Uncore C-Box 0, Counter 3 Event Select MSR		Package
Register Address: 705H, 1797	MSR_UNC_CBO_0_UNIT_STATUS	
Uncore C-Box 0, Unit Status for Counter 0-3		Package
Register Address: 706H, 1798	MSR_UNC_CBO_0_PERFCTR0	
Uncore C-Box 0, Performance Counter 0		Package
Register Address: 707H, 1799	MSR_UNC_CBO_0_PERFCTR1	
Uncore C-Box 0, Performance Counter 1		Package

2.11.2 MSRs in the Intel® Xeon® Processor E5 Family Based on Sandy Bridge Microarchitecture

Table 2-23 lists additional model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 Family based on Sandy Bridge microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2DH, and also support MSRs listed in Table 2-20 and Table 2-24.

Table 2-23. Additional MSRs Supported by the Intel® Xeon® Processors E5 Family Based on Sandy Bridge Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 17FH, 383	MSR_ERROR_CONTROL	
	MC Bank Error Configuration (R/W)	Package
0	Reserved.	
1	MemError Log Enable (R/W) When set, enables IMC status bank to log additional info in bits 36:32.	
63:2	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0. R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 cores active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 cores active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 cores active.	Package
39:32	Maximum Ratio Limit for 5C Maximum turbo ratio limit of 5 cores active.	Package
47:40	Maximum Ratio Limit for 6C Maximum turbo ratio limit of 6 cores active.	Package
55:48	Maximum Ratio Limit for 7C Maximum turbo ratio limit of 7 cores active.	Package
63:56	Maximum Ratio Limit for 8C Maximum turbo ratio limit of 8 cores active.	Package
Register Address: 285H, 645	IA32_MC5_CTL2	
See Table 2-2.		Package

Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 286H, 646	IA32_MC6_CTL2	
See Table 2-2.		Package
Register Address: 287H, 647	IA32_MC7_CTL2	
See Table 2-2.		Package
Register Address: 288H, 648	IA32_MC8_CTL2	
See Table 2-2.		Package
Register Address: 289H, 649	IA32_MC9_CTL2	
See Table 2-2.		Package
Register Address: 28AH, 650	IA32_MC10_CTL2	
See Table 2-2.		Package
Register Address: 28BH, 651	IA32_MC11_CTL2	
See Table 2-2.		Package
Register Address: 28CH, 652	IA32_MC12_CTL2	
See Table 2-2.		Package
Register Address: 28DH, 653	IA32_MC13_CTL2	
See Table 2-2.		Package
Register Address: 28EH, 654	IA32_MC14_CTL2	
See Table 2-2.		Package
Register Address: 28FH, 655	IA32_MC15_CTL2	
See Table 2-2.		Package
Register Address: 290H, 656	IA32_MC16_CTL2	
See Table 2-2.		Package
Register Address: 291H, 657	IA32_MC17_CTL2	
See Table 2-2.		Package
Register Address: 292H, 658	IA32_MC18_CTL2	
See Table 2-2.		Package
Register Address: 293H, 659	IA32_MC19_CTL2	
See Table 2-2.		Package
Register Address: 39CH, 924	MSR_PEBS_NUM_ALT	
ENABLE_PEBS_NUM_ALT (R/W)		Package
0	ENABLE_PEBS_NUM_ALT (R/W) Write 1 to enable alternate PEBS counting logic for specific events requiring additional configuration, see https://perfmon-events.intel.com/.	
63:1	Reserved, must be zero.	
Register Address: 414H, 1044	IA32_MC5_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package
Register Address: 415H, 1045	IA32_MC5_STATUS	

Table 2-23. Additional MSRs Supported by the Intel® Xeon® Processors E5 Family Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 416H, 1046	IA32_MC5_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 417H, 1047	IA32_MC5_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: 418H, 1048	IA32_MC6_CTL

See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 44AH, 1098	IA32_MC18_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 44BH, 1099	IA32_MC18_MISC	
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs."		Package
Register Address: 44CH, 1100	IA32_MC19_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Package

Table 2-23. Additional MSRs Supported by the Intel® Xeon® Processors E5 Family Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 44DH, 1101	IA32_MC19_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 44EH, 1102	IA32_MC19_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 44FH, 1103	IA32_MC19_MISC	
See Section 17.3.2.4, "IA32_MCi_MISC MSRs."		Package
Register Address: 613H, 1555	MSR_PKG_PERF_STATUS	
Package RAPL Perf Status (R/O)		Package
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
DRAM RAPL Power Limit Control (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
See Table 2-20, Table 2-23, and Table 2-24 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_2DH.		

2.11.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 Family

Intel Xeon Processor E5 family is based on the Sandy Bridge microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-24. For complete details of the uncore PMU, refer to the Intel Xeon Processor E5 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2DH.

Table 2-24. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: C08H, 3080	MSR_U_PMON_UCLK_FIXED_CTL	
Uncore U-box UCLK Fixed Counter Control		Package
Register Address: C09H, 3081	MSR_U_PMON_UCLK_FIXED_CTR	

Table 2-24. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Uncore U-box UCLK Fixed Counter		Package
Register Address: C10H, 3088	MSR_U_PMON_EVNTSEL0	
Uncore U-box Perfmon Event Select for U-box Counter 0		Package
Register Address: C11H, 3089	MSR_U_PMON_EVNTSEL1	
Uncore U-box Perfmon Event Select for U-box Counter 1		Package
Register Address: C16H, 3094	MSR_U_PMON_CTR0	
Uncore U-box Perfmon Counter 0		Package
Register Address: C17H, 3095	MSR_U_PMON_CTR1	
Uncore U-box Perfmon Counter 1		Package
Register Address: C24H, 3108	MSR_PCU_PMON_BOX_CTL	
Uncore PCU Perfmon for PCU-box-wide Control		Package
Register Address: C30H, 3120	MSR_PCU_PMON_EVNTSEL0	
Uncore PCU Perfmon Event Select for PCU Counter 0		Package
Register Address: C31H, 3121	MSR_PCU_PMON_EVNTSEL1	
Uncore PCU Perfmon Event Select for PCU Counter 1		Package
Register Address: C32H, 3122	MSR_PCU_PMON_EVNTSEL2	
Uncore PCU Perfmon Event Select for PCU Counter 2		Package
Register Address: C33H, 3123	MSR_PCU_PMON_EVNTSEL3	
Uncore PCU Perfmon Event Select for PCU Counter 3		Package
Register Address: C34H, 3124	MSR_PCU_PMON_BOX_FILTER	
Uncore PCU Perfmon box-wide Filter		Package
Register Address: C36H, 3126	MSR_PCU_PMON_CTR0	
Uncore PCU Perfmon Counter 0		Package
Register Address: C37H, 3127	MSR_PCU_PMON_CTR1	
Uncore PCU Perfmon Counter 1		Package
Register Address: C38H, 3128	MSR_PCU_PMON_CTR2	
Uncore PCU Perfmon Counter 2		Package
Register Address: C39H, 3129	MSR_PCU_PMON_CTR3	
Uncore PCU Perfmon Counter 3		Package
Register Address: D04H, 3332	MSR_C0_PMON_BOX_CTL	
Uncore C-box 0 Perfmon Local Box Wide Control		Package
Register Address: D10H, 3344	MSR_C0_PMON_EVNTSEL0	
Uncore C-box 0 Perfmon Event Select for C-box 0 Counter 0		Package
Register Address: D11H, 3345	MSR_C0_PMON_EVNTSEL1	
Uncore C-box 0 Perfmon Event Select for C-box 0 Counter 1		Package
Register Address: D12H, 3346	MSR_C0_PMON_EVNTSEL2	
Uncore C-box 0 Perfmon Event Select for C-box 0 Counter 2		Package

Table 2-24. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: D13H, 3347	MSR_C0_PMON_EVNTSEL3	
Uncore C-box 0 Perfmon Event Select for C-box 0 Counter 3		Package
Register Address: D14H, 3348	MSR_C0_PMON_BOX_FILTER	
Uncore C-box 0 Perfmon Box Wide Filter		Package
Register Address: D16H, 3350	MSR_C0_PMON_CTR0	
Uncore C-box 0 Perfmon Counter 0		Package
Register Address: D17H, 3351	MSR_C0_PMON_CTR1	
Uncore C-box 0 Perfmon Counter 1		Package
Register Address: D18H, 3352	MSR_C0_PMON_CTR2	
Uncore C-box 0 Perfmon Counter 2		Package
Register Address: D19H, 3353	MSR_C0_PMON_CTR3	
Uncore C-box 0 Perfmon Counter 3		Package
Register Address: D24H, 3364	MSR_C1_PMON_BOX_CTL	
Uncore C-box 1 Perfmon Local Box Wide Control		Package
Register Address: D30H, 3376	MSR_C1_PMON_EVNTSEL0	
Uncore C-box 1 Perfmon Event Select for C-box 1 Counter 0		Package
Register Address: D31H, 3377	MSR_C1_PMON_EVNTSEL1	
Uncore C-box 1 Perfmon Event Select for C-box 1 Counter 1		Package
Register Address: D32H, 3378	MSR_C1_PMON_EVNTSEL2	
Uncore C-box 1 Perfmon Event Select for C-box 1 Counter 2		Package
Register Address: D33H, 3379	MSR_C1_PMON_EVNTSEL3	
Uncore C-box 1 Perfmon Event Select for C-box 1 Counter 3		Package
Register Address: D34H, 3380	MSR_C1_PMON_BOX_FILTER	
Uncore C-box 1 Perfmon Box Wide Filter		Package
Register Address: D36H, 3382	MSR_C1_PMON_CTR0	
Uncore C-box 1 Perfmon Counter 0		Package
Register Address: D37H, 3383	MSR_C1_PMON_CTR1	
Uncore C-box 1 Perfmon Counter 1		Package
Register Address: D38H, 3384	MSR_C1_PMON_CTR2	
Uncore C-box 1 Perfmon Counter 2		Package
Register Address: D39H, 3385	MSR_C1_PMON_CTR3	
Uncore C-box 1 Perfmon Counter 3		Package
Register Address: D44H, 3396	MSR_C2_PMON_BOX_CTL	
Uncore C-box 2 Perfmon Local Box Wide Control		Package
Register Address: D50H, 3408	MSR_C2_PMON_EVNTSEL0	
Uncore C-box 2 Perfmon Event Select for C-box 2 Counter 0		Package
Register Address: D51H, 3409	MSR_C2_PMON_EVNTSEL1

2.12 MSRS IN THE 3RD GENERATION INTEL® CORE™ PROCESSOR FAMILY BASED ON IVY BRIDGE MICROARCHITECTURE

The 3rd generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200v2 product family based on Ivy Bridge microarchitecture support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, and Table 2-25. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3AH.

Table 2-25. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors Based on Ivy Bridge Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates that TDP Limit for Turbo mode is not programmable.	Package
31:30	Reserved.	
32	Low Power Mode Support (LPM) (R/O) When set to 1, indicates that LPM is supported. When set to 0, indicates LPM is not supported.	Package
34:33	Number of ConfigTDP Levels (R/O) 00: Only Base TDP level available. 01: One additional TDP level available. 02: Two additional TDP level available. 03: Reserved	Package
39:35	Reserved.	

Table 2-25. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors Based on Ivy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
55:48	Minimum Operating Ratio (R/O) Contains the minimum supported operating ratio in units of 100 MHz.	Package
63:56	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org.	Core
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-sate support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
24:16	Reserved	
25	C3 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	
26	C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	Enable C3 Undemotion (R/W) When set, enables undemotion from demoted C3.	

Table 2-25. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors Based on Ivy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
28	Enable C1 Undemotion (R/W) When set, enables undemotion from demoted C1.	
63:29	Reserved.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 648H, 1608	MSR_CONFIG_TDP_NOMINAL	
Base TDP Ratio (R/O)		Package
7:0	Config_TDP_Base Base TDP level ratio to be used for this specific processor (in units of 100 MHz).	
63:8	Reserved.	
Register Address: 649H, 1609	MSR_CONFIG_TDP_LEVEL1	
	ConfigTDP Level 1 ratio and power level (R/O)	Package
14:0	PKG_TDP_LVL1 Power setting for ConfigTDP Level 1.	
15	Reserved.	
23:16	Config_TDP_LVL1_Ratio ConfigTDP level 1 ratio to be used for this specific processor.	
31:24	Reserved.	
46:32	PKG_MAX_PWR_LVL1 Max Power setting allowed for ConfigTDP Level 1.	
47	Reserved.	
62:48	PKG_MIN_PWR_LVL1 MIN Power setting allowed for ConfigTDP Level 1.	
63	Reserved.	
Register Address: 64AH, 1610	MSR_CONFIG_TDP_LEVEL2	
ConfigTDP Level 2 ratio and power level (R/O)		Package
14:0	PKG_TDP_LVL2 Power setting for ConfigTDP Level 2.	
15	Reserved.	
23:16	Config_TDP_LVL2_Ratio ConfigTDP level 2 ratio to be used for this specific processor.	
31:24	Reserved.	
46:32	PKG_MAX_PWR_LVL2 Max Power setting allowed for ConfigTDP Level 2.	
47	Reserved.	

Table 2-25. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors Based on Ivy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
62:48	PKG_MIN_PWR_LVL2 MIN Power setting allowed for ConfigTDP Level 2.	
63	Reserved.	
Register Address: 64BH, 1611	MSR_CONFIG_TDP_CONTROL	
ConfigTDP Control (R/W)		Package
1:0	TDP_LEVEL (RW/L) System BIOS can program this field.	
30:2	Reserved.	
31	Config_TDP_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
Register Address: 64CH, 1612	MSR_TURBO_ACTIVATION_RATIO	
ConfigTDP Control (R/W)		Package
7:0	MAX_NON_TURBO_RATIO (RW/L) System BIOS can program this field.	
30:8	Reserved.	
31	TURBO_ACTIVATION_RATIO_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
See Table 2-20, Table 2-21, and Table 2-22 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3AH.		

2.12.1 MSRs in the Intel® Xeon® Processor E5 v2 Product Family Based on Ivy Bridge-E Microarchitecture

Table 2-26 lists model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 v2 Product Family (based on Ivy Bridge-E microarchitecture). These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3EH; see Table 2-1. These processors supports the MSR interfaces listed in Table 2-20 and Table 2-26.

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 4EH, 78	IA32_PPIN_CTL (MSR_PPIN_CTL)	
Protected Processor Inventory Number Enable Control (R/W)		Package
0	LockOut (R/WO) See Table 2-2.	
1	Enable_PPIN (R/W) See Table 2-2.	
63:2	Reserved.	

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 4FH, 79	IA32_PPIN (MSR_PPIN)	
Protected Processor Inventory Number (R/O)		Package
63:0	Protected Processor Inventory Number (R/O) See Table 2-2.	
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
22:16	Reserved.	
23	PPIN_CAP (R/O) When set to 1, indicates that Protected Processor Inventory Number (PPIN) capability can be enabled for a privileged system inventory agent to read PPIN from MSR_PPIN. When set to 0, PPIN capability is not supported. An attempt to access MSR_PPIN_CTL or MSR_PPIN will cause #GP.	Package
27:24	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
30	Programmable TJ OFFSET (R/O) When set to 1, indicates that MSR_TEMPERATURE_TARGET.[27:24] is valid and writable to specify a temperature offset.	Package
39:31	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See http://biosbits.org.		Core

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-sate support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
63:16	Reserved.	
Register Address: 179H, 377	IA32_MCG_CAP	
Global Machine Check Capability (R/O)		Thread
7:0	Count	
8	MCG_CTL_P	
9	MCG_EXT_P	
10	MCP_CMCI_P	
11	MCG_TES_P	
15:12	Reserved.	
23:16	MCG_EXT_CNT	
24	MCG_SER_P	
25	Reserved.	
26	MCG_ELOG_P	
63:27	Reserved.	
Register Address: 17FH, 383	MSR_ERROR_CONTROL	
MC Bank Error Configuration (R/W)		Package
0	Reserved.	
1	MemError Log Enable (R/W) When set, enables IMC status bank to log additional info in bits 36:32.	
63:2	Reserved.	

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target		Package
15:0	Reserved.	
23:16	Temperature Target (R/O) The minimum temperature at which PROCHOT# will be asserted. The value is degrees C.	
27:24	TCC Activation Offset (R/W) Specifies a temperature offset in degrees C from the temperature target (bits 23:16). PROCHOT# will assert at the offset target temperature. Write is permitted only if MSR_PLATFORM_INFO.[30] is set.	
63:28	Reserved.	
Register Address: 1AEH, 430	MSR_TURBO_RATIO_LIMIT1	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0. R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 9C Maximum turbo ratio limit of 9 core active.	Package
15:8	Maximum Ratio Limit for 10C Maximum turbo ratio limit of 10 core active.	Package
23:16	Maximum Ratio Limit for 11C Maximum turbo ratio limit of 11 core active.	Package
31:24	Maximum Ratio Limit for 12C Maximum turbo ratio limit of 12 core active.	Package
63:32	Reserved.

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 423H, 1059	IA32_MC8_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package
Register Address: 424H, 1060	IA32_MC9_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 425H, 1061	IA32_MC9_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 426H, 1062	IA32_MC9_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 427H, 1063	IA32_MC9_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 428H, 1064	IA32_MC10_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 429H, 1065	IA32_MC10_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42AH, 1066	IA32_MC10_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42BH, 1067	IA32_MC10_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42CH, 1068	IA32_MC11_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs." Bank MC11 reports MC errors from a specific channel of the integrated memory controller.		Package
Register Address: 42DH, 1069	IA32_MC11_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs." Bank MC11 reports MC errors from a specific channel of the integrated memory controller.		Package
Register Address: 42EH, 1070	IA32_MC11_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs." Bank MC11 reports MC errors from a specific channel of the integrated memory controller.		Package
Register Address: 42FH, 1071	IA32_MC11_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs." Bank MC11 reports MC errors from a specific channel of the integrated memory controller.		Package

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 430H, 1072	IA32_MC12_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 431H, 1073	IA32_MC12_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 432H, 1074	IA32_MC12_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 433H, 1075	IA32_MC12_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 434H, 1076	IA32_MC13_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 435H, 1077	IA32_MC13_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 436H, 1078	IA32_MC13_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 437H, 1079	IA32_MC13_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 438H, 1080	IA32_MC14_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 439H, 1081	IA32_MC14_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43AH, 1082	IA32_MC14_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43BH, 1083	IA32_MC14_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43CH, 1084	IA32_MC15_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 43DH, 1085	IA32_MC15_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43EH, 1086	IA32_MC15_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43FH, 1087	IA32_MC15_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 440H, 1088	IA32_MC16_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 441H, 1089	IA32_MC16_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 442H, 1090	IA32_MC16_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 443H, 1091	IA32_MC16_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 444H, 1092	IA32_MC17_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC17 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 445H, 1093	IA32_MC17_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC17 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 446H, 1094	IA32_MC17_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC17 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 447H, 1095	IA32_MC17_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC17 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 448H, 1096	IA32_MC18_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC18 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 449H, 1097	IA32_MC18_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC18 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 44AH, 1098	IA32_MC18_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC18 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 44BH, 1099	IA32_MC18_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC18 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 44CH, 1100	IA32_MC19_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 44DH, 1101	IA32_MC19_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 44EH, 1102	IA32_MC19_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 44FH, 1103	IA32_MC19_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 450H, 1104	IA32_MC20_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs." Bank MC20 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 451H, 1105	IA32_MC20_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs." Bank MC20 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 452H, 1106	IA32_MC20_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs." Bank MC20 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 453H, 1107	IA32_MC20_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs." Bank MC20 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 454H, 1108	IA32_MC21_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC21 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 455H, 1109	IA32_MC21_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC21 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 456H, 1110	IA32_MC21_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC21 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 457H, 1111	IA32_MC21_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC21 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 458H, 1112	IA32_MC22_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC22 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 459H, 1113	IA32_MC22_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC22 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 45AH, 1114	IA32_MC22_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC22 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 45BH, 1115	IA32_MC22_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC22 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 45CH, 1116	IA32_MC23_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC23 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 45DH, 1117	IA32_MC23_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC23 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 45EH, 1118	IA32_MC23_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC23 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 45FH, 1119	IA32_MC23_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC23 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 460H, 1120	IA32_MC24_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC24 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 461H, 1121	IA32_MC24_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC24 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 462H, 1122	IA32_MC24_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC24 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 463H, 1123	IA32_MC24_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC24 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 464H, 1124	IA32_MC25_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC25 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 465H, 1125	IA32_MC25_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC25 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 466H, 1126	IA32_MC25_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC25 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 467H, 1127	IA32_MC2MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC25 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 468H, 1128	IA32_MC26_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC26 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 469H, 1129	IA32_MC26_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC26 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 46AH, 1130	IA32_MC26_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC26 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 46BH, 1131	IA32_MC26_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC26 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 46CH, 1132	IA32_MC27_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC27 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 46DH, 1133	IA32_MC27_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC27 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 46EH, 1134	IA32_MC27_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC27 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 46FH, 1135	IA32_MC27_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC27 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 470H, 1136	IA32_MC28_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC28 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package

Register Address: 477H, 1143	IA32_MC29_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC29 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 478H, 1144	IA32_MC30_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC30 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 479H, 1145	IA32_MC30_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC30 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47AH, 1146	IA32_MC30_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC30 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47BH, 1147	IA32_MC30_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC30 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47CH, 1148	IA32_MC31_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC31 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47DH, 1149	IA32_MC31_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC31 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47EH, 1150	IA32_MC31_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC31 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47FH, 1147	IA32_MC31_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC31 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
See Table 2-20, Table 2-26 for other MSR definitions applicable to Intel Xeon processor E7 v2 with a CPUID Signature DisplayFamily_DisplayModel value of 06_3AH.		

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.12.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v2 and E7 v2 Families

Intel Xeon Processor E5 v2 and E7 v2 families are based on the Ivy Bridge-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-24 and Table 2-28. For complete detail of the uncore PMU, refer to Intel

Xeon Processor E5 v2 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3EH.

2.13 MSRS IN THE 4TH GENERATION INTEL® CORE™ PROCESSORS BASED ON HASWELL MICROARCHITECTURE

The 4th generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200v3 product family (based on Haswell microarchitecture), with a CPUID Signature DisplayFamily_DisplayModel value of 06_3CH, 06_45H, or 06_46H, support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, and Table 2-29. For an MSR listed in Table 2-20 that also appears in Table 2-29, Table 2-29 supersedes Table 2-20.

The MSRs listed in Table 2-29 also apply to processors based on Haswell-E microarchitecture (see Section 2.14).

Table 2-29. Additional MSRs Supported by Processors Based on the Haswell and Haswell-E Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 3BH, 59	IA32_TSC_ADJUST	
Per-Logical-Processor TSC ADJUST (R/W) See Table 2-2.		Thread
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
31:30	Reserved.	
32	Low Power Mode Support (LPM) (R/O) When set to 1, indicates that LPM is supported. When set to 0, indicates LPM is not supported.	Package
34:33	Number of ConfigTDP Levels (R/O) 00: Only Base TDP level available. 01: One additional TDP level available. 02: Two additional TDP level available. 03: Reserved.	Package
39:35	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
55:48	Minimum Operating Ratio (R/O) Contains the minimum supported operating ratio in units of 100 MHz.	Package
63:56	Reserved.	

Table 2-29. Additional MSRs Supported by Processors Based on the Haswell and Haswell-E Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 186H, 390	IA32_PERFEVTSEL0	
Performance Event Select for Counter 0 (R/W) Supports all fields described inTable 2-2 and the fields below.		Thread
32	IN_TX: See Section 21.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.	
Register Address: 187H, 391	IA32_PERFEVTSEL1	
Performance Event Select for Counter 1 (R/W) Supports all fields described inTable 2-2 and the fields below.		Thread
32	IN_TX: See Section 21.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.	
Register Address: 188H, 392	IA32_PERFEVTSEL2	
Performance Event Select for Counter 2 (R/W) Supports all fields described inTable 2-2 and the fields below.		Thread
32	IN_TX: See Section 21.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.	
33	IN_TXCP: See Section 21.3.6.5.1. When IN_TXCP=1 & IN_TX=1 and in sampling, a spurious PMI may occur and transactions may continuously abort near overflow conditions. Software should favor using IN_TXCP for counting over sampling. If sampling, software should use large "sample-after" value after clearing the counter configured to use IN_TXCP and also always reset the counter even when no overflow condition was reported.	
Register Address: 189H, 393	IA32_PERFEVTSEL3	
Performance Event Select for Counter 3 (R/W) Supports all fields described inTable 2-2 and the fields below.		Thread
32	IN_TX: See Section 21.3.6.5.1 When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.

15	RTM_DEBUG	
63:15	Reserved.	
Register Address: 491H, 1169	IA32_VMX_VMFUNC	
Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2.		Thread
Register Address: 60BH, 1548	MSR_PKGC_IRTL1	
Package C6/C7 Interrupt Response Limit 1 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7 state. The latency programmed in this register is for the shorter-latency sub C-states used by an MWAIT hint to a C6 or C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.	

Table 2-29. Additional MSRs Supported by Processors Based on the Haswell and Haswell-E Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
63:16	Reserved.	
Register Address: 60CH, 1548	MSR_PKGC_IRTL2	
Package C6/C7 Interrupt Response Limit 2 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7 state. The latency programmed in this register is for the longer-latency sub C-states used by an MWAIT hint to a C6 or C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt response time limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-sate management.	
63:16	Reserved.	
Register Address: 613H, 1555	MSR_PKG_PERF_STATUS	
PKG Perf Status (R/O) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 648H, 1608	MSR_CONFIG_TDP_NOMINAL	
Base TDP Ratio (R/O)		Package
7:0	Config_TDP_Base Base TDP level ratio to be used for this specific processor (in units of 100 MHz).	
63:8	Reserved.	
Register Address: 649H, 1609	MSR_CONFIG_TDP_LEVEL1	
ConfigTDP Level 1 Ratio and Power Level (R/O)		Package
14:0	PKG_TDP_LVL1 Power setting for ConfigTDP Level 1.	
15	Reserved.	
23:16	Config_TDP_LVL1_Ratio ConfigTDP level 1 ratio to be used for this specific processor.	

Table 2-29. Additional MSRs Supported by Processors Based on the Haswell and Haswell-E Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
31:24	Reserved.	
46:32	PKG_MAX_PWR_LVL1 Max Power setting allowed for ConfigTDP Level 1.	
62:47	PKG_MIN_PWR_LVL1 MIN Power setting allowed for ConfigTDP Level 1.	
63	Reserved.	
Register Address: 64AH, 1610	MSR_CONFIG_TDP_LEVEL2	
ConfigTDP Level 2 Ratio and Power Level (R/O)		Package
14:0	PKG_TDP_LVL2 Power setting for ConfigTDP Level 2.	
15	Reserved.	
23:16	Config_TDP_LVL2_Ratio ConfigTDP level 2 ratio to be used for this specific processor.	
31:24	Reserved.	
46:32	PKG_MAX_PWR_LVL2 Max Power setting allowed for ConfigTDP Level 2.	
62:47	PKG_MIN_PWR_LVL2 MIN Power setting allowed for ConfigTDP Level 2.	
63	Reserved.	
Register Address: 64BH, 1611	MSR_CONFIG_TDP_CONTROL	
ConfigTDP Control (R/W)		Package
1:0	TDP_LEVEL (RW/L) System BIOS can program this field.	
30:2	Reserved.	
31	Config_TDP_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
Register Address: 64CH, 1612	MSR_TURBO_ACTIVATION_RATIO	
ConfigTDP Control (R/W)		Package
7:0	MAX_NON_TURBO_RATIO (RW/L) System BIOS can program this field.	
30:8	Reserved.	
31	TURBO_ACTIVATION_RATIO_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
Register Address: C80H, 3200	IA32_DEBUG_INTERFACE	
Silicon Debug Feature Control (R/W) See Table 2-2.		Package

2.13.1 MSRs in the 4th Generation Intel® Core™ Processor Family Based on Haswell Microarchitecture

Table 2-30 lists model-specific registers (MSRs) that are specific to the 4th generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200 v3 product family (based on Haswell microarchitecture). These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3CH, 06_45H, or 06_46H; see Table 2-1.

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See http://biosbits.org.		Core
3:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 0000b: C0/C1 (no package C-state support) 0001b: C2 0010b: C3 0011b: C6 0100b: C7 0101b: C7s Package C states C7 are not available to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3CH.	
9:4	Reserved.	
10	I/O MWAIT Redirection Enable (R/W)	
14:11	Reserved	
15	CFG Lock (R/WO)	
24:16	Reserved.	
25	C3 State Auto Demotion Enable (R/W)	
26	C1 State Auto Demotion Enable (R/W)	
27	Enable C3 Undemotion (R/W)	
28	Enable C1 Undemotion (R/W)	
63:29	Reserved.	
Register Address: 17DH, 381	MSR_SMM_MCA_CAP	
Enhanced SMM Capabilities (SMM-RO) Reports SMM capability Enhancement. Accessible only while in SMM.		Thread
57:0	Reserved.	
58	SMM_Code_Access_Chk (SMM-RO) If set to 1, indicates that the SMM code access restriction is supported and the MSR_SMM_FEATURE_CONTROL is supported.	

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
59	Long_Flow_Indication (SMM-RO) If set to 1, indicates that the SMM long flow indicator is supported and the MSR_SMM_DELAYED is supported.	
63:60	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0, and R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.	Package
63:32	Reserved.	
Register Address: 391H, 913	MSR_UNC_PERF_GLOBAL_CTRL	
Uncore PMU Global Control		Package
0	Core 0 select.	
1	Core 1 select.	
2	Core 2 select.	
3	Core 3 select.	
18:4	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: 392H, 914	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	
Register Address: 394H, 916	MSR_UNC_PERF_FIXED_CTRL	
Uncore Fixed Counter Control (R/W)		Package
19:0	Reserved.	
20	Enable overflow propagation.	
21	Reserved.	

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
22	Enable counting.	
63:23	Reserved.	
Register Address: 395H, 917	MSR_UNC_PERF_FIXED_CTR	
Uncore Fixed Counter		Package
47:0	Current count.	
63:48	Reserved.	
Register Address: 396H, 918	MSR_UNC_CBO_CONFIG	
Uncore C-Box Configuration Information (R/O)		Package
3:0	Encoded number of C-Box, derive value by "-1".	
63:4	Reserved.	
Register Address: 3B0H, 946	MSR_UNC_ARB_PERFCTR0	
Uncore Arb Unit, Performance Counter 0		Package
Register Address: 3B1H, 947	MSR_UNC_ARB_PERFCTR1	
Uncore Arb Unit, Performance Counter 1		Package
Register Address: 3B2H, 944	MSR_UNC_ARB_PERFEVTSEL0	
Uncore Arb Unit, Counter 0 Event Select MSR		Package
Register Address: 3B3H, 945	MSR_UNC_ARB_PERFEVTSEL1	
Uncore Arb Unit, Counter 1 Event Select MSR		Package
Register Address: 391H, 913	MSR_UNC_PERF_GLOBAL_CTRL	
Uncore PMU Global Control		Package
0	Core 0 select.	
1	Core 1 select.	
2	Core 2 select.	
3	Core 3 select.	
18:4	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: 395H, 917	MSR_UNC_PERF_FIXED_CTR	
Uncore Fixed Counter		Package
47:0	Current count.	
63:48	Reserved.	
Register Address: 3B3H, 945	MSR_UNC_ARB_PERFEVTSEL1	
Uncore Arb Unit, Counter 1 Event Select MSR		Package
Register Address: 4E0H, 1248	MSR_SMM_FEATURE_CONTROL	
Enhanced SMM Feature Control (SMM-RW) Reports SMM capability Enhancement. Accessible only while in SMM.		Package

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
0	Lock (SMM-RWO) When set to '1' locks this register from further changes.	
1	Reserved.	
2	SMM_Code_Chk_En (SMM-RW) This control bit is available only if MSR_SMM_MCA_CAP[58] == 1. When set to '0' (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set to '1' any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.	
63:3	Reserved.	
Register Address: 4E2H, 1250	MSR_SMM_DELAYED	
SMM Delayed (SMM-RO) Reports the interruptible state of all logical processors in the package. Available only while in SMM and MSR_SMM_MCA_CAP[LONG_FLOW_INDICATION] == 1.		Package
N-1:0	LOG_PROC_STATE (SMM-RO) Each bit represents a logical processor of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: Microcode Update Load, C6, WBINVD, Ratio Change, Throttle. The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.	
63:N	Reserved.	
Register Address: 4E3H, 1251	MSR_SMM_BLOCKED	
SMM Blocked (SMM-RO) Reports the blocked state of all logical processors in the package. Available only while in SMM.		Package
N-1:0	LOG_PROC_STATE (SMM-RO) Each bit represents a logical processor of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: Wait For SIPI or SENTER Sleep. The reset value of this field is 0FFFH. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.	
63:N	Reserved.	
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers Used in RAPL Interfaces (R/O)		Package
3:0	Power Units See Section 16.10.1, "RAPL Interfaces."	Package
7:4	Reserved.	Package

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
12:8	Energy Status Units Energy related information (in Joules) is based on the multiplier, 1/2^ESU; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules).	Package
15:13	Reserved.	Package
19:16	Time Units See Section 16.10.1, "RAPL Interfaces."	Package
63:20	Reserved.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 640H, 1600	MSR_PP1_POWER_LIMIT	
PP1 RAPL Power Limit Control (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 641H, 1601	MSR_PP1_ENERGY_STATUS	
PP1 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 642H, 1602	MSR_PP1_POLICY	
PP1 Balance Policy (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 690H, 1680	MSR_CORE_PERF_LIMIT_REASONS	
Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)		Package
0	PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.	
3:2	Reserved.	
4	Graphics Driver Status (R0) When set, frequency is reduced below the operating system request due to Processor Graphics driver override.	
5	Autonomous Utilization-Based Frequency Control Status (R0) When set, frequency is reduced below the operating system request because the processor has detected that utilization is low.	
6	VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.	
7	Reserved.	

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
8	Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).	
9	Core Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to domain-level power limiting.	
10	Package-Level Power Limiting PL1 Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL1.	
11	Package-Level PL2 Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL2.	
12	Max Turbo Limit Status (R0) When set, frequency is reduced below the operating system request due to multi-core turbo limits.	
13	Turbo Transition Attenuation Status (R0) When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.	
15:14	Reserved.	
16	PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19:18	Reserved.	
20	Graphics Driver Log When set, indicates that the Graphics Driver Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
21	Autonomous Utilization-Based Frequency Control Log When set, indicates that the Autonomous Utilization-Based Frequency Control Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
22	VR Therm Alert Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
23	Reserved.	
24	Electrical Design Point Log When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
25	Core Power Limiting Log When set, indicates that the Core Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
26	Package-Level PL1 Power Limiting Log When set, indicates that the Package Level PL1 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.

Register Address: 422H, 1058	IA32_MC8_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 423H, 1059	IA32_MC8_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 424H, 1060	IA32_MC9_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 425H, 1061	IA32_MC9_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 426H, 1062	IA32_MC9_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 427H, 1063	IA32_MC9_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 428H, 1064	IA32_MC10_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 429H, 1065	IA32_MC10_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42AH, 1066	IA32_MC10_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42BH, 1067	IA32_MC10_MISC

See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42CH, 1068	IA32_MC11_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42DH, 1069	IA32_MC11_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42EH, 1070	IA32_MC11_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42FH, 1071	IA32_MC11_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 430H, 1072	IA32_MC12_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 431H, 1073	IA32_MC12_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 432H, 1074	IA32_MC12_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 433H, 1075	IA32_MC12_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 434H, 1076	IA32_MC13_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 435H, 1077	IA32_MC13_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 436H, 1078	IA32_MC13_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 437H, 1079	IA32_MC13_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 438H, 1080	IA32_MC14_CTL	

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 439H, 1081	IA32_MC14_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43AH, 1082	IA32_MC14_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43BH, 1083	IA32_MC14_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43CH, 1084	IA32_MC15_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43DH, 1085	IA32_MC15_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43EH, 1086	IA32_MC15_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 43FH, 1087	IA32_MC15_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 440H, 1088	IA32_MC16_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 441H, 1089	IA32_MC16_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 442H, 1090	IA32_MC16_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 443H, 1091	IA32_MC16_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 444H, 1092	IA32_MC17_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC17 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo0, CBo3, CBo6, CBo9, CBo12, CBo15.		Package

Register Address: 446H, 1094	IA32_MC17_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC17 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo0, CBo3, CBo6, CBo9, CBo12, CBo15.		Package
Register Address: 447H, 1095	IA32_MC17_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC17 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo0, CBo3, CBo6, CBo9, CBo12, CBo15.		Package
Register Address: 448H, 1096	IA32_MC18_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC18 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo1, CBo4, CBo7, CBo10, CBo13, CBo16.		Package
Register Address: 449H, 1097	IA32_MC18_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC18 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo1, CBo4, CBo7, CBo10, CBo13, CBo16.		Package
Register Address: 44AH, 1098	IA32_MC18_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC18 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo1, CBo4, CBo7, CBo10, CBo13, CBo16.		Package
Register Address: 44BH, 1099	IA32_MC18_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC18 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo1, CBo4, CBo7, CBo10, CBo13, CBo16.		Package
Register Address: 44CH, 1100	IA32_MC19_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo2, CBo5, CBo8, CBo11, CBo14, CBo17.		Package
Register Address: 44DH, 1101	IA32_MC19_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo2, CBo5, CBo8, CBo11, CBo14, CBo17.		Package
Register Address: 44EH, 1102	IA32_MC19_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo2, CBo5, CBo8, CBo11, CBo14, CBo17.		Package
Register Address: 44FH, 1103	IA32_MC19_MISC	

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo2, CBo5, CBo8, CBo11, CBo14, CBo17.		Package
Register Address: 450H, 1104	IA32_MC20_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 451H, 1105	IA32_MC20_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 452H, 1106	IA32_MC20_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 453H, 1107	IA32_MC20_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 454H, 1108	IA32_MC21_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 455H, 1109	IA32_MC21_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 456H, 1110	IA32_MC21_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 457H, 1111	IA32_MC21_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers Used in RAPL Interfaces (R/O)		Package
3:0	Power Units See Section 16.10.1, "RAPL Interfaces."	Package
7:4	Reserved.	Package
12:8	Energy Status Units Energy related information (in Joules) is based on the multiplier, 1/2^ESU; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules).	Package
15:13	Reserved.	Package
19:16	Time Units See Section 16.10.1, "RAPL Interfaces."	Package
63:20	Reserved.	

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
DRAM RAPL Power Limit Control (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) Energy Consumed by DRAM devices.		Package
31:0	Energy in 15.3 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61EH, 1566	MSR_PCIE_PLL_RATIO	
Configuration of PCIE PLL Relative to BCLK(R/W)		Package
1:0	PCIE Ratio (R/W) 00b: Use 5:5 mapping for100MHz operation (default). 01b: Use 5:4 mapping for125MHz operation. 10b: Use 5:3 mapping for166MHz operation. 11b: Use 5:2 mapping for250MHz operation.	Package
2	LPLL Select (R/W) If 1, use configured setting of PCIE Ratio.	Package
3	LONG RESET (R/W) If 1, wait an additional time-out before re-locking Gen2/Gen3 PLLs.	Package
63:4	Reserved.	
Register Address: 620H, 1568	MSR_UNCORE_RATIO_LIMIT	
Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.		Package
6:0	MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.	
7	Reserved.	
14:8	MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.	
63:15	Reserved.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
Reserved (R/O) Reads return 0.		Package

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 690H, 1680	MSR_CORE_PERF_LIMIT_REASONS	
Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)		Package
0	PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.	
2	Power Budget Management Status (R0) When set, frequency is reduced below the operating system request due to PBM limit	
3	Platform Configuration Services Status (R0) When set, frequency is reduced below the operating system request due to PCS limit	
4	Reserved.	
5	Autonomous Utilization-Based Frequency Control Status (R0) When set, frequency is reduced below the operating system request because the processor has detected that utilization is low.	
6	VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.	
7	Reserved.	
8	Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).	
9	Reserved.	
10	Multi-Core Turbo Status (R0) When set, frequency is reduced below the operating system request due to Multi-Core Turbo limits.	
12:11	Reserved.	
13	Core Frequency P1 Status (R0) When set, frequency is reduced below max non-turbo P1.	
14	Core Max N-Core Turbo Frequency Limiting Status (R0) When set, frequency is reduced below max n-core turbo frequency.	
15	Core Frequency Limiting Status (R0) When set, frequency is reduced below the operating system request.	
16	PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
17	Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
18	Power Budget Management Log When set, indicates that the PBM Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19	Platform Configuration Services Log When set, indicates that the PCS Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
20	Reserved.	
21	Autonomous Utilization-Based Frequency Control Log When set, indicates that the AUBFC Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
22	VR Therm Alert Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
23	Reserved.	
24	Electrical Design Point Log When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
25	Reserved.	
26	Multi-Core Turbo Log When set, indicates that the Multi-Core Turbo Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
28:27	Reserved.	
29	Core Frequency P1 Log When set, indicates that the Core Frequency P1 Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
30	Core Max N-Core Turbo Frequency Limiting Log When set, indicates that the Core Max n-core Turbo Frequency Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
31	Core Frequency Limiting Log When set, indicates that the Core Frequency Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
63:32	Reserved.	
Register Address: C8DH, 3213	IA32_QM_EVTSEL	
Monitoring Event Select Register (R/W) If CPUID.(EAX=07H, ECX=0):EBX.RDT-M[bit 12] = 1.		Thread
7:0	EventID (R/W) Event encoding: 0x0: No monitoring. 0x1: L3 occupancy monitoring. All other encoding reserved.	
31:8	Reserved.	
41:32	RMID (R/W)	
63:42	Reserved.	
Register Address: C8EH, 3214	IA32_QM_CTR	
Monitoring Counter Register (R/O) If CPUID.(EAX=07H, ECX=0):EBX.RDT-M[bit 12] = 1.		Thread
61:0	Resource Monitored Data	
62	Unavailable: If 1, indicates data for this RMID is not available or not monitored for this resource or RMID.	
63	Error: If 1, indicates an unsupported RMID or event type was written to IA32_PQR_QM_EVTSEL.	
Register Address: C8FH, 3215	IA32_PQR_ASSOC	
Resource Association Register (R/W)		Thread
9:0	RMID	
63: 10	Reserved.	
See Table 2-20 and Table 2-29 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3FH.		

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.14.1 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v3 Family

The Intel Xeon Processor E5 v3 and E7 v3 families are based on Haswell-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-33. For complete details of the uncore PMU, refer to the Intel Xeon Processor E5 v3 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3FH.

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 700H, 1792	MSR_PMON_GLOBAL_CTL	
Uncore Perfmon Per-Socket Global Control		Package
Register Address: 701H, 1793	MSR_PMON_GLOBAL_STATUS	
Uncore Perfmon Per-Socket Global Status		Package
Register Address: 702H, 1794	MSR_PMON_GLOBAL_CONFIG	
Uncore Perfmon Per-Socket Global Configuration		Package
Register Address: 703H, 1795	MSR_U_PMON_UCLK_FIXED_CTL	
Uncore U-Box UCLK Fixed Counter Control		Package
Register Address: 704H, 1796	MSR_U_PMON_UCLK_FIXED_CTR	
Uncore U-Box UCLK Fixed Counter		Package
Register Address: 705H, 1797	MSR_U_PMON_EVNTSEL0	
Uncore U-Box Perfmon Event Select for U-Box Counter 0		Package
Register Address: 706H, 1798	MSR_U_PMON_EVNTSEL1	
Uncore U-Box Perfmon Event Select for U-Box Counter 1		Package
Register Address: 708H, 1800	MSR_U_PMON_BOX_STATUS	
Uncore U-Box Perfmon U-Box Wide Status		Package
Register Address: 709H, 1801	MSR_U_PMON_CTR0	
Uncore U-Box Perfmon Counter 0		Package
Register Address: 70AH, 1802	MSR_U_PMON_CTR1	
Uncore U-Box Perfmon Counter 1		Package
Register Address: 710H, 1808	MSR_PCU_PMON_BOX_CTL	
Uncore PCU Perfmon for PCU-Box-Wide Control		Package
Register Address: 711H, 1809	MSR_PCU_PMON_EVNTSEL0	
Uncore PCU Perfmon Event Select for PCU Counter 0		Package
Register Address: 712H, 1810	MSR_PCU_PMON_EVNTSEL1	
Uncore PCU Perfmon Event Select for PCU Counter 1		Package
Register Address: 713H, 1811	MSR_PCU_PMON_EVNTSEL2	
Uncore PCU Perfmon Event Select for PCU Counter 2		Package
Register Address: 714H, 1812	MSR_PCU_PMON_EVNTSEL3	
Uncore PCU Perfmon Event Select for PCU Counter 3		Package
Register Address: 715H, 1813	MSR_PCU_PMON_BOX_FILTER	
Uncore PCU Perfmon Box-Wide Filter		Package
Register Address: 716H, 1814	MSR_PCU_PMON_BOX_STATUS	
Uncore PCU Perfmon Box Wide Status		Package
Register Address: 717H, 1815	MSR_PCU_PMON_CTR0	
Uncore PCU Perfmon Counter 0		Package
Register Address: 718H, 1816	MSR_PCU_PMON_CTR1

2.15 MSRS IN THE INTEL® CORE™ M PROCESSORS AND THE 5TH GENERATION INTEL® CORE™ PROCESSORS

The Intel® Core™ M-5xxx processors, 5th generation Intel® Core™ Processors, and the Intel® Xeon® Processor E3-1200 v4 family are based on Broadwell microarchitecture. The Intel® Core™ M-5xxx processors and 5th generation Intel® Core™ Processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3DH. The Intel® Xeon® Processor E3-1200 v4 family and 5th generation Intel® Core™ Processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_47H. Processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3DH or 06_47H support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, Table 2-25, Table 2-29, Table 2-30, Table 2-34, and Table 2-35. For an MSR listed in Table 2-35 that also appears in the model-specific tables of prior generations, Table 2-35 supersedes prior generation tables.

Table 2-34 lists MSRs that are common to processors based on the Broadwell microarchitectures (including CPUID Signature DisplayFamily_DisplayModel values of 06_3DH, 06_47H, 06_4FH, and 06_56H).

63:5	CR3[63:5] value to match.	
Register Address: 620H, 1568	MSR_UNCORE_RATIO_LIMIT	
Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.		Package
6:0	MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.	
7	Reserved.	
14:8	MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.	
63:15	Reserved.	

NOTES:

1. MAXPHYADDR is reported by CPUID.80000008H:EAX[7:0].

Table 2-35 lists MSRs that are specific to Intel Core M processors and 5th Generation Intel Core Processors.

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
47:40	Maximum Ratio Limit for 6C Maximum turbo ratio limit of 6core active.	Package
63:48	Reserved.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
See Table 2-20, Table 2-21, Table 2-22, Table 2-25, Table 2-29, Table 2-30, and Table 2-34 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3DH.		

2.16 MSRS IN THE INTEL® XEON® PROCESSOR E5 V4 FAMILY

The MSRs listed in Table 2-36 are available and common to the Intel® Xeon® Processor D Product Family (CPUID Signature DisplayFamily_DisplayModel value of 06_56H) and to the Intel Xeon processors E5 v4 and E7 v4 families (CPUID Signature DisplayFamily_DisplayModel value of 06_4FH). These processors are based on Broadwell microarchitecture.

See Section 2.16.1 for lists of tables of MSRs that are supported by the Intel® Xeon® Processor D Family.

Register Information / Bit Fields	**Bit Description**	**Scope**
DRAM RAPL Power Limit Control (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) Energy consumed by DRAM devices.		Package
31:0	Energy in 15.3 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 620H, 1568	MSR_UNCORE_RATIO_LIMIT	
Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.		Package
63:15	Reserved.	
14:8	MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.	
7	Reserved.	
6:0	MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
Reserved (R/O) Reads return 0.		Package
Register Address: 690H, 1680	MSR_CORE_PERF_LIMIT_REASONS	
Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)		Package
0	PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.	
2	Power Budget Management Status (R0) When set, frequency is reduced below the operating system request due to PBM limit.	

Table 2-36. Additional MSRs Common to the Intel® Xeon® Processor D and the Intel® Xeon® Processor E5 v4 Family Based on Broadwell Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
3	Platform Configuration Services Status (R0) When set, frequency is reduced below the operating system request due to PCS limit.	
4	Reserved.	
5	Autonomous Utilization-Based Frequency Control Status (R0) When set, frequency is reduced below the operating system request because the processor has detected that utilization is low.	
6	VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.	
7	Reserved.	
8	Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).	
9	Reserved.	
10	Multi-Core Turbo Status (R0) When set, frequency is reduced below the operating system request due to Multi-Core Turbo limits.	
12:11	Reserved.	
13	Core Frequency P1 Status (R0) When set, frequency is reduced below max non-turbo P1.	
14	Core Max N-Core Turbo Frequency Limiting Status (R0) When set, frequency is reduced below max n-core turbo frequency.	
15	Core Frequency Limiting Status (R0) When set, frequency is reduced below the operating system request.	
16	PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
18	Power Budget Management Log When set, indicates that the PBM Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19	Platform Configuration Services Log When set, indicates that the PCS Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.

0:19	CBM: Bit vector of available L3 ways for CLOS 15 enforcement.	
63:20	Reserved.	

2.16.1 Additional MSRs Supported in the Intel® Xeon® Processor D Product Family

The MSRs listed in Table 2-37 are available to Intel® Xeon® Processor D Product Family (CPUID Signature DisplayFamily_DisplayModel value of 06_56H). The Intel® Xeon® processor D product family is based on Broadwell microarchitecture and supports the MSR interfaces listed in Table 2-20, Table 2-29, Table 2-34, Table 2-36, and Table 2-37.

See Table 2-20, Table 2-29, Table 2-34, and Table 2-36 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_56H.		

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.16.2 Additional MSRs Supported in Intel® Xeon® Processors E5 v4 and E7 v4 Families

The MSRs listed in Table 2-37 are available to the Intel® Xeon® Processor E5 v4 and E7 v4 Families (CPUID Signature DisplayFamily_DisplayModel value of 06_4FH). The Intel® Xeon® processor E5 v4 family is based on Broadwell microarchitecture and supports the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-29, Table 2-34, Table 2-36, and Table 2-38.

0	CAT Enable. Set 1 to enable Cache Allocation Technology.	
63:1	Reserved.	
See Table 2-20, Table 2-21, Table 2-29, and Table 2-30 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_45H.		

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.17 MSRS IN THE 6TH—13TH GENERATION INTEL® CORE™ PROCESSORS, 1ST—5TH GENERATION INTEL® XEON® SCALABLE PROCESSOR FAMILIES, INTEL® CORE™ ULTRA 7 PROCESSORS, 8TH GENERATION INTEL® CORE™ I3 PROCESSORS, INTEL® XEON® E PROCESSORS, INTEL® XEON® 6 P-CORE PROCESSORS, INTEL® XEON® 6 E-CORE PROCESSORS, AND INTEL® SERIES 2 CORE™ ULTRA PROCESSORS

6th generation Intel® Core™ processors are based on Skylake microarchitecture and have a CPUID Signature DisplayFamily_DisplayModel value of 06_4EH or 06_5EH.

The Intel® Xeon® Scalable Processor Family based on the Skylake microarchitecture, the 2nd generation Intel® Xeon® Scalable Processor Family based on the Cascade Lake product, and the 3rd generation Intel® Xeon® Scalable Processor Family based on the Cooper Lake product all have a CPUID Signature DisplayFamily_DisplayModel value of 06_55H.

7th generation Intel® Core™ processors are based on the Kaby Lake microarchitecture, 8th generation and 9th generation Intel® Core™ processors, and Intel® Xeon® E processors are based on Coffee Lake microarchitecture; these processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_8EH or 06_9EH.

8th generation Intel® Core™ i3 processors are based on Cannon Lake microarchitecture and have a CPUID Signature DisplayFamily_DisplayModel value of 06_66H.

10th generation Intel® Core™ processors are based on Comet Lake microarchitecture (with a CPUID Signature DisplayFamily_DisplayModel value of 06_A5H or 06_A6H) and Ice Lake microarchitecture (with a CPUID Signature DisplayFamily_DisplayModel value of 06_7DH or 06_7EH).

11th generation Intel® Core™ processors are based on Tiger Lake microarchitecture and have a CPUID Signature DisplayFamily_DisplayModel value of 06_8CH or 06_8DH.

The 3rd generation Intel® Xeon® Scalable Processor Family is based on Ice Lake microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_6AH or 06_6CH.

12th generation Intel® Core™ processors supporting the Alder Lake performance hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_97H or 06_9AH.

13th generation Intel® Core™ processors supporting the Raptor Lake performance hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_BAH, 06_B7H, or 06_BFH.

The 4th generation Intel® Xeon® Scalable Processor Family is based on Sapphire Rapids microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_8FH.

The 5th generation Intel® Xeon® Scalable Processor Family is based on Emerald Rapids microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_CFH.

The Intel® Core™ Ultra 7 processors supporting the Meteor Lake hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_AAH.

The Intel® Xeon® 6 P-core processor is based on the Granite Rapids microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_ADH or 06_AEH.

The Intel® Xeon® 6 E-core processor is based on the Sierra Forest microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_AFH.

The Intel® Series 2 Core™ Ultra processors supporting the Lunar Lake performance hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_BDH.

These processors support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-25, Table 2-29, Table 2-35, and Table 2-39[1]. For an MSR listed in Table 2-39 that also appears in the model-specific tables of prior generations, Table 2-39 supersedes prior generation tables.

Tables 2-40 through 2-60 list additional supported MSR interfaces introduced in specific processors; see each table for additional details.

The notation of "Platform" in the Scope column (with respect to MSR_PLATFORM_ENERGY_COUNTER and MSR_PLATFORM_POWER_LIMIT) is limited to the power-delivery domain and the specifics of the power delivery integration may vary by platform vendor's implementation.

Table 2-39. Additional MSRs Supported by the 6th—13th Generation Intel® Core™ Processors, 1st—5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 E-Core Processors, Intel® Xeon® 6 P-Core Processors, and Intel® Series 2 Core™ Ultra Processors

Core and Graphics Engine Overlapped C0 Residency (R/O)		Package
63:0	Increment at the same rate as the TSC. The increment each cycle is one if at least one compute engine of the processor graphics is in C0 and at least one processor core in the package is also in C0.	
Register Address: 65CH, 1628	MSR_PLATFORM_POWER_LIMIT	
Platform Power Limit Control (R/W-L) Allows platform BIOS to limit power consumption of the platform devices to the specified values. The Long Duration power consumption is specified via Platform_Power_Limit_1 and Platform_Power_Limit_1_Time. The Short Duration power consumption limit is specified via the Platform_Power_Limit_2 with duration chosen by the processor. The processor implements an exponential-weighted algorithm in the placement of the time windows.		Platform
14:0	Platform Power Limit #1 Average Power limit value which the platform must not exceed over a time window as specified by Power_Limit_1_TIME field. The default value is the Thermal Design Power (TDP) and varies with product skus. The unit is specified in MSR_RAPLPOWER_UNIT.	
15	Enable Platform Power Limit #1 When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #1 over the time window specified by Power Limit #1 Time Window.	
16	Platform Clamping Limitation #1 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #1 value. This bit is writeable only when CPUID (EAX=6):EAX[4] is set.	
23:17	Time Window for Platform Power Limit #1 Specifies the duration of the time window over which Platform Power Limit 1 value should be maintained for sustained long duration. This field is made up of two numbers from the following equation: Time Window = (float) ((1+(X/4))*(2^Y)), where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17] The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN]. The default value is 0DH, and the unit is specified in MSR_RAPL_POWER_UNIT[Time Unit].	
31:24	Reserved.	
46:32	Platform Power Limit #2 Average Power limit value which the platform must not exceed over the Short Duration time window chosen by the processor. The recommended default value is 1.25 times the Long Duration Power Limit (i.e., Platform Power Limit # 1).	

Table 2-39. Additional MSRs Supported by the 6th—13th Generation Intel® Core™ Processors, 1st—5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 E-Core Processors, Intel® Xeon® 6 P-Core Processors, and Intel® Series 2 Core™ Ultra Processors (Contd.)

Register Information / Bit Fields	**Bit Description**	**Scope**
7	VR Thermal Design Current Status (R0) When set, frequency is reduced due to VR TDC limit.	
8	Other Status (R0) When set, frequency is reduced due to electrical or other constraints.	
9	Reserved.	
10	Package/Platform-Level Power Limiting PL1 Status (R0) When set, frequency is reduced due to package/platform-level power limiting PL1.	
11	Package/Platform-Level PL2 Power Limiting Status (R0) When set, frequency is reduced due to package/platform-level power limiting PL2/PL3.	
12	Inefficient Operation Status (R0) When set, processor graphics frequency is operating below target frequency.	
15:13	Reserved.	
16	PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
20:18	Reserved.	
21	Running Average Thermal Limit Log When set, indicates that the RATL Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
22	VR Therm Alert Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
23	VR Thermal Design Current Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
24	Other Log When set, indicates that the OTHER Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	

Table 2-39. Additional MSRs Supported by the 6th—13th Generation Intel® Core™ Processors, 1st—5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 E-Core Processors, Intel® Xeon® 6 P-Core Processors, and Intel® Series 2 Core™ Ultra Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
25	Reserved.	
26	Package/Platform-Level PL1 Power Limiting Log When set, indicates that the Package/Platform Level PL1 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
27	Package/Platform-Level PL2 Power Limiting Log When set, indicates that the Package/Platform Level PL2 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
28	Inefficient Operation Log When set, indicates that the Inefficient Operation Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
63:29	Reserved.	
Register Address: 6B1H, 1713	MSR_RING_PERF_LIMIT_REASONS	
Indicator of Frequency Clipping in the Ring Interconnect (R/W) (Frequency refers to ring interconnect in the uncore.)		Package
0	PROCHOT Status (R0) When set, frequency is reduced due to assertion of external PROCHOT.	
1	Thermal Status (R0) When set, frequency is reduced due to a thermal event.	
4:2	Reserved.	
5	Running Average Thermal Limit Status (R0) When set, frequency is reduced due to running average thermal limit.	
6	VR Therm Alert Status (R0) When set, frequency is reduced due to a thermal alert from a processor Voltage Regulator.	
7	VR Thermal Design Current Status (R0) When set, frequency is reduced due to VR TDC limit.	
8	Other Status (R0) When set, frequency is reduced due to electrical or other constraints.	
9	Reserved.	
10	Package/Platform-Level Power Limiting PL1 Status (R0) When set, frequency is reduced due to package/Platform-level power limiting PL1.	
11	Package/Platform-Level PL2 Power Limiting Status (R0) When set, frequency is reduced due to package/Platform-level power limiting PL2/PL3.	
15:12	Reserved

Uncore C-Box 3, Performance Counter 1		Package
Register Address: E01H, 3585	MSR_UNC_PERF_GLOBAL_CTRL	
Uncore PMU Global Control		Package
0	Slice 0 select.	
1	Slice 1 select.	
2	Slice 2 select.	
3	Slice 3 select.	
4	Slice 4select.	
18:5	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: E02H, 3586	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	

2.17.1 MSRs Introduced in 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture

Table 2-41 lists additional MSRs for 7th generation and 8th generation Intel Core processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_8EH or 06_9EH. For an MSR listed in Table 2-41 that also appears in the model-specific tables of prior generations, Table 2-41 supersedes prior generation tables.

Table 2-41. Additional MSRs Supported by the 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 80H, 128	MSR_TRACE_HUB_STH_ACPIBAR_BASE	
NPK Address Used by AET Messages (R/W)		Package
0	Lock Bit If set, this MSR cannot be re-written anymore. Lock bit has to be set in order for the AET packets to be directed to NPK MMIO.	
17:1	Reserved.	
63:18	ACPIBAR_BASE_ADDRESS AET target address in NPK MMIO space.	
Register Address: 1F4H, 500	MSR_PRMRR_PHYS_BASE	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MemType PRMRR BASE MemType.	
11:3	Reserved.	
45:12	Base PRMRR Base Address.	
63:46	Reserved.	
Register Address: 1F5H, 501	MSR_PRMRR_PHYS_MASK	
Processor Reserved Memory Range Register - Physical Mask Control Register (R/W)		Core
9:0	Reserved.	
10	Lock Lock bit for the PRMRR.	
11	VLD Enable bit for the PRMRR.	
45:12	Mask PRMRR MASK bits.	
63:46	Reserved.	
Register Address: 1FBH, 507	MSR_PRMRR_VALID_CONFIG	
Valid PRMRR Configurations (R/W)		Core
0	1M supported MEE size.	
4:1	Reserved.	
5	32M supported MEE size.	
6	64M supported MEE size.	
7	128M supported MEE size.	

Table 2-41. Additional MSRs Supported by the 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture (Contd.)

Register Information / Bit Fields	**Bit Description**	**Scope**
31:8	Reserved.	
Register Address: 2F4H, 756	MSR_UNCORE_PRMRR_PHYS_BASE[1]	
(R/W) The PRMRR range is used to protect the processor reserved memory from unauthorized reads and writes. Any IO access to this range is aborted. This register controls the location of the PRMRR range by indicating its starting address. It functions in tandem with the PRMRR mask register.		Package
11:0	Reserved.	
PAWIDTH-1:12	Range Base This field corresponds to bits PAWIDTH-1:12 of the base address memory range which is allocated to PRMRR memory.	
63:PAWIDTH	Reserved.	
Register Address: 2F5H, 757	MSR_UNCORE_PRMRR_PHYS_MASK[1]	
(R/W) This register controls the size of the PRMRR range by indicating which address bits must match the PRMRR base register value.		Package
9:0	Reserved.	
10	Lock Setting this bit locks all writeable settings in this register, including itself.	
11	Range_En Indicates whether the PRMRR range is enabled and valid.	
38:12	Range_Mask This field indicates which address bits must match PRMRR base in order to qualify as an PRMRR access.	
63:39	Reserved.	
Register Address: 620H, 1568	MSR_RING_RATIO_LIMIT	
Ring Ratio Limit (R/W) This register provides Min/Max Ratio Limits for the LLC and Ring.		Package
6:0	MAX_Ratio This field is used to limit the max ratio of the LLC/Ring.	
7	Reserved.	
14:8	MIN_Ratio Writing to this field controls the minimum possible ratio of the LLC/Ring.	
63:15	Reserved.	

NOTES:

1. This MSR is specific to 7th generation and 8th generation Intel® Core™ processors.

2.17.2 MSRs Specific to 8th Generation Intel® Core™ i3 Processors

Table 2-42 lists additional MSRs for 8th generation Intel Core i3 processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_66H. For an MSR listed in Table 2-42 that also appears in the model-specific tables of prior generations, Table 2-42 supersedes prior generation tables.

Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors Based on Cannon Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Thread
0	Lock (R/WL)	
1	Enable VMX Inside SMX Operation (R/WL)	
2	Enable VMX Outside SMX Operation (R/WL)	
14:8	SENTER Local Functions Enables (R/WL)	
15	SENTER Global Functions Enable (R/WL)	
17	SGX Launch Control Enable (R/WL) This bit must be set to enable runtime reconfiguration of SGX Launch Control via IA32_SGXLEPUBKEYHASHn MSR. Available only if CPUID.(EAX=07H, ECX=0H): ECX[30] = 1.	
18	SGX Global Functions Enable (R/WL)	
63:21	Reserved.	
Register Address: 350H, 848	MSR_BR_DETECT_CTRL	
Branch Monitoring Global Control (R/W)		
0	EnMonitoring Global enable for branch monitoring.	
1	EnExcept Enable branch monitoring event signaling on threshold trip. The branch monitoring event handler is signaled via the existing PMI signaling mechanism as programmed from the corresponding local APIC LVT entry.	
2	EnLBRFrz Enable LBR freeze on threshold trip. This will cause the LBR frozen bit 58 to be set in IA32_PERF_GLOBAL_STATUS when a triggering condition occurs and this bit is enabled.	
3	DisableInGuest When set to '1', branch monitoring, event triggering and LBR freeze actions are disabled when operating at VMX non-root operation.	
7:4	Reserved.	
17:8	WindowSize Window size defined by WindowCntSel. Values 0 – 1023 are supported. Once the Window counter reaches the WindowSize count both the Window Counter and all Branch Monitoring Counters are cleared.	
23:18	Reserved.	

Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors Based on Cannon Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
25:24	WindowCntSel Window event count select: '00 = Instructions retired. '01 = Branch instructions retired '10 = Return instructions retired. '11 = Indirect branch instructions retired.	
26	CntAndMode When set to '1', the overall branch monitoring event triggering condition is true only if all enabled counters' threshold conditions are true. When '0', the threshold tripping condition is true if any enabled counters' threshold is true.	
63:27	Reserved.	
Register Address: 351H, 849	MSR_BR_DETECT_STATUS	
Branch Monitoring Global Status (R/W)		
0	Branch Monitoring Event Signaled When set to '1', Branch Monitoring event signaling is blocked until this bit is cleared by software.	
1	LBRsValid This status bit is set to '1' if the LBR state is considered valid for sampling by branch monitoring software.	
7:2	Reserved.	
8	CntrHit0 Branch monitoring counter #0 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.	
9	CntrHit1 Branch monitoring counter #1 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.	
15:10	Reserved. Reserved for additional branch monitoring counters threshold hit status.	
25:16	CountWindow The current value of the window counter. The count value is frozen on a valid branch monitoring triggering condition. This is a 10-bit unsigned value.	
31:26	Reserved. Reserved for future extension of CountWindow.	

Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors Based on Cannon Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
39:32	Count0 The current value of counter 0 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit0 will also be set). This is an 8-bit signed value (2's complement). Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256). RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).	
47:40	Count1 The current value of counter 1 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit1 will also be set). This is an 8-bit signed value (2's complement). Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256). RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).	
63:48	Reserved.	
Register Address: 354H—355H, 852—853	MSR_BR_DETECT_COUNTER_CONFIG_i	
Branch Monitoring Detect Counter Configuration (R/W)		
0	CntrEn Enable counter.	
7:1	CntrEvSel Event select (other values #GP) '0000000 = RETs. '0000001 = RET-CALL bias. '0000010 = RET mispredicts. '0000011 = Branch (all) mispredicts. '0000100 = Indirect branch mispredicts. '0000101 = Far branch instructions.	
14:8	CntrThreshold Threshold (an unsigned value of 0 to 127 supported). The value 0 of counter threshold will result in event signaled after every instruction. #GP if threshold is < 2.	
15	MispredEventCnt Mispredict events counting behavior: '0 = Mispredict events are counted in a window. '1 = Mispredict events are counted based on a consecutive occurrence. CntrThreshold is treated as # of consecutive mispredicts. This control bit only applies to events specified by CntrEvSel that involve a prediction (0000010, 0000011, 0000100). Setting this bit for other events is ignored.	
63:16	Reserved.	

Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors Based on Cannon Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 3F8H, 1016	MSR_PKG_C3_RESIDENCY	
Package C3 Residency Counter (R/O)		Package
63:0	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.	
Register Address: 620H, 1568	MSR_RING_RATIO_LIMIT	
Ring Ratio Limit (R/W) This register provides Min/Max Ratio Limits for the LLC and Ring.		Package
6:0	MAX_Ratio This field is used to limit the max ratio of the LLC/Ring.	
7	Reserved.	
14:8	MIN_Ratio Writing to this field controls the minimum possible ratio of the LLC/Ring.	
63:15	Reserved.	
Register Address: 660H, 1632	MSR_CORE_C1_RESIDENCY	
Core C1 Residency Counter (R/O)		Core
63:0	Value since last reset for the Core C1 residency. Counter rate is the Max Non-Turbo frequency (same as TSC). This counter counts in case both of the core's threads are in an idle state and at least one of the core's thread residency is in a C1 state or in one of its sub states. The counter is updated only after a core C state exit. Note: Always reads 0 if core C1 is unsupported. A value of zero indicates that this processor does not support core C1 or never entered core C1 level state.	
Register Address: 662H, 1634	MSR_CORE_C3_RESIDENCY	
Core C3 Residency Counter (R/O)		Core
63:0	Will always return 0.	

Table 2-43 lists the MSRs of uncore PMU for Intel processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_66H.

Table 2-43. Uncore PMU MSRs Supported by Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 394H, 916	MSR_UNC_PERF_FIXED_CTRL	
Uncore Fixed Counter Control (R/W)		Package
19:0	Reserved.	
20	Enable overflow propagation.	
21	Reserved	
22	Enable counting.	
63:23	Reserved.	
Register Address: 395H, 917	MSR_UNC_PERF_FIXED_CTR	

Table 2-43. Uncore PMU MSRs Supported by Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Uncore Fixed Counter		Package
47:0	Current count.	
63:48	Reserved.	
Register Address: 396H, 918	MSR_UNC_CBO_CONFIG	
Uncore C-Box Configuration Information (R/O)		Package
3:0	Report the number of C-Box units with performance counters, including processor cores and processor graphics.	
63:4	Reserved.	
Register Address: 3B0H, 946	MSR_UNC_ARB_PERFCTR0	
Uncore Arb Unit, Performance Counter 0		Package
Register Address: 3B1H, 947	MSR_UNC_ARB_PERFCTR1	
Uncore Arb Unit, Performance Counter 1		Package
Register Address: 3B2H, 944	MSR_UNC_ARB_PERFEVTSEL0	
Uncore Arb Unit, Counter 0 Event Select MSR		Package
Register Address: 3B3H, 945	MSR_UNC_ARB_PERFEVTSEL1	
Uncore Arb unit, Counter 1 Event Select MSR		Package
Register Address: 700H, 1792	MSR_UNC_CBO_0_PERFEVTSEL0	
Uncore C-Box 0, Counter 0 Event Select MSR		Package
Register Address: 701H, 1793	MSR_UNC_CBO_0_PERFEVTSEL1	
Uncore C-Box 0, Counter 1 Event Select MSR		Package
Register Address: 702H, 1794	MSR_UNC_CBO_0_PERFCTR0	
Uncore C-Box 0, Performance Counter 0		Package
Register Address: 703H, 1795	MSR_UNC_CBO_0_PERFCTR1	
Uncore C-Box 0, Performance Counter 1		Package
Register Address: 708H, 1800	MSR_UNC_CBO_1_PERFEVTSEL0	
Uncore C-Box 1, Counter 0 Event Select MSR		Package
Register Address: 709H, 1801	MSR_UNC_CBO_1_PERFEVTSEL1	
Uncore C-Box 1, Counter 1 Event Select MSR		Package
Register Address: 70AH, 1802	MSR_UNC_CBO_1_PERFCTR0	
Uncore C-Box 1, Performance Counter 0		Package
Register Address: 70BH, 1803	MSR_UNC_CBO_1_PERFCTR1	
Uncore C-Box 1, Performance Counter 1		Package
Register Address: 710H, 1808	MSR_UNC_CBO_2_PERFEVTSEL0	
Uncore C-Box 2, Counter 0 Event Select MSR		Package
Register Address: 711H, 1809	MSR_UNC_CBO_2_PERFEVTSEL1	
Uncore C-Box 2, Counter 1 Event Select MSR		Package
Register Address: 712H, 1810	MSR_UNC_CBO_2_PERFCTR0	
Uncore C-Box 2, Performance Counter 0		Package

18:5	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: E02H, 3586	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	

2.17.3 MSRs Introduced in 10th Generation Intel® Core™ Processors

Table 2-44 lists additional MSRs for 10th generation Intel Core processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_7DH or 06_7EH. For an MSR listed in Table 2-44 that also appears in the model-specific tables of prior generations, Table 2-44 supersedes prior generation tables.

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register		Core
28:0	Reserved.	

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
30	Reserved.	
31	Reserved.	
Register Address: 48H, 72	IA32_SPEC_CTRL	
See Table 2-2.		Core
Register Address: 49H, 73	IA32_PREDICT_CMD	
See Table 2-2.		Thread
Register Address: 8CH, 140	IA32_SGXLEPUBKEYHASH0	
See Table 2-2.		Thread
Register Address: 8DH, 141	IA32_SGXLEPUBKEYHASH1	
See Table 2-2.		Thread
Register Address: 8EH, 142	IA32_SGXLEPUBKEYHASH2	
See Table 2-2.		Thread
Register Address: 8FH, 143	IA32_SGXLEPUBKEYHASH3	
See Table 2-2.		Thread
Register Address: A0H, 160	MSR_BIOS_MCU_ERRORCODE	
BIOS MCU ERRORCODE (R/O) This MSR indicates if WRMSR 0x79 failed to configure PRM memory and gives a hint to debug BIOS.		Package
15:0	Error Codes (R/O)	Package
30:16	Reserved.	
31	MCU Partial Success (R/O) When set to 1, WRMSR 0x79 skipped part of the functionality during BIOS.	Thread
Register Address: A5H, 165	MSR_FIT_BIOS_ERROR	
FIT BIOS ERROR (R/W) Report error codes for debug in case the processor failed to parse the Firmware Table in BIOS. Can also be used to log BIOS information.		Thread
7:0	Error Codes (R/W) Error codes for debug.	
15:8	Entry Type (R/W) Failed FIT entry type.	
16	FIT MCU Entry (R/W) FIT contains MCU entry.	
62:17	Reserved.	
63	LOCK (R/W) When set to 1, writes to this MSR will be skipped.	
Register Address: 10BH, 267	IA32_FLUSH_CMD	

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Table 2-2.		Thread
Register Address: 151H, 337	MSR_BIOS_DONE	
BIOS Done (R/WO)		Thread
0	BIOS Done Indication (R/WO) Set by BIOS when it finishes programming the processor and wants to lock the memory configuration from changes by software that is running on this thread. Writes to the bit will be ignored if EAX[0] is 0.	Thread
1	Package BIOS Done Indication (R/O) When set to 1, all threads in the package have bit 0 of this MSR set.	Package
31:2	Reserved.	
Register Address: 1F1H, 497	MSR_CRASHLOG_CONTROL	
Write Data to a Crash Log Configuration		Thread
0	CDDIS: CrashDump_Disable If set, indicates that Crash Dump is disabled.	
63:1	Reserved.	
Register Address: 2A0H, 672	MSR_PRMRR_BASE_0	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE: PRMRR BASE Memory Type.	
3	CONFIGURED: PRMRR BASE Configured.	
11:4	Reserved.	
51:12	BASE: PRMRR Base Address.	
63:52	Reserved.	
Register Address: 30CH, 780	IA32_FIXED_CTR3	
Fixed-Function Performance Counter Register 3 (R/W) Bit definitions are the same as found in IA32_FIXED_CTR0, offset 309H. See Table 2-2.		Thread
Register Address: 329H, 809	MSR_PERF_METRICS	
Performance Metrics (R/W) Reports metrics directly. Software can check (and/or expose to its guests) the availability of PERF_METRICS feature using IA32_PERF_CAPABILITIES.PERF_METRICS_AVAILABLE (bit 15).		Thread
7:0	Retiring. Percent of utilized slots by uops that eventually retire (commit).	
15:8	Bad Speculation. Percent of wasted slots due to incorrect speculation, covering utilized by uops that do not retire, or recovery bubbles (unutilized slots).	
23:16	Frontend Bound. Percent of unutilized slots where front-end did not deliver a uop while back-end is ready.	
31:24	Backend Bound. Percent of unutilized slots where a uop was not delivered to back-end due to lack of back-end resources.	
63:32	Reserved.	
Register Address: 3F2H, 1010	MSR_PEBS_DATA_CFG	

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
PEBS Data Configuration (R/W) Provides software the capability to select data groups of interest and thus reduce the record size in memory and record generation latency. Hence, a PEBS record's size and layout vary based on the selected groups. The MSR also allows software to select LBR depth for branch data records.		Thread
0	Memory Info. Setting this bit will capture memory information such as the linear address, data source and latency of the memory access in the PEBS record.	
1	GPRs. Setting this bit will capture the contents of the General Purpose registers in the PEBS record.	
2	XMMs. Setting this bit will capture the contents of the XMM registers in the PEBS record.	
3	LBRs. Setting this bit will capture LBR TO, FROM, and INFO in the PEBS record.	
23:4	Reserved.	
31:24	LBR Entries. Set the field to the desired number of entries - 1. For example, if the LBR_entries field is 0, a single entry will be included in the record. To include 32 LBR entries, set the LBR_entries field to 31 (0x1F). To ensure all PEBS records are 16-byte aligned, software can use LBR_entries that is multiple of 3.	
Register Address: 541H, 1345	MSR_CORE_UARCH_CTL	
Core Microarchitecture Control MSR (R/W)		Core
0	L1 Scrubbing Enable When set to 1, enable L1 scrubbing.	
31:1	Reserved.	
Register Address: 657H, 1623	MSR_FAST_UNCORE_MSRS_CTL	
Fast WRMSR/RDMSR Control MSR (R/W)		Thread
3:0	FAST_ACCESS_ENABLE: Bit 0: When set to '1', provides a hint for the hardware to enable fast access mode for the IA32_HWP_REQUEST MSR. This bit is sticky and is cleaned by the hardware only during reset time. This bit is valid only if FAST_UNCORE_MSRS_CAPABILITY[0] is set. Setting this bit will cause CPUID[6].EAX[18] to be set.	
31:4	Reserved.	
Register Address: 65EH, 1630	MSR_FAST_UNCORE_MSRS_STATUS	
Indication of Uncore MSRs, Post Write Activates		Thread

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
0	Indicates whether the CPU is still in the middle of writing IA32_HWP_REQUEST MSR, even after the WRMSR instruction has retired. A value of 1 indicates the last write of IA32_HWP_REQUEST is still ongoing. A value of 0 indicates the last write of IA32_HWP_REQUEST is visible outside the logical processor. Software can use the status of this bit to avoid overwriting IA32_HWP_REQUEST.	
31:1	Reserved.	
Register Address: 65FH, 1631	MSR_FAST_UNCORE_MSRS_CAPABILITY	
Fast WRMSR/RDMSR Enumeration MSR (R/O)		Thread
3:0	MSRS_CAPABILITY: Bit 0: If set to '1', hardware supports the fast access mode for the IA32_HWP_REQUEST MSR.	
31:4	Reserved.	
Register Address: 772H, 1906	IA32_HWP_REQUEST_PKG	
See Table 2-2.		Package
Register Address: 775H, 1909	IA32_PECI_HWP_REQUEST_INFO	
See Table 2-2.		Thread
Register Address: 777H, 1911	IA32_HWP_STATUS	
See Table 2-2.		Thread

2.17.4 MSRs Introduced in the 11th Generation Intel® Core™ Processors based on Tiger Lake Microarchitecture

Table 2-45 lists additional MSRs for 11th generation Intel Core processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_8CH or 06_8DH. The MSRs listed in Table 2-44 are also supported by these processors. For an MSR listed in Table 2-45 that also appears in the model-specific tables of prior generations, Table 2-45 supersedes prior generation tables.

Table 2-45. Additional MSRs Supported by the 11th Generation Intel® Core™ Processors Based on Tiger Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: A0H, 160	MSR_BIOS_MCU_ERRORCODE	
BIOS MCU ERRORCODE (R/O)		Package
15:0	Error Codes	
31:16	Reserved.	
Register Address: A7H, 167	MSR_BIOS_DEBUG	
BIOS DEBUG (R/O) This MSR indicates if WRMSR 79H failed to configure PRM memory and gives a hint to debug BIOS.		Thread
30:0	Reserved.	

Table 2-45. Additional MSRs Supported by the 11th Generation Intel® Core™ Processors Based on Tiger Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
31	MCU Partial Success When set to 1, WRMSR 79H skipped part of the functionality during BIOS.	
63:32	Reserved.	
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/O) If CPUID.(EAX=07H, ECX=0):EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Package
1:0	Reserved.	
2	FUSA_SUPPORTED	
3	RSM_IN_CPL0_ONLY When set to 1, the RSM instruction is only allowed in CPL0 (#GP triggered in any CPL != 0). When set to 0, then any CPL may execute the RSM instruction.	
4	Reserved.	
5	SPLIT_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 29 of MSR_MEMORY_CTRL (MSR address 33H).	
31:6	Reserved.	
Register Address: 492H, 1170	IA32_VMX_PROCBASED_CTLS3	
IA32_VMX_PROCBASED_CTLS3 This MSR enumerates the allowed 1-settings of the third set of processor-based controls. Specifically, VM entry allows bit X of the tertiary processor-based VM-execution controls to be 1 if and only if bit X of the MSR is set to 1. If bit X of the MSR is cleared to 0, VM entry fails if control X and the "activate tertiary controls" primary processor-based VM-execution control are both 1.		Core
0	LOADIWKEY This control determines whether executions of LOADIWKEY cause VM exits.	
63:1	Reserved.	
Register Address: 601H, 1537	MSR_VR_CURRENT_CONFIG	
Power Limit 4 (PL4) Package-level maximum power limit (in Watts). It is a proactive, instantaneous limit.		Package
12:0	PL4 Value PL4 value in 0.125 A increments. This field is locked by VR_CURRENT_CONFIG[LOCK]. When the LOCK bit is set to 1b, this field becomes Read Only.	
30:13	Reserved.	
31	Lock Indication (LOCK) This bit will lock the CURRENT_LIMIT settings in this register and will also lock this setting. This means that once set to 1b, the CURRENT_LIMIT setting and this bit become Read Only until the next Warm Reset.	

Table 2-45. Additional MSRs Supported by the 11th Generation Intel® Core™ Processors Based on Tiger Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
62:32	Not in use.	
63	Reserved.	
Register Address: 6A0H, 1696	IA32_U_CET	
Configure User Mode CET (R/W) See Table 2-2.		
Register Address: 6A2H, 1698	IA32_S_CET	
Configure Supervisor Mode CET (R/W) See Table 2-2.		
Register Address: 6A4H, 1700	IA32_PL0_SSP	
Linear address to be loaded into SSP on transition to privilege level 0. (R/W) See Table 2-2.		
Register Address: 6A5H, 1701	IA32_PL1_SSP	
Linear address to be loaded into SSP on transition to privilege level 1. (R/W) See Table 2-2.		
Register Address: 6A6H, 1702	IA32_PL2_SSP	
Linear address to be loaded into SSP on transition to privilege level 2. (R/W) See Table 2-2.		
Register Address: 6A7H, 1703	IA32_PL3_SSP	
Linear address to be loaded into SSP on transition to privilege level 3. (R/W) See Table 2-2.		
Register Address: 6A8H, 1704	IA32_INTERRUPT_SSP_TABLE_ADDR	
Linear address of a table of seven shadow stack pointers that are selected in IA-32e mode using the IST index (when not 0) from the interrupt gate descriptor. (R/W) See Table 2-2.		
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
See Table 2-2.		
Register Address: 982H, 2434	IA32_TME_ACTIVATE	
See Table 2-2.		
Register Address: 983H, 2435	IA32_TME_EXCLUDE_MASK	
See Table 2-2.		
Register Address: 984H, 2436	IA32_TME_EXCLUDE_BASE	
See Table 2-2.		
Register Address: 990H, 2448	IA32_COPY_STATUS[1]	
See Table 2-2.		Thread
Register Address: 991H, 2449	IA32_IWKEYBACKUP_STATUS[1]	
See Table 2-2.		Platform
Register Address: C82H, 3202	IA32_L2_QOS_CFG	

Table 2-45. Additional MSRs Supported by the 11th Generation Intel® Core™ Processors Based on Tiger Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
IA32_CR_L2_QOS_CFG This MSR provides software an enumeration of the parameters that L2 QoS (Intel RDT) support in any particular implementation.		Core
0	CDP_ENABLE When set to 1, it will enable the code and data prioritization for the L2 CAT/Intel RDT feature. When set to 0, code and data prioritization is disabled for L2 CAT/Intel RDT. See Chapter 19, "Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features," for further details on CDP.	
31:1	Reserved.	
Register Address: D10H—D17H, 3220—3351	IA32_L2_QOS_MASK_[0-7]	
IA32_CR_L2_QOS_MASK_[0-7] Controls MLC (L2) Intel RDT allocation. For more details on CAT/RDT, see Chapter 19, "Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features."		Package
19:0	WAYS_MASK Setting a 1 in this bit X allows threads with CLOS <n> (where N is [0-7]) to allocate to way X in the MLC. Ones are only allowed to be written to ways that physically exist in the MLC (CPUID.4.2:EBX[31:22] will indicate this). Writing a 1 to a value beyond the highest way or a non-contiguous set of 1s will cause a #GP on the WRMSR to this MSR.	
31:20	Reserved.	
Register Address: D91H, 3473	IA32_COPY_LOCAL_TO_PLATFORM[1]	
See Table 2-2.		Thread
Register Address: D92H, 3474	IA32_COPY_PLATFORM_TO_LOCAL[1]	
See Table 2-2.		Thread

NOTES:

1. Further details on Key Locker and usage of this MSR can be found here:
   https://software.intel.com/content/www/us/en/develop/download/intel-key-locker-specification.html.

2.17.5 MSRs Introduced in the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture

Table 2-46 lists additional MSRs for 12th and 13th generation Intel Core processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_97H, 06_9AH, 06_BAH, 06_B7H, or 06_BFH. Table 2-47 lists the MSRs unique to the processor P-core. Table 2-48 lists the MSRs unique to the processor E-core.

The MSRs listed in Table 2-44[1] and Table 2-45 are also supported by these processors. For an MSR listed in Table 2-46, Table 2-47, or Table 2-48 that also appears in the model-specific tables of prior generations, Table 2-46, Table 2-47, and Table 2-48 supersede prior generation tables.

1. MSRs at the following addresses are not supported in the 12th and 13th generation Intel Core processor E-core: 30CH, 329H, 541H, and 657H. The MSR at address 657H is not supported in the 12th and 13th generation Intel Core processor P-core.

Table 2-46. Additional MSRs Supported by the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register		Core
26:0	Reserved.	
27	UC_STORE_THROTTLE If set to 1, when enabled, the processor will only allow one in-progress UC store at a time.	
28	UC_LOCK_DISABLE If set to 1, a UC lock will cause a #GP(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
30	Reserved.	
31	Reserved.	
Register Address: BCH, 188	IA32_MISC_PACKAGE_CTLS	
Power Filtering Control (R/W) IA32_ARCH_CAPABILITIES[bit 10] enumerates support for this MSR. See Table 2-2.		Package
Register Address: C7H, 199	IA32_PMC6	
General Performance Counter 6 (R/W) See Table 2-2.		Core
Register Address: C8H, 200	IA32_PMC7	
General Performance Counter 7 (R/W) See Table 2-2.		Core
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/O) If CPUID.(EAX=07H, ECX=0):EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Package
0	STLB_QOS_SUPPORTED When set to 1, the STLB QoS feature is supported and the STLB QoS MSRs (1A8FH -1A97H) are accessible. When set to 0, access to these MSRs will #GP.	
1	Reserved.	
2	FUSA_SUPPORTED	
3	RSM_IN_CPL0_ONLY When set to 1, the RSM instruction is only allowed in CPL0 (#GP triggered in any CPL != 0). When set to 0, then any CPL may execute the RSM instruction.	

Table 2-46. Additional MSRs Supported by the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
4	UC_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 28 of MSR_MEMORY_CTRL (MSR address 33H).	
5	SPLIT_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 29 of MSR_MEMORY_CTRL.	
6	SNOOP_FILTER_QOS_SUPPORTED When set to 1, the Snoop Filter Qos Mask MSRs are supported. When set to 0, access to these MSRs will #GP.	
7	UC_STORE_THROTTLING_SUPPORTED When set 1, UC Store throttle capability exist through MSR_MEMORY_CTRL (33H) bit 27.	
31:8	Reserved.	
Register Address: E1H, 225	IA32_UMWAIT_CONTROL	
UMWAIT Control (R/W) See Table 2-2.		
Register Address: 10AH, 266	IA32_ARCH_CAPABILITIES	
Enumeration of Architectural Features (R/O) See Table 2-2.		
Register Address: 18CH, 396	IA32_PERFEVTSEL6	
See Table 2-20.		Core
Register Address: 18DH, 397	IA32_PERFEVTSEL7	
See Table 2-20.		Core
Register Address: 195H, 405	IA32_OVERCLOCKING_STATUS	
Overclocking Status (R/O) IA32_ARCH_CAPABILITIES[bit 23] enumerates support for this MSR. See Table 2-2.		Package
Register Address: 1ADH, 429	MSR_PRIMARY_TURBO_RATIO_LIMIT	
Primary Maximum Turbo Ratio Limit (R/W) Software can configure these limits when MSR_PLATFORM_INFO[28] = 1. Specifies Maximum Ratio Limit for each group. Maximum ratio for groups with more cores must decrease monotonically.		Package
7:0	MAX_TURBO_GROUP_0: Maximum turbo ratio limit with 1 core active.	
15:8	MAX_TURBO_GROUP_1: Maximum turbo ratio limit with 2 cores active.	
23:16	MAX_TURBO_GROUP_2: Maximum turbo ratio limit with 3 cores active.	
31:24	MAX_TURBO_GROUP_3: Maximum turbo ratio limit with 4 cores active.	
39:32	MAX_TURBO_GROUP_4: Maximum turbo ratio limit with 5 cores active.	

Table 2-46. Additional MSRs Supported by the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
47:40	MAX_TURBO_GROUP_5: Maximum turbo ratio limit with 6 cores active.	
55:48	MAX_TURBO_GROUP_6: Maximum turbo ratio limit with 7 cores active.	
63:56	MAX_TURBO_GROUP_7: Maximum turbo ratio limit with 8 cores active.	
Register Address: 493H, 1171	IA32_VMX_EXIT_CTLS2	
See Table 2-2.		
Register Address: 4C7H, 1223	IA32_A_PMC6	
Full Width Writable IA32_PMC6 Alias (R/W) See Table 2-2.		
Register Address: 4C8H, 1224	IA32_A_PMC7	
Full Width Writable IA32_PMC7 Alias (R/W) See Table 2-2.		
Register Address: 650H, 1616	MSR_SECONDARY_TURBO_RATIO_LIMIT	
Secondary Maximum Turbo Ratio Limit (R/W) Software can configure these limits when MSR_PLATFORM_INFO[28] = 1. Specifies Maximum Ratio Limit for each group. Maximum ratio for groups with more cores must decrease monotonically.		Package
7:0	MAX_TURBO_GROUP_0: Maximum turbo ratio limit with 1 core active.	
15:8	MAX_TURBO_GROUP_1: Maximum turbo ratio limit with 2 cores active.	
23:16	MAX_TURBO_GROUP_2: Maximum turbo ratio limit with 3 cores active.	
31:24	MAX_TURBO_GROUP_3: Maximum turbo ratio limit with 4 cores active.	
39:32	MAX_TURBO_GROUP_4: Maximum turbo ratio limit with 5 cores active.	
47:40	MAX_TURBO_GROUP_5: Maximum turbo ratio limit with 6 cores active.	
55:48	MAX_TURBO_GROUP_6: Maximum turbo ratio limit with 7 cores active.	
63:56	MAX_TURBO_GROUP_7: Maximum turbo ratio limit with 8 cores active.	
Register Address: 664H, 1636	MSR_MC6_RESIDENCY_COUNTER	
Module C6 Residency Counter (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Module

Table 2-46. Additional MSRs Supported by the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
63:0	Time that this module is in module-specific C6 states since last reset. Counts at 1 Mhz frequency.	
Register Address: 6E1H, 1761	IA32_PKRS	
Specifies the PK permissions associated with each protection domain for supervisor pages (R/W) See Table 2-2.		
Register Address: 776H, 1910	IA32_HWP_CTL	
See Table 2-2.		
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
Memory Encryption Capability MSR See Table 2-2.		
Register Address: 1200H—121FH, 4608—4639	IA32_LBR_x_INFO	
Last Branch Record Entry X Info Register (R/W) See Table 2-2.		
Register Address: 14CEH, 5326	IA32_LBR_CTL	
Last Branch Record Enabling and Configuration Register (R/W) See Table 2-2.		
Register Address: 14CFH, 5327	IA32_LBR_DEPTH	
Last Branch Record Maximum Stack Depth Register (R/W) See Table 2-2.		
Register Address: 1500H—151FH, 5376—5407	IA32_LBR_x_FROM_IP	
Last Branch Record Entry X Source IP Register (R/W) See Table 2-2.		
Register Address: 1600H—161FH, 5632—5663	IA32_LBR_x_TO_IP	
Last Branch Record Entry X Destination IP Register (R/W) See Table 2-2.		
Register Address: 17D2H, 6098	IA32_THREAD_FEEDBACK_CHAR	
Thread Feedback Characteristics (R/O) See Table 2-2.		
Register Address: 17D4H, 6100	IA32_HW_FEEDBACK_THREAD_CONFIG	
Hardware Feedback Thread Configuration (R/W) See Table 2-2.		
Register Address: 17DAH, 6106	IA32_HRESET_ENABLE	
History Reset Enable (R/W) See Table 2-2.		

The MSRs listed in Table 2-47 are unique to the 12th and 13th generation Intel Core processor P-core. These MSRs are not supported on the processor E-core.

Table 2-47. MSRs Supported by 12th and 13th Generation Intel® Core™ Processor P-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 1A4H, 420	MSR_PREFETCH_CONTROL	
Prefetch Disable Bits (R/W)		
0	L2_HARDWARE_PREFETCHER_DISABLE If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	
1	L2_ADJACENT_CACHE_LINE_PREFETCHER_DISABLE If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).	
2	DCU_HARDWARE_PREFETCHER_DISABLE If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	
3	DCU_IP_PREFETCHER_DISABLE If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction pointer of previous loads) to determine whether to prefetch additional lines.	
4	Reserved.	
5	AMP_PREFETCH_DISABLE If 1, disables the L2 Adaptive Multipath Probability (AMP) prefetcher.	
63:6	Reserved.	
Register Address: 3F7H, 1015	MSR_PEBS_FRONTEND	
FrontEnd Precise Event Condition Select (R/W) See Table 2-39.		Thread
Register Address: 540H, 1344	MSR_THREAD_UARCH_CTL	
Thread Microarchitectural Control (R/W)		Thread
0	WB_MEM_STRM_LD_DISABLE Disable streaming behavior for MOVNTDQA loads to WB memory type. If set, these accesses will be treated like regular cacheable loads (Data will be cached).	
63:1	Reserved.	
Register Address: 541H, 1345	MSR_CORE_UARCH_CTL	
Core Microarchitecture Control MSR (R/W) See Table 2-44.		Core
Register Address: D10H—D17H, 3220—3351	IA32_L2_QOS_MASK_[0-7]	
IA32_CR_L2_QOS_MASK_[0-7] If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] ≥ 0. Controls MLC (L2) Intel RDT allocation. For more details on CAT/RDT, see Chapter 19, “Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features.”		Core

Table 2-47. MSRs Supported by 12th and 13th Generation Intel® Core™ Processor P-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
19:0	WAYS_MASK Setting a 1 in this bit X allows threads with CLOS <n> (where N is [0-7]) to allocate to way X in the MLC. Ones are only allowed to be written to ways that physically exist in the MLC (CPUID.4.2:EBX[31:22] will indicate this). Writing a 1 to a value beyond the highest way or a non-contiguous set of 1s will cause a #GP on the WRMSR to this MSR.	
31:20	Reserved.	

The MSRs listed in Table 2-48 are unique to the 12th and 13th generation Intel Core processor E-core. These MSRs are not supported on the processor P-core.

Table 2-48. MSRs Supported by 12th and 13th Generation Intel® Core™ Processor E-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: D10H—D1FH, 3220—3359	IA32_L2_QOS_MASK_[0-15]	
IA32_CR_L2_QOS_MASK_[0-15] If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] ≥ 0. Controls MLC (L2) Intel RDT allocation. For more details on CAT/RDT, see Chapter 19, "Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features."		Module
19:0	WAYS_MASK Setting a 1 in this bit X allows threads with CLOS <n> (where N is [0-7]) to allocate to way X in the MLC. Ones are only allowed to be written to ways that physically exist in the MLC (CPUID.4.2:EBX[31:22] will indicate this). Writing a 1 to a value beyond the highest way or a non-contiguous set of 1s will cause a #GP on the WRMSR to this MSR.	
31:20	Reserved.	
Register Address: 1309H—130BH, 4873 —4875	MSR_RELOAD_FIXED_CTRx	
Reload value for IA32_FIXED_CTRx (R/W)		
47:0	Value loaded into IA32_FIXED_CTRx when a PEBS record is generated while PEBS_EN_FIXEDx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and FIXED_CTRx is overflowed.	
63:48	Reserved.	
Register Address: 14C1H—14C6H, 5313 —5318	MSR_RELOAD_PMCx	
Reload value for IA32_PMCx (R/W)		Core
47:0	Value loaded into IA32_PMCx when a PEBS record is generated while PEBS_EN_PMCx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and PMCx is overflowed.	
63:48	Reserved.	

Table 2-49 lists the MSRs of uncore PMU for Intel processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_97H, 06_9AH, 06_BAH, 06_B7H, or 06_BFH.

Table 2-49. Uncore PMU MSRs Supported by 12th and 13th Generation Intel® Core™ Processors

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 396H, 918	MSR_UNC_CBO_CONFIG	
Uncore C-Box Configuration Information (R/O)		Package
3:0	Specifies the number of C-Box units with programmable counters (including processor cores and processor graphics).	
63:4	Reserved.	
Register Address: 2000H, 8192	MSR_UNC_CBO_0_PERFEVTSEL0

Uncore Fixed Counter Control (R/W)		Package

Table 2-49. Uncore PMU MSRs Supported by 12th and 13th Generation Intel® Core™ Processors

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
19:0	Reserved.	
20	Enable overflow propagation.	
21	Reserved.	
22	Enable counting.	
63:23	Reserved.	
Register Address: 2FDFH, 12255	MSR_UNC_PERF_FIXED_CTR	
Uncore Fixed Counter		Package
43:0	Current count.	
63:44	Reserved.	
Register Address: 2FF0H, 12272	MSR_UNC_PERF_GLOBAL_CTRL	
Uncore PMU Global Control		Package
0	Slice 0 select.	
1	Slice 1 select.	
2	Slice 2 select.	
3	Slice 3 select.	
4	Slice 4 select.	
18:5	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: 2FF2H, 12274	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	

2.17.6 MSRs Introduced in the Intel® Xeon® Scalable Processor Family

The Intel® Xeon® Scalable Processor Family (CPUID Signature DisplayFamily_DisplayModel value of 06_55H) supports the MSRs listed in Table 2-50.

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Thread
0	Lock (R/WL)	
1	Enable VMX Inside SMX Operation (R/WL)	
2	Enable VMX Outside SMX Operation (R/WL)	
14:8	SENTER Local Functions Enables (R/WL)	
15	SENTER Global Functions Enable (R/WL)	
18	SGX Global Functions Enable (R/WL)	
20	LMCE_ENABLED (R/WL)	
63:21	Reserved.	
Register Address: 4EH, 78	IA32_PPIN_CTL (MSR_PPIN_CTL)	
Protected Processor Inventory Number Enable Control (R/W)		Package
0	LockOut (R/WO) See Table 2-2.	
1	Enable_PPIN (R/W) See Table 2-2.	
63:2	Reserved.	
Register Address: 4FH, 79	IA32_PPIN (MSR_PPIN)	
Protected Processor Inventory Number (R/O)		Package
63:0	Protected Processor Inventory Number (R/O) See Table 2-2.	
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) See Table 2-26.	Package
22:16	Reserved.	
23	PPIN_CAP (R/O) See Table 2-26.	Package
27:24	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) See Table 2-26.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) See Table 2-26.	Package
30	Programmable TJ OFFSET (R/O) See Table 2-26.	Package
39:31	Reserved.	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
47:40	Maximum Efficiency Ratio (R/O) See Table 2-26.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See http://biosbits.org.		Core
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-state support) 001b: C2 010b: C6 (non-retention) 011b: C6 (retention) 111b: No Package C state limits. All C states supported by the processor are available.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W)	
14:11	Reserved.	
15	CFG Lock (R/WO)	
16	Automatic C-State Conversion Enable (R/W) If 1, the processor will convert HALT or MWAT(C1) to MWAIT(C6).	
24:17	Reserved.	
25	C3 State Auto Demotion Enable (R/W)	
26	C1 State Auto Demotion Enable (R/W)	
27	Enable C3 Undemotion (R/W)	
28	Enable C1 Undemotion (R/W)	
29	Package C State Demotion Enable (R/W)	
30	Package C State Undemotion Enable (R/W)	
63:31	Reserved.	
Register Address: 179H, 377	IA32_MCG_CAP	
Global Machine Check Capability (R/O)		Thread
7:0	Count.	
8	MCG_CTL_P	
9	MCG_EXT_P	
10	MCP_CMCI_P	
11	MCG_TES_P	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
15:12	Reserved.	
23:16	MCG_EXT_CNT	
24	MCG_SER_P	
25	MCG_EM_P	
26	MCG_ELOG_P	
63:27	Reserved.	
Register Address: 17DH, 381	MSR_SMM_MCA_CAP	
Enhanced SMM Capabilities (SMM-RO) Reports SMM capability Enhancement. Accessible only while in SMM.		Thread
57:0	Reserved.	
58	SMM_Code_Access_Chk (SMM-RO) If set to 1 indicates that the SMM code access restriction is supported and a host-space interface is available to SMM handler.	
59	Long_Flow_Indication (SMM-RO) If set to 1 indicates that the SMM long flow indicator is supported and a host-space interface is available to SMM handler.	
63:60	Reserved.	
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Core
0	Thermal Status (R/O) See Table 2-2.	
1	Thermal Status Log (R/WC0) See Table 2-2.	
2	PROTCHOT # or FORCEPR# Status (R/O) See Table 2-2.	
3	PROTCHOT # or FORCEPR# Log (R/WC0) See Table 2-2.	
4	Critical Temperature Status (R/O) See Table 2-2.	
5	Critical Temperature Status Log (R/WC0) See Table 2-2.	
6	Thermal Threshold #1 Status (R/O) See Table 2-2.	
7	Thermal Threshold #1 Log (R/WC0) See Table 2-2.	
8	Thermal Threshold #2 Status (R/O) See Table 2-2.	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
9	Thermal Threshold #2 Log (R/WC0) See Table 2-2.	
10	Power Limitation Status (R/O) See Table 2-2.	
11	Power Limitation Log (R/WC0) See Table 2-2.	
12	Current Limit Status (R/O) See Table 2-2.	
13	Current Limit Log (R/WC0) See Table 2-2.	
14	Cross Domain Limit Status (R/O) See Table 2-2.	
15	Cross Domain Limit Log (R/WC0) See Table 2-2.	
22:16	Digital Readout (R/O) See Table 2-2.	
26:23	Reserved.	
30:27	Resolution in Degrees Celsius (R/O) See Table 2-2.	
31	Reading Valid (R/O) See Table 2-2.	
63:32	Reserved.	
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target		Package
15:0	Reserved.	
23:16	Temperature Target (R/O) See Table 2-26.	
27:24	TCC Activation Offset (R/W) See Table 2-26.	
63:28	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
This register defines the ratio limits. RATIO[0:7] must be populated in ascending order. RATIO[i+1] must be less than or equal to RATIO[i]. Entries with RATIO[i] will be ignored. If any of the rules above are broken, the configuration is silently rejected. If the programmed ratio is: ▪ Above the fused ratio for that core count, it will be clipped to the fuse limits (assuming !OC). ▪ Below the min supported ratio, it will be clipped.		Package
7:0	RATIO_0 Defines ratio limits.	
15:8	RATIO_1 Defines ratio limits.	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
23:16	RATIO_2 Defines ratio limits.	
31:24	RATIO_3 Defines ratio limits.	
39:32	RATIO_4 Defines ratio limits.	
47:40	RATIO_5 Defines ratio limits.	
55:48	RATIO_6 Defines ratio limits.	
63:56	RATIO_7 Defines ratio limits.	
Register Address: 1AEH, 430	MSR_TURBO_RATIO_LIMIT_CORES	
This register defines the active core ranges for each frequency point. NUMCORE[0:7] must be populated in ascending order. NUMCORE[i+1] must be greater than NUMCORE[i]. Entries with NUMCORE[i] == 0 will be ignored. The last valid entry must have NUMCORE >= the number of cores in the SKU. If any of the rules above are broken, the configuration is silently rejected.		Package
7:0	NUMCORE_0 Defines the active core ranges for each frequency point.	
15:8	NUMCORE_1 Defines the active core ranges for each frequency point.	
23:16	NUMCORE_2 Defines the active core ranges for each frequency point.	
31:24	NUMCORE_3 Defines the active core ranges for each frequency point.	
39:32	NUMCORE_4 Defines the active core ranges for each frequency point.	
47:40	NUMCORE_5 Defines the active core ranges for each frequency point.	
55:48	NUMCORE_6 Defines the active core ranges for each frequency point.	
63:56	NUMCORE_7 Defines the active core ranges for each frequency point.	
Register Address: 280H, 640	IA32_MC0_CTL2	
See Table 2-2.		Core
Register Address: 281H, 641	IA32_MC1_CTL2	
See Table 2-2.		Core
Register Address: 282H, 642	IA32_MC2_CTL2

See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC5 reports MC errors from a link interconnect module.		Package
Register Address: 418H, 1048	IA32_MC6_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 419H, 1049	IA32_MC6_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 41AH, 1050	IA32_MC6_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41BH, 1051	IA32_MC6_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41CH, 1052	IA32_MC7_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC7 reports MC errors from the M2M 0.		Package
Register Address: 41DH, 1053	IA32_MC7_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC7 reports MC errors from the M2M 0.		Package
Register Address: 41EH, 1054	IA32_MC7_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC7 reports MC errors from the M2M 0.		Package
Register Address: 41FH, 1055	IA32_MC7_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC7 reports MC errors from the M2M 0.		Package
Register Address: 420H, 1056	IA32_MC8_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC8 reports MC errors from the M2M 1.		Package
Register Address: 421H, 1057	IA32_MC8_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC8 reports MC errors from the M2M 1.		Package
Register Address: 422H, 1058	IA32_MC8_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC8 reports MC errors from the M2M 1.		Package
Register Address: 423H, 1059	IA32_MC8_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC8 reports MC errors from the M2M 1.		Package
Register Address: 424H, 1060	IA32_MC9_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 425H, 1061	IA32_MC9_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 426H, 1062	IA32_MC9_ADDR	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 427H, 1063	IA32_MC9_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 428H, 1064	IA32_MC10_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 429H, 1065	IA32_MC10_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 42AH, 1066	IA32_MC10_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 42BH, 1067	IA32_MC10_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 42CH, 1068	IA32_MC11_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 42DH, 1069	IA32_MC11_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 42EH, 1070	IA32_MC11_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 42FH, 1071	IA32_MC11_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 430H, 1072	IA32_MC12_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC12 report MC errors from each channel of a link interconnect module.		Package
Register Address: 431H, 1073	IA32_MC12_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC12 report MC errors from each channel of a link interconnect module.		Package
Register Address: 432H, 1074	IA32_MC12_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC12 report MC errors from each channel of a link interconnect module.		Package

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 433H, 1075	IA32_MC12_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC12 report MC errors from each channel of a link interconnect module.		Package
Register Address: 434H, 1076	IA32_MC13_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 435H, 1077	IA32_MC13_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 436H, 1078	IA32_MC13_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 437H, 1079	IA32_MC13_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 438H, 1080	IA32_MC14_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 439H, 1081	IA32_MC14_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43AH, 1082	IA32_MC14_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43BH, 1083	IA32_MC14_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43CH, 1084	IA32_MC15_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43DH, 1085	IA32_MC15_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43EH, 1086	IA32_MC15_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43FH, 1087	IA32_MC15_MISC	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 440H, 1088	IA32_MC16_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 441H, 1089	IA32_MC16_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 442H, 1090	IA32_MC16_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 443H, 1091	IA32_MC16_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 444H, 1092	IA32_MC17_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 445H, 1093	IA32_MC17_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 446H, 1094	IA32_MC17_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 447H, 1095	IA32_MC17_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 448H, 1096	IA32_MC18_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 449H, 1097	IA32_MC18_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 44AH, 1098	IA32_MC18_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 44BH, 1099	IA32_MC18_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 44CH, 1100	IA32_MC19_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from a link interconnect module.		Package
Register Address: 44DH, 1101	IA32_MC19_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from a link interconnect module.		Package
Register Address: 44EH, 1102	IA32_MC19_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from a link interconnect module.		Package
Register Address: 44FH, 1103	IA32_MC19_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC19 reports MC errors from a link interconnect module.		Package
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers Used in RAPL Interfaces (R/O)		Package
3:0	Power Units See Section 16.10.1, "RAPL Interfaces."	Package
7:4	Reserved.	Package
12:8	Energy Status Units Energy related information (in Joules) is based on the multiplier, 1/2^ESU; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules).	Package
15:13	Reserved.	Package
19:16	Time Units See Section 16.10.1, "RAPL Interfaces."	Package
63:20	Reserved.	
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
DRAM RAPL Power Limit Control (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) Energy consumed by DRAM devices.		Package
31:0	Energy in 15.3 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 620H, 1568	MSR_UNCORE_RATIO_LIMIT	
Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.		Package
63:15	Reserved.	
14:8	MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.	
7	Reserved.	
6:0	MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
Reserved (R/O) Reads return 0.		Package
Register Address: C8DH, 3213	IA32_QM_EVTSEL	
Monitoring Event Select Register (R/W) If CPUID.(EAX=07H, ECX=0):EBX.RDT-M[bit 12] = 1.		Thread
7:0	EventID (R/W) Event encoding: 0x00: No monitoring. 0x01: L3 occupancy monitoring. 0x02: Total memory bandwidth monitoring. 0x03: Local memory bandwidth monitoring. All other encoding reserved.	
31:8	Reserved.	
41:32	RMID (R/W)	
63:42	Reserved.	
Register Address: C8FH, 3215	IA32_PQR_ASSOC	
Resource Association Register (R/W)		Thread
9:0	RMID	
31:10	Reserved.	
51:32	CLOS (R/W)	
63: 52	Reserved.	
Register Address: C90H, 3216	IA32_L3_QOS_MASK_0	
L3 Class Of Service Mask - CLOS 0 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=0.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 0 enforcement.	
63:20	Reserved.	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: C91H, 3217	IA32_L3_QOS_MASK_1	
L3 Class Of Service Mask - CLOS 1 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=1.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 1 enforcement.	
63:20	Reserved.	
Register Address: C92H, 3218	IA32_L3_QOS_MASK_2	
L3 Class Of Service Mask - CLOS 2 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=2.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 2 enforcement.	
63:20	Reserved.	
Register Address: C93H, 3219	IA32_L3_QOS_MASK_3	
L3 Class Of Service Mask - CLOS 3 (R/W). If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=3.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 3 enforcement.	
63:20	Reserved.	
Register Address: C94H, 3220	IA32_L3_QOS_MASK_4	
L3 Class Of Service Mask - CLOS 4 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=4.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 4 enforcement.	
63:20	Reserved.	
Register Address: C95H, 3221	IA32_L3_QOS_MASK_5	
L3 Class Of Service Mask - CLOS 5 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=5.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 5 enforcement.	
63:20	Reserved.	
Register Address: C96H, 3222	IA32_L3_QOS_MASK_6	
L3 Class Of Service Mask - CLOS 6 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=6.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 6 enforcement.	
63:20	Reserved.	
Register Address: C97H, 3223	IA32_L3_QOS_MASK_7	
L3 Class Of Service Mask - CLOS 7 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=7.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 7 enforcement.	
63:20	Reserved.	
Register Address: C98H, 3224	IA32_L3_QOS_MASK_8	
L3 Class Of Service Mask - CLOS 8 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=8.		Package

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	**Bit Description**	**Scope**
0:19	CBM: Bit vector of available L3 ways for CLOS 8 enforcement.	
63:20	Reserved.	
Register Address: C99H, 3225	IA32_L3_QOS_MASK_9	
L3 Class Of Service Mask - CLOS 9 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=9.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 9 enforcement.	
63:20	Reserved.	
Register Address: C9AH, 3226	IA32_L3_QOS_MASK_10	
L3 Class Of Service Mask - CLOS 10 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=10.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 10 enforcement.	
63:20	Reserved.	
Register Address: C9BH, 3227	IA32_L3_QOS_MASK_11	
L3 Class Of Service Mask - CLOS 11 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=11.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 11 enforcement.	
63:20	Reserved.	
Register Address: C9CH, 3228	IA32_L3_QOS_MASK_12	
L3 Class Of Service Mask - CLOS 12 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=12.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 12 enforcement.	
63:20	Reserved.	
Register Address: C9DH, 3229	IA32_L3_QOS_MASK_13	
L3 Class Of Service Mask - CLOS 13 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=13.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 13 enforcement.	
63:20	Reserved.	
Register Address: C9EH, 3230	IA32_L3_QOS_MASK_14	
L3 Class Of Service Mask - CLOS 14 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=14.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 14 enforcement.	
63:20	Reserved.	
Register Address: C9FH, 3231	IA32_L3_QOS_MASK_15	
L3 Class Of Service Mask - CLOS 15 (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] >=15.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 15 enforcement.	
63:20	Reserved.	

2.17.7 MSRs Specific to the 3rd Generation Intel® Xeon® Scalable Processor Family Based on Ice Lake Microarchitecture

The 3rd generation Intel® Xeon® Scalable Processor Family based on Ice Lake microarchitecture (CPUID Signature DisplayFamily_DisplayModel value of 06_6AH or 06_6CH) support the MSRs listed in Table 2-51.

Table 2-51. MSRs Supported by the 3rd Generation Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_6AH or 06_6CH

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 612H, 1554	MSR_PACKAGE_ENERGY_TIME_STATUS	
Package energy consumed by the entire CPU (R/W)		Package
31:0	Total amount of energy consumed since last reset.	
63:32	Total time elapsed when the energy was last updated. This is a monotonic increment counter with auto wrap back to zero after overflow. Unit is 10ns.	
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
Allows software to set power limits for the DRAM domain and measurement attributes associated with each limit.		Package
14:0	DRAM_PP_PWR_LIM: Power Limit[0] for DDR domain. Units = Watts, Format = 11.3, Resolution = 0.125W, Range = 0-2047.875W.	
15	PWR_LIM_CTRL_EN: Power Limit[0] enable bit for DDR domain.	
16	Reserved.	
23:17	CTRL_TIME_WIN: Power Limit[0] time window Y value, for DDR domain. Actual time_window for RAPL is: (1/1024 seconds) * (1+(x/4)) * (2^y)	
62:24	Reserved.	
63	PP_PWR_LIM_LOCK: When set, this entire register becomes read-only. This bit will typically be set by BIOS during boot.	
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
31:0	Energy in 15.3 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM Power Parameters (R/W)		Package

Table 2-51. MSRs Supported by the 3rd Generation Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_6AH or 06_6CH (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
14:0	Spec DRAM Power (DRAM_TDP): The Spec power allowed for DRAM. The TDP setting is typical (not guaranteed). The units for this value are defined in MSR_DRAM_POWER_INFO_UNIT[PWR_UNIT].	
15	Reserved.	
30:16	Minimal DRAM Power (DRAM_MIN_PWR): The minimal power setting allowed for DRAM. Lower values will be clamped to this value. The minimum setting is typical (not guaranteed). The units for this value are defined in MSR_DRAM_POWER_INFO_UNIT[PWR_UNIT].	
31	Reserved.	
46:32	Maximal Package Power (DRAM_MAX_PWR): The maximal power setting allowed for DRAM. Higher values will be clamped to this value. The maximum setting is typical (not guaranteed). The units for this value are defined in MSR_DRAM_POWER_INFO_UNIT[PWR_UNIT].	
47	Reserved.	
54:48	Maximal Time Window (DRAM_MAX_WIN): The maximal time window allowed for the DRAM. Higher values will be clamped to this value. x = PKG_MAX_WIN[54:53] y = PKG_MAX_WIN[52:48] The timing interval window is a floating-point number given by 1.x *power(2,y). The unit of measurement is defined in MSR_DRAM_POWER_INFO_UNIT[TIME_UNIT].	
62:55	Reserved.	
63	LOCK: Lock bit to lock the register.	
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
See Table 2-2.		
Register Address: 982H, 2434	IA32_TME_ACTIVATE	
See Table 2-2.		
Register Address: 983H, 2435	IA32_TME_EXCLUDE_MASK	
See Table 2-2.		
Register Address: 984H, 2436	IA32_TME_EXCLUDE_BASE	
See Table 2-2.		

2.17.8 MSRs Specific to the 4th and 5th Generation Intel® Xeon® Scalable Processor Families

The 4th generation Intel® Xeon® Scalable Processor Family based on Sapphire Rapids microarchitecture (CPUID Signature DisplayFamily_DisplayModel value of 06_8FH) and the 5th generation Intel® Xeon® Scalable Processor Family based on Emerald Rapids microarchitecture (CPUID Signature DisplayFamily_DisplayModel value of 06_CFH) both support the MSRs listed in Section 2.17, "MSRs In the 6th—13th Generation Intel® Core™ Processors, 1st—5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 P-core processors, Intel® Xeon® 6 E-core processors, and Intel® Series 2 Core™ Ultra Processors," including Table 2-52. For an MSR listed in Table 2-52 that also appears in the model-specific tables of prior generations, Table 2-52 supersedes prior generation tables.

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register (R/W)		Core
27:0	Reserved.	
28	UC_LOCK_DISABLE If set to 1, a UC lock will cause a #GP(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
31:30	Reserved.	
Register Address: A7H, 167	MSR_BIOS_DEBUG	
BIOS DEBUG (R/O) See Table 2-45.		Thread
Register Address: BCH, 188	IA32_MISC_PACKAGE_CTLS	
Power Filtering Control (R/W) IA32_ARCH_CAPABILITIES[bit 10] enumerates support for this MSR. See Table 2-2.		Package
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/W) If CPUID.(EAX=07H, ECX=0):EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Core
0	Reserved: returns zero.	
1	Reserved: returns zero.	
2	INTEGRITY_CAPABILITIES When set to 1, the processor supports MSR_INTEGRITY_CAPABILITIES.	
3	RSM_IN_CPL0_ONLY Indicates that RSM will only be allowed in CPL0 and will #GP for all non-CPL0 privilege levels.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
4	UC_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 28 of MSR_MEMORY_CTRL (MSR address 33H).	
5	SPLIT_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 29 of MSR_MEMORY_CTRL.	
6	Reserved: returns zero.	
7	UC_STORE_THROTTLING_SUPPORTED Indicates that the snoop filter quality of service MSRs are supported on this core. This is based on the existence of a non-inclusive cache and the L2/MLC QoS feature supported.	
63:8	Reserved: returns zero.	
Register Address: E1H, 225	IA32_UMWAIT_CONTROL	
UMWAIT Control (R/W) See Table 2-2.		
Register Address: EDH, 237	MSR_RAR_CONTROL	
RAR Control (R/W)		Thread
63:32	Reserved.	
31	ENABLE RAR events are recognized. When RAR is not enabled, RARs are dropped.	
30	IGNORE_IF Allow RAR servicing at the RLP regardless of the value of RFLAGS.IF.	
29:0	Reserved.	
Register Address: EEH, 238	MSR_RAR_ACTION_VECTOR_BASE	
Pointer to RAR Action Vector (R/W)		Thread
63:MAXPHYADDR	Reserved.	
MAXPHYADDR-1:6	VECTOR_PHYSICAL_ADDRESS Pointer to the physical address of the 64B aligned RAR action vector.	
5:0	Reserved.	
Register Address: EFH, 239	MSR_RAR_PAYLOAD_TABLE_BASE	
Pointer to Base of RAR Payload Table (R/W)		Thread
63:MAXPHYADDR	Reserved.	
MAXPHYADDR-1:12	TABLE_PHYSICAL_ADDRESS Pointer to the base physical address of the 4K aligned RAR payload table.	
11:0	Reserved.	
Register Address: F0H, 240	MSR_RAR_INFO	
Read Only RAR Information (RO)		Thread
63:38	Always zero.	
37:32	Table Max Index Maximum supported payload table index.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
31:0	Supported payload type bitmap. A value of 1 in bit position [i] indicates that payload type [i] is supported.	
Register Address: 105H, 261	MSR_CORE_BIST	
Core BIST (R/W) Controls Array BIST activation and status checking as part of FUSA.		Core
31:0	BIST_ARRAY Bitmap indicating which arrays to run BIST on (WRITE). Bitmap indicating which arrays were not processed, i.e., completion mask (READ).	
39:32	BANK Array bank of the [least significant set bit] array indicated in EAX to start BIST(WRITE). Array bank interrupted or failed (READ).	
47:40	DWORD Array dword of the [least significant set bit] array indicated in EAX to start BIST (WRITE). Array dword interrupted or failed (READ).	
62:48	Reserved.	
63	CTRL_RESULT Indicates whether WRMSR should signal Machine-Check upon BIST-error (WRITE). BIST result PASS(0)/FAIL(1) of the (least significant set bit) array indicated in EAX (READ).	
Register Address: 10AH, 266	IA32_ARCH_CAPABILITIES	
Enumeration of Architectural Features (R/O) See Table 2-2.		
Register Address: 1A4H, 420	MSR_PREFETCH_CONTROL	
Prefetch Disable Bits (R/W)		
0	L2_HARDWARE_PREFETCHER_DISABLE If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	
1	L2_ADJACENT_CACHE_LINE_PREFETCHER_DISABLE If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).	
2	DCU_HARDWARE_PREFETCHER_DISABLE If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	
3	DCU_IP_PREFETCHER_DISABLE If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction pointer of previous loads) to determine whether to prefetch additional lines.	
4	Reserved.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
5	AMP_PREFETCH_DISABLE If 1, disables the L2 Adaptive Multipath Probability (AMP) prefetcher.	
63:6	Reserved.	
Register Address: 1ADH, 429	MSR_PRIMARY_TURBO_RATIO_LIMIT	
Primary Maximum Turbo Ratio Limit (R/W) See Table 2-46.		Package
Register Address: 1AEH, 430	MSR_TURBO_RATIO_LIMIT_CORES	
See Table 2-50.		Package
Register Address: 1C4H, 452	IA32_XFD	
Extended Feature Detect (R/W) See Table 2-2.		
Register Address: 1C5H, 453	IA32_XFD_ERR	
XFD Error Code (R/W) See Table 2-2.		
Register Address: 2C2H, 706	MSR_COPY_SCAN_HASHES	
COPY_SCAN_HASHES (W)		Die
63:0	SCAN_HASH_ADDR Contains the linear address of the SCAN Test HASH Binary loaded into memory.	
Register Address: 2C3H, 707	MSR_SCAN_HASHES_STATUS	
SCAN_HASHES_STATUS (R/O)		
15:0	CHUNK_SIZE Chunk size of the test in KB.	Die
23:16	NUM_CHUNKS Total number of chunks.	Die
31:24	Reserved: all zeros.	
39:32	ERROR_CODE The error-code refers to the LP that runs WRMSR(2C2H). 0x0: No error reported. 0x1: Attempt to copy scan-hashes when copy already in progress. 0x2: Secure Memory not set up correctly. 0x3: Scan-image header Image_info.ProgramID doesn't match RDMSR(2D9H)[31:24], or scan-image header Processor-Signature doesn't match F/M/S, or scan-image header Processor-Flags doesn't match PlatformID. 0x4: Reserved 0x5: Integrity check failed. 0x6: Re-install of scan test image attempted when current scan test image is in use by other LPs.	Thread
50:40	Reserved: set to all zeros.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
62:51	MAX_CORE_LIMIT Maximum Number of cores that can run Intel® In-field Scan simultaneously minus 1. 0 means 1 core at a time.	Die
63	Valid Valid bit is set when COPY_SCAN_HASHES has completed successfully.	Die
Register Address: 2C4H, 708	MSR_AUTHENTICATE_AND_COPY_CHUNK	
AUTHENTICATE_AND_COPY_CHUNK (W)		Die
7:0	CHUNK_INDEX Chunk Index, should be less than the total number of chunks defined by NUM_CHUNKS (MSR_SCAN_HASHES_STATUS[23:16]).	
63:8	CHUNK_ADDR Bits 63:8 of 256B aligned Linear address of scan chunk in memory.	
Register Address: 2C5H, 709	MSR_CHUNKS_AUTHENTICATION_STATUS	
CHUNKS_AUTHENTICATION_STATUS (R/O)		
7:0	VALID_CHUNKS Total number of Valid (authenticated) chunks.	Die
15:8	TOTAL_CHUNKS Total number of chunks.	Die
31:16	Reserved: all zeros.	
39:32	ERROR_CODE The error code refers to the LP that runs WRMSR(2C4H). 0x0: No error reported. 0x1: Attempt to authenticate a CHUNK which is already marked as authentic or is currently being installed by another core. 0x2: CHUNK authentication error. HASH of chunk did not match expected value.	Thread
63:40	Reserved: set to all zeros.	
Register Address: 2C6H, 710	MSR_ACTIVATE_SCAN	
ACTIVATE_SCAN (W)		Thread
7:0	CHUNK_START_INDEX Indicates chunk index to start from.	
15:8	CHUNK_STOP_INDEX Indicates what chunk index to stop at (inclusive).	
31:16	Reserved: all zeros.	
62:32	THREAD_WAIT_DELAY TSC based delay to allow threads to rendezvous.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
63	SIGNAL_MCE If 1, then on scan-error log MC in MC4_STATUS and signal MCE if machine check signaling enabled in MC4_CTL[0]. If 0, then no logging/no signaling.	
Register Address: 2C7H, 711	MSR_SCAN_STATUS	
SCAN_STATUS (R/O)		
7:0	CHUNK_NUM SCAN Chunk that was reached.	Core
15:8	CHUNK_STOP_INDEX Indicates what chunk index to stop at (inclusive). Maps to same field in WRMSR(ACTIVATE_SCAN).	Core
31:16	Reserved: return all zeros.	
39:32	ERROR_CODE 0x0: No error. 0x1: SCAN operation did not start. Other thread did not join in time. 0x2: SCAN operation did not start. Interrupt occurred prior to threads rendezvous. 0x3: SCAN operation did not start. Power Management conditions are inadequate to run Intel In-field Scan. 0x4: SCAN operation did not start. Non-valid chunks in the range CHUNK_STOP_INDEX : CHUNK_START_INDEX. 0x5: SCAN operation did not start. Mismatch in arguments between threads T0/T1. 0x6: SCAN operation did not start. Core not capable of performing SCAN currently. 0x8: SCAN operation did not start. Exceeded number of Logical Processors (LP) allowed to run Intel In-field Scan concurrently. MAX_CORE_LIMIT exceeded. 0x9: Interrupt occurred. Scan operation aborted prematurely, not all chunks requested have been executed.	Thread
61:40	Reserved: return all zeros.	
62	SCAN_CONTROL_ERROR Scan-System-Controller malfunction.	Core
63	SCAN_SIGNATURE_ERROR Core failed SCAN-SIGNATURE checking for this chunk.	Core
Register Address: 2C8H, 712	MSR_SCAN_MODULE_ID	
SCAN_MODULE_ID (R/O)		Module
31:0	RevID of the currently installed scan test image. Maps to Revision field in external header (offset 4).	
63:32	Reserved: return all zeros.	
Register Address: 2C9H, 713	MSR_LAST_SAF_WP	
LAST_SAF_WP (R/O)		Core

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
31:0	LAST_WP Provides information about the core when the last WRMSR(ACTIVATE_SCAN) was executed. Available only if enumerated in MSR_INTEGRITY_CAPABILITIES[10:9].	
63:32	Reserved: return all zeros.	
Register Address: 2D9H, 729	MSR_INTEGRITY_CAPABILITIES	
INTEGRITY_CAPABILITIES (R/O)		Module
0	STARTUP_SCAN_BIST When set, supports Intel In-field Scan.	
3:1	Reserved: return all zeros.	
4	PERIODIC_SCAN_BIST When set, supports Intel In-field Scan.	
23:5	Reserved: return all zeros.	
31:24	ID of the scan programs supported for this part. WRMSR(2C2H) verifies this value against the corresponding value in the scan-image header, i.e., Image_info.	
Register Address: 410H, 1040	IA32_MC4_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC4 reports MC errors from the PCU module. If SIGNAL_MCE is set, a Scan Status is logged in MC4_STATUS and MC4_MISC.		Package
Register Address: 411H, 1041	IA32_MC4_STATUS	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC4 reports MC errors from the PCU module. If SIGNAL_MCE is set, a Scan Status is logged in MC4_STATUS and MC4_MISC.		Package
Register Address: 412H, 1042	IA32_MC4_ADDR	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC4 reports MC errors from the PCU module. If SIGNAL_MCE is set, a Scan Status is logged in MC4_STATUS and MC4_MISC.		Package
Register Address: 413H, 1043	IA32_MC4_MISC	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs," through Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." Bank MC4 reports MC errors from the PCU module. If SIGNAL_MCE is set, a Scan Status is logged in MC4_STATUS and MC4_MISC.		Package
Register Address: 492H, 1170	IA32_VMX_PROCBASED_CTLS3	
Capability Reporting Register of Tertiary Processor-Based VM-Execution Controls (R/O) See Table 2-2.		
Register Address: 493H, 1171	IA32_VMX_EXIT_CTLS2	
Capability Reporting Register of Secondary VM-Exit Controls (R/O) See Table 2-2.		
Register Address: 540H, 1344	MSR_THREAD_UARCH_CTL	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Thread Microarchitectural Control (R/W) See Table 2-47.		Thread
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) Energy consumed by DRAM devices.		Package
31:0	Energy in 61 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 64DH, 1613	MSR_PLATFORM_ENERGY_STATUS	
Platform Energy Status (R/O)		Package
31:0	TOTAL_ENERGY_CONSUMED Total energy consumption in J (32.0), in 10nsec units.	
63:32	TIME_STAMP Time stamp (U32.0).	
Register Address: 65CH, 1628	MSR_PLATFORM_POWER_LIMIT	
Platform Power Limit Control (R/W-L)		Package
16:0	POWER_LIMIT_1 The average power limit value that the platform must not exceed over a time window as specified by the Power_Limit_1_TIME field. The default value is the Thermal Design Power (TDP) and varies with product skus. The unit is specified in MSR_RAPL_POWER_UNIT.	
17	POWER_LIMIT_1_EN When set, the processor can apply control policies such that the platform average power does not exceed the Power_Limit_1 value over an exponential weighted moving average of the time window.	
18	CRITICAL_POWER_CLAMP_1 When set, the processor can go below the OS-requested P States to maintain the power below the specified Power_Limit_1 value.	
25:19	POWER_LIMIT_1_TIME This indicates the time window over which the Power_Limit_1 value should be maintained. This field is made up of two numbers from the following equation: Time Window = (float) ((1+(X/4))*(2^Y)), where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17] The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN]. The default value is 0DH, and the unit is specified in MSR_RAPL_POWER_UNIT[Time Unit].	
31:26	Reserved.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
48:32	POWER_LIMIT_2 This is the Duration Power limit value that the platform must not exceed. The unit is specified in MSR_RAPL_POWER_UNIT.	
49	Enable Platform Power Limit #2 When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #2 over the Short Duration time window.	
50	Platform Clamping Limitation #2 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #2 value.	
57:51	POWER_LIMIT_2_TIME This indicates the time window over which the Power_Limit_2 value should be maintained. This field has the same format as the POWER_LIMIT_1_TIME field.	
62:58	Reserved.	
63	LOCK Setting this bit will lock all other bits of this MSR until system RESET.	
Register Address: 665H, 1637	MSR_PLATFORM_POWER_INFO	
Platform Power Information (R/W)		Package
16:0	MAX_PPL1 Maximum PP L1 value. The unit is specified in MSR_RAPL_POWER_UNIT.	
31:17	MIN_PPL1 Minimum PP L1 value. The unit is specified in MSR_RAPL_POWER_UNIT.	
48:32	MAX_PPL2 Maximum PP L2 value. The unit is specified in MSR_RAPL_POWER_UNIT.	
55:49	MAX_TW Maximum time window. The unit is specified in MSR_RAPL_POWER_UNIT.	
62:56	Reserved.	
63	LOCK Setting this bit will lock all other bits of this MSR until system RESET.	
Register Address: 666H, 1638	MSR_PLATFORM_RAPL_SOCKET_PERF_STATUS	
Platform RAPL Socket Performance Status (R/O)		Package
31:0	Count of limited performance due to platform RAPL limit.	
Register Address: 6A0H, 1696	IA32_U_CET	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Configure User Mode CET (R/W) See Table 2-2.		
Register Address: 6A2H, 1698	IA32_S_CET	
Configure Supervisor Mode CET (R/W) See Table 2-2.		
Register Address: 6A4H, 1700	IA32_PL0_SSP	
Linear address to be loaded into SSP on transition to privilege level 0. (R/W) See Table 2-2.		
Register Address: 6A5H, 1701	IA32_PL1_SSP	
Linear address to be loaded into SSP on transition to privilege level 1. (R/W) See Table 2-2.		
Register Address: 6A6H, 1702	IA32_PL2_SSP	
Linear address to be loaded into SSP on transition to privilege level 2. (R/W) See Table 2-2.		
Register Address: 6A7H, 1703	IA32_PL3_SSP	
Linear address to be loaded into SSP on transition to privilege level 3. (R/W) See Table 2-2.		
Register Address: 6A8H, 1704	IA32_INTERRUPT_SSP_TABLE_ADDR	
Linear address of a table of seven shadow stack pointers that are selected in IA-32e mode using the IST index (when not 0) from the interrupt gate descriptor. (R/W) See Table 2-2.		
Register Address: 6E1H, 1761	IA32_PKRS	
Specifies the PK permissions associated with each protection domain for supervisor pages (R/W) See Table 2-2.		
Register Address: 776H, 1910	IA32_HWP_CTL	
See Table 2-2.		
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
Memory Encryption Capability MSR See Table 2-2.		
Register Address: 985H, 2437	IA32_UINTR_RR	
User Interrupt Request Register (R/W) See Table 2-2.		
Register Address: 986H, 2438	IA32_UINTR_HANDLER	
User Interrupt Handler Address (R/W) See Table 2-2.		
Register Address: 987H, 2439	IA32_UINTR_STACKADJUST	
User Interrupt Stack Adjustment (R/W) See Table 2-2.		
Register Address: 988H, 2440	IA32_UINTR_MISC

Last Branch Record Maximum Stack Depth Register (R/W) See Table 2-2.		
Register Address: 1500H–151FH, 5376–5407	IA32_LBR_x_FROM_IP	
Last Branch Record Entry X Source IP Register (R/W) See Table 2-2.		
Register Address: 1600H–161FH, 5632–5663	IA32_LBR_x_TO_IP	
Last Branch Record Entry X Destination IP Register (R/W) See Table 2-2.		

2.17.9 MSRs Introduced in the Intel® Core™ Ultra 7 Processor Supporting Performance Hybrid Architecture

Table 2-53 lists additional MSRs for the Intel Core Ultra 7 processor with a CPUID Signature DisplayFamily_Display-Model value of 06_AAH. Table 2-54 lists the MSRs unique to the processor P-core. Table 2-55 lists the MSRs unique to the processor E-core.

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register		Core
26:0	Reserved.	
27	UC_STORE_THROTTLE If set to 1, when enabled, the processor will only allow one in-progress UC store at a time.	
28	UC_LOCK_DISABLE If set to 1, a UC lock will cause a #GP(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
63:30	Reserved.	
Register Address: 7AH, 122	IA32_FEATURE_ACTIVATION	
Feature Activation (R/W) Implements Feature Activation command. WRMSR to this address activates all 'activatable' features on this thread. See Table 2-2.		
Register Address: 80H, 128	MSR_TRACE_HUB_STH_ACPIBAR_BASE	
MSR_TRACE_HUB_STH_ACPIBAR_BASE (R/W) This register is used by BIOS to program Trace Hub STH base address that will be used by AET messages.		Thread
0	LOCK Lock bit. If set, this MSR cannot be re-written anymore. The lock bit has to be set in order for the AET packets to be directed to Trace Hub MMIO.	
17:1	Reserved.	
45:18	ADDRESS AET target address in Trace Hub MMIO space.	
63:46	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration (R/W)		Core
3:0	PKG_C_STATE_LIMIT Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings may be supported: 0000b: C0/C1 (no package C-state support) 0001b: C2 0010b: C3 0011b: C6 0100b: C7 0101b: C7s 0110b: C8 0111b: C9 1000b: C10	
7:4	MAX_CORE_C_STATE Possible values are: 0000—reserved; 0001—C1; 0010—C3, 0011—C6.	
9:8	Reserved.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
10	IO_MWAIT_REDIRECTION_ENABLE When set, will map IO_read instructions sent to IO registers PMG_IO_BASE_ADDR.PMB0+0/1/2 to MWAIT(C2,3,4) instructions; applies to deepc4 too.	
14:11	Reserved.	
15	CFG_LOCK When set, locks bits 15:0 of this register for further writes, until the next reset occurs.	
24:16	Reserved.	
25	C3_STATE_AUTO_DEMOTION_ENABLE When set, processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	
26	C1_STATE_AUTO_DEMOTION_ENABLE When set, processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	ENABLE_C3_UNDEMOTION Enable Un-Demotion from Demoted C3.	
28	ENABLE_C1_UNDEMOTION Enable Un-Demotion from Demoted C1.	
29	ENABLE_PKGC_AUTODEMOTION Enable Package C-State Auto-Demotion. It enables use of the history of past package C-state depth and residence, as a factor in determining C-State depth.	
30	ENABLE_PKGC_UNDEMOTION Enable Package C-State Un-Demotion. It enables considering cases where demotion was the incorrect decision in determining C-State depth.	
31	TIMED_MWAIT_ENABLE When set, enables Timed MWAIT feature. MWAIT would #GP on attempts to do setup MWAIT timer if this bit is not set.	
63:32	Reserved.	
Register Address: E4H, 228	MSR_IO_CAPTURE_BASE	
IO Capture Base (R/W) Power Management IO Redirection in C-state. See http://biosbits.org.		Core
15:0	LVL_2_BASE_ADDRESS Specifies the base address visible to software for IO redirection. If MSR_PKG_CST_CONFIG_CONTROL.IO_MWAIT_REDIRECTION_ENABLE, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
18:16	CST_RANGE Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL.IO_MWAIT_REDIRECTION_ENABLE: 000b—C3 is the max C-State to include. 001b—C6 is the max C-State to include. 010b—C7 is the max C-State to include.	
63:19	Reserved.	
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Feature Configuration (R/W)		Core
0	AESNI_LOCK Once this bit is set, writes to this register will not be allowed.	
1	AESNI_DISABLE This bit disables Advanced Encryption Standard feature on this processor core. To disable AES, BIOS will write '11 to this MSR on every core.	
63:2	Reserved.	
Register Address: 140H, 320	MSR_FEATURE_ENABLES	
Feature Enable (R/W) Miscellaneous enables for thread specific features.		Thread
0	CPUID_GP_ON_CPL_GT_0 Causes CPUID to #GP if CPL greater than 0 and not in SMM.	
63:1	Reserved.	
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target (R/W) Legacy register holding temperature related constants for Platform use.		Package
6:0	TCC Offset Time Window Describes the RATL averaging time window.	
7	TCC Offset Clamping Bit When enabled will allow RATL throttling below P1.	
15:8	Temperature Control Offset Fan Temperature Target Offset (a.k.a. T-Control) indicates the relative offset from the Thermal Monitor Trip Temperature at which fans should be engaged.	
23:16	TCC Activation Temperature The minimum temperature at which PROCHOT# will be asserted. The value is degrees C.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
30:24	TCC Activation Offset Specifies a temperature offset in degrees C from the temperature target (bits 23:16). PROCHOT# will assert at the offset target temperature. Write is permitted only if MSR_PLATFORM_INFO[30] is set.	
31	LOCKED When set, this entire register becomes read-only.	
63:2	Reserved.	
Register Address: 1A4H, 420	MSR_PREFETCH_CONTROL	
PREFETCH Control (R/W) Prefetch disable bits.		Thread
0	L2_HARDWARE_PREFETCHER_DISABLE If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	
1	L2_ADJACENT_CACHE_LINE_PREFETCHER_DISABLE If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).	
2	DCU_HARDWARE_PREFETCHER_DISABLE If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	
3	DCU_IP_PREFETCHER_DISABLE If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction pointer of previous loads) to determine whether to prefetch additional lines.	
4	DCU_NEXT_PAGE_PREFETCH_DISABLE If 1, disables Next Page prefetcher.	
5	AMP_PREFETCH_DISABLE If 1, disables L2 Adaptive Multipath Probability (AMP) prefetcher.	
6	LLC_PAGE_PREFETCH_DISABLE If 1, disables the LLC Page prefetcher.	
7	AOP_PREFETCH_DISABLE	
8	STREAM_PREFETCH_CODE_FETCH_DISABLE	
63:9	Reserved.	
Register Address: 1A6H, 422	MSR_OFFCORE_RSP_0	
OFFCORE_RSP_0 (R/W) Offcore Response Event Select Register		Thread
0	TRUE_DEMAND_CACHE_LOAD Demand Data Rd = DCU reads (includes partials) that is not tagged homeless.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
1	DEMAND_RFO Demand Instruction fetch = IFU Fetches. ItoM or RFO that is not tagged homeless.	
2	DEMAND_CODE_READ Demand Instruction fetch = IFU Fetches. CRd or CRd_UC.	
3	CORE_MODIFIED_WRITEBACK WBMtoI or WBMtoE.	
4	HW_PREFETCH_MLC_LOAD L2 prefetcher requests triggered by reads from MEC (except those triggered by I-side).	
5	HW_PREFETCH_MLC_RFO L2 prefetcher requests triggered by RFOs.	
6	HW_PREFETCH_MLC_CODE L2 prefetcher requests triggered by I-side requests.	
7	HW_PREFETCH_LLC_LOAD LLC prefetch requests triggered by DRd.	
8	HW_PREFETCH_LLC_RFO LLC prefetch requests triggered by RFO.	
9	HW_PREFETCH_LLC_CODE LLC prefetch requests triggered by CRd.	
10	L1_HWPREFETCH Covers Hardware PFRFO, PFNEAR, PFMED, PFFAR, PFHW, PFNTA, PFNPP, PFIPP including the homeless versions.	
11	ALL_STREAMING_STORE Write Combining. WCiL or WCiLF.	
12	CORE_NON_MODIFIED_WB WBEFtoI or WBEFtoE.	
13	LLC_PREFETCH LLC prefetch of load/code/RFO.	
14	L1_SWPREFETCH Covers Software PFRFO, PFNEAR, PFMED, PFFAR, PFHW, PFNTA, PFNPP, PFIPP including the homeless versions.	
15	OTHER Includes CLFlush, CLFlushOPT, CLDemote, CLWB, Enqueue SetMonitor, PortIn, IntA, Lock, SplitLock, Unlock, SpCyc, ClrMonitor, PortOut, IntPriUp, IntLog, IntPhy, EOI, RdCurr, WbStoI, LLCWBInv, LLCInv, NOP, PCOMMIT.	
16	ANY_RESP Match on any response.	
17	SUPPLIER_NONE No Supplier Details. DATA_PRE [6:3] = 0.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
18	LLC_HIT_M_STATE LLC/L3, M-state, DATA_PRE [6:3] = 2.	
19	LLC_HIT_E_STATE LLC/L3, E-state, DATA_PRE [6:3] = 4.	
20	LLC_HIT_S_STATE LLC/L3, S-state, DATA_PRE [6:3] = 6.	
21	LLC_HIT_F_STATE LLC/L3, F-state, DATA_PRE [6:3] = 8.	
22	FAR_MEM_LOCAL Far Memory, Local, DATA_PRE [6:3] = 1.	
23	FAR_MEM_REMOTE_0_HOP Far Memory, Remote 0-hop, DATA_PRE [6:3] = 3.	
24	FAR_MEM_REMOTE_1_HOP Far Memory, Remote 1-hop, DATA_PRE [6:3] = 5.	
25	FAR_MEM_REMOTE_2_PLUS_HOP Far Memory, Rem 2+ hop, DATA_PRE [6:3] = 7.	
26	NEAR_MEM_MISS_LOCAL_NODE LLC Miss Local Node. Near Memory, Local DATA_PRE [6:3] = E.	
27	NEAR_MEM_REMOTE_0_HOP Near Memory, Remote 0-hop, DATA_PRE [6:3] = B	
28	NEAR_MEM_REMOTE_1_HOP Near Memory, Remote 1-hop, DATA_PRE [6:3] = D.	
29	NEAR_MEM_REMOTE_2_PLUS_HOP Near Memory, Remote 2+ hop, DATA_PRE [6:3] = F.	
30	SPL_HIT Snoop Info: SPL-hit, DATA_PRE [2:0] = 6.	
31	SNOOP_NONE No details as to Snoop-related info. Snoop Info: None, DATA_PRE [2:0] = 0.	
32	NOT_NEEDED No snoop was needed to satisfy the request. Snoop Info: Not needed, DATA_PRE [2:0] = 1.	
33	MISS No snoop was needed to satisfy the request. Snoop Info: Miss, DATA_PRE [2:0] = 2.	
34	HIT_NO_FWD A snoop was needed and it Hits in at least one snooped cache. Hit denotes a cache-line was valid before snoop effect. Snoop Info: Hit No Fwd, DATA_PRE [2:0] = 3.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
35	HIT_EF_WITH_FWD A snoop was needed and data was Forwarded from a remote socket. Snoop Info: Hit EF w/Fwd, DATA_PRE [2:0] = 4.	
36	HITM A snoop was needed and it HitMed in local or remote cache. HitM denotes a cache-line was modified before snoop effect. Snoop Info: HitM, DATA_PRE [2:0] = 5.	
37	NON_DRAM Target was non-DRAM system address. Snoop Info: HitM, DATA_PRE [2:0] = 5.	
38	GO_ERR GO-ERR, RspData[3:0] = 0100.	
39	GO_NO_GO GO-NoGO, RspData[3:0] = 0111.	
40	INPKG_MEM_LOCAL In-package Memory, Local, DATA_PRE [6:3] = 9.	
41	INPKG_MEM_NONLOCAL In-package Memory, Non-Local, DATA_PRE [6:3] = C.	
43:42	Reserved.	
44	UC_LOAD PRd or UCRdF.	
45	UC_STORE WiL.	
46	PARTIAL_STREAMING_STORES WCiL.	
47	FULL_STREAMING_STORES WCiLF.	
48	L1_MODIFIED_WB EVICTION EXTTYPE from MEC.	
49	L2_MODIFIED_WB WBMtoI or WBMtoE.	
50	PSMI MemPushWr_NS (PSMI only).	
51	ITOM ItoM.	
63:52	Reserved.	
Register Address: 1A7H, 423	MSR_OFFCORE_RSP_1	
OFFCORE_RSP_1 (R/W) Offcore Response Event Select Register. See MSR_OFFCORE_RSP_0 (at1A6H).		Thread
Register Address: 1AAH, 426	MSR_MISC_PWR_MGMT	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Miscellaneous Power Management Control (R/W) Various model-specific features enumeration. See http://biosbits.org.		Package
0	Reserved.	
1	ENABLE_HWP_VOTING_RIGHT When set (1), The CPU will take into account thread HWP requests for threads that have voting rights only (ignores thread requests if they do not have voting rights). When reset(0), The CPU will take into account all thread HWP requests, even for threads that don't have voting rights. Setting this bit will cause the HWP Base feature bit to be reported in CPUID as present; clearing will cause it to be reported as non-present.	
5:2	Reserved.	
6	ENABLE_HWP Setting this bit will cause the HWP Base feature bit to report as present in CPUID; clearing this bit will cause CPUID to report the feature as non-present.	
7	ENABLE_HWP_INTERRUPT Setting this bit will cause the HWP Interrupt feature CPUID[6].EAX[8] bit to report as present; clearing will report as non-present.	
8	ENABLE_OUT_OF_BAND_AUTONOMOUS Setting this bit will cause the HWP Autonomous feature bit to report as present; clearing will report as non-present.	
11:9	Reserved.	
12	ENABLE_HWP_EPP Enable HWP EPP. Setting this bit (1) will cause the HWP CPUID[6].EAX[10] Energy Performance Preference bit to report as present (1); clearing will report as non-present (0).	
13	LOCK Setting this bit will prevent the BIOS specific bits from changing until the next reset. i.e., only Bits [0,22] which are meant for OS use can be changed once the LOCK bit is set.	
63:14	Reserved.	
Register Address: 1ADH, 429	MSR_PRIMARY_TURBO_RATIO_LIMIT	
Primary Maximum Turbo Ratio Limit (R/W) Software can configure these limits when MSR_PLATFORM_INFO[28] = 1. Specifies Maximum Ratio Limit for each group. Maximum ratio for groups with more cores must decrease monotonically.		Package
7:0	MAX_TURBO_GROUP_0: Maximum turbo ratio limit with 1 core active.	
15:8	MAX_TURBO_GROUP_1: Maximum turbo ratio limit with 2 cores active.	
23:16	MAX_TURBO_GROUP_2: Maximum turbo ratio limit with 3 cores active.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
31:24	MAX_TURBO_GROUP_3: Maximum turbo ratio limit with 4 cores active.	
39:32	MAX_TURBO_GROUP_4: Maximum turbo ratio limit with 5 cores active.	
47:40	MAX_TURBO_GROUP_5: Maximum turbo ratio limit with 6 cores active.	
55:48	MAX_TURBO_GROUP_6: Maximum turbo ratio limit with 7 cores active.	
63:56	MAX_TURBO_GROUP_7: Maximum turbo ratio limit with 8 cores active.	
Register Address: 1F1H, 497	MSR_CRASHLOG_CONTROL	
Crash Log Control (R/W) Write data to a Crash Log configuration.		Thread
0	CDDIS CrashDump_Disable: If set, indicates that Crash Dump is disabled.	
1	EN_GPRS Collect GPRs on a crash dump. Only meaningful when CDDIS is zero.	
2	EN_GPRS_IN_SMM Collect GPRs in SMM on a crash dump. Only meaningful when CDDIS is zero. EN_GPRS will override this control,	
3	TRIPLE_FAULT_SHUTDOWN Collect a crash log on a triple fault shutdown. Only meaningful when CDDIS is zero.	
63:4	Reserved.	
Register Address: 1F5H, 501	MSR_PRMRR_PHYS_MASK	
Processor Reserved Memory Range Register - Physical Mask (R/W)		Core
9:0	Reserved.	
10	LOCK Once set, this bit prevents software from modifying the PRMRR.	
11	VALID This bit serves as the enable for the PRMRR; the PRMRR must be LOCKed before it can be enabled.	
19:12	Reserved.	
45:20	MASK PRMRR Address Mask.	
63:46	Reserved.	
Register Address: 1FCH, 508	MSR_POWER_CTL	
Power Control Register (R/W) See http://biosbits.org.		Package

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
0	ENABLE_BIDIR_PROCHOT Used to enable or disable the response to PROCHOT# input. When set/enabled, the platform can force the CPU to throttle to a lower power condition such as Pn/Pm by asserting prochot#. When clear/disabled (default), the CPU ignores the status of the prochot input signal.	
1	C1E_ENABLE When set to '1', will enable the CPU to switch to the Minimum Enhanced Intel SpeedStep Technology operating point when all execution cores enter MWAIT (C1).	
2	SAPM_IMC_C2_POLICY This bit determines if self-refresh activation is allowed when entering Package C2 State. If it is set to 0b, PCODE will keep the FORCE_SR_OFF bit asserted in Package C2 State and allow its negation according to the defined latency negotiations with the PCH and Display Engine in Package C3 and deeper states. Otherwise, self-refresh is allowed in Package C2 State.	
3	FAST_BRK_SNP_EN This bit controls the VID swing rate for the OTHER_SNP_WAKE events that are detected by the iMPH. This is the event that is detected by the iMPH when a non-DMI snoopable request is observed while UCLK domain is not functional. 0b: Use slow VID swing rate. 1b: Use fast VID swing rate.	
17:4	Reserved.	
18	PWR_PERF_PLTFRM_OVR Power performance platform override.	
19	EE_TURBO_DISABLE Setting this bit disables the P-States energy efficiency optimization. Default value is 0. Disable/enable the energy efficiency optimization in P-State legacy mode (when IA32_PM_ENABLE[HWP_ENABLE] = 0), has an effect only in the turbo range or into PERF_MIN_CTL value if it is not zero set. In HWP mode (IA32_PM_ENABLE[HWP_ENABLE] == 1), has an effect between the OS desired or OS maximize to the OS minimize performance setting.	
20	RTH_DISABLE Setting this bit disables the Race to Halt optimization and avoids this optimization limitation to execute below the most efficient frequency ratio. Default value is 0 for processors that support Race to Halt optimization.	
21	DIS_PROCHOT_OUT Prochot output disable.	
22	PROCHOT_RESPONSE Prochhot configurable response enable.

Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 64FH, 1615	MSR_CORE_PERF_LIMIT_REASONS	
Core Performance Limit Reasons Indicator of Frequency Clipping in Processor Cores. (Frequency refers to processor core frequency.)		Package
0	PROCHOT (R/O) PROCHOT Status. When set, frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	THERMAL (R/O) Thermal Status. When set, frequency is reduced below the operating system request due to a thermal event.	
3:2	Reserved.	
4	RSR_LIMIT (R/O) Residency State Regulation Status. When set, frequency is reduced below the operating system request due to residency state regulation limit.	
5	RATL (R/O) Running Average Thermal Limit Status. When set, frequency is reduced below the operating system request due to Running Average Thermal Limit (RATL).	
6	VR_THERMALERT (R/O) VR Therm Alert Status. When set, frequency is reduced below the operating system request due to a thermal alert from a processor Voltage Regulator (VR).	
7	VR_TDC (R/O) VR Therm Design Current Status. When set, frequency is reduced below the operating system request due to VR thermal design current limit.	
8	OTHER (R/O) Other Status. When set, frequency is reduced below the operating system request due to electrical or other constraints.	
9	Reserved.	
10	PBM_PL1 (R/O) Package/Platform-Level Power Limiting PL1 Status. When set, frequency is reduced below the operating system request due to package/platform-level power limiting PL1.	
11	PBM_PL2 (R/O) Package/Platform-Level PL2 Power Limiting Status. When set, frequency is reduced below the operating system request due to package/platform-level power limiting PL2/PL3.	
12	MAX_TURBO_LIMIT (R/O) Max Turbo Limit Status. When set, frequency is reduced below the operating system request due to multi-core turbo limits.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
13	TURBO_ATTEN (R/O) Turbo Transition Attenuation Status. When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.	
15:14	Reserved.	
16	PROCHOT_LOG (R/W) PROCHOT Log. When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	THERMAL_LOG (R/W) Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19:18	Reserved.	
20	RSR_LIMIT_LOG (R/W) Residency State Regulation Log. When set, indicates that the Residency State Regulation Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
21	RATL_LOG (R/W) Running average thermal limit Log, RW, When set by PCODE indicates that Running average thermal limit has cause IA frequency clipping. Software should write to this bit to clear the status in this bit.	
22	VR_THERMALERT_LOG (R/W) VR Therm Alert Log. When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
23	VR_TDC_LOG (R/W) VR Thermal Design Current Log. When set, indicates that the VR TDC Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
24	OTHER_LOG (R/W) Other Log. When set, indicates that the Other Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
25	Reserved.	
26	PBM_PL1_LOG (R/W) Package/Platform-Level PL1 Power Limiting Log. When set, indicates that the Package or Platform Level PL1 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.

27	PBM_PL2_LOG (R/W) Package/Platform-Level PL2 Power Limiting Log. When set, indicates that the Package or Platform Level PL2/PL3 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
28	MAX_TURBO_LIMIT_LOG (R/W) Max Turbo Limit Log. When set, indicates that the Max Turbo Limit Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
29	TURBO_ATTEN_LOG (R/W) Turbo Transition Attenuation Log. When set, indicates that the Turbo Transition Attenuation Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
63:30	Reserved.	
Register Address: 650H, 1616	MSR_SECONDARY_TURBO_RATIO_LIMIT	
Secondary Maximum Turbo Ratio Limit (R/W) Software can configure these limits when MSR_PLATFORM_INFO[28] = 1. Specifies Maximum Ratio Limit for each group. Maximum ratio for groups with more cores must decrease monotonically.		Package
7:0	MAX_TURBO_GROUP_0: Maximum turbo ratio limit with 1 core active.	
15:8	MAX_TURBO_GROUP_1: Maximum turbo ratio limit with 2 cores active.	
23:16	MAX_TURBO_GROUP_2: Maximum turbo ratio limit with 3 cores active.	
31:24	MAX_TURBO_GROUP_3: Maximum turbo ratio limit with 4 cores active.	
39:32	MAX_TURBO_GROUP_4: Maximum turbo ratio limit with 5 cores active.	
47:40	MAX_TURBO_GROUP_5: Maximum turbo ratio limit with 6 cores active.	
55:48	MAX_TURBO_GROUP_6: Maximum turbo ratio limit with 7 cores active.	
63:56	MAX_TURBO_GROUP_7: Maximum turbo ratio limit with 8 cores active.	
Register Address: 65CH, 1628	MSR_PLATFORM_POWER_LIMIT	
Platform Power Limit Control (R/W) Allows platform BIOS to limit power consumption of the platform devices to the specified values. The Long Duration power consumption is specified via Platform_Power_Limit_1 and Platform_Power_Limit_1_Time. The Short Duration power consumption limit is specified via the Platform_Power_Limit_2 with duration chosen by the processor. The processor implements an exponential-weighted algorithm in the placement of the time windows.		Package

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
14:0	POWER_LIMIT_1 Average Power limit value which the platform must not exceed over a time window as specified by Power_Limit_1_TIME field. The default value is the Thermal Design Power (a.k.a TDP) and varies with product skus. The unit is specified in MSR_RAPLPOWER_UNIT.	
15	POWER_LIMIT_1_EN When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit 1 over the time window specified by Power Limit 1 Time Window.	
16	CRITICAL_POWER_CLAMP_1 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit 1 value.	
23:17	POWER_LIMIT_1_TIME Specifies the duration of the time window over which Platform Power Limit 1 value should be maintained for sustained long duration. This field is made up of two numbers from the following equation: Time Window = (float) ((1+(X/4))*(2^Y)), where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17] The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN]. The default value is 0DH, The unit is specified in MSR_RAPLPOWER_UNIT[Time Unit]	
31:24	Reserved.	
46:32	POWER_LIMIT_2 Average Power limit value which the platform must not exceed over the Short Duration time window chosen by the processor. The recommended default value is 1.25 times the Long Duration Power Limit (i.e., Platform Power Limit 1).	
47	POWER_LIMIT_2_EN When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit 2 over the Short Duration time window.	
48	CRITICAL_POWER_CLAMP_2 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit 2 value.	
62:49	Reserved.	
63	LOCK Setting this bit will lock all other bits of this MSR until system RESET.

IA32_L2_MASK_[8-15] (R/W) If CPUID.(EAX=10H, ECX=1):EDX.COS_MAX[15:0] ≥ 0. Controls MLC (L2) Intel RDT allocation. For more details on CAT/RDT, see Chapter 19, "Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features."		Module
15:0	WAY_MASK Capacity Bit Mask. Available ways vectors for class of service of IA core. '1 in bit indicates allocation to the way is allowed. '0 indicates allocation to the way is not allowed.	
31:16	Reserved.	
Register Address: 1309H—130BH, 4873—4875	MSR_RELOAD_FIXED_CTRx	
Reload value for IA32_FIXED_CTRx (R/W)		Thread
47:0	Value loaded into IA32_FIXED_CTRx when a PEBS record is generated while PEBS_EN_FIXEDx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and FIXED_CTRx is overflowed.	
63:48	Reserved.	
Register Address: 14C1H—14C8H, 5313 —5320	MSR_RELOAD_PMCx	
Reload value for IA32_PMCx (R/W)		Thread
47:0	Value loaded into IA32_PMCx when a PEBS record is generated while PEBS_EN_PMCx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and PMCx is overflowed.	
63:48	Reserved.	
Register Address: 1A8EH, 6798	MSR_STLB_FILL_TRANSLATION	
STLB Fill Translation (W/O) STLB QoS MSR to fill translations into STLB.		Core
3:0	CLOS Class of service to use for the fill.	
9:4	Reserved.	
10	X Set to 1 when LA is to an executable page.	
11	RW Set to 1 when LA is to a writeable page.	
63:12	LA Logical address to use for fill.	

2.17.10 MSRs Introduced in the Intel® Xeon® 6 P-Core Processors

Table 2-56 lists additional MSRs for the Intel Xeon 6 P-core processors. Intel Xeon 6 P-core processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_ADH or 06_AEH.

For an MSR listed in Table 2-56 that also appears in the model-specific tables of prior generations, Table 2-56 supersedes prior generation tables.

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 33H, 51	MSR_MEMORY_CONTROL	
MSR_MEMORY_CONTROL (R/W) Disables split locks, which are locked instructions that split a cache line.		Core
26:0	Reserved.	
27	UC_STORE_THROTTLE If set to 1, when enabled, the processor allows one in-progress, post-retirement UC stores at a time.	
28	UC_LOCK_DISABLE If set to 1, a UC load lock will trigger a fault. If clear to 0, UC load locks proceed normally.	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will trigger an #AC fault. If clear to 0, split locks proceed normally	
63:30	Reserved.	
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/W)		Thread
31:0	SMI_COUNT Running count of SMI events since the last reset.	
63:32	Reserved.	
Register Address: 39H, 57	MSR_SOCKET_ID	
Socket ID (R/W) Reassigns the package-specific portions of the APIC ID. This MSR is used on scalable DP and high-end MP platforms to resolve legacy-mode APIC ID conflicts.		Package
10:0	PACKAGE_ID: Holds package ID. This reflects the upper bits of the APIC ID.	
63:11	Reserved.	
Register Address: 7AH, 122	IA32_FEATURE_ACTIVATION	
IA32_FEATURE_ACTIVATION (R/W) Implements Feature Activation command. WRMSR to this address activates all 'activatable' features on this thread. See Table 2-2.		Thread
Register Address: 7BH, 123	IA32_MCU_ENUMERATION	
IA32_MCU_ENUMERATION (R/O) Enumeration of architectural features. See Table 2-2.		Package
Register Address: 7CH, 124	IA32_MCU_STATUS	
IA32_MCU_STATUS (R/O) Communicates results from the previous patch loads. See Table 2-2.		Package
Register Address: 82H, 130	IA32_FZM_RANGE_INDEX	
IA32_FZM_RANGE_INDEX (R/W) Index and Domain handle for a valid FZM region. Programmed by SW and used by other FRM MSRs FZM Range Index register to R/W Domain Index. See Table 2-2.		Thread

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 83H, 131	IA32_FZM_DOMAIN_CONFIG	
IA32_FZM_DOMAIN_CONFIG (R/O) Bit mask of valid regions within the domain identified by FZM_RANGE_INDEX. See Table 2-2.		Thread
Register Address: 84H, 132	IA32_FZM_RANGE_STARTADDR	
IA32_FZM_RANGE_STARTADDR (R/O) Start address of the FZM range pointed to by FZM_RANGE_INDEX. See Table 2-2.		Thread
Register Address: 85H, 133	IA32_FZM_RANGE_ENDADDR	
IA32_FZM_RANGE_ENDADDR (R/O) End address of the specified domain in FZM_RANGE_INDEX. See Table 2-2.		Thread
Register Address: 86H, 134	IA32_FZM_RANGE_WRITESTATUS	
IA32_FZM_RANGE_WRITESTATUS (R/O) Write status of the FZM range pointed to by FZM_RANGE_INDEX. See Table 2-2.		Thread
Register Address: 87H, 135	IA32_MKTME_KEYID_PARTITIONING	
MKTME KEY ID Partitioning (R/O) Enumerates the number of activated KeyIDs for Intel TME-MK and Intel TDX. See Table 2-2.		Package
Register Address: 90H, 144	IA32_SGXLEPUBKEYHASH4	
IA32_SGXLEPUBKEYHASH4 (R/W) See Table 2-2.		Thread
Register Address: 91H, 145	IA32_SGXLEPUBKEYHASH5	
IA32_SGXLEPUBKEYHASH5 (R/W) See Table 2-2.		Thread
Register Address: 98H, 152	MSR_SEAM_WBINVDP	
SEAM WBINVDP (R/W) Allows software to WBINVD sections of the LLC.		Thread
63:0	HANDLE Caches sub-block to invalidate.	
Register Address: 99H, 153	MSR_SEAM_WBNOINVDP	
SEAM WBNOINVDP (R/W) Allows software to WBNOINVD sections of the LLC.		Thread
63:0	HANDLE Caches sub-block to invalidate.	
Register Address: 9AH, 154	MSR_SEAM_INTR_PENDING	
SEAM Interrupt Pending (R/O) Report out some event pending bits.		Thread
0	INTR Interrupt is pending.	
1	NMI NMI is pending.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
2	SMI SMI is pending.	
4:3	OTHER_EVENTS Other events pending.	
63:5	Reserved.	
Register Address: 9BH, 155	IA32_SMM_MONITOR_CTL	
SMM Monitor Control (R/W) The SMM Monitor Configuration involves SMM code specifying the MSEG location and enabling dual-monitor treatment by writing to the corresponding MSR. See Table 2-2.		Thread
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/W) If CPUID.(EAX=07H, ECX=0):EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Core
0	STLB_QOS When set to 1, processor supports STLB QoS.	
1	Reserved.	
2	INTEGRITY_SUPPORTED When set to 1, processor supports Functional Safety. Specific FUSA capabilities are enumerated in MSR_FUSA_CAPABILITIES.	
3	RSM_IN_CPL0_ONLY Intel System Resources Defense: When set to 1, RSM will only be allowed in CPL0 and will #GP for all non-CPL0 privilege levels.	
4	UC_LOCK_DISABLE When set to 1, processor supports UC load lock disable.	
5	SPLIT_LOCK_DISABLE When set to 1, processor supports #AC on split locks.	
6	SNP_FILTER_QOS When set to 1, processor supports Snoop Filter Quality of Service MSRs.	
7	UC_STORE_THROTTLING When set to 1, processor supports UC store throttling through MSR_MEMORY_CTRL[UC_STORE_THROTTLE].	
63:8	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: FEH, 254	IA32_MTRRCAP	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Memory Type Range Register (R/0) See Table 2-2.		Core
Register Address: 105H, 261	MSR_ARRAY_BIST	
MSR_ARRAY_BIST (R/W) Triggered by writing and reading an MSR that can be written by Ring 0 software.		Core
31:0	ARRAY_LIST: Bit map which indicates which arrays to run MarchC- BIST ▪ Bit[0] MLC Data ▪ Bit[1] MLC Tag ▪ Bit[2] C6SRAM Data (NOP for WRMSR – used for reporting error only) ▪ Bit[3] PMA BIST (NOP for WRMSR – used for reporting error only) ▪ Bit[4] STLB Data ▪ Bit[5] IFU Data ▪ Bit[6] STLB Tag ▪ Bit[7] DCU Data ▪ Bit[8] DSB Data ▪ Bit[9] TMUL Data ▪ Bit[10] UROM pointer0 ▪ Bit[11] UROM pointer1-3 ▪ Bit[12] UROM pointer4-7 ▪ Bit[13] UROM unique0 ▪ Bit[14] UROM unique1/2 The WRMSR will run PBIST on all the arrays indicated in the bitmap, starting from the LSB. NOTE2: C6SRAM[Bit 2] and PMA[Bit 3] are only for reporting and do not execute BIST (done by EDX[15:0]uCode during Fusa-Reset).	
46:32	Reserved.	
62:47	Reserved.	
63	SIGNAL_MCE: Signal MCERR upon BIST failure.	
Register Address: 105H, 261	MSR_ARRAY_BIST_STATUS	
MSR_ARRAY_BIST_STATUS (R/0)		Core
31:0	ARRAY_COMPLETION _MASK Bitmap indicating which arrays from the ARRAY_BIST.ARRAY_LIST was not processed. 1 means not tested and 0 means tested.	
62:32	Reserved. Returns all 0s.	
63	PASS_FAIL: 0 means Pass on all arrays in the WRMSR(ARRAY_BIST.ARRAY_LIST) 1 means Fail on the LSB array in the RDMSR(ARRAY_BIST_STATUS.ARRAY_COMPLETION_MASK).	
Register Address: 122H, 290	IA32_TSX_CTRL	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
IA32_TSX_CTRL (R/W) See Table 2-2.		Thread
Register Address: 140H, 320	MSR_FEATURE_ENABLES	
Miscellaneous enables for thread-specific features. (R/W)		Thread
0	AESNI_LOCK Once this bit is set, writes to this register will not be allowed.	
63:1	Reserved.	
Register Address: 1E0H, 480	IA32_LER_INFO	
IA32_LER_INFO (R/W) Last Event Record Destination IP Register. See Table 2-2.		Thread
Register Address: 1F9H, 505	IA32_CPU_DCA_CAP	
IA32_CPU_DCA_CAP (R/O) See Table 2-2.		Thread
Register Address: 2A1H, 673	MSR_PRMRR_BASE_1	
MSR_PRMRR_BASE_1 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register.		Core
2:0	MEMTYPE Memory Type for PRMRR accesses.	
3	CONFIGURED PRMRR base configured.	
19:4	Reserved.	
51:20	BASE PRMRR Base address.	
63:52	Reserved.	
Register Address: 2A2H, 674	MSR_PRMRR_BASE_2	
MSR_PRMRR_BASE_2 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A3H, 675	MSR_PRMRR_BASE_3	
MSR_PRMRR_BASE_3 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A4H, 676	MSR_PRMRR_BASE_4	
MSR_PRMRR_BASE_4 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A5H, 677	MSR_PRMRR_BASE_5	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
MSR_PRMRR_BASE_5 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A6H, 678	MSR_PRMRR_BASE_6	
MSR_PRMRR_BASE_6 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A7H, 679	MSR_PRMRR_BASE_7	
MSR_PRMRR_BASE_7 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2B8H, 696	MSR_COPY_SBFT_HASHES	
MSR_COPY_SBFT_HASHES (W/O)		Module
63:0	SBFT_PROGRAM_SOURCE_ADDR EDX:EAX contains the linear address base of the SBFT Binary loaded into memory.	
Register Address: 2B9H, 697	MSR_SBFT_HASHES_STATUS	
MSR_COPY_SBFT_HASHES (R/O)		Core
15:0	CHUNK_SIZE EAX[15:0] - Chunk size of the test in KB.	
31:16	TOTAL_NUM_CHUNKS EAX[31:16] - Total number of chunks.	
39:32	ERROR_CODE - EDX[7:0] The error code refers to the LP that runs WRMSR(2B8H). ▪ 0x0: Reserved. ▪ 0x1: Attempt to copy SBFT-hashes when copy already in progress. ▪ 0x2: Secure Memory not set up correctly. ▪ 0x3: Scan-Image Header Image_info.ProgramID does not match MSR_INTEGRITY_CAPABILITIES[31:24], or scan-image header Processor-Signature doesn't match F/M/S, or scan-image header Processor-Flags doesn't match PlatformID. ▪ 0x4: Reserved. ▪ 0x5: Integrity check failed. ▪ 0x6: WRMSR(0x2B8) (ACTIVATE_SBAF) Reinstall of SBFT test image attempted when current SBFT test image is in use by other LPs. ▪ 0x7: Aborted due to #PF (Page Fault). ▪ 0x8: Unable to generate a Random Value.	
48:40	NUM_CHUNKS_IN_STRIDE EDX[16:8] - Number of Chunks in stride. This is the number of chunks that are installed. 0 in this field means that the CPU does not support strides, otherwise, stride value must be >=1.	
50:49	Reserved. EDX[18:17] - Set to all zeros.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
62:51	MAX_CORE_LIMIT EDX[30:19] - Maximum Number of Cores that can run SBFTAFSBAF simultaneously -1. 0 means 1 core at a time.	
63	Valid. EDX[31] - Valid bit is set when COPY_SBFT_HASHES completed successfully.	
Register Address: 2BAH, 698	MSR_AUTHENTICATE_AND_COPY_SBFT_CHUNK	
MSR_AUTHENTICATE_AND_COPY_SBFT_CHUNK (W/O)		Core
63:0	BASE_CHUNK_TABLE_ADDR EDX:EAX[63:0] - Linear Address pointing to the CHUNK TABLE (TABLE_BASE).	
Register Address: 2BBH, 699	MSR_SBFT_CHUNKS_AUTHENTICATION_STATUS	
MSR_SBFT_CHUNKS_AUTHENTICATION_STATUS (R/O)		Core
15:0	NUM_VALID_CHUNKS EAX[15:0] - Total number of Valid (authenticated) chunks.	
31:16	NUM_CHUNKS_IN_STRIDE EAX[31:16] - Number of Chunks in Stride.	
39:32	ERROR_CODE EDX[7:0] ▪ 0x0 - No error reported. ▪ 0x1 - Attempt to authenticate a CHUNK already marked as authentic or is currently being installed by another core. ▪ 0x2 - CHUNK authentication error. HASH of chunk did not match expected value. ▪ 0x3 - Aborted due to #PF. ▪ 0x4 - Chunk Outside the current Stride. ▪ 0x5 - Interrupted.	
47:40	Reserved. EDX[15:8] - Set to all zeros.	
63:48	CURRENT_MAX_BUNDLE_INDX EDX[31:16] - Maximum Bundle Index in current stride.	
Register Address: 2BCH, 700	MSR_ACTIVATE_SBFT	
MSR_ACTIVATE_SBFT (W/O)		Core
13:0	SBFT_BUNDLE_INDEX EAX[13:0] - Indicates SBFT Bundle Index to start from.	
15:14	SBFT_PRGM_INDEX EAX[15:14] - Indicates what SBFT Program index to run.	
31:16	Reserved. Set to all zeros.	
62:32	THREAD_WAIT_DELAY EDX[30:0] - TSC-based delay to allow threads to rendezvous.	
63	Reserved. EDX[31] - Must be set to 0. #GP fault otherwise.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 2BDH, 701	MSR_SBFT_STATUS	
MSR_SBFT_STATUS (R/O)		Core
13:0	SBFT_BUNDLE_INDEX EAX[13:0] - SBFT Bundle that was executed.	
15:14	SBFT_PGM_INDEX EAX[15:14] - Indicates what SBFT Program index that was last ran. Maps to same field in WRMSR(ACTIVATE_SBFT). On a test pass this field will be 2'b00.	
31:16	Reserved. EAX[31:16] - Return all zeros.	
39:32	ERROR_CODE EDX[7:0] ▪ 0x0 - No Error. ▪ 0x1 - SBFT operation did not start. Other thread could not join. ▪ 0x2 - SBFT operation did not start. Interrupt occurred prior to SBFT coordination. ▪ 0x3 - Reserved. ▪ 0x4 - SBFT operation did not start. Non-valid SBFT BUNDLES in the SBFT_BUNDLE_INDEX. ▪ 0x5 - SBFT operation did not start. Mismatch in arguments between threads T0/T1. ▪ 0x6 - SBFT operation did not start. Core is not capable of performing SBFT currently. ▪ 0x7 - Reserved. ▪ 0x8 - SBFT operation did not start. Exceeded number of Logical Processors (LP) allowed to run SBFT-At-Field concurrently. ▪ 0x9 - SBFT operation did not start. Interrupt occurred or timer about to expire. ▪ 0xA - SBFT operation did not start. SBFT_PGM_INDEX is not valid. ▪ 0xB - SBFT operation aborted due to corrupted chunk. ▪ 0xC - SBFT operation did not start. TAP Data error. ▪ 0xD - SBFT operation did not start. SBFT program is not valid. All other error codes are reserved.	
60:40	Reserved. EDX[28:8] - Return all zeros.	
61	TEST_FAIL EDX[29:29] - Architectural Signature failed. Last thread executed HLT and completed SBFT and EBX != 0xACED.	
63:62	SBFT_STATUS EDX[31:30] - SBFT status (result of running SBAF). ▪ 00 - PASS. ▪ 10 - INTERRUPTED. ▪ 01 - FAILED SIGNATURE CHECK. ▪ 11 - FAILED.	
Register Address: 2BEH, 702	MSR_SBFT_MODULE_ID	
MSR_SBFT_MODULE_ID (R/O)		Module

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
31:0	SBFT-AT-FIELD_REVID EAX[31:0] - Maps to Revision field in external header (offset 4).	
40:32	CURRENT_STRIDE_INDEX EDX[8:0] - Stride Index.	
63:41	Reserved. EDX[31:9] - Return all zeros.	
Register Address: 2BFH, 703	MSR_SBFTAF_LAST_WP	
MSR_SBFTAF_LAST_WP (R/O)		Module
31:0	LAST_WP EAX[31:0] - Provides information about the core when the last WRMSR(ACTIVATE_SBFT) was executed. Available only if enumerated in INTEGRITY_CAPABILITIES[10:9].	
39:32	Reserved.	
63:40	Reserved. EDX[31:8] - Return all zeros.	
Register Address: 2C2H, 706	MSR_COPY_SCAN_HASHES	
MSR_COPY_SCAN_HASHES (W/O)		Module
63:0	SCAN_HASH-ADDR EDX:EAX contains the linear address of the SCAN Test HASH Binary loaded into memory	
Register Address: 2C3H, 707	MSR_SCAN_HASHES_STATUS	
MSR_SCAN_HASHES_STATUS (R/O)		Core
15:0	CHUNK_SIZE EAX[15:0] - Chunk size of the test in KB.	
31:16	TOTAL_NUM_CHUNKS EAX[31:16] - Total number of chunks.	
39:32	ERROR_CODE EDX[7:0] - The error code refers to the LP that runs WRMSR(2C2H). ▪ 0x0 - Reserved. ▪ 0x1 - Attempt to copy scan-hashes when copy already in progress. ▪ 0x2 - Secure Memory not set up correctly. ▪ 0x3 - Scan-Image Header Image_info.ProgramID does not match MSR_INTEGRITY_CAPABILITIES[31:24], or scan-image header Processor-Signature doesn't match F/M/S, or scan-image header Processor-Flags doesn't match PlatformID. ▪ 0x4 - Reserved. ▪ 0x5 - Integrity check failed. ▪ 0x6 - WRMSR(0x2C6) Re-install of scan test image attempted when current scan test image is in use by other LPs. ▪ 0x7 - Aborted due to #PF (Page Fault). ▪ 0x8 - Unable to generate a Random Value.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
48:40	NUM_CHUNKS_IN_STRIDE EDX[16:8] - Number of Chunks in stride. This is the number of chunks that are installed. 0 in this field means that the CPU does not support strides, otherwise, the stride value must be >=1.	
50:49	Reserved. EDX[18:17] - Set to all zeros.	
62:51	NAME EDX[30:19] - Maximum Number of cores that can run Intel® In-field Scan simultaneously minus 1. 0 means 1 core at a time.	
63	VALID EDX[31] - Valid bit is set when COPY_SCAN_HASHES completed.	
Register Address: 2C4H, 708	MSR_AUTHENTICATE_AND_COPY_CHUNK	
MSR_AUTHENTICATE_AND_COPY_CHUNK (R/O)		Core
63:0	BASE_CHUNK_TABLE_ADDR EDX:EAX[63:0] - Linear Address pointing to the CHUNK TABLE (TABLE_BASE).	
Register Address: 2C5H, 709	MSR_CHUNKS_AUTHENTICATION_STATUS	
MSR_CHUNKS_AUTHENTICATION_STATUS (R/O)		Core
15:0	VALID_CHUNKS EAX[15:0] - Total number of Valid (authenticated) chunks.	
31:16	NUM_CHUNKS_IN_STRIDE EAX[31:16] - Number of Chunks in Stride.	
39:32	ERROR_CODE EDX[7:0] ▪ 0x0 - No-error reported. ▪ 0x1 - Attempt to authenticate a CHUNK which is already. marked as authentic or is currently being installed by another core. ▪ 0x2 - CHUNK authentication error. HASH of chunk did not match expected value. ▪ 0x3 - Aborted due to #PF (Page Fault). ▪ 0x4 - Chunk Outside the current Stride.	
63:40	Reserved. EDX[31:8] - Set to all zeros.	
Register Address: 2C6H, 710	MSR_ACTIVATE_SCAN	
MSR_ACTIVATE_SCAN (W/O)		Core
15:0	CHUNK_START_INDEX EAX[15:0] - Indicates Chunk Index from which to start.	
31:16	CHUNK_STOP_INDEX EAX[31:16] - Indicates what chunk index to stop at (inclusive).	
62:32	THREAD_WAIT_DELAY EDX[30:0] - TSC based delay to allow threads to rendezvous.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
63	SIGNAL_MCE EDX[31] ▪ If 1: On scan-error log MC in MC4_STATUS and signal MCE if machine check signaling enabled in MC4_CTL[0]. ▪ If 0: Don't no-logging/no-signaling.	
Register Address: 2C7H, 711	MSR_SCAN_STATUS	
MSR_SCAN_STATUS (R/O)		Core
15:0	CHUNK_NUM EAX[15:0] - SCAN Chunk that was reached.	
31:16	CHUNK_STOP_INDEX EAX[31:16] ▪ Indicates what chunk index to stop at (inclusive). ▪ Maps to same field in WRMSR(ACTIVATE_SCAN).	
39:32	ERROR_CODE EDX[7:0] ▪ 0x0 - No Error. ▪ 0x1 - SCAN operation did not start. Other thread could not join. ▪ 0x2 - SCAN operation did not start. Interrupt occurred prior to SCAN coordination. ▪ 0x3 - SCAN operation did not start. Power Management conditions are inadequate to run SAF. ▪ 0x4 - SCAN operation did not start. Non valid chunks in the range CHUNK_STOP_INDEX : CHUNK_START_INDEX. ▪ 0x5 - SCAN operation did not start. Mismatch in arguments between threads T0/T1. ▪ 0x6 - SCAN operation did not start. Core not capable of performing SCAN currently. ▪ 0x7 - Debug Mode. Scan-At-Field results not to be trusted. ▪ 0x8 - SCAN operation did not start. Exceeded number of Logical Processors (LP) allowed to run Scan-At-Field concurrently. MAX_CORE_LIMIT exceeded. ▪ 0x9 - Interrupt occurred. Scan operation aborted prematurely, not all chunks requested have been executed. ▪ 0xB - Scan operation aborted due to corrupted chunk. ▪ 0xC - Scan operation did not start. All other error codes are reserved.	
61:40	Reserved. EDX[29:8] - Return all zeros.	
62	SCAN_CONTROL_ERROR EDX[30] ▪ SCAN error in the Scan-At-Field controller. ▪ Non ECC error.	
63	SCAN_SIGNATURE_ERROR EDX[31] ▪ SCAN SIGNATURE error in the SCAN pattern fetched from main memory. ▪ Non ECC error.	
Register Address: 2C8H, 712	MSR_SCAN_MODULE_ID	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
MSR_SCAN_MODULE_ID (R/O)		Module
31:0	SCAN-AT-FIELD_REVID EAX[31:0] - Maps to Revision field in external header (offset 4).	
40:32	CURRENT_STRIDE_INDEX EDX[8:0] - Stride Index.	
63:41	Reserved. EDX[31:9] - Return all zeros.	
Register Address: 2C9H, 713	MSR_LAST_SAF_WP	
MSR_LAST_SAF_WP (R/O)		Module
31:0	LAST_WP EAX[31:0] ▪ Provides information about the core when the last WRMSR(ACTIVATE_SCAN) was executed. ▪ Available only if enumerated in INTEGRITY_CAPABILITIES[10:9].	
39:32	Reserved. EDX[7:0]	
63:40	Reserved. EDX[31:8] - Return all zeros.	
Register Address: 2D9H, 729	MSR_INTEGRITY_CAPABILITIES	
MSR_INTEGRITY_CAPABILITIES (R/O) Enumerates features supported in Functional Safety.		Thread
0	STARTUP_SCAN_BIST When set to 1, processor supports Startup SCAN BIST.	
1	STARTUP_MEM_BIST When set to 1, processor supports Startup MEM BIST.	
2	PERIODIC_MEM_BIST When set to 1, processor supports Periodic MEM BIST.	
3	LOCKSTEP When set to 1, processor supports Lock Step Mode.	
4	PERIODIC_SCAN_BIST When set to 1, processor supports Periodic SCAN BIST.	
5	PLL_LOSS_DETECT When set to 1, processor supports PLL LOSS detection.	
6	PWR_LOSS_DETECT When set to 1, processor supports Power Loss detection.	
7	PERRINJ When set to 1, processor supports FUSA PERRINJ.	
8	SBFT_AT_FIELD When set to 1, processor supports SBFT-At-Field.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
10:9	SAF_GEN_REV 00 = REV1; 01 = REV2; 10 = REV3; 11 = REV4.	
14:11	Reserved.	
15	PRESERVE_MEMORY_NEEDED When set to 1, processor supports FUSARR_BASE/MASK MSRs.	
20:16	TID_BIT_SHIFT Number of bits to shift right on x2APICID to get a unique topology ID of all logical processors that share a scan test engine.	
21	ALL_LP_JOIN_NEEDED All logical processors that share scan test engine need to be tested together and must join using MSR_ACTIVATE_SCAN.	
23:22	Reserved.	
31:24	PATTERN_ID Processor scan pattern ID. ID of the startup and periodic scan programs supported for this part.	
63:32	Reserved.	
Register Address: 30CH, 780	IA32_FIXED_CTR3	
Fixed-Function Performance Counter 3 (R/W) See Table 2-2.		Thread
Register Address: 4D0H, 1232	IA32_MCG_EXT_CTL	
IA32_MCG_EXT_CTL (R/W) See Table 2-2.		Thread
Register Address: 4F0H, 1264	MSR_SAF_CTRL	
MSR_SAF_CTRL (W/O)		Core
0	INVALIDATE_CURRENT_STRIDE EAX[0] ▪ Write of 1 invalidates the currently installed stride. ▪ Clears only the VALID_CHUNKS field on a RDMSR(CHUNKS_AUTHENTICATION_STATUS).	
63:1	Reserved.	
Register Address: 4F8H, 1272	MSR_SBFT_CTRL	
MSR_SBFT_CTRL (W/O)		Module
0	INVALIDATE_CURRENT_STRIDE EAX[0] - Write of 1 invalidates the currently installed stride.	
63:1	Reserved. EDX[31:0],EAX[31:1]	
Register Address: 540H, 1344	MSR_THREAD_UARCH_CTL	
Thread Microarchitectural Control (R/W)		Thread

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
0	WB_MEM_STRM_LD_DISABLE Disable streaming behavior for MOVNTDQA loads to WB memory type. If set, these accesses will be treated like regular cacheable loads (Data will be cached).	
63:1	Reserved.	
Register Address: 541H, 1345	MSR_CORE_UARCH_CTL	
Core Microarchitecture Control MSR (R/W)		Core
0	SCRUB_DIS L1 scrubbing disable.	
63:1	Reserved.	
Register Address: 664H, 1636	MSR_MC6_RESIDENCY	
MSR_MC6_RESIDENCY (R/O) Time spent in the Module C6-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).		Module
63:0	RESIDENCY Time that this module is in module-specific C6 states since last reset.	
Register Address: 6E1H, 1761	IA32_PKRS	
IA32_PKRS (R/W) Specifies the PK permissions associated with each protection domain for supervisor pages. See Table 2-2.		Thread
Register Address: 7A3H, 1955	IA32_MCU_EXT_SERVICE	
MCU Extended Service MSR (R/O) If IA32_ARCH_CAPABILITIES[22] = 1. See Table 2-2.		Module
Register Address: 7A4H, 1956	IA32_MCU_ROLLBACK_MIN_ID	
Minimal MCU Revision ID for Rollback (R/O) See Table 2-2.		Module
Register Address: 7B0H, 1968	IA32_ROLLBACK_SIGN_ID_0	
Rollback ID 0 (R/O) See Table 2-2.		Module
Register Address: 7B1H, 1969	IA32_ROLLBACK_SIGN_ID_1	
Rollback ID 1 (R/O) See Table 2-2.		Module
Register Address: 7B2H, 1970	IA32_ROLLBACK_SIGN_ID_2	
Rollback ID 2 (R/O) See Table 2-2.		Module
Register Address: 7B3H, 1971	IA32_ROLLBACK_SIGN_ID_3	
Rollback ID 3 (R/O) See Table 2-2.		Module
Register Address: 7B4H, 1972	IA32_ROLLBACK_SIGN_ID_4

Rollback ID 4 (R/O) See Table 2-2.		Module
Register Address: 7B5H, 1973	IA32_ROLLBACK_SIGN_ID_5	
Rollback ID 5 (R/O) See Table 2-2.		Module
Register Address: 7B6H, 1974	IA32_ROLLBACK_SIGN_ID_6	
Rollback ID 6 (R/O) See Table 2-2.		Module
Register Address: 7B7H, 1975	IA32_ROLLBACK_SIGN_ID_7	
Rollback ID 7 (R/O) See Table 2-2.		Module
Register Address: 7B8H, 1976	IA32_ROLLBACK_SIGN_ID_8	
Rollback ID 8 (R/O) See Table 2-2.		Module
Register Address: 7B9H, 1977	IA32_ROLLBACK_SIGN_ID_9	
Rollback ID 9 (R/O) See Table 2-2.		Module
Register Address: 7BAH, 1978	IA32_ROLLBACK_SIGN_ID_10	
Rollback ID 10 (R/O) See Table 2-2.		Module
Register Address: 7BBH, 1979	IA32_ROLLBACK_SIGN_ID_11	
Rollback ID 11 (R/O) See Table 2-2.		Module
Register Address: 7BCH, 1980	IA32_ROLLBACK_SIGN_ID_12	
Rollback ID 12 (R/O) See Table 2-2.		Module
Register Address: 7BDH, 1981	IA32_ROLLBACK_SIGN_ID_13	
Rollback ID 13 (R/O) See Table 2-2.		Module
Register Address: 7BEH, 1982	IA32_ROLLBACK_SIGN_ID_14	
Rollback ID 14 (R/O) See Table 2-2.		Module
Register Address: 7BFH, 1983	IA32_ROLLBACK_SIGN_ID_15	
Rollback ID 15 (R/O) See Table 2-2.		Module
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
IA32_TME_CAPABILITY (R/O) See Table 2-2.		Package
Register Address: 982H, 2434	IA32_TME_ACTIVATE	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
IA32_TME_ACTIVATE (R/W) See Table 2-2.		Package
Register Address: 983H, 2435	IA32_TME_EXCLUDE_MASK	
Intel TME Exclude Mask (R/W) See Table 2-2.		Package
Register Address: 984H, 2436	IA32_TME_EXCLUDE_BASE	
Intel TME Exclude Base (R/W) See Table 2-2.		Package
Register Address: 985H, 2437	IA32_UINTR_RR	
User Interrupt Request Register (R/W) See Table 2-2.		Thread
Register Address: 986H, 2438	IA32_UINTR_HANDLER	
User Interrupt Handler Address (R/W) See Table 2-2.		Thread
Register Address: 987H, 2439	IA32_UINTR_STACKADJUST	
User Interrupt Stack Adjustment (R/W) See Table 2-2.		Thread
Register Address: 988H, 2440	IA32_UINTR_NV	
User-Interrupt Size and Notification Vector (R/W) See Table 2-2.		Thread
Register Address: 989H, 2441	IA32_UINTR_PD	
User Interrupt PID Address (R/W) See Table 2-2.		Thread
Register Address: 98AH, 2442	IA32_UINTR_TT	
User-Interrupt Target Table (R/W) See Table 2-2.		Thread
Register Address: 990H, 2448	IA32_COPY_STATUS	
IA32_COPY_STATUS (R/O) See Table 2-2.		Thread
Register Address: 991H, 2449	IA32_IWKEYBACKUP_STATUS	
IA32_IWKEYBACKUP_STATUS (R/O) See Table 2-2.		Package
Register Address: 9FBH, 2555	IA32_TME_CLEAR_SAVED_KEY	
IA32_TME_CLEAR_SAVED_KEY (R/W) See Table 2-2.		Package
Register Address: 9FFH, 2559	MSR_CORE_MKTME_ACTIVATE	
MSR to read TME_ACTIVATE[MK_TME_KEYID_BITS] (R/O)		Core
31:0	Reserved.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
35:32	READ_MK_TME_KEYID_BITS This value will be returned on a RDMSR, but must be zero on a WRMSR.	
63:36	Reserved.	
Register Address: C84H, 3204	MSR_MBA_CFG	
Memory Bandwidth Allocation (MBA) Configuration (R/W)		Package
1:0	Reserved.	
2	RAMBAE Resource Aware MBA Enable.	
63:3	Reserved.	
Register Address: CA0H, 3232	MSR_RMID_SNC_CONFIG	
RMID_SNC_CONFIG (R/W)		Package
0	RMID_LOCALIZED_DISTRIBUTION_MODE_ENABLE If set, Localized RMID distribution mode is enabled. If Clear, RMID Sharing mode is enabled.	
63:1	Reserved.	
Register Address: D50H, 3408	IA32_L2_QOS_EXT_BW_THRTL_0	
Memory Bandwidth Enforcement for COS0 (R/W) See Table 2-2.		Package
Register Address: D51H, 3409	IA32_L2_QOS_EXT_BW_THRTL_1	
Memory Bandwidth Enforcement for COS1 (R/W) See Table 2-2.		Package
Register Address: D52H, 3410	IA32_L2_QOS_EXT_BW_THRTL_2	
Memory Bandwidth Enforcement for COS2 (R/W) See Table 2-2.		Package
Register Address: D53H, 3411	IA32_L2_QOS_EXT_BW_THRTL_3	
Memory Bandwidth Enforcement for COS3 (R/W) See Table 2-2.		Package
Register Address: D54H, 3412	IA32_L2_QOS_EXT_BW_THRTL_4	
Memory Bandwidth Enforcement for COS4 (R/W) See Table 2-2.		Package
Register Address: D55H, 3413	IA32_L2_QOS_EXT_BW_THRTL_5	
Memory Bandwidth Enforcement for COS5 (R/W) See Table 2-2.		Package
Register Address: D56H, 3414	IA32_L2_QOS_EXT_BW_THRTL_6	
Memory Bandwidth Enforcement for COS6 (R/W) See Table 2-2.		Package

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Memory Bandwidth Enforcement for COS7 (R/W) See Table 2-2.		Package
Register Address: D58H, 3416	IA32_L2_QOS_EXT_BW_THRTL_8	
Memory Bandwidth Enforcement for COS8 (R/W) See Table 2-2.		Package
Register Address: D59H, 3417	IA32_L2_QOS_EXT_BW_THRTL_9	
Memory Bandwidth Enforcement for COS9 (R/W) See Table 2-2.		Package
Register Address: D5AH, 3418	IA32_L2_QOS_EXT_BW_THRTL_10	
Memory Bandwidth Enforcement for COS10 (R/W) See Table 2-2.		Package
Register Address: D5BH, 3419	IA32_L2_QOS_EXT_BW_THRTL_11	
Memory Bandwidth Enforcement for COS11 (R/W) See Table 2-2.		Package
Register Address: D5CH, 3420	IA32_L2_QOS_EXT_BW_THRTL_12	
Memory Bandwidth Enforcement for COS12 (R/W) See Table 2-2.		Package
Register Address: D5DH, 3421	IA32_L2_QOS_EXT_BW_THRTL_13	
Memory Bandwidth Enforcement for COS13 (R/W) See Table 2-2.		Package
Register Address: D5EH, 3422	IA32_L2_QOS_EXT_BW_THRTL_14	
Memory Bandwidth Enforcement for COS14 (R/W) See Table 2-2.		Package
Register Address: D91H, 3473	IA32_COPY_LOCAL_TO_PLATFORM	
See Table 2-2.		Thread
Register Address: D92H, 3474	IA32_COPY_PLATFORM_TO_LOCAL	
See Table 2-2.		Thread
Register Address: D93H, 3475	IA32_PASID	
See Table 2-2.		Thread
Register Address: 1400H, 5120	IA32_SEAMRR_BASE	
SEAM Memory Range Register for TDx - Base Address (R/W) See Table 2-2.		Core
Register Address: 1401H, 5121	IA32_SEAMRR_MASK	
SEAM Memory Range Register for TDX (R/W) See Table 2-2.		Core
Register Address: 1A8FH, 6799	MSR_STLB_QOS_INFO	
STLB_QOS_INFO (R/O) STLB QoS MASK configuration.		Core

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
5:0	NCLOS Number of CLOS supported for STLB resource using minus-1 notation.	
15:6	Reserved.	
19:16	4K_2M_CBM Length of capacity bitmask for 4K and 2M pages using minus-1 notation.	
28:20	Reserved.	
29	STLB_FILL_TRANSLATION_MSR_SUPPORTED MSR interface to fill STLB translations supported.	
30	4K_2M_ALIAS Indicates that 4K/2M pages alias into the same structure.	
63:31	Reserved.	
Register Address: 1B01H, 6913	IA32_UARCH_MISC_CTL	
IA32_UARCH_MISC_CTL (R/W) See Table 2-2.		Thread

2.17.11 MSRs Introduced in the Intel® Xeon® 6 E-Core Processors

Table 2-57 lists additional MSRs for the Intel Xeon 6 E-core processors. Intel Xeon 6 E-core processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_AFH.

For an MSR listed in Table 2-57 that also appears in the model-specific tables of prior generations, Table 2-57 supersedes prior generation tables.

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 2FH, 47	IA32_BARRIER	
BARRIER (R/O) The IA32_BARRIER MSR ensures ordered execution by acting like LFENCE, controlling the sequencing of subsequent MSR reads after prior MSR reads and instructions. See Table 2-2.		Core
Register Address: 33H, 51	MSR_MEMORY_CONTROL	
Memory Control (R/W) Disables split locks, which are locked instructions that split a cache line.		Core
26:0	Reserved.	
27	UC_STORE_THROTTLE If set to 1, when enabled, the processor allows one in-progress, post-retirement UC stores at a time.	
28	UC_LOCK_DISABLE If set to 1, a UC load lock will trigger a fault. If clear to 0, UC load locks proceed normally.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will trigger an #AC fault. If clear to 0, split locks proceed normally.	
63:30	Reserved.	
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/W)		Thread
31:0	SMI_COUNT Running count of SMI events since the last reset.	
63:32	Reserved.	
Register Address: 39H, 57	MSR_SOCKET_ID	
Socket ID (R/W) Reassigns the package-specific portions of the APIC ID. This MSR is used on scalable DP and high-end MP platforms to resolve legacy-mode APIC ID conflicts.		Package
10:0	PACKAGE_ID Holds package ID. This reflects the upper bits of the APIC ID.	
63:11	Reserved.	
Register Address: 7BH, 123	IA32_MCU_ENUMERATION	
Enumeration of Architectural Features (R/O) See Table 2-2.		Package
Register Address: 7CH, 124	IA32_MCU_STATUS	
MCU Status (R/O) Communicates results from the previous patch loads. See Table 2-2.		Package
Register Address: 87H, 135	IA32_MKTME_KEYID_PARTITIONING	
MKTME KEY ID Partitioning (R/O) Enumerates the number of activated KeyIDs for Intel TME-MK and Intel TDX. See Table 2-2.		Package
Register Address: 98H, 152	MSR_SEAM_WBINVDP	
SEAM WBINVDP (R/W) Allows software to WBINVD sections of the LLC.		Thread
63:0	HANDLE Caches sub-block to invalidate.	
Register Address: 99H, 153	MSR_SEAM_WBNOINVDP	
SEAM WBNOINVDP (R/W) Allows software to WBNOINVD sections of the LLC.		Thread
63:0	HANDLE Caches sub-block to invalidate.	
Register Address: 9AH, 154	MSR_SEAM_INTR_PENDING	
SEAM Interrupt Pending (R/O) Report out some event pending bits.		Thread
0	INTR Interrupt is pending.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
1	NMI NMI is pending.	
2	SMI SMI is pending.	
4:3	OTHER_EVENTS Other events pending.	
63:5	Reserved.	
Register Address: 9BH, 155	IA32_SMM_MONITOR_CTL	
SMM Monitor Control (R/W) The SMM Monitor Configuration involves SMM code specifying the MSEG location and enabling dual-monitor treatment by writing to the corresponding MSR. See Table 2-2.		Thread
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information (R/O) Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
15:8	MAX_NON_TURBO_LIM_RATIO This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	
25:16	Reserved.	
26	DCU_16K_MODE_AVAIL 0b: Indicates that the part does not support the 16K DCU mode. 1b: Indicates that the part supports 16K DCU mode.	
27	Reserved.	
28	PRG_TURBO_RATIO_EN Programmable Turbo Ratios per number of Active Cores. 0 = Programming Not Allowed. 1 = Programming Allowed.	
34:29	Reserved.	
35	BIOS_GUARD_ENABLE Indicates whether the BIOS Guard feature is enabled in the CPU.	
36	PEG2DMIDIS_EN 0 = PEG2DMIDIS is disabled. 1 = PEG2DMIDIS is enabled.	
39:37	Reserved.	
47:40	MAX_EFFICIENCY_RATIO Maximum Efficiency Ratio. This is given in units of 100 MHz.	
58:48	Reserved.	
59	SMM_SUPOVR_STATE_LOCK_ENABLE When set, indicates that the CPU supports MSR SMM_SUPOVR_STATE_LOCK and the Hardware Shield feature.	
63:60	Reserved.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/W) If CPUID.(EAX=07H, ECX=0):EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Core
0	STLB_QOS When set to 1, processor supports STLB QoS.	
1	Reserved.	
2	INTEGRITY_SUPPORTED When set to 1, processor supports Functional Safety. Specific FUSA capabilities are enumerated in MSR_FUSA_CAPABILITIES.	
3	RSM_IN_CPL0_ONLY Intel System Resources Defense: When set to 1, RSM will only be allowed in CPL0 and will #GP for all non-CPL0 privilege levels.	
4	UC_LOCK_DISABLE When set to 1, processor supports UC load lock disable.	
5	SPLIT_LOCK_DISABLE When set to 1, processor supports #AC on split locks.	
6	SNP_FILTER_QOS When set to 1, processor supports Snoop Filter Quality of Service MSRs.	
7	UC_STORE_THROTTLING When set to 1, processor supports UC store throttling through MSR_MEMORY_CTRL[UC_STORE_THROTTLE].	
63:8	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: FEH, 254	IA32_MTRRCAP	
Memory Type Range Register (R/O) See Table 2-2.		Core
Register Address: 140H, 320	MSR_FEATURE_ENABLES	
Miscellaneous Enables for Thread-Specific Features (R/W)		Thread
0	AESNI_LOCK Once this bit is set, writes to this register will not be allowed.	
63:1	Reserved.	
Register Address: 1B0H, 432	IA32_ENERGY_PERF_BIAS	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
IA32_ENERGY_PERF_BIAS (R/W) See Table 2-2.		Thread
Register Address: 1B1H, 433	IA32_PACKAGE_THERM_STATUS	
IA32_PACKAGE_THERM_STATUS See Table 2-2.		Package
Register Address: 1B2H, 434	IA32_PACKAGE_THERM_INTERRUPT	
IA32_PACKAGE_THERM_INTERRUPT (R/W) See Table 2-2.		Package
Register Address: 2A1H, 673	MSR_PRMRR_BASE_1	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE Memory Type for PRMRR accesses.	
3	CONFIGURED PRMRR base configured.	
11:4	Reserved.	
51:12	BASE PRMRR Base address.	
63:52	Reserved.	
Register Address: 2A2H, 674	MSR_PRMRR_BASE_2	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE Memory Type for PRMRR accesses.	
3	CONFIGURED PRMRR base configured.	
11:4	Reserved.	
51:12	BASE PRMRR Base address.	
63:52	Reserved.	
Register Address: 2A3H, 675	MSR_PRMRR_BASE_3	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE Memory Type for PRMRR accesses.	
3	CONFIGURED PRMRR base configured.	
11:4	Reserved.	
51:12	BASE PRMRR Base address.	
63:52	Reserved.	
Register Address: 2C2H, 706	MSR_COPY_SCAN_HASHES	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
MSR_COPY_SCAN_HASHES (W/O)		Module
63:0	SCAN_HASH-ADDR EDX:EAX contains the linear address of the SCAN Test HASH Binary loaded into memory	
Register Address: 2C3H, 707	MSR_SCAN_HASHES_STATUS	
MSR_SCAN_HASHES_STATUS (R/O)		Core
15:0	CHUNK_SIZE EAX[15:0] - Chunk size of the test in KB.	
31:16	TOTAL_NUM_CHUNKS EAX[31:16] - Total number of chunks.	
39:32	ERROR_CODE EDX[7:0] - The error code refers to the LP that runs WRMSR(2C2H). ▪ 0x0 - Reserved. ▪ 0x1 - Attempt to copy scan-hashes when copy already in progress. ▪ 0x2 - Secure Memory not set up correctly. ▪ 0x3 - Scan-Image Header Image_info.ProgramID does not match MSR_INTEGRITY_CAPABILITIES[31:24], or scan-image header Processor-Signature doesn't match F/M/S, or scan-image header Processor-Flags doesn't match PlatformID. ▪ 0x4 - Reserved. ▪ 0x5 - Integrity check failed. ▪ 0x6 - WRMSR(0x2C6) Re-install of scan test image attempted when current scan test image is in use by other LPs. ▪ 0x7 - Aborted due to #PF (Page Fault). ▪ 0x8 - Unable to generate a Random Value.	
48:40	NUM_CHUNKS_IN_STRIDE EDX[16:8] - Number of Chunks in stride. This is the number of chunks that are installed. 0 in this field means that the CPU does not support strides, otherwise, the stride value must be >=1	
50:49	Reserved. EDX[18:17] - Set to all zeros.	
62:51	NAME EDX[30:19] - Maximum Number of cores that can run Intel® In-field Scan simultaneously minus 1. 0 means 1 core at a time.	
63	VALID EDX[31] - Valid bit is set when COPY_SCAN_HASHES completed.	
Register Address: 2C4H, 708	MSR_AUTHENTICATE_AND_COPY_CHUNK	
MSR_AUTHENTICATE_AND_COPY_CHUNK(R/O)		Core
63:0	BASE_CHUNK_TABLE_ADDR EDX:EAX[63:0] - Linear Address pointing to the CHUNK TABLE (TABLE_BASE).	
Register Address: 2C5H, 709	MSR_CHUNKS_AUTHENTICATION_STATUS	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
MSR_CHUNKS_AUTHENTICATION_STATUS (R/O)		Core
15:0	VALID_CHUNKS EAX[15:0] - Total number of Valid (authenticated) chunks.	
31:16	NUM_CHUNKS_IN_STRIDE EAX[31:16] - Number of Chunks in Stride.	
39:32	ERROR_CODE EDX[7:0] ▪ 0x0 - No-error reported. ▪ 0x1 - Attempt to authenticate a CHUNK which is already marked as authentic or is currently being installed by another core. ▪ 0x2 - CHUNK authentication error. HASH of chunk did not match expected value. ▪ 0x3 - Aborted due to #PF (Page Fault). ▪ 0x4 - Chunk Outside the current Stride.	
63:40	Reserved. EDX[31:8] - Set to all zeros.	
Register Address: 2C6H, 710	MSR_ACTIVATE_SCAN	
MSR_ACTIVATE_SCAN (W/O)		Core
15:0	CHUNK_START_INDEX EAX[15:0] - Indicates Chunk Index from which to start.	
31:16	CHUNK_STOP_INDEX EAX[31:16] - Indicates what chunk index to stop at (inclusive).	
62:32	THREAD_WAIT_DELAY EDX[30:0] - TSC based delay to allow threads to rendezvous.	
63	SIGNAL_MCE EDX[31] ▪ If 1: On scan-error log MC in MC4_STATUS and signal MCE if machine check signaling enabled in MC4_CTL[0]. ▪ If 0: Don't no-logging/no-signaling.	
Register Address: 2C7H, 711	MSR_SCAN_STATUS	
MSR_SCAN_STATUS (R/O)		Core
15:0	CHUNK_NUM EAX[15:0] - SCAN Chunk that was reached.	
31:16	CHUNK_STOP_INDEX EAX[31:16] ▪ Indicates what chunk index to stop at (inclusive). ▪ Maps to same field in WRMSR(ACTIVATE_SCAN).	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
39:32	ERROR_CODE EDX[7:0] ▪ 0x0 - No Error. ▪ 0x1 - SCAN operation did not start. Other thread could not join. ▪ 0x2 - SCAN operation did not start. Interrupt occurred prior to SCAN coordination. ▪ 0x3 - SCAN operation did not start. Power Management conditions are inadequate to run SAF. ▪ 0x4 - SCAN operation did not start. Non valid chunks in the range CHUNK_STOP_INDEX : CHUNK_START_INDEX. ▪ 0x5 - SCAN operation did not start. Mismatch in arguments between threads T0/T1. ▪ 0x6 - SCAN operation did not start. Core not capable of performing SCAN currently. ▪ 0x7 - Debug Mode. Scan-At-Field results not to be trusted. ▪ 0x8 - SCAN operation did not start. Exceeded number of Logical Processors (LP) allowed to run Scan-At-Field concurrently. MAX_CORE_LIMIT exceeded. ▪ 0x9 - Interrupt occurred. Scan operation aborted prematurely, not all chunks requested have been executed. ▪ 0xB - Scan operation aborted due to corrupted chunk. ▪ 0xC - Scan operation did not start. All other error codes are reserved.	
61:40	Reserved. EDX[29:8] - Return all zeros.	
62	SCAN_CONTROL_ERROR EDX[30] ▪ SCAN error in the Scan-At-Field controller. ▪ Non ECC error.	
63	SCAN_SIGNATURE_ERROR EDX[31] ▪ SCAN SIGNATURE error in the SCAN pattern fetched from main memory. ▪ Non ECC error.	
Register Address: 2C8H, 712	MSR_SCAN_MODULE_ID	
MSR_SCAN_MODULE_ID (R/O)		Module
31:0	SCAN-AT-FIELD_REVID EAX[31:0] - Maps to Revision field in external header (offset 4).	
40:32	CURRENT_STRIDE_INDEX EDX[8:0] - Stride Index.	
63:41	Reserved. EDX[31:9] - Return all zeros.	
Register Address: 2C9H, 713	MSR_LAST_SAF_WP	
MSR_LAST_SAF_WP (R/O)		Module

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
31:0	LAST_WP EAX[31:0] ▪ Provides information about the core when the last WRMSR(ACTIVATE_SCAN) was executed. ▪ Available only if enumerated in INTEGRITY_CAPABILITIES[10:9].	
39:32	Reserved. EDX[7:0]	
63:40	Reserved. EDX[31:8] - Return all zeros.	
Register Address: 2D6H, 726	MSR_TRIGGER_PERIODIC_MEM_BIST	
MSR_TRIGGER_PERIODIC_MEM_BIST (W/O)		Core
0	SIGNAL_MCE EAX[0] - If 1, then signal MCE on fail if machine check signaling enabled in the corresponding MCi_CTL. If 0 then don't signal machine checks.	
7:1	ARRAY_BANK EAX[7:1] - Reserved.	
15:8	TST_STEP_PARAM EAX[15:8] 0: Test All Arrays, or Test Arrays in STEPs of NUM_STEPS.	
31:16	Reserved. EAX[31:16]	
63:32	Reserved. EAX[31:0]	
Register Address: 2D7H, 727	MSR_PERIODIC_MEM_BIST_STATUS	
MSR_PERIODIC_MEM_BIST_STATUS (R/O)		Core
0	MEM_BIST_STATUS 0: PASS. 1: FAIL.	
63:1	Reserved.	
Register Address: 2D9H, 729	MSR_INTEGRITY_CAPABILITIES	
MSR_INTEGRITY_CAPABILITIES (R/O) Enumerates features supported in Functional Safety.		Thread
0	STARTUP_SCAN_BIST When set to 1, processor supports Startup SCAN BIST.	
1	STARTUP_MEM_BIST When set to 1, processor supports Startup MEM BIST.	
2	PERIODIC_MEM_BIST When set to 1, processor supports Periodic MEM BIST.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
3	LOCKSTEP When set to 1, processor supports Lock Step Mode.	
4	PERIODIC_SCAN_BIST When set to 1, processor supports Periodic SCAN BIST.	
5	PLL_LOSS_DETECT When set to 1, processor supports PLL LOSS detection.	
6	PWR_LOSS_DETECT When set to 1, processor supports Power Loss detection.	
7	PERRINJ When set to 1, processor supports FUSA PERRINJ.	
8	SBFT_AT_FIELD When set to 1, processor supports SBFT-At-Field.	
10:9	SAF_GEN_REV 00 = REV1; 01 = REV2; 10 = REV3; 11 = REV4.	
14:11	Reserved.	
15	PRESERVE_MEMORY_NEEDED When set to 1, processor supports FUSARR_BASE/MASK MSRs.	
20:16	TID_BIT_SHIFT Number of bits to shift right on x2APICID to get a unique topology ID of all logical processors that share a scan test engine.	
21	ALL_LP_JOIN_NEEDED All logical processors that share scan test engine need to be tested together and must join using MSR_ACTIVATE_SCAN.	
23:22	Reserved.	
31:24	PATTERN_ID Processor scan pattern ID. ID of the startup and periodic scan programs supported for this part.	
63:32	Reserved.	
Register Address: 2DCH, 732	IA32_INTEGRITY_STATUS	
IA32_INTEGRITY_STATUS (R/O) Provides status information for integrity features. See Table 2-2.		Thread
Register Address: 3F9H, 1017	MSR_PKG_C6_RESIDENCY	
MSR_PKG_C6_RESIDENCY (R/O)		Package
63:0	Package C6 Residency Counter	
Register Address: 3FAH, 1018	MSR_PKG_C7_RESIDENCY	
MSR_PKG_C7_RESIDENCY (R/O)		Package
63:0	Package C7 Residency Counter	
Register Address: 3FCH, 1020	MSR_CORE_C3_RESIDENCY	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
MSR_CORE_C3_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C3 Residency Counter Time spent in the Core C-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).	
Register Address: 3FDH, 1021	MSR_CORE_C6_RESIDENCY	
MSR_CORE_C6_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C6 Residency Counter Time spent in the Core C-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).	
Register Address: 3FEH, 1022	MSR_CORE_C7_RESIDENCY	
MSR_CORE_C7_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C7 Residency Counter Time spent in the Core C-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).	
Register Address: 4F0H, 1264	MSR_SAF_CTRL	
MSR_SAF_CTRL (W/O)		Core
0	INVALIDATE_CURRENT_STRIDE EAX[0] ▪ Write of 1 invalidates the currently installed stride. ▪ Clears only the VALID_CHUNKS field on a RDMSR(CHUNKS_AUTHENTICATION_STATUS).	
63:1	Reserved.	
Register Address: 664H, 1636	MSR_MC6_RESIDENCY	
MSR_MC6_RESIDENCY (R/O) Time spent in the Module C6-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).		Module
63:0	RESIDENCY Time that this module is in module-specific C6 states since last reset.	
Register Address: 6E0H, 1760	IA32_TSC_DEADLINE	
TSC Target of Local APIC's TSC Deadline Mode (R/W) See Table 2-2.		Thread
Register Address: 7A3H, 1955	IA32_MCU_EXT_SERVICE	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
MCU Extended Service (R/W) See Table 2-2.		Module
Register Address: 7A4H, 1956	IA32_MCU_ROLLBACK_MIN_ID	
Minimal MCU Revision ID (R/O) See Table 2-2.		Module
Register Address: 7A5H, 1957	IA32_MCU_STAGING_MBOX_ADDR	
IA32_MCU_STAGING_MBOX_ADDR (R/O) See Table 2-2.		Package
Register Address: 7B0H, 1968	IA32_ROLLBACK_SIGN_ID_0	
Rollback ID 0 (R/O) See Table 2-2.		Module
Register Address: 7B1H, 1969	IA32_ROLLBACK_SIGN_ID_1	
Rollback ID 1 (R/O) See Table 2-2.		Module
Register Address: 7B2H, 1970	IA32_ROLLBACK_SIGN_ID_2	
Rollback ID 2 (R/O) See Table 2-2.		Module
Register Address: 7B3H, 1971	IA32_ROLLBACK_SIGN_ID_3	
Rollback ID 3 (R/O) See Table 2-2.		Module
Register Address: 7B4H, 1972	IA32_ROLLBACK_SIGN_ID_4	
Rollback ID 4 (R/O) See Table 2-2.		Module
Register Address: 7B5H, 1973	IA32_ROLLBACK_SIGN_ID_5	
Rollback ID 5 (R/O) See Table 2-2.		Module
Register Address: 7B6H, 1974	IA32_ROLLBACK_SIGN_ID_6	
Rollback ID 6 (R/O) See Table 2-2.		Module
Register Address: 7B7H, 1975	IA32_ROLLBACK_SIGN_ID_7	
Rollback ID 7 (R/O) See Table 2-2.		Module
Register Address: 7B8H, 1976	IA32_ROLLBACK_SIGN_ID_8	
Rollback ID 8 (R/O) See Table 2-2.		Module
Register Address: 7B9H, 1977	IA32_ROLLBACK_SIGN_ID_9	
Rollback ID 9 (R/O) See Table 2-2.		Module
Register Address: 7BAH, 1978	IA32_ROLLBACK_SIGN_ID_10	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Rollback ID 10 (R/O) See Table 2-2.		Module
Register Address: 7BBH, 1979	IA32_ROLLBACK_SIGN_ID_11	
Rollback ID 11 (R/O) See Table 2-2.		Module
Register Address: 7BCH, 1980	IA32_ROLLBACK_SIGN_ID_12	
Rollback ID 12 (R/O) See Table 2-2.		Module
Register Address: 7BDH, 1981	IA32_ROLLBACK_SIGN_ID_13	
Rollback ID 13 (R/O) See Table 2-2.		Module
Register Address: 7BEH, 1982	IA32_ROLLBACK_SIGN_ID_14	
Rollback ID 14 (R/O) See Table 2-2.		Module
Register Address: 7BFH, 1983	IA32_ROLLBACK_SIGN_ID_15	
Rollback ID 15 (R/O) See Table 2-2.		Module
Register Address: 988H, 2440	IA32_UINTR_NV	
User Interrupt Size and Notification Vector (R/W) See Table 2-2.		Thread
Register Address: 9FBH, 2555	IA32_TME_CLEAR_SAVED_KEY	
IA32_TME_CLEAR_SAVED_KEY (R/W) See Table 2-2.		Package
Register Address: 9FFH, 2559	MSR_CORE_MKTME_ACTIVATE	
MSR_CORE_MKTME_ACTIVATE (R/O) MSR to read TME_ACTIVATE[MK_TME_KEYID_BITS].		Core
31:0	Reserved.	
35:32	READ_MK_TME_KEYID_BITS This value will be returned on a RDMSR, but must be zero on a WRMSR.	
63:36	Reserved.	
Register Address: C84H, 3204	MSR_MBA_CFG	
Memory Bandwidth Allocation (MBA) Configuration (R/W)		Package
1:0	Reserved.	
2	RAMBAE Resource Aware MBA Enable.	
63:3	Reserved.	
Register Address: CA0H, 3232	MSR_RMID_SNC_CONFIG	
MSR_RMID_SNC_CONFIG (R/W)		Package

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
0	RMID_LOCALIZED_DISTRIBUTION_MODE_ENABLE If set, Localized RMID distribution mode is enabled. If Clear, RMID Sharing mode is enabled.	
63:1	Reserved.	
Register Address: D50H, 3408	IA32_L2_QOS_EXT_BW_THRTL_0	
Memory Bandwidth Enforcement for COS0 (R/W) See Table 2-2.		Package
Register Address: D51H, 3409	IA32_L2_QOS_EXT_BW_THRTL_1	
Memory Bandwidth Enforcement for COS1 (R/W) See Table 2-2.		Package
Register Address: D52H, 3410	IA32_L2_QOS_EXT_BW_THRTL_2	
Memory Bandwidth Enforcement for COS2 (R/W) See Table 2-2.		Package
Register Address: D53H, 3411	IA32_L2_QOS_EXT_BW_THRTL_3	
Memory Bandwidth Enforcement for COS3 (R/W) See Table 2-2.		Package
Register Address: D54H, 3412	IA32_L2_QOS_EXT_BW_THRTL_4	
Memory Bandwidth Enforcement for COS4 (R/W) See Table 2-2.		Package
Register Address: D55H, 3413	IA32_L2_QOS_EXT_BW_THRTL_5	
Memory Bandwidth Enforcement for COS5 (R/W) See Table 2-2.		Package
Register Address: D56H, 3414	IA32_L2_QOS_EXT_BW_THRTL_6	
Memory Bandwidth Enforcement for COS6 (R/W) See Table 2-2.		Package
Register Address: D57H, 3415	IA32_L2_QOS_EXT_BW_THRTL_7	
Memory Bandwidth Enforcement for COS7 (R/W) See Table 2-2.		Package
Register Address: D58H, 3416	IA32_L2_QOS_EXT_BW_THRTL_8	
Memory Bandwidth Enforcement for COS8 (R/W) See Table 2-2.		Package
Register Address: D59H, 3417	IA32_L2_QOS_EXT_BW_THRTL_9	
Memory Bandwidth Enforcement for COS9 (R/W) See Table 2-2.		Package
Register Address: D5AH, 3418	IA32_L2_QOS_EXT_BW_THRTL_10	
Memory Bandwidth Enforcement for COS10 (R/W) See Table 2-2.		Package
Register Address: D5BH, 3419	IA32_L2_QOS_EXT_BW_THRTL_11	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Memory Bandwidth Enforcement for COS11 (R/W) See Table 2-2.		Package
Register Address: D5CH, 3420	IA32_L2_QOS_EXT_BW_THRTL_12	
Memory Bandwidth Enforcement for COS12 (R/W) See Table 2-2.		Package
Register Address: D5DH, 3421	IA32_L2_QOS_EXT_BW_THRTL_13	
Memory Bandwidth Enforcement for COS13 (R/W) See Table 2-2.		Package
Register Address: D5EH, 3422	IA32_L2_QOS_EXT_BW_THRTL_14	
Memory Bandwidth Enforcement for COS14 (R/W) See Table 2-2.		Package
Register Address: E00H, 3584	IA32_QOS_CORE_BW_THRTL_0	
CBA Levels Based on COS for Bandwidth Throttling (R/W) See Table 2-2.		Thread
Register Address: E01H, 3585	IA32_QOS_CORE_BW_THRTL_1	
CBA Levels Based on COS for Bandwidth Throttling (R/W) See Table 2-2.		Thread
Register Address: 1400H, 5120	IA32_SEAMRR_BASE	
SEAM Memory Range Register for TDX - Base Address (R/W) See Table 2-2.		Core
Register Address: 1401H, 5121	IA32_SEAMRR_MASK	
SEAM Memory Range Register for TDX (R/W) See Table 2-2.		Core
Register Address: 1A8FH, 6799	MSR_STLB_QOS_INFO	
STLB_QOS_INFO (R/O) STLB QoS MASK configuration.		Core
5:0	NCLOS Number of CLOS supported for STLB resource using minus-1 notation.	
15:6	Reserved.	
19:16	4K_2M_CBM Length of capacity bitmask for 4K and 2M pages using minus-1 notation.	
28:20	Reserved.	
29	STLB_FILL_TRANSLATION_MSR_SUPPORTED MSR interface to fill STLB translations supported.	
30	4K_2M_ALIAS Indicates that 4K/2M pages alias into the same structure.	
63:31	Reserved.	

2.17.12 MSRs Introduced in the Intel® Series 2 Core™ Ultra Processor Supporting Performance Hybrid Architecture

Table 2-58 lists additional MSRs for the Intel Series 2 Core Ultra processor with a CPUID Signature DisplayFamily_DisplayModel value of 06_BDH. Table 2-59 lists the MSRs unique to the processor P-core. Table 2-60 lists the MSRs unique to the processor E-core.

For an MSR listed in Table 2-58, Table 2-59, or Table 2-60 that also appears in the model-specific tables of prior generations, Table 2-58, Table 2-59, and Table 2-60 supersede prior generation tables.

Table 2-58. Additional MSRs Supported by the Intel® Series 2 Core™ Ultra Processors Supporting Performance Hybrid Architecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Thread
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2.		Thread
Register Address: 601H, 1537	MSR_PKG_POWER_LIMIT_4	
Package Power Limit 4 (R/W) Package-level maximum power limit (in Watts).		Package
15:0	POWER_LIMIT_4 PL4 Value in 0.125 W increments. This field is locked by PKG_POWER_LIMIT_4.LOCK. When the LOCK bit is set to 1, this field becomes Read Only. If the value is 0, PL4 limit is disabled.	
30:16	Reserved.	
31	LOCK This bit will lock the POWER_LIMIT_4 settings in this register and will also lock this setting. This means that once set to 1, the POWER_LIMIT_4 setting and this bit become Read Only until the next Warm Reset.	
63:32	Reserved.	
Register Address: 630H, 1584	MSR_PKG_C8_RESIDENCY	
MSR_PKG_C8_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
59:0	Package C8 Residency Counter Value since last reset that this package is in processor-specific C8 states. Count at the same frequency as the TSC.	
63:60	Reserved.	
Register Address: 631H, 1585	MSR_PKG_C9_RESIDENCY	
MSR_PKG_C9_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package

Table 2-58. Additional MSRs Supported by the Intel® Series 2 Core™ Ultra Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
59:0	Package C9 Residency Counter Value since last reset that this package is in processor-specific C9 states. Count at the same frequency as the TSC.	
63:60	Reserved.	
Register Address: 632H, 1586	MSR_PKG_C10_RESIDENCY	
MSR_PKG_C10_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
59:0	Package C10 Residency Counter Value since last reset that this package is in processor-specific C10 states. Count at the same frequency as the TSC.	
63:60	Reserved.	
Register Address: 651H, 1617	MSR_SECONDARY_TURBO_RATIO_LIMIT_CORES	
SECONDARY_TURBO_RATIO_LIMIT_CORES (R/W) This register defines the active core ranges for each frequency point. ▪ NUMCORE[0:7] must be populated in ascending order. ▪ NUMCORE[i+1] must be greater than NUMCORE[i]. ▪ Entries with NUMCORE[i] == 0 will be ignored. ▪ The last valid entry must have NUMCORE >= the number of cores in the SKU. If any of the rules above are broken, we will silently reject the configuration.		Package
7:0	CORE_COUNT_0 Defines the active core ranges for each frequency point.	
15:8	CORE_COUNT_1 Defines the active core ranges for each frequency point.	
23:16	CORE_COUNT_2 Defines the active core ranges for each frequency point.	
31:24	CORE_COUNT_3 Defines the active core ranges for each frequency point.	
39:32	CORE_COUNT_4 Defines the active core ranges for each frequency point.	
47:40	CORE_COUNT_5 Defines the active core ranges for each frequency point.	
55:48	CORE_COUNT_6 Defines the active core ranges for each frequency point.	
63:56	CORE_COUNT_7 Defines the active core ranges for each frequency point.	
Register Address: 658H, 1624	MSR_WEIGHTED_CORE_C0	
Core-Count Weighted C0 Residency (R/O)		Package

Table 2-58. Additional MSRs Supported by the Intel® Series 2 Core™ Ultra Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
63:0	DATA Increment at the same rate as the TSC. The increment each cycle is weighted by the number of processor cores in the package that reside in C0. If N cores are simultaneously in C0, then each cycle the counter increments by N.	
Register Address: 659H, 1625	MSR_ANY_CORE_C0	
Any Core C0 Residency (R/O)		Package
63:0	DATA Increment at the same rate as the TSC. The increment each cycle is weighted by the number of processor cores in the package that reside in C0. If N cores are simultaneously in C0, then each cycle the counter increments by N.	
Register Address: 65AH, 1626	MSR_ANY_GFXE_C0	
Any Graphics Engine C0 Residency (R/O)		Package
63:0	DATA Increment at the same rate as the TSC. The increment each cycle is one if any processor graphic device's compute engines are in C0.	
Register Address: 65BH, 1627	MSR_CORE_GFXE_OVERLAP_C0	
Core and Graphics Engine Overlapped C0 Residency (R/O)		Package
63:0	DATA Increment at the same rate as the TSC. The increment each cycle is one if at least one compute engine of the processor graphics is in C0 and at least one processor core in the package is also in C0.	
Register Address: C88H, 3208	IA32_RESOURCE_PRIORITY	
Thread scope Resource Priority Enable (R/W) See Table 2-2.		Thread
Register Address: C89H, 3209	IA32_RESOURCE_PRIORITY_PKG	
IA32_RESOURCE_PRIORITY_PKG (R/W) See Table 2-2.		Package
Register Address: 1900H, 6400	IA32_PMC_GP0_CTR	
Full Width Writable General Performance Counter 0 (R/W) See Table 2-2.		Thread
Register Address: 1901H, 6401	IA32_PMC_GP0_CFG_A	
IA32_PMC_GP0_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 0. See Table 2-2.		Thread
Register Address: 1904H, 6404	IA32_PMC_GP1_CTR	
Full Width Writable General Performance Counter 1 (R/W) See Table 2-2.		Thread
Register Address: 1905H, 6405	IA32_PMC_GP1_CFG_A

2.18 MSRS IN THE INTEL® XEON PHI™ PROCESSOR 3200/5200/7200 SERIES AND THE INTEL® XEON PHI™ PROCESSOR 7215/7285/7295 SERIES

The Intel® Xeon Phi™ processor 3200, 5200, 7200 series, with a CPUID Signature DisplayFamily_DisplayModel value of 06_57H, supports the MSR interfaces listed in Table 2-61. These processors are based on the Knights Landing microarchitecture. The Intel® Xeon Phi™ processor 7215, 7285, 7295 series, with a CPUID Signature DisplayFamily_DisplayModel value of 06_85H, supports the MSR interfaces listed in Table 2-61 and Table 2-62. These processors are based on the Knights Mill microarchitecture. Some MSRs are shared between a pair of processor cores, and the scope is marked as module.

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors."		Module
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors."		Module
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination." See Table 2-2.		Thread
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and Table 2-2.		Thread
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2.		Package
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Thread
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/O)		Thread
31:0	SMI Count (R/O)	
63:32	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64Processor (R/W) See Table 2-2.		Thread
0	Lock. (R/WL)	
1	Reserved.	
2	Enable VMX outside SMX operation. (R/WL)	
Register Address: 3BH, 59	IA32_TSC_ADJUST	
Per-Logical-Processor TSC ADJUST (R/W) See Table 2-2.		Thread
Register Address: 4EH, 78	IA32_PPIN_CTL (MSR_PPIN_CTL)	
Protected Processor Inventory Number Enable Control (R/W)		Package
0	LockOut (R/WO) See Table 2-2.	

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
1	Enable_PPIN (R/W) See Table 2-2.	
63:2	Reserved	
Register Address: 4FH, 79	IA32_PPIN (MSR_PPIN)	
Protected Processor Inventory Number (R/O)		Package
63:0	Protected Processor Inventory Number (R/O) See Table 2-2.	
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Core
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Thread
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Thread
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Thread
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org.		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
39:30	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
63:48	Reserved.	

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W)		Package
2:0	Package C-State Limit (R/W) Specifies the lowest C-state for the package. This feature does not limit the processor core C-state. The power-on default value from bit[2:0] of this register reports the deepest package C-state the processor is capable to support when manufactured. It is recommended that BIOS always read the power-on default value reported from this bit field to determine the supported deepest C-state on the processor and leave it as default without changing it. 000b - C0/C1 (No package C-state support) 001b - C2 010b - C6 (non retention)* 011b - C6 (Retention)* 100b - Reserved 101b - Reserved 110b - Reserved 111b - No package C-state limit. All C-States supported by the processor are available. Note: C6 retention mode provides more power saving than C6 non-retention mode. Limiting the package to C6 non retention mode does prevent the MSR_PKG_C6_RESIDENCY counter (MSR 3F9h) from being incremented.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO registers at MSR_PMG_IO_CAPTURE_BASE[15:0] to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/O) When set, locks bits [15:0] of this register for further writes until the next reset occurs.	
25	Reserved.	
26	C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	Reserved.	
28	C1 State Auto Undemotion Enable (R/W) When set, enables Undemotion from Demoted C1.	
29	PKG C-State Auto Demotion Enable (R/W) When set, enables Package C state demotion.	
63:30	Reserved.	
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Capture Base (R/W)		Tile

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
15:0	LVL_2 Base Address (R/W) Microcode will compare IO-read zone to this base address to determine if an MWAIT(C2/3/4) needs to be issued instead of the IO-read. Should be programmed to the chipset Plevel_2 IO address.	
22:16	C-State Range (R/W) The IO-port block size in which IO-redirection will be executed (0-127). Should be programmed based on the number of LVLx registers existing in the chipset.	
63:23	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: FEH, 254	IA32_MTRRCAP	
Memory Type Range Register (R/O) See Table 2-2.		Core
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, the AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.	
Register Address: 140H, 320	MISC_FEATURE_ENABLES	
MISC_FEATURE_ENABLES		Thread
0	Reserved.	
1	User Mode MONITOR and MWAIT (R/W) If set to 1, the MONITOR and MWAIT instructions do not cause invalid-opcode exceptions when executed with CPL > 0 or in virtual-8086 mode. If MWAIT is executed when CPL > 0 or in virtual-8086 mode, and if EAX indicates a C-state other than C0 or C1, the instruction operates as if EAX indicated the C-state C1.	
63:2	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS

63:9	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-2) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP.		Thread
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W)		Thread
0	LBR Setting this bit to 1 enables the processor to record a running trace of the most recent branches taken by the processor in the LBR stack.	

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
1	BTF Setting this bit to 1 enables the processor to treat EFLAGS.TF as single-step on branches instead of single-step on instructions.	
5:2	Reserved.	
6	TR Setting this bit to 1 enables branch trace messages to be sent.	
7	BTS Setting this bit enables branch trace messages (BTMs) to be logged in a BTS buffer.	
8	BTINT When clear, BTMs are logged in a BTS buffer in circular fashion. When this bit is set, an interrupt is generated by the BTS facility when the BTS buffer is full.	
9	BTS_OFF_OS When set, BTS or BTM is skipped if CPL = 0.	
10	BTS_OFF_USR When set, BTS or BTM is skipped if CPL > 0.	
11	FREEZE_LBRS_ON_PMI When set, the LBR stack is frozen on a PMI request.	
12	FREEZE_PERFMON_ON_PMI When set, each ENABLE bit of the global counter control MSR are frozen (address 3BFH) on a PMI request.	
13	Reserved.	
14	FREEZE_WHILE_SMM When set, freezes perfmon and trace messages while in SMM.	
31:15	Reserved.

Table 2-62 lists model-specific registers that are supported by the Intel® Xeon Phi™ processor 7215, 7285, 7295 series based on the Knights Mill microarchitecture.

Table 2-62. Additional MSRs Supported by the Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_85H

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Register Address: 9BH, 155	IA32_SMM_MONITOR_CTL	
SMM Monitor Configuration (R/W) This MSR is readable only if VMX is enabled, and writeable only if VMX is enabled and in SMM mode, and is used to configure the VMX MSEG base address. See Table 2-2.		Core
Register Address: 480H, 1152	IA32_VMX_BASIC	

Table 2-62. Additional MSRs Supported by the Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2.		Core
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTLS	
Capability Reporting Register of Pin-based VM-execution Controls (R/O) See Table 2-2.		Core
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTLS	
Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)		Core
Register Address: 483H, 1155	IA32_VMX_EXIT_CTLS	
Capability Reporting Register of VM-exit Controls (R/O) See Table 2-2.		Core
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTLS	
Capability Reporting Register of VM-entry Controls (R/O) See Table 2-2.		Core
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2.		Core
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2.		Core
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2.		Core
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2.		Core
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2.		Core
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2.		Core
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLS2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Table 2-2.		Core
Register Address: 48CH, 1164	IA32_VMX_EPT_VPID_ENUM	
Capability Reporting Register of EPT and VPID (R/O) See Table 2-2.		Core
Register Address: 48DH, 1165	IA32_VMX_TRUE_PINBASED_CTLS	

Table 2-62. Additional MSRs Supported by the Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Scope**
Capability Reporting Register of Pin-Based VM-Execution Flex Controls (R/O) See Table 2-2.		Core
Register Address: 48EH, 1166	IA32_VMX_TRUE_PROCBASED_CTLS	
Capability Reporting Register of Primary Processor-Based VM-Execution Flex Controls (R/O) See Table 2-2.		Core
Register Address: 48FH, 1167	IA32_VMX_TRUE_EXIT_CTLS	
Capability Reporting Register of VM-Exit Flex Controls (R/O) See Table 2-2.		Core
Register Address: 490H, 1168	IA32_VMX_TRUE_ENTRY_CTLS	
Capability Reporting Register of VM-Entry Flex Controls (R/O) See Table 2-2.		Core
Register Address: 491H, 1169	IA32_VMX_FMFUNC	
Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2.		Core

2.19 MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS

Table 2-63 lists MSRs (architectural and model-specific) that are defined across processor generations based on Intel NetBurst microarchitecture. The processor can be identified by its CPUID signatures of DisplayFamily encoding of 0FH, see Table 2-1.

- MSRs with an "IA32_" prefix are designated as "architectural." This means that the functions of these MSRs and their addresses remain the same for succeeding families of IA-32 processors.
- MSRs with an "MSR_" prefix are model specific with respect to address functionalities. The column "Model Availability" lists the model encoding value(s) within the Pentium 4 and Intel Xeon processor family at the specified register address. The model encoding value of a processor can be queried using CPUID. See "CPUID—CPU Identification" in Chapter 3 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A.

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
Register Address: 0H, 0	IA32_P5_MC_ADDR		
See Section 2.23, "MSRs in Pentium Processors."		0, 1, 2, 3, 4, 6	Shared
Register Address: 1H, 1	IA32_P5_MC_TYPE		
See Section 2.23, "MSRs in Pentium Processors."		0, 1, 2, 3, 4, 6	Shared
Register Address: 6H, 6	IA32_MONITOR_FILTER_LINE_SIZE		
See Section 10.10.5, "Monitor/Mwait Address Range Determination."		3, 4, 6	Shared
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER		
Time Stamp Counter See Table 2-2.		0, 1, 2, 3, 4, 6	Unique

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
On earlier processors, only the lower 32 bits are writable. On any write to the lower 32 bits, the upper 32 bits are cleared. For processor family 0FH, models 3 and 4: all 64 bits are writable.			
Register Address: 17H, 23	IA32_PLATFORM_ID		
Platform ID (R) See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.		0, 1, 2, 3, 4, 6	Shared
Register Address: 1BH, 27	IA32_APIC_BASE		
APIC Location and Status (R/W) See Table 2-2. See Section 12.4.4, "Local APIC Status and Location."		0, 1, 2, 3, 4, 6	Unique
Register Address: 2AH, 42	MSR_EBC_HARD_POWERON		
Processor Hard Power-On Configuration (R/W) Enables and disables processor features. (R) Indicates current processor configuration.		0, 1, 2, 3, 4, 6	Shared
0	Output Tri-state Enabled (R) Indicates whether tri-state output is enabled (1) or disabled (0) as set by the strapping of SMI#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
1	Execute BIST (R) Indicates whether the execution of the BIST is enabled (1) or disabled (0) as set by the strapping of INIT#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
2	In Order Queue Depth (R) Indicates whether the in order queue depth for the system bus is 1 (1) or up to 12 (0) as set by the strapping of A7#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
3	MCERR# Observation Disabled (R) Indicates whether MCERR# observation is enabled (0) or disabled (1) as determined by the strapping of A9#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
4	BINIT# Observation Enabled (R) Indicates whether BINIT# observation is enabled (0) or disabled (1) as determined by the strapping of A10#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
6:5	APIC Cluster ID (R) Contains the logical APIC cluster ID value as set by the strapping of A12# and A11#. The logical cluster ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
7	Bus Park Disable (R) Indicates whether bus park is enabled (0) or disabled (1) as set by the strapping of A15#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
11:8	Reserved.		
13:12	Agent ID (R) Contains the logical agent ID value as set by the strapping of BR[3:0]. The logical ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.		
63:14	Reserved.		
Register Address: 2BH, 43	MSR_EBC_SOFT_POWERON		
Processor Soft Power-On Configuration (R/W) Enables and disables processor features.		0, 1, 2, 3, 4, 6	Shared
0	RCNT/SCNT On Request Encoding Enable (R/W) Controls the driving of RCNT/SCNT on the request encoding. Set to enable (1); clear to disabled (0, default).		
1	Data Error Checking Disable (R/W) Set to disable system data bus parity checking; clear to enable parity checking.		
2	Response Error Checking Disable (R/W) Set to disable (default); clear to enable.		
3	Address/Request Error Checking Disable (R/W) Set to disable (default); clear to enable.		
4	Initiator MCERR# Disable (R/W) Set to disable MCERR# driving for initiator bus requests (default); clear to enable.		
5	Internal MCERR# Disable (R/W) Set to disable MCERR# driving for initiator internal errors (default); clear to enable.		
6	BINIT# Driver Disable (R/W) Set to disable BINIT# driver (default); clear to enable driver.		
63:7	Reserved.		
Register Address: 2CH, 44	MSR_EBC_FREQUENCY_ID		
Processor Frequency Configuration The bit field layout of this MSR varies according to the MODEL value in the CPUID version information. The following bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding equal or greater than 2. (R) The field Indicates the current processor frequency configuration.		2,3, 4, 6	Shared
15:0	Reserved.		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
18:16	Scalable Bus Speed (R/W) Indicates the intended scalable bus speed: Encoding Scalable Bus Speed 000B 100 MHz (Model 2) 000B 266 MHz (Model 3 or 4) 001B 133 MHz 010B 200 MHz 011B 166 MHz 100B 333 MHz (Model 6)		
	133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.		
	266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 000B and model encoding = 3 or 4. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 100B and model encoding = 6. All other values are reserved.		
23:19	Reserved.		
31:24	Core Clock Frequency to System Bus Frequency Ratio (R) The processor core clock frequency to system bus frequency ratio observed at the deassertion of the reset pin.		
63:32	Reserved.		
Register Address: 2CH, 44	MSR_EBC_FREQUENCY_ID		
Processor Frequency Configuration (R) The bit field layout of this MSR varies according to the MODEL value of the CPUID version information. This bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding less than 2. Indicates current processor frequency configuration.		0, 1	Shared
20:0	Reserved.		
23:21	Scalable Bus Speed (R/W) Indicates the intended scalable bus speed: Encoding Scalable Bus Speed 000B 100 MHz All others values reserved.		
63:24	Reserved.		
Register Address: 3AH, 58	IA32_FEATURE_CONTROL		
Control Features in IA-32 Processor (R/W) See Table 2-2. (If CPUID.01H:ECX.[bit 5])		3, 4, 6	Unique
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
BIOS Update Trigger Register (W) See Table 2-2.		0, 1, 2, 3, 4, 6	Shared
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID		
BIOS Update Signature ID (R/W) See Table 2-2.		0, 1, 2, 3, 4, 6	Unique
Register Address: 9BH, 155	IA32_SMM_MONITOR_CTL		
SMM Monitor Configuration (R/W) See Table 2-2.		3, 4, 6	Unique
Register Address: FEH, 254	IA32_MTRRCAP		
MTRR Information See Section 13.11.1, "MTRR Feature Identification."		0, 1, 2, 3, 4, 6	Unique
Register Address: 174H, 372	IA32_SYSENTER_CS		
CS Register Target for CPL 0 Code (R/W) See Table 2-2 and Section 6.8.7, "Performing Fast Calls to System Procedures with the SYSENTER and SYSEXIT Instructions."		0, 1, 2, 3, 4, 6	Unique
Register Address: 175H, 373	IA32_SYSENTER_ESP		
Stack Pointer for CPL 0 Stack (R/W) See Table 2-2 and Section 6.8.7, "Performing Fast Calls to System Procedures with the SYSENTER and SYSEXIT Instructions."		0, 1, 2, 3, 4, 6	Unique
Register Address: 176H, 374	IA32_SYSENTER_EIP		
CPL 0 Code Entry Point (R/W) See Table 2-2 and Section 6.8.7, "Performing Fast Calls to System Procedures with the SYSENTER and SYSEXIT Instructions."		0, 1, 2, 3, 4, 6	Unique
Register Address: 179H, 377	IA32_MCG_CAP		
Machine Check Capabilities (R) See Table 2-2 and Section 17.3.1.1, "IA32_MCG_CAP MSR."		0, 1, 2, 3, 4, 6	Unique
Register Address: 17AH, 378	IA32_MCG_STATUS		
Machine Check Status (R) See Table 2-2 and Section 17.3.1.2, "IA32_MCG_STATUS MSR."		0, 1, 2, 3, 4, 6	Unique
Register Address: 17BH, 379	IA32_MCG_CTL		
Machine Check Feature Enable (R/W) See Table 2-2 and Section 17.3.1.3, "IA32_MCG_CTL MSR."			
Register Address: 180H, 384	MSR_MCG_RAX		
Machine Check EAX/RAX Save State See Section 17.3.2.6, "IA32_MCG Extended Machine Check State MSRs."		0, 1, 2, 3, 4, 6	Unique
63:0	Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.		
Register Address: 181H, 385	MSR_MCG_RBX		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
Machine Check EBX/RBX Save State See Section 17.3.2.6, "IA32_MCG Extended Machine Check State MSRs."		0, 1, 2, 3, 4, 6	Unique
63:0	Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.		
Register Address: 182H, 386	MSR_MCG_RCX		
Machine Check ECX/RCX Save State See Section 17.3.2.6, "IA32_MCG Extended Machine Check State MSRs."		0, 1, 2, 3, 4, 6	Unique
63:0	Contains register state at time of machine check error. When in non-64-bit modes at the time of the error, bits 63-32 do not contain valid data.		
Register Address: 183H, 387	MSR_MCG_RDX

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
Register Address: 19AH, 410	IA32_CLOCK_MODULATION		
Thermal Monitor Control (R/W) See Table 2-2 and Section 16.8.3, "Software Controlled Clock Modulation."		0, 1, 2, 3, 4, 6	Unique
Register Address: 19BH, 411	IA32_THERM_INTERRUPT		
Thermal Interrupt Control (R/W) See Section 16.8.2, "Thermal Monitor," and Table 2-2.		0, 1, 2, 3, 4, 6	Unique
Register Address: 19CH, 412	IA32_THERM_STATUS		
Thermal Monitor Status (R/W) See Section 16.8.2, "Thermal Monitor," and Table 2-2.		0, 1, 2, 3, 4, 6	Shared
Register Address: 19DH, 413	MSR_THERM2_CTL		
Thermal Monitor 2 Control			
For Family F, Model 3 processors: When read, specifies the value of the target TM2 transition last written. When set, it sets the next target value for TM2 transition.		3	Shared
For Family F, Model 4 and Model 6 processors: When read, specifies the value of the target TM2 transition last written. Writes may cause #GP exceptions.		4, 6	Shared
Register Address: 1A0H, 416	IA32_MISC_ENABLE		
Enable Miscellaneous Processor Features (R/W)		0, 1, 2, 3, 4, 6	Shared
0	Fast-Strings Enable. See Table 2-2.		
1	Reserved.		
2	x87 FPU Fopcode Compatibility Mode Enable		
3	Thermal Monitor 1 Enable See Section 16.8.2, "Thermal Monitor," and Table 2-2.		
4	Split-Lock Disable When set, the bit causes an #AC exception to be issued instead of a split-lock cycle. Operating systems that set this bit must align system structures to avoid split-lock scenarios. When the bit is clear (default), normal split-locks are issued to the bus. This debug feature is specific to the Pentium 4 processor.		
5	Reserved.		
6	Third-Level Cache Disable (R/W) When set, the third-level cache is disabled; when clear (default) the third-level cache is enabled. This flag is reserved for processors that do not have a third-level cache. Note that the bit controls only the third-level cache; and only if overall caching is enabled through the CD flag of control register CR0, the page-level cache controls, and/or the MTRRs. See Section 13.5.4, "Disabling and Enabling the L3 Cache."		
7	Performance Monitoring Available (R) See Table 2-2.		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique[1]
8	Suppress Lock Enable When set, assertion of LOCK on the bus is suppressed during a Split Lock access. When clear (default), LOCK is not suppressed.		
9	Prefetch Queue Disable When set, disables the prefetch queue. When clear (default), enables the prefetch queue.		
10	FERR# Interrupt Reporting Enable (R/W) When set, interrupt reporting through the FERR# pin is enabled; when clear, this interrupt reporting function is disabled. When this flag is set and the processor is in the stop-clock state (STPCLK# is asserted), asserting the FERR# pin signals to the processor that an interrupt (such as, INIT#, BINIT#, INTR, NMI, SMI#, or RESET#) is pending and that the processor should return to normal operation to handle the interrupt. This flag does not affect the normal operation of the FERR# pin (to indicate an unmasked floating-point error) when the STPCLK# pin is not asserted.		
11	Branch Trace Storage Unavailable (BTS_UNAVILABLE) (R) See Table 2-2. When set, the processor does not support branch trace storage (BTS); when clear, BTS is supported.		
12	PEBS_UNAVILABLE: Processor Event Based Sampling Unavailable (R) See Table 2-2. When set, the processor does not support processor event-based sampling (PEBS); when clear, PEBS is supported.		
13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.	3	
17:14	Reserved.		
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	3, 4, 6	

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
19	Adjacent Cache Line Prefetch Disable (R/W) When set to 1, the processor fetches the cache line of the 128-byte sector containing currently required data. When set to 0, the processor fetches both cache lines in the sector. Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit.		
21:20	Reserved.		
22	Limit CPUID MAXVAL (R/W) See Table 2-2. Setting this can cause unexpected behavior to software that depends on the availability of CPUID leaves greater than 3.	3, 4, 6	
23	xTPR Message Disable (R/W) See Table 2-2.		Shared
24	L1 Data Cache Context Mode (R/W) When set, the L1 data cache is placed in shared mode; when clear (default), the cache is placed in adaptive mode. This bit is only enabled for IA-32 processors that support Intel Hyper-Threading Technology. See Section 13.5.6, "L1 Data Cache Context Mode." When L1 is running in adaptive mode and CR3s are identical, data in L1 is shared across logical processors. Otherwise, L1 is not shared and cache use is competitive. If the Context ID feature flag (ECX[10]) is set to 0 after executing CPUID with EAX = 1, the ability to switch modes is not supported. BIOS must not alter the contents of IA32_MISC_ENABLE[24].		
33:25	Reserved.		
34	XD Bit Disable (R/W) See Table 2-3.		Unique
63:35	Reserved.		
Register Address: 1A1H, 417	MSR_PLATFORM_BRV		
Platform Feature Requirements (R)		3, 4, 6	Shared
17:0	Reserved.		
18	PLATFORM Requirements When set to 1, indicates the processor has specific platform requirements. The details of the platform requirements are listed in the respective data sheets of the processor.		
63:19	Reserved.		
Register Address: 1D7H, 471	MSR_LER_FROM_LIP		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 19.13.3, "Last Exception Records."		0, 1, 2, 3, 4, 6	Unique
31:0	From Linear IP Linear address of the last branch instruction.		
63:32	Reserved.		
Register Address: 1D7H, 471	MSR_LER_FROM_LIP		
63:0	From Linear IP Linear address of the last branch instruction (If IA-32e mode is active).		Unique
Register Address: 1D8H, 472	MSR_LER_TO_LIP		
Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 19.13.3, "Last Exception Records."		0, 1, 2, 3, 4, 6	Unique
31:0	From Linear IP Linear address of the target of the last branch instruction.		
63:32	Reserved.		
Register Address: 1D8H, 472	MSR_LER_TO_LIP		
63:0	From Linear IP Linear address of the target of the last branch instruction (If IA-32e mode is active).		Unique
Register Address: 1D9H, 473	MSR_DEBUGCTLA		
Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 19.13.1, "MSR_DEBUGCTLA MSR."		0, 1, 2, 3, 4, 6	Unique
Register Address: 1DAH, 474	MSR_LASTBRANCH_TOS		
Last Branch Record Stack TOS (R/O) Contains an index (0-3 or 0-15) that points to the top of the last branch record stack (that is, that points the index of the MSR containing the most recent branch record). See Section 19.13.2, "LBR Stack for Processors Based on Intel NetBurst® Microarchitecture," and addresses 1DBH-1DEH and 680H-68FH.		0, 1, 2, 3, 4, 6	Unique
Register Address: 1DBH, 475	MSR_LASTBRANCH_0		
Last Branch Record 0 (R/O) One of four last branch record registers on the last branch record stack. It contains pointers to the source and destination instruction for one of the last four branches, exceptions, or interrupts that the processor took. MSR_LASTBRANCH_0 through MSR_LASTBRANCH_3 at 1DBH-1DEH are available only on family 0FH, models 0H-02H. They have been replaced by the MSRs at 680H-68FH and 6C0H-6CFH. See Section 19.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."		0, 1, 2	Unique

Register Address: 3E1H, 993	MSR_CRU_ESCR5		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
See Section 21.6.3.1, "ESCR MSRs."		0, 1, 2, 3, 4, 6	Shared
Register Address: 3F0H, 1008	MSR_TC_PRECISE_EVENT		
See Section 21.6.3.1, "ESCR MSRs."		0, 1, 2, 3, 4, 6	Shared
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)		
Processor Event Based Sampling (PEBS) (R/W) Controls the enabling of processor event sampling and replay tagging.		0, 1, 2, 3, 4, 6	Shared
12:0	See https://perfmon-events.intel.com/.		
23:13	Reserved.		
24	UOP Tag Enables replay tagging when set.		
25	ENABLE_PEBS_MY_THR (R/W) Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 21.6.4.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is called ENABLE_PEBS in IA-32 processors that do not support Intel Hyper-Threading Technology.		
26	ENABLE_PEBS_OTH_THR (R/W) Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 21.6.4.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is reserved for IA-32 processors that do not support Intel Hyper-Threading Technology.		
63:27	Reserved.		
Register Address: 3F2H, 1010	MSR_PEBS_MATRIX_VERT		
See https://perfmon-events.intel.com/.		0, 1, 2, 3, 4, 6	Shared
Register Address: 400H, 1024	IA32_MC0_CTL		
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		0, 1, 2, 3, 4, 6	Shared
Register Address: 401H, 1025	IA32_MC0_STATUS		
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		0, 1, 2, 3, 4, 6	Shared
Register Address: 402H, 1026	IA32_MC0_ADDR		
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		0, 1, 2, 3, 4, 6	Shared
Register Address: 403H, 1027	IA32_MC0_MISC		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." The IA32_MC0_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		0, 1, 2, 3, 4, 6	Shared
Register Address: 404H, 1028	IA32_MC1_CTL		
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		0, 1, 2, 3, 4, 6	Shared
Register Address: 405H, 1029	IA32_MC1_STATUS		
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		0, 1, 2, 3, 4, 6	Shared
Register Address: 406H, 1030	IA32_MC1_ADDR		
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		0, 1, 2, 3, 4, 6	Shared
Register Address: 407H, 1031	IA32_MC1_MISC		
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." The IA32_MC1_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.			Shared
Register Address: 408H, 1032	IA32_MC2_CTL		
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		0, 1, 2, 3, 4, 6	Shared
Register Address: 409H, 1033	IA32_MC2_STATUS		
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		0, 1, 2, 3, 4, 6	Shared
Register Address: 40AH, 1034	IA32_MC2_ADDR		
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.			
Register Address: 40BH, 1035	IA32_MC2_MISC		
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." The IA32_MC2_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.			
Register Address: 40CH, 1036	IA32_MC3_CTL		
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		0, 1, 2, 3, 4, 6	Shared
Register Address: 40DH, 1037	IA32_MC3_STATUS		
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		0, 1, 2, 3, 4, 6	Shared
Register Address: 40EH, 1038	IA32_MC3_ADDR		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		0, 1, 2, 3, 4, 6	Shared
Register Address: 40FH, 1039	IA32_MC3_MISC		
See Section 17.3.2.4, "IA32_MC**i**_MISC MSRs." The IA32_MC3_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		0, 1, 2, 3, 4, 6	Shared
Register Address: 410H, 1040	IA32_MC4_CTL

Register Address: 481H, 1153	IA32_VMX_PINBASED_CTLS		
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2 and Appendix A.3, "VM-Execution Controls."		3, 4, 6	Unique
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTLS		
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls," and Table 2-2.		3, 4, 6	Unique
Register Address: 483H, 1155	IA32_VMX_EXIT_CTLS		
Capability Reporting Register of VM-Exit Controls (R/O) See Appendix A.4, "VM-Exit Controls," and Table 2-2.		3, 4, 6	Unique
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTLS		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	**Bit Description**	**Model Availability**	**Shared/ Unique[1]**
Capability Reporting Register of VM-Entry Controls (R/O) See Appendix A.5, "VM-Entry Controls," and Table 2-2.		3, 4, 6	Unique
Register Address: 485H, 1157	IA32_VMX_MISC		
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Appendix A.6, "Miscellaneous Data," and Table 2-2.		3, 4, 6	Unique
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0		
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0," and Table 2-2.		3, 4, 6	Unique
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1		
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0," and Table 2-2.		3, 4, 6	Unique
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0		
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4," and Table 2-2.		3, 4, 6	Unique
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1		
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4," and Table 2-2.		3, 4, 6	Unique
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM		
Capability Reporting Register of VMCS Field Enumeration (R/O) See Appendix A.9, "VMCS Enumeration," and Table 2-2.		3, 4, 6	Unique
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLS2		
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls," and Table 2-2.		3, 4, 6	Unique
Register Address: 600H, 1536	IA32_DS_AREA		
DS Save Area (R/W) See Table 2-2 and Section 21.6.3.4, "Debug Store (DS) Mechanism."		0, 1, 2, 3, 4, 6	Unique
Register Address: 680H, 1664	MSR_LASTBRANCH_0_FROM_IP		
Last Branch Record 0 (R/W) One of 16 pairs of last branch record registers on the last branch record stack (680H-68FH). This part of the stack contains pointers to the source instruction for one of the last 16 branches, exceptions, or interrupts taken by the processor. The MSRs at 680H-68FH, 6C0H-6CfH are not available in processor releases before family 0FH, model 03H. These MSRs replace MSRs previously located at 1DBH-1DEH. which performed the same function for early releases. See Section 19.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."		3, 4, 6	Unique
Register Address: 681H, 1665	MSR_LASTBRANCH_1_FROM_IP		
Last Branch Record 1 See description of MSR_LASTBRANCH_0 at 680H.		3, 4, 6	Unique
Register Address: 682H, 1666	MSR_LASTBRANCH_2_FROM_IP		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique[1]
NOTES 1. For HT-enabled processors, there may be more than one logical processors per physical unit. If an MSR is Shared, this means that one MSR is shared between logical processors. If an MSR is unique, this means that each logical processor has its own MSR.			

2.19.1 MSRs Unique to Intel® Xeon® Processor MP with L3 Cache

The MSRs listed in Table 2-64 apply to Intel® Xeon® Processor MP with up to 8MB level three cache. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 3 or 4 (see CPUID instruction for more details).

Table 2-64. MSRs Unique to 64-bit Intel® Xeon® Processor MP with Up to an 8 MB L3 Cache

Register Address: Hex	Register Name		
Register Information		Model Availability	Shared/ Unique
Register Address: 107CCH	MSR_IFSB_BUSQ0		
IFSB BUSQ Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared
Register Address: 107CDH	MSR_IFSB_BUSQ1		
IFSB BUSQ Event Control and Counter Register (R/W)		3, 4	Shared
Register Address: 107CEH	MSR_IFSB_SNPQ0		
IFSB SNPQ Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared
Register Address: 107CFH	MSR_IFSB_SNPQ1		
IFSB SNPQ Event Control and Counter Register (R/W)		3, 4	Shared
Register Address: 107D0H	MSR_EFSB_DRDY0		
EFSB DRDY Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared
Register Address: 107D1H	MSR_EFSB_DRDY1		
EFSB DRDY Event Control and Counter Register (R/W)		3, 4	Shared
Register Address: 107D2H	MSR_IFSB_CTL6		
IFSB Latency Event Control Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared
Register Address: 107D3H	MSR_IFSB_CNTR7		
IFSB Latency Event Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared

The MSRs listed in Table 2-65 apply to Intel® Xeon® Processor 7100 series. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the

presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 6 (See CPUID instruction for more details.). The performance monitoring MSRs listed in Table 2-65 are shared between logical processors in the same core, but are replicated for each core.

Table 2-65. MSRs Unique to Intel® Xeon® Processor 7100 Series

Register Address: Hex	Register Name		
Register Information		Model Availability	Shared/ Unique
Register Address: 107CCH	MSR_EMON_L3_CTR_CTL0		
GBUSQ Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		6	Shared
Register Address: 107CDH	MSR_EMON_L3_CTR_CTL1		
GBUSQ Event Control and Counter Register (R/W)		6	Shared
Register Address: 107CEH	MSR_EMON_L3_CTR_CTL2		
GSNPQ Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		6	Shared
Register Address: 107CFH	MSR_EMON_L3_CTR_CTL3

Register Address: 107D0H	MSR_EMON_L3_CTR_CTL4		
FSB Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		6	Shared
Register Address: 107D1H	MSR_EMON_L3_CTR_CTL5		
FSB Event Control and Counter Register (R/W)		6	Shared
Register Address: 107D2H	MSR_EMON_L3_CTR_CTL6		
FSB Event Control and Counter Register (R/W)		6	Shared
Register Address: 107D3H	MSR_EMON_L3_CTR_CTL7		
FSB Event Control and Counter Register (R/W)		6	Shared

2.20 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Model-specific registers (MSRs) for Intel Core Solo, Intel Core Duo processors, and Dual-core Intel Xeon processor LV are listed in Table 2-66. The column "Shared/Unique" applies to Intel Core Duo processor. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Register Address: 0H, 0	P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors," and Table 2-2.		Unique
Register Address: 1H, 1	P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors," and Table 2-2.		Unique

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Unique
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and Table 2-2.		Unique
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.		Shared
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Unique
Register Address: 2AH, 42	MSR_EBL_CR_POWERON	
Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.		Shared
0	Reserved.	
1	Data Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
2	Response Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
3	MCERR# Drive Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
4	Address Parity Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
6: 5	Reserved.	
7	BINIT# Driver Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
8	Output Tri-state Enabled (R/O) 1 = Enabled; 0 = Disabled.	
9	Execute BIST (R/O) 1 = Enabled; 0 = Disabled.	
10	MCERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled.	
11	Reserved.	
12	BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled.	

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
13	Reserved	
14	1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes	
15	Reserved.	
17:16	APIC Cluster ID (R/O)	
18	System Bus Frequency (R/O) 0 = 100 MHz. 1 = Reserved.	
19	Reserved.	
21: 20	Symmetric Arbitration ID (R/O)	
26:22	Clock Frequency Ratio (R/O)	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in IA-32 Processor (R/W) See Table 2-2.		Unique
Register Address: 40H, 64	MSR_LASTBRANCH_0	
Last Branch Record 0 (R/W) One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the 'to' address. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."		Unique
Register Address: 41H, 65	MSR_LASTBRANCH_1	
Last Branch Record 1 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 42H, 66	MSR_LASTBRANCH_2	
Last Branch Record 2 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 43H, 67	MSR_LASTBRANCH_3	
Last Branch Record 3 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 44H, 68	MSR_LASTBRANCH_4	
Last Branch Record 4 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 45H, 69	MSR_LASTBRANCH_5	
Last Branch Record 5 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 46H, 70	MSR_LASTBRANCH_6	
Last Branch Record 6 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 47H, 71	MSR_LASTBRANCH_7

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Last Branch Record 7 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Unique
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Unique
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Unique
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Unique
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the scalable bus clock speed.		Shared
2:0	▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 101B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B.	
63:3	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: FEH, 254	IA32_MTRRCAP	
See Table 2-2.		Unique
Register Address: 11EH, 281	MSR_BBL_CR_CTL3	
Control Register 3 Used to configure the L2 Cache.		Shared
0	L2 Hardware Enabled (R/O) 1 = If the L2 is hardware-enabled. 0 = Indicates if the L2 is hardware-disabled.	

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
7:1	Reserved.	
8	L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.	
22:9	Reserved.	
23	L2 Not Present (R/O) 0 = L2 Present. 1 = L2 Not Present.	
63:24	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Unique
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Unique
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Unique
Register Address: 179H, 377	IA32_MCG_CAP	
See Table 2-2.		Unique
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Unique
0	RIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.	
1	EIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved	
Register Address: 186H, 390	IA32_PERFEVTSEL0	
See Table 2-2.		Unique
Register Address: 187H, 391	IA32_PERFEVTSEL1	
See Table 2-2.		Unique

Register Address: 199H, 409	IA32_PERF_CTL	
See Table 2-2.		Unique
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2.		Unique
Register Address: 19BH, 411	IA32_THERM_INTERRUPT	
Thermal Interrupt Control (R/W) See Table 2-2 and Section 16.8.2, "Thermal Monitor."		Unique
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2 and Section 16.8.2, "Thermal Monitor".		Unique
Register Address: 19DH, 413	MSR_THERM2_CTL	
Thermal Monitor 2 Control		Unique
15:0	Reserved.	
16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.	
63:16	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Miscellaneous Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
2:0	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2.	Unique
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Shared
9:8	Reserved.	
10	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.	Shared
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Shared

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
12	Reserved.	
13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.	Shared
15:14	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) 1 = Enhanced Intel SpeedStep Technology enabled	Shared
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Shared
19	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2. Setting this bit may cause behavior in software that depends on the availability of CPUID leaves greater than 2.	Shared
33:23	Reserved.	
34	XD Bit Disable (R/W) See Table 2-3.	Shared
63:35	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).		Unique
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in Table 2-2.		Unique
Register Address: 1DDH, 477	MSR_LER_FROM_LIP	
Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 1DEH, 478	MSR_LER_TO_LIP	
Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 200H, 512	MTRRphysBase0

Register Address: 2FFH, 767	IA32_MTRR_DEF_TYPE	
Default Memory Types (R/W) See Table 2-2 and Section 13.11.2.1, "IA32_MTRR_DEF_TYPE MSR."		Unique
Register Address: 400H, 1024	IA32_MC0_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Unique
Register Address: 401H, 1025	IA32_MC0_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 402H, 1026	IA32_MC0_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 404H, 1028	IA32_MC1_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Unique
Register Address: 405H, 1029	IA32_MC1_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 406H, 1030	IA32_MC1_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 408H, 1032	IA32_MC2_CTL	

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Unique
Register Address: 409H, 1033	IA32_MC2_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 40AH, 1034	IA32_MC2_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 40CH, 1036	MSR_MC4_CTL	
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."		Unique
Register Address: 40DH, 1037	MSR_MC4_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 40EH, 1038	MSR_MC4_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 410H, 1040	IA32_MC3_CTL	
IA32_MC3_CTL	See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."	
Register Address: 411H, 1041	IA32_MC3_STATUS	
IA32_MC3_STATUS	See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."	
Register Address: 412H, 1042	MSR_MC3_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 413H, 1043	MSR_MC3_MISC	
Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCi_STATUS register is set.		Unique
Register Address: 414H, 1044	MSR_MC5_CTL	
Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).		Unique
Register Address: 415H, 1045	MSR_MC5_STATUS	
Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.		Unique
Register Address: 416H, 1046	MSR_MC5_ADDR	
Machine Check Error Reporting Register - contains the address of the code or data memory location that produced the machine-check error if the ADDRV flag in the IA32_MCi_STATUS register is set.		Unique
Register Address: 417H, 1047	MSR_MC5_MISC	

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCi_STATUS register is set.		Unique
Register Address: 480H, 1152	IA32_VMX_BASIC	
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2 and Appendix A.1, "Basic VMX Information." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTLS	
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTLS	
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 483H, 1155	IA32_VMX_EXIT_CTLS	
Capability Reporting Register of VM-Exit Controls (R/O) See Appendix A.4, "VM-Exit Controls." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTLS	
Capability Reporting Register of VM-Entry Controls (R/O) See Appendix A.5, "VM-Entry Controls." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Appendix A.6, "Miscellaneous Data." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Appendix A.9, "VMCS Enumeration." (If CPUID.01H:ECX.[bit 5])		Unique
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLS2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls." (If CPUID.01H:ECX.[bit 5] and IA32_VMX_PROCBASED_CTLS[bit 63])		Unique
Register Address: 600H, 1536	IA32_DS_AREA	

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	**Bit Description**	**Shared/ Unique**
DS Save Area (R/W) See Table 2-2 and Section 21.6.3.4, "Debug Store (DS) Mechanism."		Unique
31:0	DS Buffer Management Area Linear address of the first byte of the DS buffer management area.	
63:32	Reserved.	
Register Address: C000_0080H	IA32_EFER	
See Table 2-2.		Unique
10:0	Reserved.	
11	Execute Disable Bit Enable	
63:12	Reserved.	

2.21 MSRS IN THE PENTIUM M PROCESSOR

Model-specific registers (MSRs) for the Pentium M processor are similar to those described in Section 2.22 for P6 family processors. The following table describes new MSRs and MSRs whose behavior has changed on the Pentium M processor.

Table 2-67. MSRs in Pentium M Processors

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
Register Address: 0H, 0	P5_MC_ADDR
See Section 2.23, "MSRs in Pentium Processors."	
Register Address: 1H, 1	P5_MC_TYPE
See Section 2.23, "MSRs in Pentium Processors."	
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER
See Section 19.17, "Time-Stamp Counter," and see Table 2-2.	
Register Address: 17H, 23	IA32_PLATFORM_ID
Platform ID (R) See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.	
Register Address: 2AH, 42	MSR_EBL_CR_POWERON
Processor Hard Power-On Configuration (R/W) Enables and disables processor features. (R) Indicates current processor configuration.	
0	Reserved.
1	Data Error Checking Enable (R) 0 = Disabled. Always 0 on the Pentium M processor.

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
2	Response Error Checking Enable (R) 0 = Disabled. Always 0 on the Pentium M processor.
3	MCERR# Drive Enable (R) 0 = Disabled. Always 0 on the Pentium M processor.
4	Address Parity Enable (R) 0 = Disabled. Always 0 on the Pentium M processor.
6:5	Reserved.
7	BINIT# Driver Enable (R) 1 = Enabled; 0 = Disabled. Always 0 on the Pentium M processor.
8	Output Tri-state Enabled (R/O) 1 = Enabled; 0 = Disabled.
9	Execute BIST (R/O) 1 = Enabled; 0 = Disabled.
10	MCERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled. Always 0 on the Pentium M processor.
11	Reserved.
12	BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled. Always 0 on the Pentium M processor.
13	Reserved.
14	1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes. Always 0 on the Pentium M processor.
15	Reserved.
17:16	APIC Cluster ID (R/O) Always 00B on the Pentium M processor.
18	System Bus Frequency (R/O) 0 = 100 MHz. 1 = Reserved. Always 0 on the Pentium M processor.
19	Reserved.
21: 20	Symmetric Arbitration ID (R/O) Always 00B on the Pentium M processor.
26:22	Clock Frequency Ratio (R/O)
Register Address: 40H, 64	MSR_LASTBRANCH_0

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
Last Branch Record 0 (R/W) One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the to address. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."	
Register Address: 41H, 65	MSR_LASTBRANCH_1
Last Branch Record 1 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 42H, 66	MSR_LASTBRANCH_2
Last Branch Record 2 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 43H, 67	MSR_LASTBRANCH_3
Last Branch Record 3 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 44H, 68	MSR_LASTBRANCH_4
Last Branch Record 4 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 45H, 69	MSR_LASTBRANCH_5
Last Branch Record 5 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 46H, 70	MSR_LASTBRANCH_6
Last Branch Record 6 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 47H, 71	MSR_LASTBRANCH_7
Last Branch Record 7 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 119H, 281	MSR_BBL_CR_CTL
Control Register Used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response.	
63:0	Reserved.
Register Address: 11EH, 281	MSR_BBL_CR_CTL3
Control Register 3 Used to configure the L2 Cache.	
0	L2 Hardware Enabled (R/O) 1 = If the L2 is hardware-enabled. 0 = Indicates if the L2 is hardware-disabled.
4:1	Reserved.

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
5	ECC Check Enable (R/O) This bit enables ECC checking on the cache data bus. ECC is always generated on write cycles. 0 = Disabled (default). 1 = Enabled. For the Pentium M processor, ECC checking on the cache data bus is always enabled.
7:6	Reserved.
8	L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
22:9	Reserved.
23	L2 Not Present (R/O) 0 = L2 Present. 1 = L2 Not Present.
63:24	Reserved.
Register Address: 179H, 377	IA32_MCG_CAP
Read-only register that provides information about the machine-check architecture of the processor.	
7:0	Count (R/O) Indicates the number of hardware unit error reporting banks available in the processor.
8	IA32_MCG_CTL Present (R/O) 1 = Indicates that the processor implements the MSR_MCG_CTL register found at MSR 17BH. 0 = Not supported.
63:9	Reserved.
Register Address: 17AH, 378	IA32_MCG_STATUS
Global Machine Check Status	
0	RIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.
1	EIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
2	MCIP When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
63:3	Reserved.
Register Address: 198H, 408	IA32_PERF_STATUS

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
See Table 2-2.	
Register Address: 199H, 409	IA32_PERF_CTL
See Table 2-2.	
Register Address: 19AH, 410	IA32_CLOCK_MODULATION
Clock Modulation (R/W). See Table 2-2 and Section 16.8.3, "Software Controlled Clock Modulation."	
Register Address: 19BH, 411	IA32_THERM_INTERRUPT
Thermal Interrupt Control (R/W) See Table 2-2 and Section 16.8.2, "Thermal Monitor."	
Register Address: 19CH, 412	IA32_THERM_STATUS
Thermal Monitor Status (R/W) See Table 2-2 and Section 16.8.2, "Thermal Monitor."	
Register Address: 19DH, 413	MSR_THERM2_CTL
Thermal Monitor 2 Control	
15:0	Reserved.
16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.
63:16	Reserved.
Register Address: 1A0H, 416	IA32_MISC_ENABLE
Enable Miscellaneous Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.	
2:0	Reserved.
3	Automatic Thermal Control Circuit Enable (R/W) 1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows processor clocks to be automatically modulated based on the processor's thermal sensor operation. 0 = Disabled (default). The automatic thermal control circuit enable bit determines if the thermal control circuit (TCC) will be activated when the processor's internal thermal sensor determines the processor is about to exceed its maximum operating temperature. When the TCC is activated and TM1 is enabled, the processors clocks will be forced to a 50% duty cycle. BIOS must enable this feature. The bit should not be confused with the on-demand thermal control circuit enable bit.
6:4	Reserved.
7	Performance Monitoring Available (R) 1 = Performance monitoring enabled. 0 = Performance monitoring disabled.

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
9:8	Reserved.
10	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor. 0 = Indicates compatible FERR# signaling behavior. This bit must be set to 1 to support XAPIC interrupt model usage.
	Branch Trace Storage Unavailable (R/O) 1 = Processor doesn't support branch trace storage (BTS) 0 = BTS is supported
12	Processor Event Based Sampling Unavailable (R/O) 1 = Processor does not support processor event based sampling (PEBS); 0 = PEBS is supported. The Pentium M processor does not support PEBS.
15:13	Reserved.
16	Enhanced Intel SpeedStep Technology Enable (R/W) 1 = Enhanced Intel SpeedStep Technology enabled. On the Pentium M processor, this bit may be configured to be read-only.
22:17	Reserved.
23	xTPR Message Disable (R/W) When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority. The default is processor specific.
63:24	Reserved.
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See also: ▪ MSR_LASTBRANCH_0_FROM_IP (at 40H). ▪ Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."	
Register Address: 1D9H, 473	MSR_DEBUGCTLB
Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."	
Register Address: 1DDH, 477	MSR_LER_TO_LIP
Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)," and Section 19.16.2, "Last Branch and Last Exception MSRs."	
Register Address: 1DEH, 478	MSR_LER_FROM_LIP

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)," and Section 19.16.2, "Last Branch and Last Exception MSRs."	
Register Address: 2FFH, 767	IA32_MTRR_DEF_TYPE
Default Memory Types (R/W) Sets the memory type for the regions of physical memory that are not mapped by the MTRRs. See Section 13.11.2.1, "IA32_MTRR_DEF_TYPE MSR."	
Register Address: 400H, 1024	IA32_MC0_CTL
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."	
Register Address: 401H, 1025	IA32_MC0_STATUS
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."	
Register Address: 402H, 1026	IA32_MC0_ADDR
See Section 14.3.2.3., "IA32_MCi_ADDR MSRs". The IA32_MC0_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC0_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 404H, 1028	IA32_MC1_CTL
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."	
Register Address: 405H, 1029	IA32_MC1_STATUS
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."	
Register Address: 406H, 1030	IA32_MC1_ADDR
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 408H, 1032	IA32_MC2_CTL
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."	
Register Address: 409H, 1033	IA32_MC2_STATUS
See Chapter 17.3.2.2, "IA32_MCi_STATUS MSRS."	
Register Address: 40AH, 1034	IA32_MC2_ADDR
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDRV flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 40CH, 1036	MSR_MC4_CTL
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."	
Register Address: 40DH, 1037	MSR_MC4_STATUS
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."	
Register Address: 40EH, 1038	MSR_MC4_ADDR

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 410H, 1040	MSR_MC3_CTL
See Section 17.3.2.1, "IA32_MC**i**_CTL MSRs."	
Register Address: 411H, 1041	MSR_MC3_STATUS
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."	
Register Address: 412H, 1042	MSR_MC3_ADDR
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDRV flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 600H, 1536	IA32_DS_AREA
DS Save Area (R/W) See Table 2-2. Points to the DS buffer management area, which is used to manage the BTS and PEBS buffers. See Section 21.6.3.4, "Debug Store (DS) Mechanism."	
31:0	DS Buffer Management Area Linear address of the first byte of the DS buffer management area.
63:32	Reserved.

2.22 MSRS IN THE P6 FAMILY PROCESSORS

The following MSRs are defined for the P6 family processors. The MSRs in this table that are shaded are available only in the Pentium II and Pentium III processors. Beginning with the Pentium 4 processor, some of the MSRs in this list have been designated as "architectural" and have had their names changed. See Table 2-2 for a list of the architectural MSRs.

Table 2-68. MSRs in the P6 Family Processors

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
Register Address: 0H, 0	P5_MC_ADDR
See Section 2.23, "MSRs in Pentium Processors."	
Register Address: 1H, 1	P5_MC_TYPE
See Section 2.23, "MSRs in Pentium Processors."	
Register Address: 10H, 16	TSC
See Section 19.17, "Time-Stamp Counter."	
Register Address: 17H, 23	IA32_PLATFORM_ID
Platform ID (R) The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.	
49:0	Reserved.

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
52:50	Platform Id (R) Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7
56:53	L2 Cache Latency Read.
59:57	Reserved.
60	Clock Frequency Ratio Read.
63:61	Reserved.
Register Address: 1BH, 27	APIC_BASE
Section 12.4.4, "Local APIC Status and Location."	
7:0	Reserved.
8	Boot Strap Processor Indicator Bit 1 = BSP
10:9	Reserved.
11	APIC Global Enable Bit - Permanent till reset 1 = Enabled. 0 = Disabled.
31:12	APIC Base Address.
63:32	Reserved.
Register Address: 2AH, 42	EBL_CR_POWERON
Processor Hard Power-On Configuration (R/W) Enables and disables processor features, and (R) indicates current processor configuration.	
0	Reserved[1]
1	Data Error Checking Enable (R/W) 1 = Enabled. 0 = Disabled.
2	Response Error Checking Enable FRCERR Observation Enable (R/W) 1 = Enabled. 0 = Disabled.
3	AERR# Drive Enable (R/W) 1 = Enabled. 0 = Disabled.
4	BERR# Enable for Initiator Bus Requests (R/W) 1 = Enabled. 0 = Disabled.

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
5	Reserved.
6	BERR# Driver Enable for Initiator Internal Errors (R/W) 1 = Enabled. 0 = Disabled.
7	BINIT# Driver Enable (R/W) 1 = Enabled. 0 = Disabled.
8	Output Tri-state Enabled (R) 1 = Enabled. 0 = Disabled.
9	Execute BIST (R) 1 = Enabled. 0 = Disabled.
10	AERR# Observation Enabled (R) 1 = Enabled. 0 = Disabled.
11	Reserved.
12	BINIT# Observation Enabled (R) 1 = Enabled. 0 = Disabled.
13	In Order Queue Depth (R) 1 = 1. 0 = 8.
14	1-MByte Power on Reset Vector (R) 1 = 1MByte. 0 = 4GBytes.
15	FRC Mode Enable (R) 1 = Enabled. 0 = Disabled.
17:16	APIC Cluster ID (R)
19:18	System Bus Frequency (R) 00 = 66MHz. 10 = 100Mhz. 01 = 133MHz. 11 = Reserved.
21: 20	Symmetric Arbitration ID (R)
25:22	Clock Frequency Ratio (R)
26	Low Power Mode Enable (R/W)
27	Clock Frequency Ratio
63:28	Reserved.[1]
Register Address: 33H, 51	MSR_TEST_CTRL

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
Test Control Register	
29:0	Reserved.
30	Streaming Buffer Disable
31	Disable LOCK# Assertion for split locked access.
Register Address: 79H, 121	BIOS_UPDT_TRIG
BIOS Update Trigger Register.	
Register Address: 88H, 136	BBL_CR_D0[63:0]
Chunk 0 data register D[63:0]: used to write to and read from the L2.	
Register Address: 89H, 137	BBL_CR_D1
Chunk 1 data register D[63:0]: used to write to and read from the L2.	
Register Address: 8AH, 138	BBL_CR_D2
Chunk 2 data register D[63:0]: used to write to and read from the L2.	
Register Address: 8BH, 139	BIOS_SIGN/BBL_CR_D3
BIOS Update Signature Register or Chunk 3 data register D[63:0]. Used to write to and read from the L2 depending on the usage model.	
Register Address: C1H, 193	PerfCtr0 (PERFCTR0)
Performance Counter Register See Table 2-2.	
Register Address: C2H, 194	PerfCtr1 (PERFCTR1)
Performance Counter Register See Table 2-2.	
Register Address: FEH, 254	MTRRcap
Memory Type Range Registers	
Register Address: 116H, 278	BBL_CR_ADDR
Address register: used to send specified address (A31-A3) to L2 during cache initialization accesses.	
2:0	Reserved; set to 0.
31:3	Address bits [35:3].
63:32	Reserved.
Register Address: 118H, 280	BBL_CR_DECC
Data ECC register D[7:0]: used to write ECC and read ECC to/from L2.	
Register Address: 119H, 281	BBL_CR_CTL
Control register: used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response.	

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
4:0	L2 Command: 01100 = Data Read w/ LRU update (RLU). 01110 = Tag Read w/ Data Read (TRR). 01111 = Tag Inquire (TI). 00010 = L2 Control Register Read (CR). 00011 = L2 Control Register Write (CW). 010 + MESI encode = Tag Write w/ Data Read (TWR). 111 + MESI encode = Tag Write w/ Data Write (TWW). 100 + MESI encode = Tag Write (TW).
6:5	
7	State to L2
9:8	Reserved.
11:10	Way 0 - 00, Way 1 - 01, Way 2 - 10, Way 3 - 11 Way to L2
13:12	Modified - 11,Exclusive - 10, Shared - 01, Invalid - 00 Way from L2
15:14	State from L2.
16	Reserved.
17	L2 Hit.
18	Reserved.
20:19	User supplied ECC.
21	Processor number: [2] Disable = 1. Enable = 0. Reserved.
63:22	Reserved.
Register Address: 11AH, 282	BBL_CR_TRIG
Trigger register: used to initiate a cache configuration accesses access, Write only with Data = 0.	
Register Address: 11BH, 283	BBL_CR_BUSY
Busy register: indicates when a cache configuration accesses L2 command is in progress. D[0] = 1 = BUSY.	
Register Address: 11EH, 286	BBL_CR_CTL3
Control register 3: used to configure the L2 Cache.	
0	L2 Configured (read/write).
4:1	L2 Cache Latency (read/write).
5	ECC Check Enable (read/write).
6	Address Parity Check Enable (read/write).
7	CRTN Parity Check Enable (read/write).
8	L2 Enabled (read/write).

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
10:9	L2 Associativity (read only): 00 = Direct Mapped. 01 = 2 Way. 10 = 4 Way. 11 = Reserved.
12:11	Number of L2 banks (read only).
17:13	Cache size per bank (read/write): 00001 = 256 KBytes. 00010 = 512 KBytes. 00100 = 1 MByte. 01000 = 2 MBytes. 10000 = 4 MBytes.
18	Cache State error checking enable (read/write).
19	Reserved.
22:20	L2 Physical Address Range support: 111 = 64 GBytes. 110 = 32 GBytes. 101 = 16 GBytes. 100 = 8 GBytes. 011 = 4 GBytes. 010 = 2 GBytes. 001 = 1 GByte. 000 = 512 MBytes.
23	L2 Hardware Disable (read only).
24	Reserved.
25	Cache bus fraction (read only).
63:26	Reserved.
Register Address: 174H, 372	SYSENTER_CS_MSR
CS register target for CPL 0 code	
Register Address: 175H, 373	SYSENTER_ESP_MSR
Stack pointer for CPL 0 stack	
Register Address: 176H, 374	SYSENTER_EIP_MSR
CPL 0 code entry point	
Register Address: 179H, 377	MCG_CAP
Machine Check Global Control Register	
Register Address: 17AH, 378	MCG_STATUS
Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.	
Register Address: 17BH, 379	MCG_CTL
Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).	
Register Address: 186H, 390	PerfEvtSel0 (EVNTSEL0)

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
Performance Event Select Register 0 (R/W)	
7:0	Event Select Refer to Performance Counter section for a list of event encodings.
15:8	UMASK (Unit Mask) Unit mask register set to 0 to enable all count options.
16	USER Controls the counting of events at Privilege levels of 1, 2, and 3.
17	OS Controls the counting of events at Privilege level of 0.
18	E Occurrence/Duration Mode Select: 1 = Occurrence. 0 = Duration.
19	PC Enabled the signaling of performance counter overflow via BP0 pin.
20	INT Enables the signaling of counter overflow via input to APIC: 1 = Enable. 0 = Disable.
22	ENABLE Enables the counting of performance events in both counters: 1 = Enable. 0 = Disable.
23	INV Inverts the result of the CMASK condition: 1 = Inverted. 0 = Non-Inverted.
31:24	CMASK (Counter Mask)
Register Address: 187H, 391	PerfEvtSel1 (EVNTSEL1)
Performance Event Select for Counter 1 (R/W)	
7:0	Event Select Refer to Performance Counter section for a list of event encodings.
15:8	UMASK (Unit Mask) Unit mask register set to 0 to enable all count options.
16	USER Controls the counting of events at Privilege levels of 1, 2, and 3.
17	OS Controls the counting of events at Privilege level of 0.

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
18	E Occurrence/Duration Mode Select: 1 = Occurrence. 0 = Duration.
19	PC Enabled the signaling of performance counter overflow via BP0 pin.
20	INT Enables the signaling of counter overflow via input to APIC. 1 = Enable. 0 = Disable.
23	INV Inverts the result of the CMASK condition. 1 = Inverted. 0 = Non-Inverted.
31:24	CMASK (Counter Mask)
Register Address: 1D9H, 473	DEBUGCTLMSR
Enables last branch, interrupt, and exception recording; taken branch breakpoints; the breakpoint reporting pins; and trace messages. This register can be written to using the WRMSR instruction, when operating at privilege level 0 or when in real-address mode.	
0	Enable/Disable Last Branch Records
1	Branch Trap Flag
2	Performance Monitoring/Break Point Pins
3	Performance Monitoring/Break Point Pins
4	Performance Monitoring/Break Point Pins
5	Performance Monitoring/Break Point Pins
6	Enable/Disable Execution Trace Messages
31:7	Reserved.
Register Address: 1DBH, 475	LASTBRANCHFROMIP
32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.	
Register Address: 1DCH, 476	LASTBRANCHTOIP
32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.	
Register Address: 1DDH, 477	LASTINTFROMIP
Last INT from IP	
Register Address: 1DEH, 478	LASTINTTOIP
Last INT to IP	
Register Address: 200H, 512	MTRRphysBase0
Memory Type Range Registers	
Register Address: 201H, 513	MTRRphysMask0
Memory Type Range Registers	

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
Register Address: 202H, 514	MTRRphysBase1
Memory Type Range Registers	
Register Address: 203H, 515	MTRRphysMask1
Memory Type Range Registers	
Register Address: 204H, 516	MTRRphysBase2
Memory Type Range Registers	
Register Address: 205H, 517	MTRRphysMask2
Memory Type Range Registers	
Register Address: 206H, 518	MTRRphysBase3
Memory Type Range Registers

Register Address: 2FFH, 767	MTRRdefType
Memory Type Range Registers	
2:0	Default memory type
10	Fixed MTRR enable
11	MTRR Enable
Register Address: 400H, 1024	MC0_CTL
Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).	
Register Address: 401H, 1025	MC0_STATUS
Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.	
15:0	MC_STATUS_MCACOD
31:16	MC_STATUS_MSCOD
57	MC_STATUS_DAM
58	MC_STATUS_ADDRV
59	MC_STATUS_MISCV
60	MC_STATUS_EN. (Note: For MC0_STATUS only, this bit is hardcoded to 1.)
61	MC_STATUS_UC
62	MC_STATUS_O
63	MC_STATUS_V
Register Address: 402H, 1026	MC0_ADDR
Register Address: 403H, 1027	MC0_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
Register Address: 404H, 1028	MC1_CTL

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	**Bit Description**
Register Address: 405H, 1029	MC1_STATUS
Bit definitions same as MC0_STATUS.	
Register Address: 406H, 1030	MC1_ADDR
Register Address: 407H, 1031	MC1_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
Register Address: 408H, 1032	MC2_CTL
Register Address: 409H, 1033	MC2_STATUS
Bit definitions same as MC0_STATUS.	
Register Address: 40AH, 1034	MC2_ADDR
Register Address: 40BH, 1035	MC2_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
Register Address: 40CH, 1036	MC4_CTL
Register Address: 40DH, 1037	MC4_STATUS
Bit definitions same as MC0_STATUS, except bits 0, 4, 57, and 61 are hardcoded to 1.	
Register Address: 40EH, 1038	MC4_ADDR
Defined in MCA architecture but not implemented in P6 Family processors.	
Register Address: 40FH, 1039	MC4_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
Register Address: 410H, 1040	MC3_CTL
Register Address: 411H, 1041	MC3_STATUS
Bit definitions same as MC0_STATUS.	
Register Address: 412H, 1042	MC3_ADDR
Register Address: 413H, 1043	MC3_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	

NOTES

1. Bit 0 of this register has been redefined several times, and is no longer used in P6 family processors.
2. The processor number feature may be disabled by setting bit 21 of the BBL_CR_CTL MSR (model-specific register address 119h) to "1". Once set, bit 21 of the BBL_CR_CTL may not be cleared. This bit is write-once. The processor number feature will be disabled until the processor is reset.
3. The Pentium III processor will prevent FSB frequency overclocking with a new shutdown mechanism. If the FSB frequency selected is greater than the internal FSB frequency the processor will shutdown. If the FSB selected is less than the internal FSB frequency the BIOS may choose to use bit 11 to implement its own shutdown policy.

2.23 MSRS IN PENTIUM PROCESSORS

The following MSRs are defined for the Pentium processors. The P5_MC_ADDR, P5_MC_TYPE, and TSC MSRs (named IA32_P5_MC_ADDR, IA32_P5_MC_TYPE, and IA32_TIME_STAMP_COUNTER in the Pentium 4 processor) are architectural; that is, code that accesses these registers will run on Pentium 4 and P6 family processors without generating exceptions (see Section 2.1, "Architectural MSRs"). The CESR, CTR0, and CTR1 MSRs are unique to Pentium processors; code that accesses these registers will generate exceptions on Pentium 4 and P6 family processors.

Table 2-69. MSRs in the Pentium Processor

Register Address: Hex, Decimal Register Information	Register Name
Register Address: 0H, 0	P5_MC_ADDR
See Section 17.10.2, "Pentium Processor Machine-Check Exception Handling."	
Register Address: 1H, 1	P5_MC_TYPE
See Section 17.10.2, "Pentium Processor Machine-Check Exception Handling."	
Register Address: 10H, 16	TSC
See Section 19.17, "Time-Stamp Counter."	
Register Address: 11H, 17	CESR
See Section 21.6.9.1, "Control and Event Select Register (CESR)."	
Register Address: 12H, 18	CTR0
Section 21.6.9.3, "Events Counted."	
Register Address: 13H, 19	CTR1
Section 21.6.9.3, "Events Counted."
