 - If the instruction does not cause a fault, an MTF VM exit is pending on the instruction boundary following execution of that instruction. If the instruction is INT1, INT3, or INTO, this boundary follows delivery of any software exception. If the instruction is INT *n*, this boundary follows delivery of a software interrupt. If the instruction is HLT, the MTF VM exit will be from the HLT activity state.

No MTF VM exit occurs if another VM exit occurs before reaching the instruction boundary on which an MTF VM exit would be pending (e.g., due to an exception or triple fault).

An MTF VM exit occurs on the instruction boundary on which it is pending unless a higher priority event takes precedence or the MTF VM exit is blocked due to the activity state:

- System-management interrupts (SMIs), INIT signals, and higher priority events take priority over MTF VM exits. MTF VM exits take priority over debug-trap exceptions and lower priority events.
- No MTF VM exit occurs if the processor is in either the shutdown activity state or wait-for-SIPI activity state. If a non-maskable interrupt subsequently takes the logical processor out of the shutdown activity state without causing a VM exit, an MTF VM exit is pending after delivery of that interrupt.

1. This item includes the cases of an invalid opcode exception—#UD—generated by the UD0, UD1, UD2, and UDB instructions and a BOUND-range exceeded exception—#BR—generated by the BOUND instruction.

Special treatment may apply to Intel SGX instructions or if the logical processor is in enclave mode. See Section 42.2 for details.

27.5.3 Translation of Guest-Physical Addresses Using EPT

The extended page-table mechanism (EPT) is a feature that can be used to support the virtualization of physical memory. When EPT is in use, certain physical addresses are treated as guest-physical addresses and are not used to access memory directly. Instead, guest-physical addresses are translated by traversing a set of EPT paging structures to produce physical addresses that are used to access memory.

Details of the EPT mechanism are given in Section 30.3.

27.5.4 Translation of Guest-Physical Addresses Used by Intel Processor Trace

As described in Chapter 35, Intel® Processor Trace (Intel PT) captures information about software execution using dedicated hardware facilities.

Intel PT can be configured so that the trace output is written to memory using physical addresses. For example, when the ToPA (table of physical addresses) output mechanism is used, the `IA32_RTIT_OUTPUT_BASE` MSR contains the physical address of the base of the current ToPA. Each entry in that table contains the physical address of an output region in memory. When an output region becomes full, the ToPA output mechanism directs subsequent trace output to the next output region as indicated in the ToPA.

When the “Intel PT uses guest physical addresses” VM-execution control is 1, the logical processor treats the addresses used by Intel PT (the output addresses as well as those used to discover the output addresses) as guest-physical addresses, translating to physical addresses using EPT before trace output is written to memory.

Translating these addresses through EPT implies that the trace-output mechanism may cause EPT violations and VM exits; details are provided in Section 27.5.4.1. Section 27.5.4.2 describes a mechanism that ensures that these VM exits do not cause loss of trace data.

27.5.4.1 Guest-Physical Address Translation for Intel PT: Details

When the “Intel PT uses guest physical addresses” VM-execution control is 1, the addresses used by Intel PT are treated as guest-physical addresses and translated using EPT. These addresses include the addresses of the output regions as well as the addresses of the ToPA entries that contain the output-region addresses.

Translation of accesses by the trace-output process may result in EPT violations or EPT misconfigurations (Section 30.3.3), resulting in VM exits. EPT violations resulting for the trace-output process always cause VM exits and are never converted to virtualization exceptions (Section 27.5.7.1).

If no EPT violation or EPT misconfiguration occurs and if page-modification logging (Section 30.3.6) is enabled, the address of an output region may be added to the page-modification log. If the log is full, a page-modification log-full event occurs, resulting in a VM exit.

If the “virtualize APIC accesses” VM-execution control is 1, a guest-physical address used by the trace-output process may be translated to an address on the APIC-access page. In this case, the access by the trace-output process causes an APIC-access VM exit as discussed in Section 31.4.6.1.

27.5.4.2 Trace-Address Pre-Translation (TAPT)

Because it buffers trace data produced by Intel PT before it is written to memory, the processor ensures that buffered data is not lost when a VM exit disables Intel PT. Specifically, the processor ensures that there is sufficient space left in the current output page for the buffered data. If this were not done, buffered trace data could be lost and the resulting trace corrupted.

To prevent the loss of buffered trace data, the processor uses a mechanism called **trace-address pre-translation (TAPT)**. With TAPT, the processor translates using EPT the guest-physical address of the current output region before that address would be used to write buffered trace data to memory.

Because of TAPT, no translation (and thus no EPT violation) occurs at the time output is written to memory; the writes to memory use translations that were cached as part of TAPT. (The details given in Section 27.5.4.1 apply to TAPT.) TAPT ensures that, if a write to the output region would cause an EPT violation, the resulting VM exit is delivered at the time of TAPT, before the region would be used. This allows software to resolve the EPT violation at that time and ensures that, when it is necessary to write buffered trace data to memory, that data will not be lost due to an EPT violation.

TAPT (and resulting VM exits) may occur at any of the following times:

- When software in VMX non-root operation enables tracing by loading the IA32_RTIT_CTL MSR to set the TraceEn bit, using the WRMSR instruction or the XRSTORS instruction.
Any VM exit resulting from TAPT in this case is trap-like: the WRMSR or XRSTORS completes before the VM exit occurs (for example, the value of CS:RIP saved in the guest-state area of the VMCS references the next instruction).
- At an instruction boundary when one output region becomes full and Intel PT transitions to the next output region.
VM exits resulting from TAPT in this case take priority over any pending debug exceptions. Such a VM exit will save information about such exceptions in the guest-state area of the VMCS.
- As part of a VM entry that enables Intel PT. See Section 28.5 for details.

TAPT may translate not only the guest-physical address of the current output region but those of subsequent output regions as well. (Doing so may provide better protection of trace data.) This implies that any VM exits resulting from TAPT may result from the translation of output-region addresses other than that of the current output region.

27.5.5 APIC Virtualization

APIC virtualization is a collection of features that can be used to support the virtualization of interrupts and the Advanced Programmable Interrupt Controller (APIC). When APIC virtualization is enabled, the processor emulates many accesses to the APIC, tracks the state of the virtual APIC, and delivers virtual interrupts — all in VMX non-root operation without a VM exit.

Details of the APIC virtualization are given in Chapter 31.

27.5.6 VM Functions

A **VM function** is an operation provided by the processor that can be invoked from VMX non-root operation without a VM exit. VM functions are enabled and configured by the settings of different fields in the VMCS. Software in VMX non-root operation invokes a VM function with the **VMFUNC** instruction; the value of EAX selects the specific VM function being invoked.

Section 27.5.6.1 explains how VM functions are enabled. Section 27.5.6.2 specifies the behavior of the VMFUNC instruction. Section 27.5.6.3 describes a specific VM function called **EPTP switching**.

27.5.6.1 Enabling VM Functions

Software enables VM functions generally by setting the “enable VM functions” VM-execution control. A specific VM function is enabled by setting the corresponding VM-function control.

Suppose, for example, that software wants to enable EPTP switching (VM function 0; see Section 26.6.14). To do so, it must set the “activate secondary controls” VM-execution control (bit 31 of the primary processor-based VM-execution controls), the “enable VM functions” VM-execution control (bit 13 of the secondary processor-based VM-execution controls) and the “EPTP switching” VM-function control (bit 0 of the VM-function controls).

27.5.6.2 General Operation of the VMFUNC Instruction

The VMFUNC instruction causes an invalid-opcode exception (#UD) if the “enable VM functions” VM-execution controls is 0¹ or the value of EAX is greater than 63 (only VM functions 0–63 can be enable). Otherwise, the instruc-

tion causes a VM exit if the bit at position EAX is 0 in the VM-function controls (the selected VM function is not enabled). If such a VM exit occurs, the basic exit reason used is 59 (3BH), indicating “VMFUNC”, and the length of the VMFUNC instruction is saved into the VM-exit instruction-length field. If the instruction causes neither an invalid-opcode exception nor a VM exit due to a disabled VM function, it performs the functionality of the VM function specified by the value in EAX.

Individual VM functions may perform additional fault checking (e.g., one might cause a general-protection exception if $CPL > 0$). In addition, specific VM functions may include checks that might result in a VM exit. If such a VM exit occurs, VM-exit information is saved as described in the previous paragraph. The specification of a VM function may indicate that additional VM-exit information is provided.

The specific behavior of the EPTP-switching VM function (including checks that result in VM exits) is given in Section 27.5.6.3.

27.5.6.3 EPTP Switching

EPTP switching is VM function 0. This VM function allows software in VMX non-root operation to load a new value for the EPT pointer (EPTP), thereby establishing a different EPT paging-structure hierarchy (see Section 30.3 for details of the operation of EPT). Software is limited to selecting from a list of potential EPTP values configured in advance by software in VMX root operation.

Specifically, the value of ECX is used to select an entry from the EPTP list, the 4-KByte structure referenced by the EPTP-list address (see Section 26.6.14; because this structure contains 512 8-Byte entries, VMFUNC causes a VM exit if $ECX \geq 512$). The EPTP value in the selected entry is evaluated to determine whether it is valid for EPTP switching: a value is valid if (1) it is the same as the current EPTP value in bits 5:3 (these bits specify the EPT page-walk length); and (2) it would not cause VM entry to fail (see Section 28.2.1.1). If the value is invalid, a VM exit occurs. Otherwise, the value is stored in the EPTP field of the current VMCS and is used for subsequent accesses using guest-physical addresses. The following pseudocode provides details:

```
IF ECX ≥ 512
    THEN VM exit;
ELSE
    tent_EPTP := 8 bytes from EPTP-list address + 8 * ECX;
    IF tent_EPTP is not a valid EPTP value (would cause VM entry to fail if in EPTP or change EPT page-walk length)
        THEN VM exit;
    ELSE
        write tent_EPTP to the EPTP field in the current VMCS;
        use tent_EPTP as the new EPTP value for address translation;
        IF processor supports the 1-setting of the “EPT-violation #VE” VM-execution control
            THEN
                write ECX[15:0] to EPTP-index field in current VMCS;
                use ECX[15:0] as EPTP index for subsequent EPT-violation virtualization exceptions (see Section 27.5.7.2);
        FI;
    FI;
FI;
```

Execution of the EPTP-switching VM function does not modify the state of any registers; no flags are modified.

If the “Intel PT uses guest physical addresses” VM-execution control is 1 and $IA32\_RTIT\_CTL.TraceEn = 1$, any execution of the EPTP-switching VM function causes a VM exit.¹

As noted in Section 27.5.6.2, an execution of the EPTP-switching VM function that causes a VM exit (as specified above), uses the basic exit reason 59, indicating “VMFUNC”. The length of the VMFUNC instruction is saved into the VM-exit instruction-length field. No additional VM-exit information is provided.

1. “Enable VM functions” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the “enable VM functions” VM-execution control were 0. See Section 26.6.2.

1. Such a VM exit ensures the proper recording of trace data that might otherwise be lost during the change of EPT paging-structure hierarchy. Software handling the VM exit can change emulate the VM function and then resume the guest.

An execution of VMFUNC loads EPTP from the EPTP list (and thus does not cause a fault or VM exit) is called an **EPTP-switching VMFUNC**. After an EPTP-switching VMFUNC, control passes to the next instruction. The logical processor starts creating and using guest-physical and combined mappings associated with the new value of bits 51:12 of EPTP; the combined mappings created and used are associated with the current VPID and PCID (these are not changed by VMFUNC).¹ If the “enable VPID” VM-execution control is 0, an EPTP-switching VMFUNC invalidates combined mappings associated with VPID 0000H (for all PCIDs and for all EPTRTA values, where EPTRTA is the value of bits 51:12 of EPTP).

Because an EPTP-switching VMFUNC may change the translation of guest-physical addresses, it may affect use of the guest-physical address in CR3. The EPTP-switching VMFUNC cannot itself cause a VM exit due to an EPT violation or an EPT misconfiguration due to the translation of that guest-physical address through the new EPT paging structures. The following items provide details that apply if CR0.PG = 1:

- If 32-bit paging or 4-level paging² is in use (either CR4.PAE = 0 or IA32_EFER.LMA = 1), the next memory access with a linear address uses the translation of the guest-physical address in CR3 through the new EPT paging structures. As a result, this access may cause a VM exit due to an EPT violation or an EPT misconfiguration encountered during that translation.
- If PAE paging is in use (CR4.PAE = 1 and IA32_EFER.LMA = 0), an EPTP-switching VMFUNC **does not** load the four page-directory-pointer-table entries (PDPTEs) from the guest-physical address in CR3. The logical processor continues to use the four guest-physical addresses already present in the PDPTEs. The guest-physical address in CR3 is not translated through the new EPT paging structures (until some operation that would load the PDPTEs).

The EPTP-switching VMFUNC cannot itself cause a VM exit due to an EPT violation or an EPT misconfiguration encountered during the translation of a guest-physical address in any of the PDPTEs. A subsequent memory access with a linear address uses the translation of the guest-physical address in the appropriate PDPTE through the new EPT paging structures. As a result, such an access may cause a VM exit due to an EPT violation or an EPT misconfiguration encountered during that translation.

If an EPTP-switching VMFUNC establishes an EPTP value that enables accessed and dirty flags for EPT (by setting bit 6), subsequent memory accesses may fail to set those flags as specified if there has been no appropriate execution of INVEPT since the last use of an EPTP value that does not enable accessed and dirty flags for EPT (because bit 6 is clear) and that is identical to the new value on bits 51:12.

If the processor supports the 1-setting of the “EPT-violation #VE” VM-execution control, an EPTP-switching VMFUNC loads the value in ECX[15:0] into to EPTP-index field in current VMCS. Subsequent EPT-violation virtualization exceptions will save this value into the virtualization-exception information area (see Section 27.5.7.2).

27.5.7 Virtualization Exceptions

A **virtualization exception** is a new processor exception. It uses vector 20 and is abbreviated #VE.

A virtualization exception can occur only in VMX non-root operation. Virtualization exceptions occur only with certain settings of certain VM-execution controls. Generally, these settings imply that certain conditions that would normally cause VM exits instead cause virtualization exceptions

In particular, the 1-setting of the “EPT-violation #VE” VM-execution control causes some EPT violations to generate virtualization exceptions instead of VM exits. Section 27.5.7.1 provides the details of how the processor determines whether an EPT violation causes a virtualization exception or a VM exit.

When the processor encounters a virtualization exception, it saves information about the exception to the virtualization-exception information area; see Section 27.5.7.2.

After saving virtualization-exception information, the processor delivers a virtualization exception as it would any other exception; see Section 27.5.7.3 for details.

1. If the “enable VPID” VM-execution control is 0, the current VPID is 0000H; if CR4.PCIDE = 0, the current PCID is 000H.

2. Earlier versions of this manual used the term “IA-32e paging” to identify 4-level paging.

27.5.7.1 Convertible EPT Violations

If the “EPT-violation #VE” VM-execution control is 0 (e.g., on processors that do not support this feature), EPT violations always cause VM exits. If instead the control is 1, certain EPT violations may be converted to cause virtualization exceptions instead; such EPT violations are **convertible**.

The values of certain EPT paging-structure entries determine which EPT violations are convertible. Specifically, bit 63 of certain EPT paging-structure entries may be defined to mean **suppress #VE**:

- If bits 2:0 of an EPT paging-structure entry are all 0, the entry is not **present**.¹ If the processor encounters such an entry while translating a guest-physical address, it causes an EPT violation. The EPT violation is convertible if and only if bit 63 of the entry is 0.
- If an EPT paging-structure entry is present, the following cases apply:
 - If the value of the EPT paging-structure entry is not supported, the entry is **misconfigured**. If the processor encounters such an entry while translating a guest-physical address, it causes an EPT misconfiguration (not an EPT violation). EPT misconfigurations always cause VM exits.
 - If the value of the EPT paging-structure entry is supported, the following cases apply:
 - If bit 7 of the entry is 1, or if the entry is an EPT PTE, the entry maps a page. If the processor uses such an entry to translate a guest-physical address, and if an access to that address causes an EPT violation, the EPT violation is convertible if and only if bit 63 of the entry is 0.
 - If bit 7 of the entry is 0 and the entry is not an EPT PTE, the entry references another EPT paging structure. The processor does not use the value of bit 63 of the entry to determine whether any subsequent EPT violation is convertible.

If an access to a guest-physical address causes an EPT violation, bit 63 of exactly one of the EPT paging-structure entries used to translate that address is used to determine whether the EPT violation is convertible: either a entry that is not present (if the guest-physical address does not translate to a physical address) or an entry that maps a page (if it does).

A convertible EPT violation instead causes a virtualization exception if the following all hold:

- CR0.PE = 1;
- the logical processor is not in the process of delivering an event through the IDT;
- the EPT violation did not cause a shadow stack to become prematurely busy (see Section 27.4.3);
- the EPT violation does not result from the output process of Intel Processor Trace (Section 27.5.4); and
- the 32 bits at offset 4 in the virtualization-exception information area are all 0.

Delivery of virtualization exceptions writes the value FFFFFFFFH to offset 4 in the virtualization-exception information area (see Section 27.5.7.2). Thus, once a virtualization exception occurs, another can occur only if software clears this field.

27.5.7.2 Virtualization-Exception Information

Virtualization exceptions save data into the virtualization-exception information area (see Section 26.6.19). Table 27-23 enumerates the data saved and the format of the area.

Table 27-23. Format of the Virtualization-Exception Information Area

Byte Offset	Contents
0	The 32-bit value that would have been saved into the VMCS as an exit reason had a VM exit occurred instead of the virtualization exception. For EPT violations, this value is 48 (00000030H)
4	FFFFFFFFH

1. If the “mode-based execute control for EPT” VM-execution control is 1, an EPT paging-structure entry is present if any of bits 2:0 or bit 10 is 1.

Table 27-23. Format of the Virtualization-Exception Information Area (Contd.)

Byte Offset	Contents
8	The 64-bit value that would have been saved into the VMCS as an exit qualification had a VM exit occurred instead of the virtualization exception
16	The 64-bit value that would have been saved into the VMCS as a guest-linear address had a VM exit occurred instead of the virtualization exception
24	The 64-bit value that would have been saved into the VMCS as a guest-physical address had a VM exit occurred instead of the virtualization exception
32	The current 16-bit value of the EPTP index VM-execution control (see Section 26.6.19 and Section 27.5.6.3)

A VMM may allow guest software to access the virtualization-exception information area. If it does, the guest software may modify that memory (e.g., to clear the 32-bit value at offset 4; see Section 27.5.7.1). (This is an exception to the general requirement given in Section 26.11.4.)

27.5.7.3 Delivery of Virtualization Exceptions

After saving virtualization-exception information, the processor treats a virtualization exception as it does other exceptions:

- If bit 20 (#VE) is 1 in the exception bitmap in the VMCS, a virtualization exception causes a VM exit (see below). If the bit is 0, the virtualization exception is delivered using gate descriptor 20 in the IDT.
- Virtualization exceptions produce no error code. Delivery of a virtualization exception pushes no error code on the stack.
- With respect to double faults, virtualization exceptions have the same severity as page faults. If delivery of a virtualization exception encounters a nested fault that is either contributory or a page fault, a double fault (#DF) is generated. See Chapter 7, “Interrupt 8—Double Fault Exception (#DF)” in Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

It is not possible for a virtualization exception to be encountered while delivering another exception (see Section 27.5.7.1).

If a virtualization exception causes a VM exit directly (because bit 20 is 1 in the exception bitmap), information about the exception is saved normally in the VM-exit interruption information field in the VMCS (see Section 29.2.2). Specifically, the event is reported as a hardware exception with vector 20 and no error code. Bit 12 of the field (NMI unblocking due to IRET) is set normally.

If a virtualization exception causes a VM exit indirectly (because bit 20 is 0 in the exception bitmap and delivery of the exception generates an event that causes a VM exit), information about the exception is saved normally in the IDT-vectoring information field in the VMCS (see Section 29.2.4). Specifically, the event is reported as a hardware exception with vector 20 and no error code.

27.5.8 PASID Translation

The ENQCMD and ENQCMLS instructions each performs a 64-byte enqueue store that includes a 20-bit PASID value in bits 19:0. For ENQCMD, the PASID is normally the value of IA32_PASID[19:0], while for ENQCMLS, the PASID is normally read from memory.

If the “PASID translation” VM-execution control is 1, the PASID value identified in the previous paragraph is treated as a **guest PASID**. PASID translation converts this guest PASID to a 20-bit **host PASID**. After this translation, the enqueue store is performed, using the host PASID in place of the guest PASID.

PASID translation is implemented by two hierarchies of data structures (**PASID-translation hierarchies**) configured by a VMM. Guest PASIDs 00000H to 7FFFFH are translated through the low PASID-translation hierarchy, while guest PASIDs 80000 to FFFFFH are translated through the high PASID-translation hierarchy.

The root of each PASID-translation hierarchy is a 4-KByte **PASID directory**. The low PASID directory is located at the low PASID directory address, and the high PASID directory is located at the high PASID directory address (these physical addresses are VM-execution control fields in the VMCS). A PASID directory comprises 512 8-byte entries, each of which has the following format:

- Bit 0 is the entry's present bit. The entry is used only if this bit is 1.
- Bits 11:1 are reserved and must be 0.
- Bits **MAXPHYADDR-1:12** specify the 4-KByte aligned address of a PASID table (see below), where **MAXPHYADDR** is defined as follows:
 - Usually, **MAXPHYADDR** is the processor's supported physical-address width as enumerated in **CPUID.80000008H:EAX[7:0]** (this width is at most 52).
 - If **IA32_TME_ACTIVATE[0] = 1** (indicating that TME has been configured), **MAXPHYADDR** is reduced by the value of **IA32_TME_ACTIVATE[39:36]** when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM.¹
- Bits 63:**MAXPHYADDR** are reserved and must be 0.

A PASID-translation hierarchy also includes up to 512 4-KByte **PASID tables**; each of these is referenced by a PASID directory entry (see above). A PASID table comprises 1024 4-byte entries, each of which has the following format:

- Bits 19:0 are the host PASID specified by the entry.
- Bits 30:20 are reserved and must be 0.
- Bit 31 is the entry's valid bit. The entry is used only if this bit is 1.

When PASID translation is enabled, the guest PASID determined by the instruction (see above) is converted to a host PASID using the following process:

- If bit 19 of guest PASID is clear, the low PASID directory is used; otherwise, the high PASID directory is used.
- Bits 18:10 of the guest PASID select an entry from the PASID directory. A VM exit occurs if the entry's present bit is clear or if any reserved bit is set. Otherwise, bits **MAXPHYADDR-1:0** of the entry (with bit 0 cleared) contain the physical address of a PASID table.
- Bits 9:0 of the guest PASID select an entry from the PASID table. A VM exit occurs if the entry's valid bit is clear or if any reserved bit is set. Otherwise, bits 19:0 of the entry are the host PASID.

If PASID translation results in a VM exit (due to a present or valid bit being clear, or a reserved bit being set), the instruction does not complete and no enqueue store is performed.

27.6 UNRESTRICTED GUESTS

The first processors to support VMX operation require **CR0.PE** and **CR0.PG** to be 1 in VMX operation (see Section 25.8). This restriction implies that guest software cannot be run in unpaged protected mode or in real-address mode. Later processors support a VM-execution control called "unrestricted guest".² If this control is 1, **CR0.PE** and **CR0.PG** may be 0 in VMX non-root operation. Such processors allow guest software to run in unpaged protected mode or in real-address mode. The following items describe the behavior of such software:

- The **MOV CR0** instructions does not cause a general-protection exception simply because it would set either **CR0.PE** and **CR0.PG** to 0. See Section 27.3 for details.
- A logical processor treats the values of **CR0.PE** and **CR0.PG** in VMX non-root operation just as it does outside VMX operation. Thus, if **CR0.PE = 0**, the processor operates as it does normally in real-address mode (for example, it uses the 16-bit **interrupt table** to deliver interrupts and exceptions). If **CR0.PG = 0**, the processor operates as it does normally when paging is disabled.

1. **IA32_TME_ACTIVATE[39:36]** is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than **IA32_TME_ACTIVATE[35:32]**, which is the number physical-address bits used for key identifiers generally.

2. "Unrestricted guest" is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the "unrestricted guest" VM-execution control were 0. See Section 26.6.2.

- Processor operation is modified by the fact that the processor is in VMX non-root operation and by the settings of the VM-execution controls just as it is in protected mode or when paging is enabled. Instructions, interrupts, and exceptions that cause VM exits in protected mode or when paging is enabled also do so in real-address mode or when paging is disabled. The following examples should be noted:
 - If CR0.PG = 0, page faults do not occur and thus cannot cause VM exits.
 - If CR0.PE = 0, invalid-TSS exceptions do not occur and thus cannot cause VM exits.
 - If CR0.PE = 0, the following instructions cause invalid-opcode exceptions and do not cause VM exits: INVEPT, INVVPID, LLDT, LTR, SLDT, STR, VMCLEAR, VMLAUNCH, VMPTRLD, VMPTRST, VMREAD, VMRESUME, VMWRITE, VMXOFF, and VMXON.
- If CR0.PG = 0, each linear address is passed directly to the EPT mechanism for translation to a physical address.¹ The guest memory type passed on to the EPT mechanism is WB (writeback).

1. As noted in Section 28.2.1.1, the “enable EPT” VM-execution control must be 1 if the “unrestricted guest” VM-execution control is 1.

21. Updates to Chapter 28, Volume 3B

Change bars and violet text show changes to Chapter 28 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

Changes to this chapter:

- Updated Section 28.2.1, "Checks on VMX Controls" and its subsections 28.2.1.1, 28.3.1.2, and 28.2.1.3 for SEAM.
- Updated Section 28.2.2, "Checks on Host Control Registers, MSRs, and SSP" with field width information for SEAM.
- In Section 28.3.1.1, "Checks on Guest Control Registers, Debug Registers, and MSRs", provided details for field width of the CR3 field in the list of checks performed on processors that support Intel 64 architecture.
- In Section 28.3.1.5, "Checks on Guest Non-Register State", provided additional information on field width for the VMCS link pointer in the list of checks performed on fields in the guest-state area corresponding to non-register state.
- In Section 28.7.2, "Activity State", updated reference to Intel® Trusted Execution Technology Measured Launched Environment Programming Guide.

Software can enter VMX non-root operation using either of the VM-entry instructions VMLAUNCH and VMRESUME. VMLAUNCH can be used only with a VMCS whose launch state is clear and VMRESUME can be used only with a VMCS whose the launch state is launched. VMLAUNCH should be used for the first VM entry after VMCLEAR; VMRESUME should be used for subsequent VM entries with the same VMCS.

Each VM entry performs the following steps in the order indicated:

1. Basic checks are performed to ensure that VM entry can commence (Section 28.1).
2. The control and host-state areas of the VMCS are checked to ensure that they are proper for supporting VMX non-root operation and that the VMCS is correctly configured to support the next VM exit (Section 28.2).
3. The following are performed in parallel or in any order (Section 28.3):
 - The guest-state area of the VMCS is checked to ensure that, after the VM entry completes, the state of the logical processor is consistent with IA-32 and Intel 64 architectures.
 - Processor state is loaded from the guest-state area and based on controls in the VMCS.
 - Address-range monitoring is cleared.
4. MSRs are loaded from the VM-entry MSR-load area (Section 28.4).
5. If VMLAUNCH is being executed, the launch state of the VMCS is set to “launched.”
6. If the “Intel PT uses guest physical addresses” VM-execution control is 1, trace-address pre-translation (TAPT) may occur (see Section 27.5.4 and Section 28.5).
7. An event may be injected in the guest context (Section 28.6).

Steps 1–4 above perform checks that may cause VM entry to fail. Such failures occur in one of the following three ways:

- Some of the checks in Section 28.1 may generate ordinary faults (for example, an invalid-opcode exception). Such faults are delivered normally.
- Some of the checks in Section 28.1 and all the checks in Section 28.2 cause control to pass to the instruction following the VM-entry instruction. The failure is indicated by setting RFLAGS.ZF¹ (if there is a current VMCS) or RFLAGS.CF (if there is no current VMCS). If there is a current VMCS, an error number indicating the cause of the failure is stored in the VM-instruction error field. See Chapter 31 for the error numbers.
- The checks in Section 28.3 and Section 28.4 cause processor state to be loaded from the host-state area of the VMCS (as would be done on a VM exit). Information about the failure is stored in the VM-exit information fields. See Section 28.8 for details.

EFLAGS.TF = 1 causes a VM-entry instruction to generate a single-step debug exception only if failure of one of the checks in Section 28.1 and Section 28.2 causes control to pass to the following instruction. A VM-entry does not generate a single-step debug exception in any of the following cases: (1) the instruction generates a fault; (2) failure of one of the checks in Section 28.3 or in loading MSRs causes processor state to be loaded from the host-state area of the VMCS; or (3) the instruction passes all checks in Section 28.1, Section 28.2, and Section 28.3 and there is no failure in loading MSRs.

Section 33.15 describes the dual-monitor treatment of system-management interrupts (SMIs) and system-management mode (SMM). Under this treatment, code running in SMM returns using VM entries instead of the RSM instruction. A VM entry **returns from SMM** if it is executed in SMM and the “entry to SMM” VM-entry control is 0. VM entries that return from SMM differ from ordinary VM entries in ways that are detailed in Section 33.15.4.

1. This chapter uses the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For IA-32 processors, this notation refers to the 32-bit forms of those registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to lower 32 bits of the indicated register.

28.1 BASIC VM-ENTRY CHECKS

Before a VM entry commences, the current state of the logical processor is checked in the following order:

1. If the logical processor is in virtual-8086 mode or compatibility mode, an invalid-opcode exception is generated.
2. If the current privilege level (CPL) is not zero, a general-protection exception is generated.
3. If there is no current VMCS, RFLAGS.CF is set to 1 and control passes to the next instruction.
4. If there is a current VMCS but the current VMCS is a shadow VMCS (see Section 26.10), RFLAGS.CF is set to 1 and control passes to the next instruction.
5. If there is a current VMCS that is not a shadow VMCS, the following conditions are evaluated in order; any of these cause VM entry to fail:
 - a. If there is MOV-SS blocking (see Table 26-3).
 - b. If the VM entry is invoked by VMLAUNCH and the VMCS launch state is not clear.
 - c. If the VM entry is invoked by VMRESUME and the VMCS launch state is not launched.

If any of these checks fail, RFLAGS.ZF is set to 1 and control passes to the next instruction. An error number indicating the cause of the failure is stored in the VM-instruction error field. See Chapter 31 for the error numbers.

28.2 CHECKS ON VMX CONTROLS AND HOST-STATE AREA

If the checks in Section 28.1 do not cause VM entry to fail, the control and host-state areas of the VMCS are checked to ensure that they are proper for supporting VMX non-root operation, that the VMCS is correctly configured to support the next VM exit, and that, after the next VM exit, the processor's state is consistent with the Intel 64 and IA-32 architectures.

VM entry fails if any of these checks fail. When such failures occur, control is passed to the next instruction, RFLAGS.ZF is set to 1 to indicate the failure, and the VM-instruction error field is loaded with an error number that indicates whether the failure was due to the controls or the host-state area (see Chapter 31).

These checks may be performed in any order. Thus, an indication by error number of one cause (for example, host state) does not imply that there are not also other errors. Different processors may thus give different error numbers for the same VMCS. Some checks prevent establishment of settings (or combinations of settings) that are currently reserved. Future processors may allow such settings (or combinations) and may not perform the corresponding checks. The correctness of software should not rely on VM-entry failures resulting from the checks documented in this section.

The checks on the controls and the host-state area are presented in Section 28.2.1 through Section 28.2.4. These sections reference VMCS fields that correspond to processor state. Unless otherwise stated, these references are to fields in the host-state area.

28.2.1 Checks on VMX Controls

This section identifies VM-entry checks on the VMX control fields.

Some of these fields contain physical addresses. These fields are checked against the allowed address width:

- If `IA32_VMX_BASIC[48]` is read as 1 (implying that the processor does not support Intel 64 architecture; see Section A.1, "Basic VMX Information"), these addresses must not set any bits in the range 63:32.
- Otherwise, the widths of physical addresses are limited by `MAXPHYADDR`, a value derived from the value enumerated in `CPUID.80000008H:EAX[7:0]` (at most 52). If `TME_ACTIVATE[0] = 1` (indicating that TME has been configured), `MAXPHYADDR` is reduced by the value of `IA32_TME_ACTIVATE[39:36]` when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM.¹ Physical address should not set bits in the range 63:MAXPHYADDR.

28.2.1.1 VM-Execution Control Fields

VM entries perform the following checks on the VM-execution control fields:¹

- Reserved bits in the pin-based VM-execution controls must be set properly. Software may consult the VMX capability MSRs to determine the proper settings (see Appendix A.3.1).
- Reserved bits in the primary processor-based VM-execution controls must be set properly. Software may consult the VMX capability MSRs to determine the proper settings (see Appendix A.3.2).
- If the “activate secondary controls” primary processor-based VM-execution control is 1, reserved bits in the secondary processor-based VM-execution controls must be cleared. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.3.3).
If the “activate secondary controls” primary processor-based VM-execution control is 0 (or if the processor does not support the 1-setting of that control), no checks are performed on the secondary processor-based VM-execution controls. The logical processor operates as if all the secondary processor-based VM-execution controls were 0.
- If the “activate tertiary controls” primary processor-based VM-execution control is 1, reserved bits in the tertiary processor-based VM-execution controls must be cleared. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.3.4).
If the “activate tertiary controls” primary processor-based VM-execution control is 0 (or if the processor does not support the 1-setting of that control), no checks are performed on the tertiary processor-based VM-execution controls. The logical processor operates as if all the tertiary processor-based VM-execution controls were 0.
- The CR3-target count must not be greater than 4. Future processors may support a different number of CR3-target values. Software should read the VMX capability MSR IA32_VMX_MISC to determine the number of values supported (see Appendix A.6).
- Bits 11:0 of the following fields must be 0, and the fields are also subject to the checks on physical-address width described above in Section 28.2.1:
 - If the “use I/O bitmaps” VM-execution control is 1, each I/O-bitmap address.
 - If the “use MSR bitmaps” VM-execution control is 1, the MSR-bitmap address.
 - If the “use TPR shadow” VM-execution control is 1, the virtual-APIC address.
If the checks on that address are satisfied, bytes 3:1 of VTPR (see Section 31.1.1) may be cleared (behavior may be implementation-specific).
The clearing of these bytes may occur even if the VM entry fails. This is true either if the failure causes control to pass to the instruction following the VM-entry instruction or if it causes processor state to be loaded from the host-state area of the VMCS.
 - If the “virtualize APIC-accesses” VM-execution control is 1, the APIC-access address.
 - If the “enable PML” VM-execution control is 1, the PML address.
 - If the “sub-page write permissions for EPT” VM-execution control is 1, the SPPTP VM-execution control field (see Table 26-11 in Section 26.6.21).
 - If the “enable VM functions” processor-based VM-execution control is 1 and the “EPTP switching” VM-function control is 1, the EPTP-list address.
 - If the “VMCS shadowing” VM-execution control is 1, the VMREAD-bitmap and VMWRITE-bitmap addresses.
 - If the “EPT-violation #VE” VM-execution control is 1, the virtualization-exception information address.
 - If the “PASID translation” VM-execution control is 1, the low PASID directory address and the high PASID directory address.

1. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

1. If the “activate secondary controls” primary processor-based VM-execution control is 0, VM entry operates as if each secondary processor-based VM-execution control were 0. Similarly, if the “activate tertiary controls” primary processor-based VM-execution control is 0, VM entry operates as if each tertiary processor-based VM-execution control were 0. See Section 26.6.2.

- If the “use TPR shadow” VM-execution control is 1 and the “virtual-interrupt delivery” VM-execution control is 0, bits 31:4 of the TPR threshold VM-execution control field must be 0.
- The following check is performed if the “use TPR shadow” VM-execution control is 1 and the “virtualize APIC accesses” and “virtual-interrupt delivery” VM-execution controls are both 0: the value of bits 3:0 of the TPR threshold VM-execution control field should not be greater than the value of bits 7:4 of VTPR (see Section 31.1.1).
- If the “NMI exiting” VM-execution control is 0, the “virtual NMIs” VM-execution control must be 0.
- If the “virtual NMIs” VM-execution control is 0, the “NMI-window exiting” VM-execution control must be 0.
- If the “use TPR shadow” VM-execution control is 0, the following VM-execution controls must also be 0: “virtualize x2APIC mode”, “APIC-register virtualization”, “virtual-interrupt delivery”, and “IPI virtualization”.
- If the “use TPR shadow” VM-execution control is 0, the following VM-execution controls must also be 0: “virtualize x2APIC mode”, “APIC-register virtualization”, “virtual-interrupt delivery”, and “IPI virtualization”.
- If the “virtualize x2APIC mode” VM-execution control is 1, the “virtualize APIC accesses” VM-execution control must be 0.
- If the “virtual-interrupt delivery” VM-execution control is 1, the “external-interrupt exiting” VM-execution control must be 1.
- If the “process posted interrupts” VM-execution control is 1, the following must be true:
 - The “virtual-interrupt delivery” VM-execution control is 1.
 - The “acknowledge interrupt on exit” VM-exit control is 1.
 - The posted-interrupt notification vector has a value in the range 0–255 (bits 15:8 are all 0).
 - Bits 5:0 of the posted-interrupt descriptor address are all 0.
 - [The posted-interrupt descriptor address satisfies the checks on physical-address width described above in Section 28.2.1.](#)
- If the “IPI virtualization” VM-execution control is 1, the following must be true:
 - Bits 2:0 of the PID-pointer table address are all 0.
 - The PID-pointer table address [satisfies the checks on physical-address width described above in Section 28.2.1.](#)
 - [The address of the last entry in the PID-pointer table satisfies the checks on physical-address width described above.](#) (This address is the PID-pointer table address plus 8 times the last PID-pointer index.)
- If the “enable VPID” VM-execution control is 1, the value of the VPID VM-execution control field must not be 0000H.
- If the “enable EPT” VM-execution control is 1, the EPTP VM-execution control field (see Table 26-9 in Section 26.6.11) must satisfy the following checks:
 - The EPT memory type (bits 2:0) must be a value supported by the processor as indicated in the IA32_VMX_EPT_VPID_CAP MSR (see Appendix A.10).
 - Bits 5:3 must contain a value 1 less than an EPT page-walk length supported by the processor as indicated in the IA32_VMX_EPT_VPID_CAP MSR (see Section 30.3.2 and Appendix A.10).
 - Bit 6 (enable bit for accessed and dirty flags for EPT) must be 0 if bit 21 of the IA32_VMX_EPT_VPID_CAP MSR (see Appendix A.10) is read as 0, indicating that the processor does not support accessed and dirty flags for EPT.
 - Reserved bits 11:7 must all be 0.
 - [The 4-KByte-aligned address defined by bits 63:12 must satisfy the checks on physical-address width described above in Section 28.2.1.](#)
- The “enable EPT” VM-execution control must be 1 if any of the following VM-execution controls is 1: “enable PML”, “unrestricted guest”, “mode-based execute control for EPT”, “sub-page write permissions for EPT”, “Intel PT uses guest physical addresses”, “enable HLAT”, “EPT paging-write control”, or “guest-paging verification”.
- [The following checks apply if the logical processor is in SEAM at the time of VM entry:](#)
 - [The “enable EPT” VM-execution control must be 1.](#)

- Bits 11:0 and bits 63:M must be zero in the SEAM shared EPT pointer, where M is the value enumerated by CPUID.80000008H:EAX[7:0].
- If the “enable VM functions” processor-based VM-execution control is 1, reserved bits in the VM-function controls must be clear. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.11). In addition, the following check is performed based on the setting of bits in the VM-function controls (see Section 26.6.14):
 - If “EPTP switching” VM-function control is 1, the “enable EPT” VM-execution control must also be 1.
If the “enable VM functions” processor-based VM-execution control is 0, no checks are performed on the VM-function controls.
- If the logical processor is operating with Intel PT enabled (if IA32_RTIT_CTL.TraceEn = 1) at the time of VM entry, the “load IA32_RTIT_CTL” VM-entry control must be 0.
- If the “Intel PT uses guest physical addresses” VM-execution control is 1, the “load IA32_RTIT_CTL” VM-entry control and the “clear IA32_RTIT_CTL” VM-exit control must both be 1.
- If the “use TSC scaling” VM-execution control is 1, the TSC-multiplier must not be zero.
- If the “enable HLAT” VM-execution control is 1, the following bits in the HLATP VM-execution control field (see Table 26-12 in Section 26.6.22) must be zero: bits 2:0, bits 11:5. In addition, the 4-KByte-aligned address defined by bits 63:12 must satisfy the checks on physical-address width described above in Section 28.2.1.

28.2.1.2 VM-Exit Control Fields

VM entries perform the following checks on the VM-exit control fields.

- Reserved bits in the primary VM-exit controls must be set properly. Software may consult the VMX capability MSRs to determine the proper settings (see Appendix A.4.1).
- If the “activate secondary controls” primary VM-exit control is 1, reserved bits in the secondary VM-exit controls must be cleared. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.4.2).
- If the “activate secondary controls” primary VM-exit control is 0 (or if the processor does not support the 1-setting of that control), no checks are performed on the secondary VM-exit controls. The logical processor operates as if all the secondary VM-exit controls were 0.
- If the “activate VMX-preemption timer” VM-execution control is 0, the “save VMX-preemption timer value” VM-exit control must also be 0.
- The following checks are performed for the VM-exit MSR-store address if the VM-exit MSR-store count field is non-zero:
 - The lower 4 bits of the VM-exit MSR-store address must be 0. The address must satisfy the checks on physical-address width described above in Section 28.2.1.
 - The address of the last byte in the VM-exit MSR-store area must satisfy the checks on physical-address width described above. The address of this last byte is VM-exit MSR-store address + (MSR count * 16) – 1. (The arithmetic used for the computation uses more bits than the processor’s physical-address width.)
- The following checks are performed for the VM-exit MSR-load address if the VM-exit MSR-load count field is non-zero:
 - The lower 4 bits of the VM-exit MSR-load address must be 0. The address must satisfy the checks on physical-address width described above.
 - The address of the last byte in the VM-exit MSR-load area must satisfy the checks on physical-address width described above. The address of this last byte is VM-exit MSR-load address + (MSR count * 16) – 1. (The arithmetic used for the computation uses more bits than the processor’s physical-address width.)

28.2.1.3 VM-Entry Control Fields

VM entries perform the following checks on the VM-entry control fields.

- Reserved bits in the VM-entry controls must be set properly. Software may consult the VMX capability MSRs to determine the proper settings (see Appendix A.5).

- Fields relevant to VM-entry event injection must be set properly. These fields are the VM-entry interruption-information field (see Table 26-18 in Section 26.8.3, “VM-Entry Controls for Event Injection”), the VM-entry exception error code, and the VM-entry instruction length. If the valid bit (bit 31) in the VM-entry interruption-information field is 1, the following must hold:
 - The field’s interruption type (bits 10:8) is not set to a reserved value. Value 1 is reserved on all logical processors; value 7 (other event) is reserved on logical processors that do not support the 1-setting of the “monitor trap flag” VM-execution control.
 - The field’s vector (bits 7:0) is consistent with the interruption type:
 - If the interruption type is non-maskable interrupt (NMI), the vector is 2.
 - If the interruption type is hardware exception, the vector is at most 31.
 - If the interruption type is other event, the vector is 0 (pending MTF VM exit).
 - The field’s deliver-error-code bit (bit 11) is 1 if each of the following holds: (1) the interruption type is hardware exception; (2) either (a) the “unrestricted guest” VM-execution control is 0; or (b) bit 0 (corresponding to CR0.PE) is set in the CR0 field in the guest-state area; (3) IA32_VMX_BASIC[56] is read as 0 (see Appendix A.1); and (4) the vector indicates one of the following exceptions: #DF (vector 8), #TS (10), #NP (11), #SS (12), #GP (13), #PF (14), or #AC (17).
 - The field’s deliver-error-code bit is 0 if any of the following holds: (1) the interruption type is not hardware exception; (2) both (a) the “unrestricted guest” VM-execution control is 1; and (b) bit 0 is clear in the CR0 field in the guest-state area; or (3) IA32_VMX_BASIC[56] is read as 0 and the vector is in one of the following ranges: 0–7, 9, 15, 16, or 18–31.
 - Reserved bits in the field (30:12) are 0.
 - If the deliver-error-code bit (bit 11) is 1, bits 31:16 of the VM-entry exception error-code field are 0.
 - If the interruption type is software interrupt, software exception, or privileged software exception, the VM-entry instruction-length field is in the range 0–15. A VM-entry instruction length of 0 is allowed only if IA32_VMX_MISC[30] is read as 1; see Appendix A.6.
- The following checks are performed for the VM-entry MSR-load address if the VM-entry MSR-load count field is non-zero:
 - The lower 4 bits of the VM-entry MSR-load address must be 0. The address must [satisfy the checks on physical-address width described above in Section 28.2.1](#).
 - [The address of the last byte in the VM-entry MSR-load area must satisfy the checks on physical-address width described above](#). The address of this last byte is VM-entry MSR-load address + (MSR count * 16) – 1. (The arithmetic used for the computation uses more bits than the processor’s physical-address width.)

If IA32_VMX_BASIC[48] is read as 1, neither address should set any bits in the range 63:32; see Appendix A.1, “Basic VMX Information”.
- If the processor is not in SMM, the “entry to SMM” and “deactivate dual-monitor treatment” VM-entry controls must be 0.
- The “entry to SMM” and “deactivate dual-monitor treatment” VM-entry controls cannot both be 1.

28.2.2 Checks on Host Control Registers, MSRs, and SSP

The following checks are performed on fields in the host-state area that correspond to control registers and MSRs:

- The CR0 field must not set any bit to a value not supported in VMX operation (see Section 25.8).¹
- The CR4 field must not set any bit to a value not supported in VMX operation (see Section 25.8).
- If bit 23 in the CR4 field (corresponding to CET) is 1, bit 16 in the CR0 field (WP) must also be 1.
- On processors that support Intel 64 architecture, the CR3 field must be such that bits reserved in CR3 are 0.² [In particular, bits 63:32 are checked for allowed address width](#):

1. The bits corresponding to CR0.NW (bit 29) and CR0.CD (bit 30) are never checked because the values of these bits are not changed by VM exit; see Section 29.5.1.

- If IA32_VMX_BASIC[48] is read as 1 (implying that the processor does not support Intel 64 architecture; see Appendix A.1, “Basic VMX Information”), the field must not set any of bits 63:32.
- Otherwise, the field’s width is limited by MAXPHYADDR, which is derived from the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM. The field should not set bits in the range 63:MAXPHYADDR.
- On processors that support Intel 64 architecture, the IA32_SYSENTER_ESP field and the IA32_SYSENTER_EIP field must each contain a canonical address.
- If the “load IA32_PERF_GLOBAL_CTRL” VM-exit control is 1, bits reserved in the IA32_PERF_GLOBAL_CTRL MSR must be 0 in the field for that register (see Figure 21-3).
- If the “load IA32_PAT” VM-exit control is 1, the value of the field for the IA32_PAT MSR must be one that could be written by WRMSR without fault at CPL 0. Specifically, each of the 8 bytes in the field must have one of the values 0 (UC), 1 (WC), 4 (WT), 5 (WP), 6 (WB), or 7 (UC-).
- If the “load IA32_EFER” VM-exit control is 1, bits reserved in the IA32_EFER MSR must be 0 in the field for that register. In addition, the values of the LMA and LME bits in the field must each be that of the “host address-space size” VM-exit control.
- If the “load CET state” VM-exit control is 1, the IA32_S_CET field must not set any bits reserved in the IA32_S_CET MSR, and bit 10 (corresponding to SUPPRESS) and bit 11 (TRACKER) in the field cannot both be set.
- If the “load CET state” VM-exit control is 1, bits 1:0 must be 0 in the SSP field.
- If the “load PKRS” VM-exit control is 1, bits 63:32 must be 0 in the IA32_PKRS field.

28.2.3 Checks on Host Segment and Descriptor-Table Registers

The following checks are performed on fields in the host-state area that correspond to segment and descriptor-table registers:

- In the selector field for each of CS, SS, DS, ES, FS, GS, and TR, the RPL (bits 1:0) and the TI flag (bit 2) must be 0.
- The selector fields for CS and TR cannot be 0000H.
- The selector field for SS cannot be 0000H if the “host address-space size” VM-exit control is 0.
- On processors that support Intel 64 architecture, the base-address fields for FS, GS, GDTR, IDTR, and TR must contain canonical addresses.

28.2.4 Checks Related to Address-Space Size

On processors that support Intel 64 architecture, the following checks related to address-space size are performed on VMX controls and fields in the host-state area:

- If the logical processor is outside IA-32e mode (if IA32_EFER.LMA = 0) at the time of VM entry, the following must hold:
 - The “IA-32e mode guest” VM-entry control is 0.
 - The “host address-space size” VM-exit control is 0.
- If the logical processor is in IA-32e mode (if IA32_EFER.LMA = 1) at the time of VM entry, the “host address-space size” VM-exit control must be 1.
- If the “host address-space size” VM-exit control is 0, the following must hold:
 - The “IA-32e mode guest” VM-entry control is 0.

-
2. Bit 63 of the CR3 field in the host-state area must be 0. This is true even though, If CR4.PCIDE = 1, bit 63 of the source operand to MOV to CR3 is used to determine whether cached translation information is invalidated.

- Bit 17 of the CR4 field (corresponding to CR4.PCIDE) is 0.
- Bits 63:32 in the RIP field are 0.
- If the “load CET state” VM-exit control is 1, bits 63:32 in the IA32_S_CET field and in the SSP field are 0.
- If the “host address-space size” VM-exit control is 1, the following must hold:
 - Bit 5 of the CR4 field (corresponding to CR4.PAE) is 1.
 - The RIP field contains a canonical address.
 - If the “load CET state” VM-exit control is 1, the IA32_S_CET field and the SSP field contain canonical addresses.
- If the “load CET state” VM-exit control is 1, the IA32_INTERRUPT_SSP_TABLE_ADDR field contains a canonical address.

On processors that do not support Intel 64 architecture, checks are performed to ensure that the “IA-32e mode guest” VM-entry control and the “host address-space size” VM-exit control are both 0.

28.3 CHECKING AND LOADING GUEST STATE

If all checks on the VMX controls and the host-state area pass (see Section 28.2), the following operations take place concurrently: (1) the guest-state area of the VMCS is checked to ensure that, after the VM entry completes, the state of the logical processor is consistent with IA-32 and Intel 64 architectures; (2) processor state is loaded from the guest-state area or as specified by the VM-entry control fields; and (3) address-range monitoring is cleared.

Because the checking and the loading occur concurrently, a failure may be discovered only after some state has been loaded. For this reason, the logical processor responds to such failures by loading state from the host-state area, as it would for a VM exit. See Section 28.8.

28.3.1 Checks on the Guest State Area

This section describes checks performed on fields in the guest-state area. These checks may be performed in any order. Some checks prevent establishment of settings (or combinations of settings) that are currently reserved. Future processors may allow such settings (or combinations) and may not perform the corresponding checks. The correctness of software should not rely on VM-entry failures resulting from the checks documented in this section.

The following subsections reference fields that correspond to processor state. Unless otherwise stated, these references are to fields in the guest-state area.

28.3.1.1 Checks on Guest Control Registers, Debug Registers, and MSRs

The following checks are performed on fields in the guest-state area corresponding to control registers, debug registers, and MSRs:

- The CR0 field must not set any bit to a value not supported in VMX operation (see Section 25.8). The following are exceptions:
 - Bit 0 (corresponding to CR0.PE) and bit 31 (PG) are not checked if the “unrestricted guest” VM-execution control is 1.¹
 - Bit 29 (corresponding to CR0.NW) and bit 30 (CD) are never checked because the values of these bits are not changed by VM entry; see Section 28.3.2.1.
- If bit 31 in the CR0 field (corresponding to PG) is 1, bit 0 in that field (PE) must also be 1.²

1. “Unrestricted guest” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the “unrestricted guest” VM-execution control were 0. See Section 26.6.2.

2. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, bit 0 in the CR0 field must be 1 unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

- The CR4 field must not set any bit to a value not supported in VMX operation (see Section 25.8).
- If bit 23 in the CR4 field (corresponding to CET) is 1, bit 16 in the CR0 field (WP) must also be 1.
- If the “load debug controls” VM-entry control is 1, bits reserved in the IA32_DEBUGCTL MSR must be 0 in the field for that register. The first processors to support the virtual-machine extensions supported only the 1-setting of this control and thus performed this check unconditionally.
- The following checks are performed on processors that support Intel 64 architecture:
 - If the “IA-32e mode guest” VM-entry control is 1, bit 31 in the CR0 field (corresponding to CR0.PG) and bit 5 in the CR4 field (corresponding to CR4.PAE) must each be 1.¹
 - If the “IA-32e mode guest” VM-entry control is 0, bit 17 in the CR4 field (corresponding to CR4.PCIDE) must be 0.
 - The CR3 field must be such that bits reserved in CR3 are 0.² In particular, the field’s width is limited by MAXPHYADDR, a value derived from the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If the “enable EPT” VM-execution control is 0 (implying that the logical processor is not in SEAM) and IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36]. The CR3 field should not set any of bits 63:MAXPHYADDR.
 - If the “load debug controls” VM-entry control is 1, bits 63:32 in the DR7 field must be 0. The first processors to support the virtual-machine extensions supported only the 1-setting of this control and thus performed this check unconditionally (if they supported Intel 64 architecture).
 - The IA32_SYSENTER_ESP field and the IA32_SYSENTER_EIP field must each contain a canonical address.
 - If the “load CET state” VM-entry control is 1, the IA32_S_CET field and the IA32_INTERRUPT_SSP_TABLE_ADDR field must contain canonical addresses.
- If the “load IA32_PERF_GLOBAL_CTRL” VM-entry control is 1, bits reserved in the IA32_PERF_GLOBAL_CTRL MSR must be 0 in the field for that register (see Figure 21-3).
- If the “load IA32_PAT” VM-entry control is 1, the value of the field for the IA32_PAT MSR must be one that could be written by WRMSR without fault at CPL 0. Specifically, each of the 8 bytes in the field must have one of the values 0 (UC), 1 (WC), 4 (WT), 5 (WP), 6 (WB), or 7 (UC-).
- If the “load IA32_EFER” VM-entry control is 1, the following checks are performed on the field for the IA32_EFER MSR:
 - Bits reserved in the IA32_EFER MSR must be 0.
 - Bit 10 (corresponding to IA32_EFER.LMA) must equal the value of the “IA-32e mode guest” VM-entry control. It must also be identical to bit 8 (LME) if bit 31 in the CR0 field (corresponding to CR0.PG) is 1.³
- If the “load IA32_BNDCFGS” VM-entry control is 1, the following checks are performed on the field for the IA32_BNDCFGS MSR:
 - Bits reserved in the IA32_BNDCFGS MSR must be 0.
 - The linear address in bits 63:12 must be canonical.
- If the “load IA32_RTIT_CTL” VM-entry control is 1, bits reserved in the IA32_RTIT_CTL MSR must be 0 in the field for that register (see Table 35-6).
- If the “load CET state” VM-entry control is 1, the IA32_S_CET field must not set any bits reserved in the IA32_S_CET MSR, and bit 10 (corresponding to SUPPRESS) and bit 11 (TRACKER) of the field cannot both be set.
- If the “load guest IA32_LBR_CTL” VM-entry control is 1, bits reserved in the IA32_LBR_CTL MSR must be 0 in the field for that register.

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, bit 31 in the CR0 field must be 1 unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

2. Bit 63 of the CR3 field in the host-state area must be 0. This is true even though, If CR4.PCIDE = 1, bit 63 of the source operand to MOV to CR3 is used to determine whether cached translation information is invalidated.

3. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, bit 31 in the CR0 field must be 1 unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

- If the “load PKRS” VM-entry control is 1, bits 63:32 must be 0 in the IA32_PKRS field.
- If the “load UINV” VM-entry control is 1, bits 15:8 must be 0 in the guest UINV field.

28.3.1.2 Checks on Guest Segment Registers

This section specifies the checks on the fields for CS, SS, DS, ES, FS, GS, TR, and LDTR. The following terms are used in defining these checks:

- The guest will be **virtual-8086** if the VM flag (bit 17) is 1 in the RFLAGS field in the guest-state area.
- The guest will be **IA-32e mode** if the “IA-32e mode guest” VM-entry control is 1. (This is possible only on processors that support Intel 64 architecture.)
- Any one of these registers is said to be **usable** if the unusable bit (bit 16) is 0 in the access-rights field for that register.

The following are the checks on these fields:

- Selector fields.
 - TR. The TI flag (bit 2) must be 0.
 - LDTR. If LDTR is usable, the TI flag (bit 2) must be 0.
 - SS. If the guest will not be virtual-8086 and the “unrestricted guest” VM-execution control is 0, the RPL (bits 1:0) must equal the RPL of the selector field for CS.¹
- Base-address fields.
 - CS, SS, DS, ES, FS, GS. If the guest will be virtual-8086, the address must be the selector field shifted left 4 bits (multiplied by 16).
 - The following checks are performed on processors that support Intel 64 architecture:
 - TR, FS, GS. The address must be canonical.
 - LDTR. If LDTR is usable, the address must be canonical.
 - CS. Bits 63:32 of the address must be zero.
 - SS, DS, ES. If the register is usable, bits 63:32 of the address must be zero.
- Limit fields for CS, SS, DS, ES, FS, GS. If the guest will be virtual-8086, the field must be 0000FFFFH.
- Access-rights fields.
 - CS, SS, DS, ES, FS, GS.
 - If the guest will be virtual-8086, the field must be 000000F3H. This implies the following:
 - Bits 3:0 (Type) must be 3, indicating an expand-up read/write accessed data segment.
 - Bit 4 (S) must be 1.
 - Bits 6:5 (DPL) must be 3.
 - Bit 7 (P) must be 1.
 - Bits 11:8 (reserved), bit 12 (software available), bit 13 (reserved/L), bit 14 (D/B), bit 15 (G), bit 16 (unusable), and bits 31:17 (reserved) must all be 0.
 - If the guest will not be virtual-8086, the different sub-fields are considered separately:
 - Bits 3:0 (Type).
 - CS. The values allowed depend on the setting of the “unrestricted guest” VM-execution control:
 - If the control is 0, the Type must be 9, 11, 13, or 15 (accessed code segment).

1. “Unrestricted guest” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the “unrestricted guest” VM-execution control were 0. See Section 26.6.2.

- If the control is 1, the Type must be either 3 (read/write accessed expand-up data segment) or one of 9, 11, 13, and 15 (accessed code segment).
- SS. If SS is usable, the Type must be 3 or 7 (read/write, accessed data segment).
- DS, ES, FS, GS. The following checks apply if the register is usable:
 - Bit 0 of the Type must be 1 (accessed).
 - If bit 3 of the Type is 1 (code segment), then bit 1 of the Type must be 1 (readable).
- Bit 4 (S). If the register is CS or if the register is usable, S must be 1.
- Bits 6:5 (DPL).
 - CS.
 - If the Type is 3 (read/write accessed expand-up data segment), the DPL must be 0. The Type can be 3 only if the “unrestricted guest” VM-execution control is 1.
 - If the Type is 9 or 11 (non-conforming code segment), the DPL must equal the DPL in the access-rights field for SS.
 - If the Type is 13 or 15 (conforming code segment), the DPL cannot be greater than the DPL in the access-rights field for SS.
 - SS.
 - If the “unrestricted guest” VM-execution control is 0, the DPL must equal the RPL from the selector field.
 - The DPL must be 0 either if the Type in the access-rights field for CS is 3 (read/write accessed expand-up data segment) or if bit 0 in the CR0 field (corresponding to CR0.PE) is 0.¹
 - DS, ES, FS, GS. The DPL cannot be less than the RPL in the selector field if (1) the “unrestricted guest” VM-execution control is 0; (2) the register is usable; and (3) the Type in the access-rights field is in the range 0 – 11 (data segment or non-conforming code segment).
- Bit 7 (P). If the register is CS or if the register is usable, P must be 1.
- Bits 11:8 (reserved). If the register is CS or if the register is usable, these bits must all be 0.
- Bit 14 (D/B). For CS, D/B must be 0 if the guest will be IA-32e mode and the L bit (bit 13) in the access-rights field is 1.
- Bit 15 (G). The following checks apply if the register is CS or if the register is usable:
 - If any bit in the limit field in the range 11:0 is 0, G must be 0.
 - If any bit in the limit field in the range 31:20 is 1, G must be 1.
- Bits 31:17 (reserved). If the register is CS or if the register is usable, these bits must all be 0.
- TR. The different sub-fields are considered separately:
 - Bits 3:0 (Type).
 - If the guest will not be IA-32e mode, the Type must be 3 (16-bit busy TSS) or 11 (32-bit busy TSS).
 - If the guest will be IA-32e mode, the Type must be 11 (64-bit busy TSS).
 - Bit 4 (S). S must be 0.
 - Bit 7 (P). P must be 1.
 - Bits 11:8 (reserved). These bits must all be 0.
 - Bit 15 (G).

1. The following apply if either the “unrestricted guest” VM-execution control or bit 31 of the primary processor-based VM-execution controls is 0: (1) bit 0 in the CR0 field must be 1 if the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation; and (2) the Type in the access-rights field for CS cannot be 3.

- If any bit in the limit field in the range 11:0 is 0, G must be 0.
- If any bit in the limit field in the range 31:20 is 1, G must be 1.
- Bit 16 (Unusable). The unusable bit must be 0.
- Bits 31:17 (reserved). These bits must all be 0.
- LDTR. The following checks on the different sub-fields apply only if LDTR is usable:
 - Bits 3:0 (Type). The Type must be 2 (LDT).
 - Bit 4 (S). S must be 0.
 - Bit 7 (P). P must be 1.
 - Bits 11:8 (reserved). These bits must all be 0.
 - Bit 15 (G).
 - If any bit in the limit field in the range 11:0 is 0, G must be 0.
 - If any bit in the limit field in the range 31:20 is 1, G must be 1.
 - Bits 31:17 (reserved). These bits must all be 0.

28.3.1.3 Checks on Guest Descriptor-Table Registers

The following checks are performed on the fields for GDTR and IDTR:

- On processors that support Intel 64 architecture, the base-address fields must contain canonical addresses.
- Bits 31:16 of each limit field must be 0.

28.3.1.4 Checks on Guest RIP, RFLAGS, and SSP

The following checks are performed on fields in the guest-state area corresponding to RIP, RFLAGS, and SSP (shadow-stack pointer):

- RIP. The following checks are performed on processors that support Intel 64 architecture:
 - Bits 63:32 must be 0 if the “IA-32e mode guest” VM-entry control is 0 or if the L bit (bit 13) in the access-rights field for CS is 0.
 - If the processor supports $N < 64$ linear-address bits, bits 63:N must be identical if the “IA-32e mode guest” VM-entry control is 1 and the L bit in the access-rights field for CS is 1.¹ (No check applies if the processor supports 64 linear-address bits.) The guest RIP value is not required to be canonical; the value of bit N-1 may differ from that of bit N.
- RFLAGS.
 - Reserved bits 63:22 (bits 31:22 on processors that do not support Intel 64 architecture), bit 15, bit 5 and bit 3 must be 0 in the field, and reserved bit 1 must be 1.
 - The VM flag (bit 17) must be 0 either if the “IA-32e mode guest” VM-entry control is 1 or if bit 0 in the CR0 field (corresponding to CR0.PE) is 0.²
 - The IF flag (RFLAGS[bit 9]) must be 1 if the valid bit (bit 31) in the VM-entry interruption-information field is 1 and the interruption type (bits 10:8) is external interrupt.
- SSP. The following checks are performed if the “load CET state” VM-entry control is 1
 - Bits 1:0 must be 0.

1. Software can determine the number N by executing CPUID with 80000008H in EAX. The number of linear-address bits supported is returned in bits 15:8 of EAX.

2. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, bit 0 in the CR0 field must be 1 unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

- If the processor supports the Intel 64 architecture, bits 63:N must be identical, where N is the CPU's maximum linear-address width. (This check does not apply if the processor supports 64 linear-address bits.) The guest SSP value is not required to be canonical; the value of bit N-1 may differ from that of bit N.

28.3.1.5 Checks on Guest Non-Register State

The following checks are performed on fields in the guest-state area corresponding to non-register state:

- Activity state.
 - The activity-state field must contain a value in the range 0 – 3, indicating an activity state supported by the implementation (see Section 26.4.2). Future processors may include support for other activity states. Software should read the VMX capability MSR IA32_VMX_MISC (see Appendix A.6) to determine what activity states are supported.
 - The activity-state field must not indicate the HLT state if the DPL (bits 6:5) in the access-rights field for SS is not 0.¹
 - The activity-state field must indicate the active state if the interruptibility-state field indicates blocking by either MOV-SS or by STI (if either bit 0 or bit 1 in that field is 1).
 - If the valid bit (bit 31) in the VM-entry interruption-information field is 1, the interruption to be delivered (as defined by interruption type and vector) must not be one that would normally be blocked while a logical processor is in the activity state corresponding to the contents of the activity-state field. The following items enumerate the interruptions (as specified in the VM-entry interruption-information field) whose injection is allowed for the different activity states:
 - Active. Any interruption is allowed.
 - HLT. The only events allowed are the following:
 - Those with interruption type external interrupt or non-maskable interrupt (NMI).
 - Those with interruption type hardware exception and vector 1 (debug exception) or vector 18 (machine-check exception).
 - Those with interruption type other event and vector 0 (pending MTF VM exit).

See Table 26-18 in Section 26.8.3 for details regarding the format of the VM-entry interruption-information field.
 - Shutdown. Only NMIs and machine-check exceptions are allowed.
 - Wait-for-SIPI. No interruptions are allowed.
- The activity-state field must not indicate the wait-for-SIPI state if the "entry to SMM" VM-entry control is 1.
- Interruptibility state.
 - The reserved bits (bits 31:5) must be 0.
 - The field cannot indicate blocking by both STI and MOV SS (bits 0 and 1 cannot both be 1).
 - Bit 0 (blocking by STI) must be 0 if the IF flag (bit 9) is 0 in the RFLAGS field.
 - Bit 0 (blocking by STI) and bit 1 (blocking by MOV-SS) must both be 0 if the valid bit (bit 31) in the VM-entry interruption-information field is 1 and the interruption type (bits 10:8) in that field has value 0, indicating external interrupt, or value 2, indicating non-maskable interrupt (NMI).
 - Bit 2 (blocking by SMI) must be 0 if the processor is not in SMM.
 - Bit 2 (blocking by SMI) must be 1 if the "entry to SMM" VM-entry control is 1.
 - Bit 3 (blocking by NMI) must be 0 if the "virtual NMIs" VM-execution control is 1, the valid bit (bit 31) in the VM-entry interruption-information field is 1, and the interruption type (bits 10:8) in that field has value 2 (indicating NMI).
 - If bit 4 (enclave interruption) is 1, bit 1 (blocking by MOV-SS) must be 0 and the processor must support for SGX by enumerating CPUID.07H.00H:EBX.SGX[2] as 1.

1. As noted in Section 26.4.1, SS.DPL corresponds to the logical processor's current privilege level (CPL).

NOTE

If the “virtual NMIs” VM-execution control is 0, there is no requirement that bit 3 be 0 if the valid bit in the VM-entry interruption-information field is 1 and the interruption type in that field has value 2.

- Pending debug exceptions.
 - Bits 11:4, bit 13, bit 15, and bits 63:17 (bits 31:17 on processors that do not support Intel 64 architecture) must be 0.
 - The following checks are performed if any of the following holds: (1) the interruptibility-state field indicates blocking by STI (bit 0 in that field is 1); (2) the interruptibility-state field indicates blocking by MOV SS (bit 1 in that field is 1); or (3) the activity-state field indicates HLT:
 - Bit 14 (BS) must be 1 if the TF flag (bit 8) in the RFLAGS field is 1 and the BTF flag (bit 1) in the IA32_DEBUGCTL field is 0.
 - Bit 14 (BS) must be 0 if the TF flag (bit 8) in the RFLAGS field is 0 or the BTF flag (bit 1) in the IA32_DEBUGCTL field is 1.
 - The following checks are performed if bit 16 (RTM) is 1:
 - Bits 11:0, bits 15:13, and bits 63:17 (bits 31:17 on processors that do not support Intel 64 architecture) must be 0; bit 12 must be 1.
 - The processor must support for RTM by enumerating CPUID.07H.00H:EBX[11] as 1.
 - The interruptibility-state field must not indicate blocking by MOV SS (bit 1 in that field must be 0).
- VMCS link pointer. The following checks apply if the field contains a value other than FFFFFFFF_FFFFFFFFH:
 - Bits 11:0 must be 0.
 - The field’s width is limited by MAXPHYADDR, a value derived from the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM. The VMCS link pointer should not set bits in the range 63:MAXPHYADDR.
 - The 4 bytes located in memory referenced by the value of the field (as a physical address) must satisfy the following:
 - Bits 30:0 must contain the processor’s VMCS revision identifier (see Section 26.2).¹
 - Bit 31 must contain the setting of the “VMCS shadowing” VM-execution control.² This implies that the referenced VMCS is a shadow VMCS (see Section 26.10) if and only if the “VMCS shadowing” VM-execution control is 1.
 - If the processor is not in SMM or the “entry to SMM” VM-entry control is 1, the field must not contain the current VMCS pointer.
 - If the processor is in SMM and the “entry to SMM” VM-entry control is 0, the field must differ from the executive-VMCS pointer.

28.3.1.6 Checks on Guest Page-Directory-Pointer-Table Entries

If CR0.PG = 1, CR4.PAE = 1, and IA32_EFER.LME = 0, the logical processor uses **PAE paging** (see Section 5.4 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A).³ When PAE paging is in use, the

1. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field. For all processors produced prior to this change, bit 31 of the VMCS revision identifier was 0.
2. “VMCS shadowing” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the “VMCS shadowing” VM-execution control were 0. See Section 26.6.2.
3. On processors that support Intel 64 architecture, the physical-address extension may support more than 36 physical-address bits. Software can determine the number physical-address bits supported by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

physical address in CR3 references a table of **page-directory-pointer-table entries** (PDPTEs). A MOV to CR3 when PAE paging is in use checks the validity of the PDPTEs.

A VM entry is to a guest that uses PAE paging if (1) bit 31 (corresponding to CR0.PG) is set in the CR0 field in the guest-state area; (2) bit 5 (corresponding to CR4.PAE) is set in the CR4 field; and (3) the “IA-32e mode guest” VM-entry control is 0. Such a VM entry checks the validity of the PDPTEs:

- If the “enable EPT” VM-execution control is 0, VM entry checks the validity of the PDPTEs referenced by the CR3 field in the guest-state area if either (1) PAE paging was not in use before the VM entry; or (2) the value of CR3 is changing as a result of the VM entry. VM entry may check their validity even if neither (1) nor (2) hold.¹
- If the “enable EPT” VM-execution control is 1, VM entry checks the validity of the PDPTE fields in the guest-state area (see Section 26.4.2).

A VM entry to a guest that does not use PAE paging does not check the validity of any PDPTEs.

A VM entry that checks the validity of the PDPTEs uses the same checks that are used when CR3 is loaded with MOV to CR3 when PAE paging is in use.² If MOV to CR3 would cause a general-protection exception due to the PDPTEs that would be loaded (e.g., because a reserved bit is set), the VM entry fails.

28.3.2 Loading Guest State

Processor state is updated on VM entries in the following ways:

- Some state is loaded from the guest-state area.
- Some state is determined by VM-entry controls.
- The page-directory pointers are loaded based on the values of certain control registers.

This loading may be performed in any order and in parallel with the checking of VMCS contents (see Section 28.3.1).

The loading of guest state is detailed in Section 28.3.2.1 to Section 28.3.2.4. These sections reference VMCS fields that correspond to processor state. Unless otherwise stated, these references are to fields in the guest-state area.

In addition to the state loading described in this section, VM entries may load MSRs from the VM-entry MSR-load area (see Section 28.4). This loading occurs only after the state loading described in this section and the checking of VMCS contents described in Section 28.3.1.

28.3.2.1 Loading Guest Control Registers, Debug Registers, and MSRs

The following items describe how guest control registers, debug registers, and MSRs are loaded on VM entry:

- CR0 is loaded from the CR0 field with the exception of the following bits, which are never modified on VM entry: ET (bit 4); reserved bits 15:6, 17, and 28:19; NW (bit 29) and CD (bit 30).³ The values of these bits in the CR0 field are ignored.
- CR3 and CR4 are loaded from the CR3 field and the CR4 field, respectively.
- If the “load debug controls” VM-entry control is 1, DR7 is loaded from the DR7 field with the exception that bit 12 and bits 15:14 are always 0 and bit 10 is always 1. The values of these bits in the DR7 field are ignored.

The first processors to support the virtual-machine extensions supported only the 1-setting of the “load debug controls” VM-entry control and thus always loaded DR7 from the DR7 field.

1. “Enable EPT” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the “enable EPT” VM-execution control were 0. See Section 26.6.2.

2. This implies that (1) bits 11:9 in each PDPTE are ignored; and (2) if bit 0 (present) is clear in one of the PDPTEs, bits 63:1 of that PDPTE are ignored.

3. Bits 15:6, bit 17, and bit 28:19 of CR0 and CR0.ET are unchanged by executions of MOV to CR0. Bits 15:6, bit 17, and bit 28:19 of CR0 are always 0 and CR0.ET is always 1.

- The following describes how certain MSRs are loaded using fields in the guest-state area:
 - If the “load debug controls” VM-entry control is 1, the IA32_DEBUGCTL MSR is loaded from the IA32_DEBUGCTL field. The first processors to support the virtual-machine extensions supported only the 1-setting of this control and thus always loaded the IA32_DEBUGCTL MSR from the IA32_DEBUGCTL field.
 - The IA32_SYSENTER_CS MSR is loaded from the IA32_SYSENTER_CS field. Since this field has only 32 bits, bits 63:32 of the MSR are cleared to 0.
 - The IA32_SYSENTER_ESP and IA32_SYSENTER_EIP MSRs are loaded from the IA32_SYSENTER_ESP field and the IA32_SYSENTER_EIP field, respectively. On processors that do not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are cleared to 0.
 - The following are performed on processors that support Intel 64 architecture:
 - The MSRs FS.base and GS.base are loaded from the base-address fields for FS and GS, respectively (see Section 28.3.2.2).
 - If the “load IA32_EFER” VM-entry control is 0, bits in the IA32_EFER MSR are modified as follows:
 - IA32_EFER.LMA is loaded with the setting of the “IA-32e mode guest” VM-entry control.
 - If CR0 is being loaded so that CR0.PG = 1, IA32_EFER.LME is also loaded with the setting of the “IA-32e mode guest” VM-entry control.¹ Otherwise, IA32_EFER.LME is unmodified.
- See below for the case in which the “load IA32_EFER” VM-entry control is 1
- If the “load IA32_PERF_GLOBAL_CTRL” VM-entry control is 1, the IA32_PERF_GLOBAL_CTRL MSR is loaded from the IA32_PERF_GLOBAL_CTRL field.
 - If the “load IA32_PAT” VM-entry control is 1, the IA32_PAT MSR is loaded from the IA32_PAT field.
 - If the “load IA32_EFER” VM-entry control is 1, the IA32_EFER MSR is loaded from the IA32_EFER field.
 - If the “load IA32_BNDCFGS” VM-entry control is 1, the IA32_BNDCFGS MSR is loaded from the IA32_BNDCFGS field.
 - If the “load IA32_RTIT_CTL” VM-entry control is 1, the IA32_RTIT_CTL MSR is loaded from the IA32_RTIT_CTL field.
 - If the “load CET” VM-entry control is 1, the IA32_S_CET and IA32_INTERRUPT_SSP_TABLE_ADDR MSRs are loaded from the IA32_S_CET field and the IA32_INTERRUPT_SSP_TABLE_ADDR field, respectively. On processors that do not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are cleared to 0.
 - If the “load guest IA32_LBR_CTL” VM-entry control is 1, the IA32_LBR_CTL MSR is loaded from the IA32_LBR_CTL guest state field.
 - If the “load PKRS” VM-entry control is 1, the IA32_PKRS MSR is loaded from the IA32_PKRS field.
 - If the “load UINV” VM-entry control is 1, UINV is loaded with the low 8 bits of the UINV field. UINV is represented in bits 39:32 of the IA32_UINTR_MISC MSR. The remainder of the MSR is not modified.
- With the exception of FS.base and GS.base, any of these MSRs is subsequently overwritten if it appears in the VM-entry MSR-load area. See Section 28.4.
- The SMBASE register is unmodified by all VM entries except those that return from SMM.

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, VM entry must be loading CR0 so that CR0.PG = 1 unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

28.3.2.2 Loading Guest Segment Registers and Descriptor-Table Registers

For each of CS, SS, DS, ES, FS, GS, TR, and LDTR, fields are loaded from the guest-state area as follows:

- The unusable bit is loaded from the access-rights field. This bit can never be set for TR (see Section 28.3.1.2). If it is set for one of the other registers, the following apply:
 - For each of CS, SS, DS, ES, FS, and GS, uses of the segment cause faults (general-protection exception or stack-fault exception) outside 64-bit mode, just as they would had the segment been loaded using a null selector. This bit does not cause accesses to fault in 64-bit mode.
 - If this bit is set for LDTR, uses of LDTR cause general-protection exceptions in all modes, just as they would had LDTR been loaded using a null selector.

If this bit is clear for any of CS, SS, DS, ES, FS, GS, TR, and LDTR, a null selector value does not cause a fault (general-protection exception or stack-fault exception).
- TR. The selector, base, limit, and access-rights fields are loaded.
- CS.
 - The following fields are always loaded: selector, base address, limit, and (from the access-rights field) the L, D, and G bits.
 - For the other fields, the unusable bit of the access-rights field is consulted:
 - If the unusable bit is 0, all of the access-rights field is loaded.
 - If the unusable bit is 1, the remainder of CS access rights are undefined after VM entry.
- SS, DS, ES, FS, GS, and LDTR.
 - The selector fields are loaded.
 - For the other fields, the unusable bit of the corresponding access-rights field is consulted:
 - If the unusable bit is 0, the base-address, limit, and access-rights fields are loaded.
 - If the unusable bit is 1, the base address, the segment limit, and the remainder of the access rights are undefined after VM entry with the following exceptions:
 - Bits 3:0 of the base address for SS are cleared to 0.
 - SS.DPL is always loaded from the SS access-rights field. This will be the current privilege level (CPL) after the VM entry completes.
 - SS.B is always set to 1.
 - The base addresses for FS and GS are loaded from the corresponding fields in the VMCS. On processors that support Intel 64 architecture, the values loaded for base addresses for FS and GS are also manifest in the FS.base and GS.base MSRs.
 - On processors that support Intel 64 architecture, bits 63:32 of the base addresses for SS, DS, and ES are cleared to 0.

GDTR and IDTR are loaded using the base and limit fields.

28.3.2.3 Loading Guest RIP, RSP, RFLAGS, and SSP

RSP, RIP, and RFLAGS are loaded from the RSP field, the RIP field, and the RFLAGS field, respectively.

If the “load CET” VM-entry control is 1, SSP (shadow-stack pointer) is loaded from the SSP field.

The following items regard the upper 32 bits of these fields on VM entries that are not to 64-bit mode:

- Bits 63:32 of RSP are undefined outside 64-bit mode. Thus, a logical processor may ignore the contents of bits 63:32 of the RSP field on VM entries that are not to 64-bit mode.
- As noted in Section 28.3.1.4, bits 63:32 of the RIP and RFLAGS fields must be 0 on VM entries that are not to 64-bit mode. (The same is true for SSP for VM entries that are not to 64-bit mode when the “load CET” VM-entry control is 1.)

28.3.2.4 Loading Page-Directory-Pointer-Table Entries

As noted in Section 28.3.1.6, the logical processor uses PAE paging if CR0.PG = 1, CR4.PAE = 1, and IA32_EFER.LME = 0. A VM entry to a guest that uses PAE paging loads the PDPTs into internal, non-architectural registers based on the setting of the “enable EPT” VM-execution control:

- If the control is 0, the PDPTs are loaded from the page-directory-pointer table referenced by the physical address in the value of CR3 being loaded by the VM entry (see Section 28.3.2.1). The values loaded are treated as physical addresses in VMX non-root operation.
- If the control is 1, the PDPTs are loaded from corresponding fields in the guest-state area (see Section 26.4.2). The values loaded are treated as guest-physical addresses in VMX non-root operation.

28.3.2.5 Updating Non-Register State

Section 30.4 describes how the VMX architecture controls how a logical processor manages information in the TLBs and paging-structure caches. The following items detail how VM entries invalidate cached mappings:

- If the “enable VPID” VM-execution control is 0, the logical processor invalidates linear mappings and combined mappings associated with VPID 0000H (for all PCIDs); combined mappings for VPID 0000H are invalidated for all EPTRTA values (EPTRTA is the value of bits 51:12 of EPTP).
- VM entries are not required to invalidate any guest-physical mappings, nor are they required to invalidate any linear mappings or combined mappings if the “enable VPID” VM-execution control is 1.

If the “virtual-interrupt delivery” VM-execution control is 1, VM entry loads the values of RVI and SVI from the guest interrupt-status field in the VMCS (see Section 26.4.2). After doing so, the logical processor first causes PPR virtualization (Section 31.1.3) and then evaluates pending virtual interrupts (Section 31.2.1).

If a virtual interrupt is recognized, it may be delivered in VMX non-root operation immediately after VM entry (including any specified event injection) completes; see Section 28.7.5. See Section 31.2.2 for details regarding the delivery of virtual interrupts.

28.3.3 Clearing Address-Range Monitoring

The Intel 64 and IA-32 architectures allow software to monitor a specified address range using the MONITOR and MWAIT instructions. See Section 10.10.4 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A. VM entries clear any address-range monitoring that may be in effect.

28.4 LOADING MSRS

VM entries may load MSRs from the VM-entry MSR-load area (see Section 26.8.2). Specifically each entry in that area (up to the number specified in the VM-entry MSR-load count) is processed in order by loading the MSR indexed by bits 31:0 with the contents of bits 127:64 as they would be written by WRMSR.¹

Processing of an entry fails in any of the following cases:

- The value of bits 31:0 is either C0000100H (the IA32_FS_BASE MSR) or C0000101 (the IA32_GS_BASE MSR).
- The value of bits 31:8 is 000008H, meaning that the indexed MSR is one that allows access to an APIC register when the local APIC is in x2APIC mode.
- The value of bits 31:0 indicates an MSR that can be written only in system-management mode (SMM) and the VM entry did not commence in SMM. (IA32_SMM_MONITOR_CTL is an MSR that can be written only in SMM.)
- The value of bits 31:0 indicates an MSR that cannot be loaded on VM entries for model-specific reasons. A processor may prevent loading of certain MSRs even if they can normally be written by WRMSR. Such model-specific behavior is documented in Chapter 2, “Model-Specific Registers (MSRs),” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4.

1. Because attempts to modify the value of IA32_EFER.LMA by WRMSR are ignored, attempts to modify it using the VM-entry MSR-load area are also ignored.

- Bits 63:32 are not all 0.
- An attempt to write bits 127:64 to the MSR indexed by bits 31:0 of the entry would cause a general-protection exception if executed via WRMSR with CPL = 0.¹

The VM entry fails if processing fails for any entry. The logical processor responds to such failures by loading state from the host-state area, as it would for a VM exit. See Section 28.8.

If any MSR is being loaded in such a way that would architecturally require a TLB flush, the TLBs are updated so that, after VM entry, the logical processor will not use any translations that were cached before the transition.

28.5 TRACE-ADDRESS PRE-TRANSLATION (TAPT)

When the “Intel PT uses guest physical addresses” VM-execution control is 1, the addresses used by Intel PT are treated as guest-physical addresses, and these are translated to physical addresses using EPT.

VM entry uses **trace-address pre-translation (TAPT)** to prevent buffered trace data from being lost due to an EPT violation; see Section 27.5.4.2. VM entry uses TAPT only if Intel PT will be enabled following VM entry (IA32_RTIT_CTL.TraceEn = 1) and only if the “Intel PT uses guest physical addresses” VM-execution control is 1

As noted in Section 27.5.4, TAPT may cause a VM exit due to an EPT violation, EPT misconfiguration, page-modification log-full event, or APIC access. If such a VM exit occurs as a result of TAPT during VM entry, the VM exit operates as if it had occurred in VMX non-root operation after the VM entry completed (in the guest context).

If TAPT during VM entry causes a VM exit, the VM entry does not perform event injection (Section 28.6), even if the valid bit in the VM-entry interruption-information field is 1. Such VM exits save the contents of VM-entry interruption-information and VM-entry exception error code fields into the IDT-vectoring information and IDT-vectoring error code fields, respectively.

28.6 EVENT INJECTION

If the valid bit in the VM-entry interruption-information field (see Section 26.8.3) is 1, VM entry causes an event to be delivered (or made pending) after all components of guest state have been loaded (including MSRs) and after the VM-execution control fields have been established.

- If the interruption type in the field is 0 (external interrupt), 2 (non-maskable interrupt); 3 (hardware exception), 4 (software interrupt), 5 (privileged software exception), or 6 (software exception), the event is delivered as described in Section 28.6.1.
- If the interruption type in the field is 7 (other event) and the vector field is 0, an MTF VM exit is pending after VM entry. See Section 28.6.2.

28.6.1 Vectored-Event Injection

VM entry delivers an injected vectored event within the guest context established by VM entry. This means that delivery occurs after all components of guest state have been loaded (including MSRs) and after the VM-execution control fields have been established.² The event is delivered using the vector in that field to select a descriptor in the IDT. Since event injection occurs after loading IDTR from the guest-state area, this is the guest IDT.

Section 28.6.1.1 provides details of vectored-event injection. In general, the event is delivered exactly as if it had been generated normally.

1. If CR0.PG = 1, WRMSR to the IA32_EFER MSR causes a general-protection exception if it would modify the LME bit. If VM entry has established CR0.PG = 1, the IA32_EFER MSR should not be included in the VM-entry MSR-load area for the purpose of modifying the LME bit.

2. This does not imply that injection of an exception or interrupt will cause a VM exit due to the settings of VM-execution control fields (such as the exception bitmap) that would cause a VM exit if the event had occurred in VMX non-root operation. In contrast, a nested exception encountered during event delivery may cause a VM exit; see Section 28.6.1.1.

An exception is made if the following all hold: bit 25 (UINTR) is set to 1 in the guest CR4 field and the “IA-32e mode guest” VM-entry control is 1, and VM entry is modified if it is injecting an external interrupt whose vector is the value that UINV would have after VM entry. In this case, the logical processor then performs user-interrupt notification processing as specified in Section 8.5.2 instead of the process described in Section 28.6.1.1. (If the guest activity-state field indicated the HLT state, the logical processor enters the HLT state following user-interrupt notification processing.)

If event delivery (or user-interrupt notification processing; see above) encounters a nested exception (for example, a general-protection exception because the vector indicates a descriptor beyond the IDT limit), the exception bitmap is consulted using the vector of that exception:

- If the bit for the nested exception is 0, the nested exception is delivered normally. If the nested exception is benign, it is delivered through the IDT. If it is contributory or a page fault, a double fault may be generated, depending on the nature of the event whose delivery encountered the nested exception. See Chapter 7, “Interrupt 8—Double Fault Exception (#DF)” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.¹
- If the bit for the nested exception is 1, a VM exit occurs. Section 28.6.1.2 details cases in which event injection causes a VM exit.

28.6.1.1 Details of Vectored-Event Injection

The event-injection process is controlled by the contents of the VM-entry interruption information field (format given in Table 26-18), the VM-entry exception error-code field, and the VM-entry instruction-length field. The following items provide details of the process:

- The value pushed on the stack for RFLAGS is generally that which was loaded from the guest-state area. The value pushed for the RF flag is not modified based on the type of event being delivered. However, the pushed value of RFLAGS may be modified if a software interrupt is being injected into a guest that will be in virtual-8086 mode (see below). After RFLAGS is pushed on the stack, the value in the RFLAGS register is modified as is done normally when delivering an event through the IDT.
- The instruction pointer that is pushed on the stack depends on the type of event and whether nested exceptions occur during its delivery. The term **current guest RIP** refers to the value to be loaded from the guest-state area. The value pushed is determined as follows:²
 - If VM entry successfully injects (with no nested exception) an event with interruption type external interrupt, NMI, or hardware exception, the current guest RIP is pushed on the stack.
 - If VM entry successfully injects (with no nested exception) an event with interruption type software interrupt, privileged software exception, or software exception, the current guest RIP is incremented by the VM-entry instruction length before being pushed on the stack.
 - If VM entry encounters an exception while injecting an event and that exception does not cause a VM exit, the current guest RIP is pushed on the stack regardless of event type or VM-entry instruction length. If the encountered exception does cause a VM exit that saves RIP, the saved RIP is current guest RIP.
- If the deliver-error-code bit (bit 11) is set in the VM-entry interruption-information field, the contents of the VM-entry exception error-code field is pushed on the stack as an error code would be pushed during delivery of an exception.
- DR6, DR7, and the IA32_DEBUGCTL MSR are not modified by event injection, even if the event has vector 1 (normal deliveries of debug exceptions, which have vector 1, do update these registers).
- If VM entry is injecting a software interrupt and the guest will be in virtual-8086 mode (RFLAGS.VM = 1), no general-protection exception can occur due to RFLAGS.IOPL < 3. A VM monitor should check RFLAGS.IOPL before injecting such an event and, if desired, inject a general-protection exception instead of a software interrupt.

1. Hardware exceptions with the following unused vectors are considered benign: 15 and 21–31. A hardware exception with vector 20 is considered benign unless the processor supports the 1-setting of the “EPT-violation #VE” VM-execution control; in that case, it has the same severity as page faults.

2. While these items refer to RIP, the width of the value pushed (16 bits, 32 bits, or 64 bits) is determined normally.

- If VM entry is injecting a software interrupt and the guest will be in virtual-8086 mode with virtual-8086 mode extensions ($RFLAGS.VM = CR4.VME = 1$), event delivery is subject to VME-based interrupt redirection based on the software interrupt redirection bitmap in the task-state segment (TSS) as follows:
 - If bit n in the bitmap is clear (where n is the number of the software interrupt), the interrupt is directed to an 8086 program interrupt handler: the processor uses a 16-bit interrupt-vector table (IVT) located at linear address zero. If the value of $RFLAGS.IOPL$ is less than 3, the following modifications are made to the value of $RFLAGS$ that is pushed on the stack: $IOPL$ is set to 3, and IF is set to the value of VIF .
 - If bit n in the bitmap is set (where n is the number of the software interrupt), the interrupt is directed to a protected-mode interrupt handler. (In other words, the injection is treated as described in the next item.) In this case, the software interrupt does not invoke such a handler if $RFLAGS.IOPL < 3$ (a general-protection exception occurs instead). However, as noted above, $RFLAGS.IOPL$ cannot cause an injected software interrupt to cause such an exception. Thus, in this case, the injection invokes a protected-mode interrupt handler independent of the value of $RFLAGS.IOPL$.

Injection of events of other types are not subject to this redirection.

- If VM entry is injecting a software interrupt (not redirected as described above) or software exception, privilege checking is performed on the IDT descriptor being accessed as would be the case for executions of $INT\ n$, $INT3$, or $INTO$ (the descriptor's DPL cannot be less than CPL). There is no checking of $RFLAGS.IOPL$, even if the guest will be in virtual-8086 mode. Failure of this check may lead to a nested exception. Injection of an event with interruption type external interrupt, NMI, hardware exception, and privileged software exception, or with interruption type software interrupt and being redirected as described above, do not perform these checks.
- If VM entry is injecting a non-maskable interrupt (NMI) and the "virtual NMIs" VM-execution control is 1, virtual-NMI blocking is in effect after VM entry.
- The transition causes a last-branch record to be logged if the LBR bit is set in the $IA32\_DEBUGCTL$ MSR. This is true even for events such as debug exceptions, which normally clear the LBR bit before delivery.
- The last-exception record MSRs (LERs) may be updated based on the setting of the LBR bit in the $IA32\_DEBUGCTL$ MSR. Events such as debug exceptions, which normally clear the LBR bit before they are delivered, and therefore do not normally update the LERs, may do so as part of VM-entry event injection.
- If injection of an event encounters a nested exception, the value of the EXT bit (bit 0) in any error code for that nested exception is determined as follows:
 - If event being injected has interruption type external interrupt, NMI, hardware exception, or privileged software exception and encounters a nested exception (but does not produce a double fault), the error code for that exception sets the EXT bit.
 - If event being injected is a software interrupt or a software exception and encounters a nested exception, the error code for that exception clears the EXT bit.
 - If event delivery encounters a nested exception and delivery of that exception encounters another exception (but does not produce a double fault), the error code for that exception sets the EXT bit.
 - If a double fault is produced, the error code for the double fault is 0000H (the EXT bit is clear).

28.6.1.2 VM Exits During Event Injection

An event being injected never causes a VM exit directly regardless of the settings of the VM-execution controls. For example, setting the "NMI exiting" VM-execution control to 1 does not cause a VM exit due to injection of an NMI.

However, the event-delivery process may lead to a VM exit:

- If the vector in the VM-entry interruption-information field identifies a task gate in the IDT, the attempted task switch may cause a VM exit just as it would had the injected event occurred during normal execution in VMX non-root operation (see Section 27.4.2).
- If event delivery encounters a nested exception, a VM exit may occur depending on the contents of the exception bitmap (see Section 27.2).
- If event delivery generates a double-fault exception (due to a nested exception); the logical processor encounters another nested exception while attempting to call the double-fault handler; and that exception does not cause a VM exit due to the exception bitmap; then a VM exit occurs due to triple fault (see Section 27.2).

- If event delivery injects a double-fault exception and encounters a nested exception that does not cause a VM exit due to the exception bitmap, then a VM exit occurs due to triple fault (see Section 27.2).
- If the “virtualize APIC accesses” VM-execution control is 1 and event delivery generates an access to the APIC-access page, that access is treated as described in Section 31.4 and may cause a VM exit.¹

If the event-delivery process does cause a VM exit, the processor state before the VM exit is determined just as it would be had the injected event occurred during normal execution in VMX non-root operation. If the injected event directly accesses a task gate that cause a VM exit or if the first nested exception encountered causes a VM exit, information about the injected event is saved in the IDT-vectoring information field (see Section 29.2.4).

The material in this section applies also if injection of an external interrupt results in user-interrupt notification processing instead of event delivery (see Section 28.6.1 earlier).

28.6.1.3 Event Injection for VM Entries to Real-Address Mode

If VM entry is loading CR0.PE with 0, any injected vectored event is delivered as would normally be done in real-address mode.² Specifically, VM entry uses the vector provided in the VM-entry interruption-information field to select a 4-byte entry from an interrupt-vector table at the linear address in IDTR.base. Further details are provided in Section 15.1.4 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

Because bit 11 (deliver error code) in the VM-entry interruption-information field must be 0 if CR0.PE will be 0 after VM entry (see Section 28.2.1.3), vectored events injected with CR0.PE = 0 do not push an error code on the stack. This is consistent with event delivery in real-address mode.

If event delivery encounters a fault (due to a violation of IDTR.limit or of SS.limit), the fault is treated as if it had occurred during event delivery in VMX non-root operation. Such a fault may lead to a VM exit as discussed in Section 28.6.1.2.

28.6.2 Injection of Pending MTF VM Exits

If the interruption type in the VM-entry interruption-information field is 7 (other event) and the vector field is 0, VM entry causes an MTF VM exit to be pending on the instruction boundary following VM entry. This is the case even if the “monitor trap flag” VM-execution control is 0. See Section 27.5.2 for the treatment of pending MTF VM exits.

28.7 SPECIAL FEATURES OF VM ENTRY

This section details a variety of features of VM entry. It uses the following terminology: a VM entry is **vectoring** if the valid bit (bit 31) of the VM-entry interruption information field is 1 and the interruption type in the field is 0 (external interrupt), 2 (non-maskable interrupt); 3 (hardware exception), 4 (software interrupt), 5 (privileged software exception), or 6 (software exception).

28.7.1 Interruptibility State

The interruptibility-state field in the guest-state area (see Table 26-3) contains bits that control blocking by STI, blocking by MOV SS, and blocking by NMI. This field impacts event blocking after VM entry as follows:

- If the VM entry is vectoring, there is no blocking by STI or by MOV SS following the VM entry, regardless of the contents of the interruptibility-state field.

1. “Virtualize APIC accesses” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the “virtualize APIC accesses” VM-execution control were 0. See Section 26.6.2.

2. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, VM entry must be loading CR0.PE with 1 unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

- If the VM entry is not vectoring, the following apply:
 - Events are blocked by STI if and only if bit 0 in the interruptibility-state field is 1. This blocking is cleared after the guest executes one instruction or incurs an exception (including a debug exception made pending by VM entry; see Section 28.7.3).
 - Events are blocked by MOV SS if and only if bit 1 in the interruptibility-state field is 1. This may affect the treatment of pending debug exceptions; see Section 28.7.3. This blocking is cleared after the guest executes one instruction or incurs an exception (including a debug exception made pending by VM entry).
 - The blocking of non-maskable interrupts (NMIs) is determined as follows:
 - If the “virtual NMIs” VM-execution control is 0, NMIs are blocked if and only if bit 3 (blocking by NMI) in the interruptibility-state field is 1. If the “NMI exiting” VM-execution control is 0, execution of the IRET instruction removes this blocking (even if the instruction generates a fault). If the “NMI exiting” control is 1, IRET does not affect this blocking.
 - The following items describe the use of bit 3 (blocking by NMI) in the interruptibility-state field if the “virtual NMIs” VM-execution control is 1:
 - The bit’s value does not affect the blocking of NMIs after VM entry. NMIs are not blocked in VMX non-root operation (except for ordinary blocking for other reasons, such as by the MOV SS instruction, the wait-for-SIPI state, etc.)
 - The bit’s value determines whether there is virtual-NMI blocking after VM entry. If the bit is 1, virtual-NMI blocking is in effect after VM entry. If the bit is 0, there is no virtual-NMI blocking after VM entry unless the VM entry is injecting an NMI (see Section 28.6.1.1). Execution of IRET removes virtual-NMI blocking (even if the instruction generates a fault).
- If the “NMI exiting” VM-execution control is 0, the “virtual NMIs” control must be 0; see Section 28.2.1.1.
- Blocking of system-management interrupts (SMIs) is determined as follows:
 - If the VM entry was not executed in system-management mode (SMM), SMI blocking is unchanged by VM entry.
 - If the VM entry was executed in SMM, SMIs are blocked after VM entry if and only if the bit 2 in the interruptibility-state field is 1.

28.7.2 Activity State

The activity-state field in the guest-state area controls whether, after VM entry, the logical processor is active or in one of the inactive states identified in Section 26.4.2. The use of this field is determined as follows:

- If the VM entry is vectoring, the logical processor is in the active state after VM entry. While the consistency checks described in Section 28.3.1.5 on the activity-state field do apply in this case, the contents of the activity-state field do not determine the activity state after VM entry.
- If the VM entry is not vectoring, the logical processor ends VM entry in the activity state specified in the guest-state area. If VM entry ends with the logical processor in an inactive activity state, the VM entry generates any special bus cycle that is normally generated when that activity state is entered from the active state. If VM entry would end with the logical processor in the shutdown state and the logical processor is in SMX operation,¹ an Intel® TXT shutdown condition occurs. [See the Intel® Trusted Execution Technology Measured Launched Environment Developer’s Guide. The error code used is 0000H, indicating “legacy shutdown.”](#)
- Some activity states unconditionally block certain events. The following blocking is in effect after any VM entry that puts the processor in the indicated state:
 - The active state blocks start-up IPIs (SIPIs). SIPIs that arrive while a logical processor is in the active state and in VMX non-root operation are discarded and do not cause VM exits.
 - The HLT state blocks start-up IPIs (SIPIs). SIPIs that arrive while a logical processor is in the HLT state and in VMX non-root operation are discarded and do not cause VM exits.

1. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENTER]. See Chapter 7, “Safer Mode Extensions Reference,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2D.

- The shutdown state blocks external interrupts and SIPIs. External interrupts that arrive while a logical processor is in the shutdown state and in VMX non-root operation do not cause VM exits even if the “external-interrupt exiting” VM-execution control is 1. SIPIs that arrive while a logical processor is in the shutdown state and in VMX non-root operation are discarded and do not cause VM exits.
- The wait-for-SIPI state blocks external interrupts, non-maskable interrupts (NMIs), INIT signals, and system-management interrupts (SMIs). Such events do not cause VM exits if they arrive while a logical processor is in the wait-for-SIPI state and in VMX non-root operation.

28.7.3 Delivery of Pending Debug Exceptions after VM Entry

The pending debug exceptions field in the guest-state area indicates whether there are debug exceptions that have not yet been delivered (see Section 26.4.2). This section describes how these are treated on VM entry.

There are no pending debug exceptions after VM entry if any of the following are true:

- The VM entry is vectoring with one of the following interruption types: external interrupt, non-maskable interrupt (NMI), hardware exception, or privileged software exception.
- The interruptibility-state field does not indicate blocking by MOV SS and the VM entry is vectoring with either of the following interruption type: software interrupt or software exception.
- The VM entry is not vectoring and the activity-state field indicates either shutdown or wait-for-SIPI.

If none of the above hold, the pending debug exceptions field specifies the debug exceptions that are pending for the guest. There are **valid pending debug exceptions** if either the BS bit (bit 14) or the enable-breakpoint bit (bit 12) is 1. If there are valid pending debug exceptions, they are handled as follows:

- If the VM entry is not vectoring, the pending debug exceptions are treated as they would had they been encountered normally in guest execution:
 - If the logical processor is not blocking such exceptions (the interruptibility-state field indicates no blocking by MOV SS), a debug exception is delivered after VM entry (see below).
 - If the logical processor is blocking such exceptions (due to blocking by MOV SS), the pending debug exceptions are held pending or lost as would normally be the case.
- If the VM entry is vectoring (with interruption type software interrupt or software exception and with blocking by MOV SS), the following items apply:
 - For injection of a software interrupt or of a software exception with vector 3 (#BP) or vector 4 (#OF) — or a privileged software exception with vector 1 (#DB) — the pending debug exceptions are treated as they would had they been encountered normally in guest execution if the corresponding instruction (INT1, INT3, or INTO) were executed after a MOV SS that encountered a debug trap.
 - For injection of a software exception with a vector other than 3 and 4, the pending debug exceptions may be lost or they may be delivered after injection (see below).

If there are no valid pending debug exceptions (as defined above), no pending debug exceptions are delivered after VM entry.

If a pending debug exception is delivered after VM entry, it has the priority of “traps on the previous instruction” (see Section 7.9 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A). Thus, INIT signals and system-management interrupts (SMIs) take priority of such an exception, as do VM exits induced by the TPR threshold (see Section 28.7.7) and pending MTF VM exits (see Section 28.7.8). The exception takes priority over any pending non-maskable interrupt (NMI) or external interrupt and also over VM exits due to the 1-settings of the “interrupt-window exiting” and “NMI-window exiting” VM-execution controls.

A pending debug exception delivered after VM entry causes a VM exit if the bit 1 (#DB) is 1 in the exception bitmap. If it does not cause a VM exit, it updates DR6 normally.

28.7.4 VMX-Preemption Timer

If the “activate VMX-preemption timer” VM-execution control is 1, VM entry starts the VMX-preemption timer with the unsigned value in the VMX-preemption timer-value field.

It is possible for the VMX-preemption timer to expire during VM entry (e.g., if the value in the VMX-preemption timer-value field is zero). If this happens (and if the VM entry was not to the wait-for-SIPI state), a VM exit occurs with its normal priority after any event injection and before execution of any instruction following VM entry. For example, any pending debug exceptions established by VM entry (see Section 28.7.3) take priority over a timer-induced VM exit. (The timer-induced VM exit will occur after delivery of the debug exception, unless that exception or its delivery causes a different VM exit.)

See Section 27.5.1 for details of the operation of the VMX-preemption timer in VMX non-root operation, including the blocking and priority of the VM exits that it causes.

28.7.5 Interrupt-Window Exiting and Virtual-Interrupt Delivery

If “interrupt-window exiting” VM-execution control is 1, an open interrupt window may cause a VM exit immediately after VM entry (see Section 27.2 for details). If the “interrupt-window exiting” VM-execution control is 0 but the “virtual-interrupt delivery” VM-execution control is 1, a virtual interrupt may be delivered immediately after VM entry (see Section 28.3.2.5 and Section 31.2.1).

The following items detail the treatment of these events:

- These events occur after any event injection specified for VM entry.
- Non-maskable interrupts (NMIs) and higher priority events take priority over these events. These events take priority over external interrupts and lower priority events.
- These events wake the logical processor if it just entered the HLT state because of a VM entry (see Section 28.7.2). They do not occur if the logical processor just entered the shutdown state or the wait-for-SIPI state.

28.7.6 NMI-Window Exiting

The “NMI-window exiting” VM-execution control may cause a VM exit to occur immediately after VM entry (see Section 27.2 for details).

The following items detail the treatment of these VM exits:

- These VM exits follow event injection if such injection is specified for VM entry.
- Debug-trap exceptions (see Section 28.7.3) and higher priority events take priority over VM exits caused by this control. VM exits caused by this control take priority over non-maskable interrupts (NMIs) and lower priority events.
- VM exits caused by this control wake the logical processor if it just entered either the HLT state or the shutdown state because of a VM entry (see Section 28.7.2). They do not occur if the logical processor just entered the wait-for-SIPI state.

28.7.7 VM Exits Induced by the TPR Threshold

If the “use TPR shadow” and “virtualize APIC accesses” VM-execution controls are both 1 and the “virtual-interrupt delivery” VM-execution control is 0, a VM exit occurs immediately after VM entry if the value of bits 3:0 of the TPR threshold VM-execution control field is greater than the value of bits 7:4 of VTPR (see Section 31.1.1).¹

The following items detail the treatment of these VM exits:

- The VM exits are not blocked if RFLAGS.IF = 0 or by the setting of bits in the interruptibility-state field in guest-state area.
- The VM exits follow event injection if such injection is specified for VM entry.
- VM exits caused by this control take priority over system-management interrupts (SMIs), INIT signals, and lower priority events. They thus have priority over the VM exits described in Section 28.7.5, Section 28.7.6, and Section 28.7.8, as well as any interrupts or debug exceptions that may be pending at the time of VM entry.

1. “Virtualize APIC accesses” and “virtual-interrupt delivery” are secondary processor-based VM-execution controls. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if these controls were 0. See Section 26.6.2.

- These VM exits wake the logical processor if it just entered the HLT state as part of a VM entry (see Section 28.7.2). They do not occur if the logical processor just entered the shutdown state or the wait-for-SIPI state. If such a VM exit is suppressed because the processor just entered the shutdown state, it occurs after the delivery of any event that cause the logical processor to leave the shutdown state while remaining in VMX non-root operation (e.g., due to an NMI that occurs while the “NMI-exiting” VM-execution control is 0).
- The basic exit reason is “TPR below threshold.”

28.7.8 Pending MTF VM Exits

As noted in Section 28.6.2, VM entry may cause an MTF VM exit to be pending immediately after VM entry. The following items detail the treatment of these VM exits:

- System-management interrupts (SMIs), INIT signals, and higher priority events take priority over these VM exits. These VM exits take priority over debug-trap exceptions and lower priority events.
- These VM exits wake the logical processor if it just entered the HLT state because of a VM entry (see Section 28.7.2). They do not occur if the logical processor just entered the shutdown state or the wait-for-SIPI state.

28.7.9 VM Entries and Advanced Debugging Features

VM entries are not logged with last-branch records, do not produce branch-trace messages, and do not update the branch-trace store.

28.7.10 User-Interrupt Recognition After VM Entry

A VM entry results in recognition of a pending user interrupt if it completes with $CR4.UINTR = IA32\_EFER.LMA = 1$ and with $UIRR \neq 0$; otherwise, no pending user interrupt is recognized.

28.8 VM-ENTRY FAILURES DURING OR AFTER LOADING GUEST STATE

VM-entry failures due to the checks identified in Section 28.3.1 and failures during the MSR loading identified in Section 28.4 are treated differently from those that occur earlier in VM entry. In these cases, the following steps take place:

1. Information about the VM-entry failure is recorded in the VM-exit information fields:
 - Exit reason.
 - Bits 15:0 of this field contain the basic exit reason. It is loaded with a number indicating the general cause of the VM-entry failure. The following numbers are used:
 33. VM-entry failure due to invalid guest state. A VM entry failed one of the checks identified in Section 28.3.1.
 34. VM-entry failure due to MSR loading. A VM entry failed in an attempt to load MSRs (see Section 28.4).
 41. VM-entry failure due to machine-check event. A machine-check event occurred during VM entry (see Section 28.9).
 - Bit 31 is set to 1 to indicate a VM-entry failure.
 - The remainder of the field (bits 30:16) is cleared.
 - Exit qualification. This field is set based on the exit reason.
 - VM-entry failure due to invalid guest state. In most cases, the exit qualification is cleared to 0. The following non-zero values are used in the cases indicated:
 1. Not used.
 2. Failure was due to a problem loading the PDPTEs (see Section 28.3.1.6).

3. Failure was due to an attempt to inject a non-maskable interrupt (NMI) into a guest that is blocking events through the STI blocking bit in the interruptibility-state field.
4. Failure was due to an invalid VMCS link pointer (see Section 28.3.1.5).

VM-entry checks on guest-state fields may be performed in any order. Thus, an indication by exit qualification of one cause does not imply that there are not also other errors. Different processors may give different exit qualifications for the same VMCS.

- VM-entry failure due to MSR loading. The exit qualification is loaded to indicate which entry in the VM-entry MSR-load area caused the problem (1 for the first entry, 2 for the second, etc.).

— All other VM-exit information fields are unmodified.

2. Processor state is loaded as would be done on a VM exit (see Section 29.5). If this results in $[CR4.PAE \ \& \ CR0.PG \ \& \ \sim IA32\_EFER.LMA] = 1$, page-directory-pointer-table entries (PDPTes) may be checked and loaded (see Section 29.5.4).
3. The state of blocking by NMI is what it was before VM entry.
4. MSRs are loaded as specified in the VM-exit MSR-load area (see Section 29.6).

Although this process resembles that of a VM exit, many steps taken during a VM exit do not occur for these VM-entry failures:

- Most VM-exit information fields are not updated (see step 1 above).
- The valid bit in the VM-entry interruption-information field is not cleared.
- The guest-state area is not modified.
- No MSRs are saved into the VM-exit MSR-store area.

28.9 MACHINE-CHECK EVENTS DURING VM ENTRY

If a machine-check event occurs during a VM entry, one of the following occurs:

- The machine-check event is handled as if it occurred before the VM entry:
 - If $CR4.MCE = 0$, operation of the logical processor depends on whether the logical processor is in SMX operation:¹
 - If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs. The error code used is 000CH, indicating “unrecoverable machine-check condition.”
 - If the logical processor is outside SMX operation, it goes to the shutdown state.
 - If $CR4.MCE = 1$, a machine-check exception (#MC) is delivered through the IDT.
- The machine-check event is handled after VM entry completes:
 - If the VM entry ends with $CR4.MCE = 0$, operation of the logical processor depends on whether the logical processor is in SMX operation:
 - If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs with error code 000CH (unrecoverable machine-check condition).
 - If the logical processor is outside SMX operation, it goes to the shutdown state.
 - If the VM entry ends with $CR4.MCE = 1$, a machine-check exception (#MC) is generated:
 - If bit 18 (#MC) of the exception bitmap is 0, the exception is delivered through the guest IDT.
 - If bit 18 of the exception bitmap is 1, the exception causes a VM exit.
- A VM-entry failure occurs as described in Section 28.8. The basic exit reason is 41, for “VM-entry failure due to machine-check event.”

1. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENTER]. A logical processor is outside SMX operation if GETSEC[SENTER] has not been executed or if GETSEC[SEXIT] was executed after the last execution of GETSEC[SENTER]. See Chapter 7, “Safer Mode Extensions Reference,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2D.

The first option is not used if the machine-check event occurs after any guest state has been loaded. The second option is used only if VM entry is able to load all guest state.

22. Updates to Chapter 29, Volume 3C

Change bars and **violet** text show changes to Chapter 29 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

Changes to this chapter:

- Added UDB in the description of Section 29.2.2, "Information for VM Exits Due to Vectored Events". UDB was also added UDB to list of sources that generate BOUND-range exceeded exceptions and invalid opcode exceptions.
- In Section 29.2.4, "Information for VM Exits During Event Delivery", added UDB to list of sources that generate BOUND-range exceeded exceptions and invalid opcode exceptions.
- Added SEAMCALL and TDCALL to the list of instructions that can cause fault-like exits under for VM-exit instruction length in Section 29.2.5, "Information for VM Exits Due to Instruction Execution".
- Updated the range of CR3 bits that cannot be modified with MAXPHYADDR in Section 29.5.1, "Loading Host Control Registers, Debug Registers, MSRs".

VM exits occur in response to certain instructions and events in VMX non-root operation as detailed in Section 27.1 through Section 27.2. VM exits perform the following operations:

1. Information about the cause of the VM exit is recorded in the VM-exit information fields and VM-entry control fields are modified as described in Section 29.2.
2. Processor state is saved in the guest-state area (Section 29.3).
3. MSRs may be saved in the VM-exit MSR-store area (Section 29.4). This step is not performed for SMM VM exits that activate the dual-monitor treatment of SMIs and SMM.
4. The following may be performed in parallel and in any order (Section 29.5):
 - Processor state is loaded based in part on the host-state area and some VM-exit controls. This step is not performed for SMM VM exits that activate the dual-monitor treatment of SMIs and SMM. See Section 33.15.6 for information on how processor state is loaded by such VM exits.
 - Address-range monitoring is cleared.
5. MSRs may be loaded from the VM-exit MSR-load area (Section 29.6). This step is not performed for SMM VM exits that activate the dual-monitor treatment of SMIs and SMM.

VM exits are not logged with last-branch records, do not produce branch-trace messages, and do not update the branch-trace store.

Section 29.1 clarifies the nature of the architectural state before a VM exit begins. The steps described above are detailed in Section 29.2 through Section 29.6.

Section 33.15 describes the dual-monitor treatment of system-management interrupts (SMIs) and system-management mode (SMM). Under this treatment, ordinary transitions to SMM are replaced by VM exits to a separate SMM monitor. Called **SMM VM exits**, these are caused by the arrival of an SMI or the execution of VMCALL in VMX root operation. SMM VM exits differ from other VM exits in ways that are detailed in Section 33.15.2.

29.1 ARCHITECTURAL STATE BEFORE A VM EXIT

This section describes the architectural state that exists before a VM exit, especially for VM exits caused by events that would normally be delivered through the IDT. Note the following:

- An exception causes a VM exit **directly** if the bit corresponding to that exception is set in the exception bitmap. A non-maskable interrupt (NMI) causes a VM exit directly if the “NMI exiting” VM-execution control is 1. An external interrupt causes a VM exit directly if the “external-interrupt exiting” VM-execution control is 1. A start-up IPI (SIPI) that arrives while a logical processor is in the wait-for-SIPI activity state causes a VM exit directly. INIT signals that arrive while the processor is not in the wait-for-SIPI activity state cause VM exits directly.
- An exception, NMI, external interrupt, or software interrupt causes a VM exit **indirectly** if it does not do so directly but delivery of the event causes a nested exception, double fault, task switch, APIC access (see Section 31.4), EPT violation, EPT misconfiguration, page-modification log-full event (see Section 30.3.6), or SPP-related event (see Section 30.3.4) that causes a VM exit.
- An event **results** in a VM exit if it causes a VM exit (directly or indirectly).

The following bullets detail when architectural state is and is not updated in response to VM exits:

- If an event causes a VM exit directly, it does not update architectural state as it would have if it had it not caused the VM exit:
 - A debug exception does not update DR6, DR7, or IA32_DEBUGCTL. (Information about the nature of the debug exception is saved in the exit qualification field.)
 - A page fault does not update CR2. (The linear address causing the page fault is saved in the exit-qualification field.)

- An NMI causes subsequent NMIs to be blocked, but only after the VM exit completes.
 - An external interrupt does not acknowledge the interrupt controller and the interrupt remains pending, unless the “acknowledge interrupt on exit” VM-exit control is 1. In such a case, the interrupt controller is acknowledged and the interrupt is no longer pending.
 - The flags L0 – L3 in DR7 (bit 0, bit 2, bit 4, and bit 6) are not cleared when a task switch causes a VM exit.
 - If a task switch causes a VM exit, none of the following are modified by the task switch: old task-state segment (TSS); new TSS; old TSS descriptor; new TSS descriptor; RFLAGS.NT¹; or the TR register.
 - No last-exception record is made if the event that would do so directly causes a VM exit.
 - If a machine-check exception causes a VM exit directly, this does not prevent machine-check MSRs from being updated. These are updated by the machine-check event itself and not the resulting machine-check exception.
 - If the logical processor is in an inactive state (see Section 26.4.2) and not executing instructions, some events may be blocked but others may return the logical processor to the active state. Unblocked events may cause VM exits.² If an unblocked event causes a VM exit directly, a return to the active state occurs only after the VM exit completes.³ The VM exit generates any special bus cycle that is normally generated when the active state is entered from that activity state.
- MTF VM exits (see Section 27.5.2 and Section 28.7.8) are not blocked in the HLT activity state. If an MTF VM exit occurs in the HLT activity state, the logical processor returns to the active state only after the VM exit completes. MTF VM exits are blocked the shutdown state and the wait-for-SIPI state.
- If an event causes a VM exit indirectly, the event does update architectural state:
 - A debug exception updates DR6, DR7, and the IA32_DEBUGCTL MSR. No debug exceptions are considered pending.
 - A page fault updates CR2.
 - An NMI causes subsequent NMIs to be blocked before the VM exit commences.
 - An external interrupt acknowledges the interrupt controller and the interrupt is no longer pending.
 - If the logical processor had been in an inactive state, it enters the active state and, before the VM exit commences, generates any special bus cycle that is normally generated when the active state is entered from that activity state.
 - There is no blocking by STI or by MOV SS when the VM exit commences.
 - Processor state that is normally updated as part of delivery through the IDT (CS, RIP, SS, RSP, RFLAGS) is not modified. However, the incomplete delivery of the event may write to the stack.
 - The treatment of last-exception records is implementation dependent:
 - Some processors make a last-exception record when beginning the delivery of an event through the IDT (before it can encounter a nested exception). Such processors perform this update even if the event encounters a nested exception that causes a VM exit (including the case where nested exceptions lead to a triple fault).
 - Other processors delay making a last-exception record until event delivery has reached some event handler successfully (perhaps after one or more nested exceptions). Such processors do not update the last-exception record if a VM exit or triple fault occurs before an event handler is reached.

1. This chapter uses the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For processors that do not support Intel 64 architecture, this notation refers to the 32-bit forms of those registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to lower 32 bits of the indicated register.

2. If a VM exit takes the processor from an inactive state resulting from execution of a specific instruction (HLT or MWAIT), the value saved for RIP by that VM exit will reference the following instruction.

3. An exception is made if the logical processor had been inactive due to execution of MWAIT; in this case, it is considered to have become active before the VM exit.

- If the “virtual NMIs” VM-execution control is 1, VM entry injects an NMI, and delivery of the NMI causes a nested exception, double fault, task switch, EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event, or APIC access that causes a VM exit, virtual-NMI blocking is in effect before the VM exit commences.
- If a VM exit results from a fault, EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event that is encountered during execution of IRET and the “NMI exiting” VM-execution control is 0, any blocking by NMI is cleared before the VM exit commences. However, the previous state of blocking by NMI may be recorded in the exit qualification or in the VM-exit interruption-information field; see Section 29.2.3.
- If a VM exit results from a fault, EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event that is encountered during execution of IRET and the “virtual NMIs” VM-execution control is 1, virtual-NMI blocking is cleared before the VM exit commences. However, the previous state of blocking by NMI may be recorded in the exit qualification or in the VM-exit interruption-information field; see Section 29.2.3.
- Suppose that a VM exit is caused directly by an x87 FPU Floating-Point Error (#MF) or by any of the following events if the event was unblocked due to (and given priority over) an x87 FPU Floating-Point Error: an INIT signal, an external interrupt, an NMI, an SMI; or a machine-check exception. In these cases, there is no blocking by STI or by MOV SS when the VM exit commences.
- Normally, a last-branch record may be made when an event is delivered through the IDT. However, if such an event results in a VM exit before delivery is complete, no last-branch record is made.
- If machine-check exception results in a VM exit, processor state is suspect and may result in suspect state being saved to the guest-state area. A VM monitor should consult the RIPV and EIPV bits in the IA32_MC_G_STATUS MSR before resuming a guest that caused a VM exit resulting from a machine-check exception.
- If a VM exit results from a fault, APIC access (see Section 31.4), EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event that is encountered while executing an instruction, data breakpoints due to that instruction may have been recognized and information about them may be saved in the pending debug exceptions field (unless the VM exit clears that field; see Section 29.3.4).
- The following VM exits are considered to happen after an instruction is executed:
 - VM exits resulting from debug traps (single-step, I/O breakpoints, and data breakpoints).
 - VM exits resulting from debug exceptions (data breakpoints) whose recognition was delayed by blocking by MOV SS.
 - VM exits resulting from some machine-check exceptions.
 - Trap-like VM exits due to execution of MOV to CR8 when the “CR8-load exiting” VM-execution control is 0 and the “use TPR shadow” VM-execution control is 1 (see Section 31.3). (Such VM exits can occur only from 64-bit mode and thus only on processors that support Intel 64 architecture.)
 - Trap-like VM exits due to execution of WRMSR when the “use MSR bitmaps” VM-execution control is 1; the value of ECX is in the range 800H–8FFH; and the bit corresponding to the ECX value in write bitmap for low MSRs is 0; and the “virtualize x2APIC mode” VM-execution control is 1. See Section 31.5.
 - VM exits caused by APIC-write emulation (see Section 31.4.3.2) that result from APIC accesses as part of instruction execution.

For these VM exits, the instruction’s modifications to architectural state complete before the VM exit occurs. Such modifications include those to the logical processor’s interruptibility state (see Table 26-3). If there had been blocking by MOV SS, POP SS, or STI before the instruction executed, such blocking is no longer in effect.

A VM exit that occurs in enclave mode sets bit 27 of the exit-reason field and bit 4 of the guest interruptibility-state field. Before such a VM exit is delivered, an Asynchronous Enclave Exit (AEX) occurs (see Chapter 39, “Enclave Exiting Events”). An AEX modifies architectural state (Section 39.3). In particular, the processor establishes the following architectural state as indicated:

- The following bits in RFLAGS are cleared: CF, PF, AF, ZF, SF, OF, and RF.
- FS and GS are restored to the values they had prior to the most recent enclave entry.
- RIP is loaded with the AEP of interrupted enclave thread.
- RSP is loaded from the URSP field in the enclave’s state-save area (SSA).

29.2 RECORDING VM-EXIT INFORMATION AND UPDATING VM-ENTRY CONTROL FIELDS

VM exits begin by recording information about the nature of and reason for the VM exit in the VM-exit information fields. Section 29.2.1 to Section 29.2.5 detail the use of these fields.

In addition to updating the VM-exit information fields, the valid bit (bit 31) is cleared in the VM-entry interruption-information field. If bit 5 of the IA32_VMX_MISC MSR (index 485H) is read as 1 (see Appendix A.6), the value of IA32_EFER.LMA is stored into the “IA-32e mode guest” VM-entry control.¹

29.2.1 Basic VM-Exit Information

Section 26.9.1 defines the basic VM-exit information fields. The following items detail their use.

- **Exit reason.**
 - Bits 15:0 of this field contain the basic exit reason. It is loaded with a number indicating the general cause of the VM exit. Appendix C lists the numbers used and their meaning.

Future processors may introduce new VM exits with new basic exit reasons. Any such VM exit will occur only with VM-execution control settings introduced by the same processor or due to execution of an instruction that would cause an invalid-opcode exception (#UD) on previous processors. Software written for a particular processor generation should be aware that, if run on a later processor generation, it may experience VM exits with new basic exit reasons; it should also be aware that such a VM exit would result only from execution of an instruction that would have caused #UD on the earlier processor generation.
 - Bit 25 is set if the “prematurely busy shadow stack” VM-exit control is 1 and the VM exit caused a shadow stack become prematurely busy (see Section 27.4.3). Otherwise, the bit is cleared.
 - Bit 26 of this field is set to 1 if the VM exit occurred after assertion of a bus lock while the “VMM bus-lock detection” VM-execution control was 1. Such VM exits include those that occur due to the 1-setting of that control as well as others that might occur during execution of an instruction that asserted a bus lock.
 - Bit 27 of this field is set to 1 if the VM exit occurred while the logical processor was in enclave mode.

Such VM exits include those caused by interrupts, non-maskable interrupts, system-management interrupts, INIT signals, and exceptions occurring in enclave mode as well as exceptions encountered during the delivery of such events incident to enclave mode.

A VM exit also sets this bit if it was due to or incident to delivery of an event that was either (1) made pending or injected by VM entry while the guest interruptibility-state field indicates an enclave interruption (bit 4 of the field was 1); or (2) pending following an execution of RSM that occurred while bit 1 was set in the byte at offset 7EE0H in the state save image in SMRAM.
 - The remainder of the field (bits 31:28 and bits 24:16) is cleared to 0 (certain SMM VM exits may set some of these bits; see Section 33.15.2.3).²
- **Exit qualification.** This field is saved for VM exits due to the following causes: debug exceptions; page-fault exceptions; start-up IPIs (SIPs); system-management interrupts (SMIs) that arrive immediately after the execution of I/O instructions; task switches; INVEPT; INVLPG; INVPCID; INVVPID; LGDT; LIDT; LLDT; LTR; RDMSRLIST; SGDT; SIDT; SLDT; STR; VMCLEAR; VMPTRLD; VMPTRST; VMREAD; VMWRITE; VMXON; WBINVD; WBNOINVD; WRMSR; WRMSRLIST; WRMSRNS; XRSTORS; XSAVES; control-register accesses; MOV DR; I/O instructions; MWAIT; accesses to the APIC-access page (see Section 31.4); EPT violations (see Section 30.3.3.2); EOI virtualization (see Section 31.1.4); APIC-write emulation (see Section 31.4.3.3); page-modification log full (see Section 30.3.6); SPP-related events (see Section 30.3.4); and instruction timeout (see Section 27.2). For all other VM exits, this field is cleared. The following items provide details:

1. Bit 5 of the IA32_VMX_MISC MSR is read as 1 on any logical processor that supports the 1-setting of the “unrestricted guest” VM-execution control.

2. Bit 31 of this field is set on certain VM-entry failures; see Section 28.8.

- For a debug exception, the exit qualification contains information about the debug exception. The information has the format given in Table 29-1.

Table 29-1. Exit Qualification for Debug Exceptions

Bit Position(s)	Contents
3:0	B3 – B0. When set, each of these bits indicates that the corresponding breakpoint condition was met. Any of these bits may be set even if its corresponding enabling bit in DR7 is not set.
10:4	Not currently defined.
11	BLD. When set, this bit indicates that a bus lock was asserted while OS bus-lock detection was enabled and CPL > 0 (see Section 19.3.1.6 (“OS Bus-Lock Detection”)). ¹
12	Not currently defined.
13	BD. When set, this bit indicates that the cause of the debug exception is “debug register access detected.”
14	BS. When set, this bit indicates that the cause of the debug exception is either the execution of a single instruction (if RFLAGS.TF = 1 and IA32_DEBUGCTL.BTF = 0) or a taken branch (if RFLAGS.TF = DEBUGCTL.BTF = 1).
15	Not currently defined.
16	RTM. When set, this bit indicates that a debug exception (#DB) or a breakpoint exception (#BP) occurred inside an RTM region while advanced debugging of RTM transactional regions was enabled (see Section 17.3.7, “RTM-Enabled Debugger Support,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1). ²
63:17	Not currently defined. Bits 63:32 exist only on processors that support Intel 64 architecture.

NOTES:

1. In general, the format of this field matches that of DR6. However, DR6 **clears** bit 11 to indicate detection of a bus lock, while this field **sets** the bit to indicate that condition.
2. In general, the format of this field matches that of DR6. However, DR6 **clears** bit 16 to indicate an RTM-related exception, while this field **sets** the bit to indicate that condition.

- For a page-fault exception, the exit qualification contains the linear address that caused the page fault. If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata. On processors that support Intel 64 architecture, bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit.

If the page-fault exception occurred during execution of an instruction in enclave mode (and not during delivery of an event incident to enclave mode), bits 11:0 of the exit qualification are cleared.

- For a start-up IPI (SIPI), the exit qualification contains the SIPI vector information in bits 7:0. Bits 63:8 of the exit qualification are cleared to 0.
- For a task switch, the exit qualification contains details about the task switch, encoded as shown in Table 29-2.
- For INVLPG, the exit qualification contains the linear-address operand of the instruction.
 - On processors that support Intel 64 architecture, bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit.
 - If the INVLPG source operand specifies an unusable segment, the linear address specified in the exit qualification will match the linear address that the INVLPG would have used if no VM exit occurred. This address is not architecturally defined and may be implementation-specific.
- For INVEPT, INVPCID, INVVPID, LGDT, LIDT, LLDT, LTR, SGDT, SIDT, SLDT, STR, VMCLEAR, VMPTRLD, VMPTRST, VMREAD, VMWRITE, VMXON, XRSTORS, and XSAVES, the exit qualification receives the value of the instruction’s displacement field, which is sign-extended to 64 bits if necessary (32 bits on processors

Table 29-2. Exit Qualification for Task Switches

Bit Position(s)	Contents
15:0	Selector of task-state segment (TSS) to which the guest attempted to switch
29:16	Not currently defined
31:30	Source of task switch initiation: 0: CALL instruction 1: IRET instruction 2: JMP instruction 3: Task gate in IDT
63:32	Not currently defined. These bits exist only on processors that support Intel 64 architecture.

that do not support Intel 64 architecture). If the instruction has no displacement (for example, has a register operand), zero is stored into the exit qualification.

On processors that support Intel 64 architecture, an exception is made for RIP-relative addressing (used only in 64-bit mode). Such addressing causes an instruction to use an address that is the sum of the displacement field and the value of RIP that references the following instruction. In this case, the exit qualification is loaded with the sum of the displacement field and the appropriate RIP value.

In all cases, bits of this field beyond the instruction's address size are undefined. For example, suppose that the address-size field in the VM-exit instruction-information field (see Section 26.9.4 and Section 29.2.5) reports an n -bit address size. Then bits 63: n (bits 31: n on processors that do not support Intel 64 architecture) of the instruction displacement are undefined.

- For a control-register access, the exit qualification contains information about the access and has the format given in Table 29-3.
- For MOV DR, the exit qualification contains information about the instruction and has the format given in Table 29-4.
- For an I/O instruction, the exit qualification contains information about the instruction and has the format given in Table 29-5.
- For MWAIT, the exit qualification contains a value that indicates whether address-range monitoring hardware was armed. The exit qualification is set either to 0 (if address-range monitoring hardware is not armed) or to 1 (if address-range monitoring hardware is armed).
- For RDMSRLIST and WRMSRLIST, the exit qualification depends on the setting of the “use MSR bitmaps” VM-execution control. If the control is 0, the exit qualification is zero. If the control is 1, the exit qualification is the index of the MSR whose access caused the VM exit (see Section 27.1.3).
- WBINVD and WBNOINVD use the same basic exit reason (see Appendix C). For WBINVD, the exit qualification is 0, while for WBNOINVD it is 1.
- WRMSR and WRMSRNS use the same basic exit reason (see Appendix C). For WRMSR, the exit qualification is 0, while for WRMSRNS it is 1.
- For an APIC-access VM exit resulting from a linear access or a guest-physical access to the APIC-access page (see Section 31.4), the exit qualification contains information about the access and has the format given in Table 29-6.¹

If the access to the APIC-access page occurred during execution of an instruction in enclave mode (and not during delivery of an event incident to enclave mode), bits 11:0 of the exit qualification are cleared.

Such a VM exit that set bits 15:12 of the exit qualification to 0000b (data read during instruction execution) or 0001b (data write during instruction execution) set bit 12—which distinguishes data read from data

1. The exit qualification is undefined if the access was part of the logging of a branch record or a processor-event-based-sampling (PEBS) record to the DS save area. It is recommended that software configure the paging structures so that no address in the DS save area translates to an address on the APIC-access page.

write—to that which would have been stored in bit 1—W/R—of the page-fault error code had the access caused a page fault instead of an APIC-access VM exit. This implies the following:

- For an APIC-access VM exit caused by the CLFLUSH and CLFLUSHOPT instructions, the access type is “data read during instruction execution.”
- For an APIC-access VM exit caused by the ENTER instruction, the access type is “data write during instruction execution.”

Table 29-3. Exit Qualification for Control-Register Accesses

Bit Positions	Contents
3:0	Number of control register (0 for CLTS and LMSW). Bit 3 is always 0 on processors that do not support Intel 64 architecture as they do not support CR8.
5:4	Access type: 0 = MOV to CR 1 = MOV from CR 2 = CLTS 3 = LMSW
6	LMSW operand type: 0 = register 1 = memory For CLTS and MOV CR, cleared to 0
7	Not currently defined
11:8	For MOV CR, the general-purpose register: 0 = RAX 1 = RCX 2 = RDX 3 = RBX 4 = RSP 5 = RBP 6 = RSI 7 = RDI 8–15 represent R8–R15, respectively (used only on processors that support Intel 64 architecture) For CLTS and LMSW, cleared to 0
15:12	Not currently defined
31:16	For LMSW, the LMSW source data For CLTS and MOV CR, cleared to 0
63:32	Not currently defined. These bits exist only on processors that support Intel 64 architecture.

- For an APIC-access VM exit caused by the MASKMOVQ instruction or the MASKMOVDQU instruction, the access type is “data write during instruction execution.”
- For an APIC-access VM exit caused by the MONITOR instruction, the access type is “data read during instruction execution.”
- For an APIC-access VM exit caused directly by an access to a linear address in the DS save area (BTS or PEBS), the access type is “linear access for monitoring.”
- For an APIC-access VM exit caused by a guest-physical access performed for an access to the DS save area (e.g., to access a paging structure to translate a linear address), the access type is “guest-physical access for monitoring or trace.”

- For an APIC-access VM exit caused by trace-address pre-translation (TAPT) when the “Intel PT uses guest physical addresses” VM-execution control is 1, the access type is “guest-physical access for monitoring or trace.”

Such a VM exit stores 1 for bit 31 for IDT-vectoring information field (see Section 29.2.4) if and only if it sets bits 15:12 of the exit qualification to 0011b (linear access during event delivery) or 1010b (guest-physical access during event delivery).

See Section 31.4.4 for further discussion of these instructions and APIC-access VM exits.

For APIC-access VM exits resulting from physical accesses to the APIC-access page (see Section 31.4.6), the exit qualification is undefined.

- For an EPT violation, the exit qualification contains information about the access causing the EPT violation and has the format given in Table 29-7.

As noted in that table, the format and meaning of the exit qualification depends on the setting of the “mode-based execute control for EPT” VM-execution control and whether the processor supports advanced VM-exit information for EPT violations.¹

An EPT violation that occurs during as a result of execution of a read-modify-write operation sets bit 1 (data write). Whether it also sets bit 0 (data read) is implementation-specific and, for a given implementation, may differ for different kinds of read-modify-write operations.

Table 29-4. Exit Qualification for MOV DR

Bit Position(s)	Contents
2:0	Number of debug register
3	Not currently defined
4	Direction of access (0 = MOV to DR; 1 = MOV from DR)
7:5	Not currently defined
11:8	General-purpose register: 0 = RAX 1 = RCX 2 = RDX 3 = RBX 4 = RSP 5 = RBP 6 = RSI 7 = RDI 8 - 15 = R8 - R15, respectively
63:12	Not currently defined. Bits 63:32 exist only on processors that support Intel 64 architecture.

1. Software can determine whether advanced VM-exit information for EPT violations is supported by consulting the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10).

Table 29-5. Exit Qualification for I/O Instructions

Bit Position(s)	Contents
2:0	Size of access: 0 = 1-byte 1 = 2-byte 3 = 4-byte Other values not used
3	Direction of the attempted access (0 = OUT, 1 = IN)
4	String instruction (0 = not string; 1 = string)
5	REP prefixed (0 = not REP; 1 = REP)
6	Operand encoding (0 = DX, 1 = immediate)
15:7	Not currently defined
31:16	Port number (as specified in DX or in an immediate operand)
63:32	Not currently defined. These bits exist only on processors that support Intel 64 architecture.

Table 29-6. Exit Qualification for APIC-Access VM Exits from Linear Accesses and Guest-Physical Accesses

Bit Position(s)	Contents
11:0	- If the APIC-access VM exit is due to a linear access, the offset of access within the APIC page. - Undefined if the APIC-access VM exit is due a guest-physical access
15:12	Access type: 0 = linear access for a data read during instruction execution 1 = linear access for a data write during instruction execution 2 = linear access for an instruction fetch 3 = linear access (read or write) during event delivery 4 = linear access for monitoring 10 = guest-physical access during event delivery 11 = guest-physical access for monitoring or trace 15 = guest-physical access for an instruction fetch or during instruction execution Other values not used
16	This bit is set for certain accesses that are asynchronous to instruction execution and not part of event delivery. These includes guest-physical accesses related to trace output by Intel PT (see Section 27.5.4), accesses related to PEBS on processors with the “EPT-friendly” enhancement (see Section 21.9.5), and accesses that occur during user-interrupt delivery (see Section 8.4.2).
63:17	Not currently defined. Bits 63:32 exist only on processors that support Intel 64 architecture.

Bit 12 reports “NMI unblocking due to IRET”; see Section 29.2.3.

Bit 16 is set for certain accesses that are asynchronous to instruction execution and not part of event delivery. These include trace-address pre-translation (TAPT) for Intel PT (see Section 27.5.4), accesses related to PEBS on processors with the “EPT-friendly” enhancement (see Section 21.9.5), and accesses as part of user-interrupt delivery (see Section 8.4.2).

- For VM exits caused as part of EOI virtualization (Section 31.1.4), bits 7:0 of the exit qualification are set to vector of the virtual interrupt that was dismissed by the EOI virtualization. Bits above bit 7 are cleared.

- For APIC-write VM exits (Section 31.4.3.3), bits 11:0 of the exit qualification are set to the page offset of the write access that caused the VM exit.¹ Bits above bit 11 are cleared.
- For a VM exit due to a page-modification log-full event (Section 30.3.6), bit 12 of the exit qualification reports “NMI unblocking due to IRET” (see Section 29.2.3). Bit 16 is set if the VM exit occurs during TAPT, EPT-friendly PEBS, or user-interrupt delivery. All other bits of the exit qualification are undefined.
- For a VM exit due to an SPP-related event (Section 30.3.4), bit 11 of the exit qualification indicates the type of event: 0 indicates an SPP misconfiguration and 1 indicates an SPP miss. Bit 12 of the exit qualification reports “NMI unblocking due to IRET” (see Section 29.2.3). Bit 16 is set if the VM exit occurs during TAPT, EPT-friendly PEBS, or user-interrupt delivery. All other bits of the exit qualification are undefined.
- If the “PASID translation” VM-execution control, PASID translation is performed for executions of the ENQCMD and ENQCMLS instructions (see Section 27.5.8). PASID translation may fail, resulting in a VM exit. Such a VM exit saves an exit qualification specified in the following items:
 - For ENQCMD, the exit qualification is IA32_PASID[19:0].
 - For ENQCMLS, the exit qualification contains the low 32 bits of the instruction’s source operand (which had been read from memory prior to PASID translation).
- For a VM exit due to an instruction timeout (Section 27.2), bit 0 indicates (if set) that the context of the virtual machine is invalid and that the VM should not be resumed. Bit 12 of the exit qualification reports “NMI unblocking due to IRET” (see Section 29.2.3). All other bits of the exit qualification are undefined.
- **Guest linear address.** For some VM exits, this field receives a linear address that pertains to the VM exit. The field is set for different VM exits as follows:
 - VM exits due to attempts to execute LMSW with a memory operand. In these cases, this field receives the linear address of that operand. Bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit. If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata.
 - VM exits due to attempts to execute INS or OUTS for which the relevant segment is usable (if the relevant segment is not usable, the value is undefined). (ES is always the relevant segment for INS; for OUTS, the relevant segment is DS unless overridden by an instruction prefix.) The linear address is the base address of relevant segment plus (E)DI (for INS) or (E)SI (for OUTS). Bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit. If linear-address masking had been in effect (Section 4.4), the address recorded is the original address before any masking (and may thus contain any metadata).
 - VM exits due to EPT violations that set bit 7 of the exit qualification (see Table 29-7; these are all EPT violations except those resulting from an attempt to load the PDPTES as of execution of the MOV CR instruction and those due to TAPT). The linear address may translate to the guest-physical address whose access caused the EPT violation. Alternatively, translation of the linear address may reference a paging-structure entry whose access caused the EPT violation. Bits 63:32 are cleared if the logical processor was not in 64-bit mode before the VM exit. If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata.

If the EPT violation occurred during execution of an instruction in enclave mode (and not during delivery of an event incident to enclave mode), bits 11:0 of this field are cleared.
 - VM exits due to SPP-related events. If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata.
 - If the “prematurely busy shadow stack” VM-exit control is 1, certain VM exits (besides those noted above) save the linear address that pertains to the VM exit if the VM exit caused a shadow stack to become prematurely busy (see Section 27.4.3). This is true for VM exits due for these reasons: EPT misconfiguration, page-modification log-full event, and instruction timeout. (A VM exit due to instruction timeout that sets bit 0 of the exit qualification, indicating that VM context is invalid, does not save a valid linear address.) If linear-address masking had been in effect (Section 4.4), the address recorded reflects the result of that masking and does not contain any masked metadata.
 - For all other VM exits, the field is undefined.

1. Execution of WRMSR with ECX = 83FH (self-IPI MSR) can lead to an APIC-write VM exit; the exit qualification for such an APIC-write VM exit is 3F0H.

- **Guest-physical address.** For a VM exit due to an EPT violation, an EPT misconfiguration, or an SPP-related event, this field receives the guest-physical address that caused the EPT violation or EPT misconfiguration. For all other VM exits, the field is undefined.

If the EPT violation or EPT misconfiguration occurred during execution of an instruction in enclave mode (and not during delivery of an event incident to enclave mode), bits 11:0 of this field are cleared.

Table 29-7. Exit Qualification for EPT Violations

Bit Position(s)	Contents
0	Set if the access causing the EPT violation was a data read. ¹
1	Set if the access causing the EPT violation was a data write. ¹
2	Set if the access causing the EPT violation was an instruction fetch.
3	The logical-AND of bit 0 in the EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation (indicates whether the guest-physical address was readable). ²
4	The logical-AND of bit 1 in the EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation (indicates whether the guest-physical address was writeable). ²
5	The logical-AND of bit 2 in the EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation. ² If the “mode-based execute control for EPT” VM-execution control is 0, this indicates whether the guest-physical address was executable. If that control is 1, this indicates whether the guest-physical address was executable for supervisor-mode linear addresses.
6	If the “mode-based execute control” VM-execution control is 0, the value of this bit is undefined. If that control is 1, this bit is the logical-AND of bit 10 in the EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation. In this case, it indicates whether the guest-physical address was executable for user-mode linear addresses. ³
7	Set if the guest linear-address field is valid. The guest linear-address field is valid for all EPT violations except those resulting from an attempt to load the guest PDPTes as part of the execution of the MOV CR instruction and those due to trace-address pre-translation (TAPT; Section 27.5.4).
8	If bit 7 is 1: ▪ Set if the access causing the EPT violation is to a guest-physical address that is the translation of a linear address. ▪ Clear if the access causing the EPT violation is to a paging-structure entry as part of a page walk or the update of an accessed or dirty bit. Reserved if bit 7 is 0 (cleared to 0).
9	If bit 7 is 1, bit 8 is 1, and the processor supports advanced VM-exit information for EPT violations, ⁴ this bit is 0 if the linear address is a supervisor-mode linear address and 1 if it is a user-mode linear address. (If CR0.PG = 0, the translation of every linear address is a user-mode linear address and thus this bit will be 1.) Otherwise, this bit is undefined.
10	If bit 7 is 1, bit 8 is 1, and the processor supports advanced VM-exit information for EPT violations, ⁴ this bit is 0 if paging translates the linear address to a read-only page and 1 if it translates to a read/write page. (If CR0.PG = 0, every linear address is read/write and thus this bit will be 1.) Otherwise, this bit is undefined.
11	If bit 7 is 1, bit 8 is 1, and the processor supports advanced VM-exit information for EPT violations, ⁴ this bit is 0 if paging translates the linear address to an executable page and 1 if it translates to an execute-disable page. (If CR0.PG = 0, CR4.PAE = 0, or IA32_EFER.NXE = 0, every linear address is executable and thus this bit will be 0.) Otherwise, this bit is undefined.
12	NMI unblocking due to IRET (see Section 29.2.3).

Table 29-7. Exit Qualification for EPT Violations (Contd.)

Bit Position(s)	Contents
13	Set if the access causing the EPT violation was a shadow-stack access.
14	If supervisor shadow-stack control is enabled (by setting bit 7 of EPTP), this bit is the same as bit 60 in the EPT paging-structure entry that maps the page of the guest-physical address of the access causing the EPT violation. Otherwise (or if translation of the guest-physical address terminates before reaching an EPT paging-structure entry that maps a page), this bit is undefined.
15	This bit is set if the EPT violation was caused as a result of guest-paging verification. See Section 30.3.3.2.
16	This bit is set if the access was asynchronous to instruction execution not the result of event delivery. The bit is set if the access is related to trace output by Intel PT (see Section 27.5.4), accesses related to PEBS on processors with the “EPT-friendly” enhancement (see Section 21.9.5), or to user-interrupt delivery (see Section 8.4.2). Otherwise, this bit is cleared.
63:17	Not currently defined. Bits 63:32 exist only on processors that support Intel 64 architecture.

NOTES:

1. If accessed and dirty flags for EPT are enabled, processor accesses to guest paging-structure entries are treated as writes with regard to EPT violations (see Section 30.3.3.2). If such an access causes an EPT violation, the processor sets both bit 0 and bit 1 of the exit qualification.
2. Bits 5:3 are cleared to 0 if either (1) any of EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation is not present; or (2) 4-level EPT is in use and the guest-physical address sets any bits in the range 51:48 (see Section 30.3.2).
3. Bit 6 is cleared to 0 if (1) the “mode-based execute control” VM-execution control is 1; and (2) either (a) any of EPT paging-structure entries used to translate the guest-physical address of the access causing the EPT violation is not present; or (b) 4-level EPT is in use and the guest-physical address sets any bits in the range 51:48 (see Section 30.3.2).
4. Software can determine whether advanced VM-exit information for EPT violations is supported by consulting the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10).

29.2.2 Information for VM Exits Due to Vectored Events

Section 26.9.2 defines fields containing information for VM exits due to the following events: exceptions (including those generated by the instructions INT1, INT3, INTO, BOUND, UD1, UD2, and UDB); external interrupts that occur while the “acknowledge interrupt on exit” VM-exit control is 1; and non-maskable interrupts (NMIs).¹ Such VM exits include those that occur on an attempt at a task switch that causes an exception before generating the VM exit due to the task switch that causes the VM exit.

The following items detail the use of these fields:

- **VM-exit interruption information** (format given in Table 26-20). The following items detail how this field is established for VM exits due to these events:
 - For an exception, bits 7:0 receive the exception vector (at most 31). For an NMI, bits 7:0 are set to 2. For an external interrupt, bits 7:0 receive the vector.
 - Bits 10:8 are set to 0 (external interrupt), 2 (non-maskable interrupt), 3 (hardware exception), 5 (privileged software exception), or 6 (software exception). Hardware exceptions comprise all exceptions except the following:
 - Debug exceptions (#DB) generated by the INT1 instruction; these are privileged software exceptions. (Other debug exceptions are considered hardware exceptions, as are those caused by executions of INT1 in enclave mode.)
 - Breakpoint exceptions (#BP; generated by INT3) and overflow exceptions (#OF; generated by INTO); these are software exceptions. (A #BP that occurs in enclave mode is considered a hardware exception.)

1. INT1 and INT3 refer to the instructions with opcodes F1 and CC, respectively, and not to INT *n* with value 1 or 3 for *n*.

BOUND-range exceeded exceptions (#BR; generated by BOUND) and invalid opcode exceptions (#UD) generated by UD0, UD1, UD2, and UDB are hardware exceptions.

- Bit 11 is set to 1 if the VM exit is caused by a hardware exception that would have delivered an error code on the stack. This bit is always 0 if the VM exit occurred while the logical processor was in real-address mode (CR0.PE=0).¹ If bit 11 is set to 1, the error code is placed in the VM-exit interruption error code (see below).
- Bit 12 reports “NMI unblocking due to IRET”; see Section 29.2.3. The value of this bit is undefined if the VM exit is due to a double fault (the interruption type is hardware exception and the vector is 8).
- Bits 30:13 are always set to 0.
- Bit 31 is always set to 1.

For other VM exits (including those due to external interrupts when the “acknowledge interrupt on exit” VM-exit control is 0), the field is marked invalid (by clearing bit 31) and the remainder of the field is undefined.

- **VM-exit interruption error code.**

- For VM exits that set both bit 31 (valid) and bit 11 (error code valid) in the VM-exit interruption-information field, this field receives the error code that would have been pushed on the stack had the event causing the VM exit been delivered normally through the IDT. The EXT bit is set in this field exactly when it would be set normally. For exceptions that occur during the delivery of double fault (if the IDT-vectoring information field indicates a double fault), the EXT bit is set to 1, assuming that (1) that the exception would produce an error code normally (if not incident to double-fault delivery) and (2) that the error code uses the EXT bit (not for page faults, which use a different format).
- For other VM exits, the value of this field is undefined.

29.2.3 Information About NMI Unblocking Due to IRET

A VM exit may occur during execution of the IRET instruction for reasons including the following: faults, EPT violations, page-modification log-full events, SPP-related events, or instruction timeouts.

An execution of IRET that commences while non-maskable interrupts (NMIs) are blocked will unblock NMIs even if a fault or VM exit occurs; the state saved by such a VM exit will indicate that NMIs were not blocked.

VM exits for the reasons enumerated above provide more information to software by saving a bit called “NMI unblocking due to IRET.” This bit is defined if (1) either the “NMI exiting” VM-execution control is 0 or the “virtual NMIs” VM-execution control is 1; (2) the VM exit does not set the valid bit in the IDT-vectoring information field (see Section 29.2.4); and (3) the VM exit is not due to a double fault. In these cases, the bit is defined as follows:

- The bit is 1 if the VM exit resulted from a memory access as part of execution of the IRET instruction and one of the following holds:
 - The “virtual NMIs” VM-execution control is 0 and blocking by NMI (see Table 26-3) was in effect before execution of IRET.
 - The “virtual NMIs” VM-execution control is 1 and virtual-NMI blocking was in effect before execution of IRET.
- The bit is 0 for all other relevant VM exits.

For VM exits due to faults, NMI unblocking due to IRET is saved in bit 12 of the VM-exit interruption-information field (Section 29.2.2). For VM exits due to EPT violations, page-modification log-full events, SPP-related events, and instruction timeouts, NMI unblocking due to IRET is saved in bit 12 of the exit qualification (Section 29.2.1).

(Executions of IRET may also incur VM exits due to APIC accesses and EPT misconfigurations. These VM exits do not report information about NMI unblocking due to IRET.)

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, a logical processor cannot be in real-address mode unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

29.2.4 Information for VM Exits During Event Delivery

Section 26.9.3 defined fields containing information for VM exits that occur while delivering an event through the IDT and as a result of any of the following cases:¹

- A fault occurs during event delivery and causes a VM exit (because the bit associated with the fault is set to 1 in the exception bitmap).
- A task switch is invoked through a task gate in the IDT. The VM exit occurs due to the task switch only after the initial checks of the task switch pass (see Section 27.4.2).
- Event delivery causes an APIC-access VM exit (see Section 31.4).
- An EPT violation, EPT misconfiguration, page-modification log-full event, or SPP-related event that occurs during event delivery.
- Any of the above VM exits that occur during user-interrupt notification processing (see Section 8.5.2). Such VM exits will be treated as if they occurred during delivery of an external interrupt with the vector UINV.

These fields are used for VM exits that occur during delivery of events injected as part of VM entry (see Section 28.6.1.2).

A VM exit is not considered to occur during event delivery in any of the following circumstances:

- The original event causes the VM exit directly (for example, because the original event is a non-maskable interrupt (NMI) and the “NMI exiting” VM-execution control is 1).
- The original event results in a double-fault exception that causes the VM exit directly.
- The VM exit occurred as a result of fetching the first instruction of the handler invoked by the event delivery.
- The VM exit is caused by a triple fault.
- The original event was a software interrupt (INT *n*) executed in virtual-8086 mode with EFLAGS.IOPL < 3 and the VM exit was due to a general-protection exception (#GP) that occurred because either CR4.VME = 0 or bit *n* of the software interrupt redirection bit map in the TSS is set.

The following items detail the use of these fields:

- IDT-vectoring information (format given in Table 26-21). The following items detail how this field is established for VM exits that occur during event delivery:
 - If the VM exit occurred during delivery of an exception, bits 7:0 receive the exception vector (at most 31). If the VM exit occurred during delivery of an NMI, bits 7:0 are set to 2. If the VM exit occurred during delivery of an external interrupt, bits 7:0 receive the vector.
 - Bits 10:8 are set to indicate the type of event that was being delivered when the VM exit occurred: 0 (external interrupt), 2 (non-maskable interrupt), 3 (hardware exception), 4 (software interrupt), 5 (privileged software interrupt), or 6 (software exception).

Hardware exceptions comprise all exceptions except the following:²

- Debug exceptions (#DB) generated by the INT1 instruction; these are privileged software exceptions. (Other debug exceptions are considered hardware exceptions, as are those caused by executions of INT1 in enclave mode.)
- Breakpoint exceptions (#BP; generated by INT3) and overflow exceptions (#OF; generated by INTO); these are software exceptions. (A #BP that occurs in enclave mode is considered a hardware exception.)

BOUND-range exceeded exceptions (#BR; generated by BOUND) and invalid opcode exceptions (#UD) generated by UD0, UD1, UD2, and UDB are hardware exceptions.

- Bit 11 is set to 1 if the VM exit occurred during delivery of a hardware exception that would have delivered an error code on the stack. This bit is always 0 if the VM exit occurred while the logical processor was in

1. This includes the case in which a VM exit occurs while delivering a software interrupt (INT *n*) through the 16-bit IVT (interrupt vector table) that is used in virtual-8086 mode with virtual-machine extensions (if RFLAGS.VM = CR4.VME = 1).

2. In the following items, INT1 and INT3 refer to the instructions with opcodes F1 and CC, respectively, and not to INT *n* with value 1 or 3 for *n*.

real-address mode (CR0.PE=0).¹ If bit 11 is set to 1, the error code is placed in the IDT-vectoring error code (see below).

- Bit 12 is undefined.
- Bits 30:13 are always set to 0.
- Bit 31 is always set to 1.

For other VM exits, the field is marked invalid (by clearing bit 31) and the remainder of the field is undefined.

- IDT-vectoring error code.
 - For VM exits that set both bit 31 (valid) and bit 11 (error code valid) in the IDT-vectoring information field, this field receives the error code that would have been pushed on the stack by the event that was being delivered through the IDT at the time of the VM exit. The EXT bit is set in this field when it would be set normally.
 - For other VM exits, the value of this field is undefined.

29.2.5 Information for VM Exits Due to Instruction Execution

Section 26.9.4 defined fields containing information for VM exits that occur due to instruction execution. (The VM-exit instruction length is also used for VM exits that occur during the delivery of a software interrupt or software exception.) The following items detail their use.

- **VM-exit instruction length.** This field is used in the following cases:
 - For fault-like VM exits due to attempts to execute one of the following instructions that cause VM exits unconditionally (see Section 27.1.2) or based on the settings of VM-execution controls (see Section 27.1.3): CLTS, CPUID, ENCLS, GETSEC, HLT, IN, INS, INVD, INVEPT, INVLPG, INVPCID, INVVPID, LGDT, LIDT, LLD, LMSW, LOADIWKEY, LTR, MONITOR, MOV CR, MOV DR, MWAIT, OUT, OUTS, PAUSE, PCONFIG, RDMSR, RDP, RDRAND, RDSEED, RDTSC, RDTSCP, RSM, SEAMCALL, SGDT, SIDT, SLDT, STR, TDCALL, SGDT, SIDT, SLDT, STR, TPAUSE, UMWAIT, VMCALL, VMCLEAR, VMLAUNCH, VMPTRLD, VMPTRST, VMREAD, VMRESUME, VMWRITE, VMXOFF, VMXON, WBINVD, WBNOINVD, WRMSR, XRSTORS, XSETBV, and XSAVES.²
 - For VM exits due to software exceptions (those generated by executions of INT3 or INTO) or privileged software exceptions (those generated by executions of INT1).
 - For VM exits due to faults encountered during delivery of a software interrupt, privileged software exception, or software exception.
 - For VM exits due to attempts to effect a task switch via instruction execution. These are VM exits that produce an exit reason indicating task switch and either of the following:
 - An exit qualification indicating execution of CALL, IRET, or JMP instruction.
 - An exit qualification indicating a task gate in the IDT and an IDT-vectoring information field indicating that the task gate was encountered during delivery of a software interrupt, privileged software exception, or software exception.
 - For APIC-access VM exits and for VM exits caused by EPT violations, page-modification log-full events, and SPP-related events encountered during delivery of a software interrupt, privileged software exception, or software exception.³
 - For VM exits due executions of VMFUNC that fail because one of the following is true:

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PE must be 1 in VMX operation, a logical processor cannot be in real-address mode unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
2. This item applies only to fault-like VM exits. It does not apply to trap-like VM exits following executions of the MOV to CR8 instruction when the “use TPR shadow” VM-execution control is 1 or to those following executions of the WRMSR instruction when the “virtualize x2APIC mode” VM-execution control is 1.
3. The VM-exit instruction-length field is not defined following APIC-access VM exits resulting from physical accesses (see Section 31.4.6) even if encountered during delivery of a software interrupt, privileged software exception, or software exception.

- EAX indicates a VM function that is not enabled (the bit at position EAX is 0 in the VM-function controls; see Section 27.5.6.2).
- EAX = 0 and either ECX $\geq$ 512 or the value of ECX selects an invalid tentative EPTP value (see Section 27.5.6.3).

In all the above cases, this field receives the length in bytes (1–15) of the instruction (including any instruction prefixes) whose execution led to the VM exit (see the next paragraph for one exception).

The cases of VM exits encountered during delivery of a software interrupt, privileged software exception, or software exception include those encountered during delivery of events injected as part of VM entry (see Section 28.6.1.2). If the original event was injected as part of VM entry, this field receives the value of the VM-entry instruction length.

All VM exits other than those listed in the above items leave this field undefined.

If the VM exit occurred in enclave mode, this field is cleared (none of the previous items apply).

Table 29-8. Format of the VM-Exit Instruction-Information Field as Used for INS and OUTS

Bit Position(s)	Content
6:0	Undefined.
9:7	Address size: 0: 16-bit 1: 32-bit 2: 64-bit (used only on processors that support Intel 64 architecture) Other values not used.
14:10	Undefined.
17:15	Segment register: 0: ES 1: CS 2: SS 3: DS 4: FS 5: GS Other values not used. Undefined for VM exits due to execution of INS.
31:18	Undefined.

- **VM-exit instruction information.** For VM exits due to attempts to execute INS, INVEPT, INVPCID, INVVPID, LIDT, LGDT, LLDT, LOADIWKEY, LTR, OUTS, RDRAND, RDSEED, SIDT, SGDT, SLDT, STR, TPAUSE, UMWAIT, VMCLEAR, VMPTRLD, VMPTRST, VMREAD, VMWRITE, VMXON, XRSTORS, or XSAVES, this field receives information about the instruction that caused the VM exit. The format of the field depends on the identity of the instruction causing the VM exit:
 - For VM exits due to attempts to execute INS or OUTS, the field has the format is given in Table 29-8.¹
 - For VM exits due to attempts to execute INVEPT, INVPCID, or INVVPID, the field has the format is given in Table 29-9.
 - For VM exits due to attempts to execute LIDT, LGDT, SIDT, or SGDT, the field has the format is given in Table 29-10.
 - For VM exits due to attempts to execute LLDT, LTR, SLDT, or STR, the field has the format is given in Table 29-11.
 - For VM exits due to attempts to execute RDRAND or RDSEED, the field has the format is given in Table 29-12.

1. The format of the field was undefined for these VM exits on the first processors to support the virtual-machine extensions. Software can determine whether the format specified in Table 29-8 is used by consulting the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

- For VM exits due to attempts to execute TPAUSE or UMWAIT, the field has the format is given in Table 29-13.
- For VM exits due to attempts to execute VMCLEAR, VMPTRLD, VMPTRST, VMXON, XRSTORS, or XSAVES, the field has the format is given in Table 29-14.
- For VM exits due to attempts to execute VMREAD or VMWRITE, the field has the format is given in Table 29-15.
- For VM exits due to attempts to execute LOADIWKEY, the field has the format is given in Table 29-16.

For all other VM exits, the field is undefined, unless the VM exit occurred in enclave mode, in which case the field is cleared.

- **I/O RCX, I/O RSI, I/O RDI, I/O RIP.** These fields are undefined except for SMM VM exits due to system-management interrupts (SMIs) that arrive immediately after retirement of I/O instructions. See Section 33.15.2.3. Note that, if the VM exit occurred in enclave mode, these fields are all cleared.
- **MSR data.** An execution of WRMSRLIST may cause a VM exit if it would write to an MSR for which the MSR bitmaps do not allow writes (see Section 27.1.3). Such VM exits save the 64-bit data that would have been written to the MSR into this field in the VMCS.

30:7	Undefined.
31:28	Reg2: identifies the second XMM register operand (see above).

29.3 SAVING GUEST STATE

VM exits save certain components of processor state into corresponding fields in the guest-state area of the VMCS (see Section 26.4). On processors that support Intel 64 architecture, the full value of each natural-width field (see Section 26.11.2) is saved regardless of the mode of the logical processor before and after the VM exit.

In general, the state saved is that which was in the logical processor at the time the VM exit commences. See Section 29.1 for a discussion of which architectural updates occur at that time.

Section 29.3.1 through Section 29.3.4 provide details for how various components of processor state are saved. These sections reference VMCS fields that correspond to processor state. Unless otherwise stated, these references are to fields in the guest-state area.

29.3.1 Saving Control Registers, Debug Registers, and MSRs

Contents of certain control registers, debug registers, and MSRs are saved as follows:

- The contents of CR0, CR3, CR4, and the IA32_SYSENTER_CS, IA32_SYSENTER_ESP, and IA32_SYSENTER_EIP MSRs are saved into the corresponding fields. Bits 63:32 of the IA32_SYSENTER_CS MSR are not saved. On processors that do not support Intel 64 architecture, bits 63:32 of the IA32_SYSENTER_ESP and IA32_SYSENTER_EIP MSRs are not saved.
- If the “save debug controls” VM-exit control is 1, the contents of DR7 and the IA32_DEBUGCTL MSR are saved into the corresponding fields. The first processors to support the virtual-machine extensions supported only the 1-setting of this control and thus always saved data into these fields.
- If the “save IA32_PAT” VM-exit control is 1, the contents of the IA32_PAT MSR are saved into the corresponding field.
- If the “save IA32_EFER” VM-exit control is 1, the contents of the IA32_EFER MSR are saved into the corresponding field.
- If the processor supports either the 1-setting of the “load IA32_BNDCFGS” VM-entry control or that of the “clear IA32_BNDCFGS” VM-exit control, the contents of the IA32_BNDCFGS MSR are saved into the corresponding field.

- If the processor supports either the 1-setting of the “load IA32_RTIT_CTL” VM-entry control or that of the “clear IA32_RTIT_CTL” VM-exit control, the contents of the IA32_RTIT_CTL MSR are saved into the corresponding field.
- If the processor supports the 1-setting of the “load CET” VM-entry control, the contents of the IA32_S_CET and IA32_INTERRUPT_SSP_TABLE_ADDR MSRs are saved into the corresponding fields. On processors that do not support Intel 64 architecture, bits 63:32 of these MSRs are not saved.
- If the processor supports either the 1-setting of the “load guest IA32_LBR_CTL” VM-entry control or that of the “clear IA32_LBR_CTL” VM-exit control, the contents of the IA32_LBR_CTL MSR are saved into the corresponding field.
- If the processor supports the 1-setting of the “load PKRS” VM-entry control, the contents of the IA32_PKRS MSR are saved into the corresponding field.
- If a processor supports user interrupts, every VM exit saves UINV into the guest UINV field in the VMCS (bits 15:8 of the field are cleared).
- If the “save IA32_PERF_GLOBAL_CTL” VM-exit control is 1, the contents of the IA32_PERF_GLOBAL_CTL MSR are saved into the corresponding field.
- The value of the SMBASE field is undefined after all VM exits except SMM VM exits. See Section 33.15.2.

29.3.2 Saving Segment Registers and Descriptor-Table Registers

For each segment register (CS, SS, DS, ES, FS, GS, LDTR, or TR), the values saved for the base-address, segment-limit, and access rights are based on whether the register was unusable (see Section 26.4.1) before the VM exit:

- If the register was unusable, the values saved into the following fields are undefined: (1) base address; (2) segment limit; and (3) bits 7:0 and bits 15:12 in the access-rights field. The following exceptions apply:
 - CS.
 - The base-address and segment-limit fields are saved.
 - The L, D, and G bits are saved in the access-rights field.
 - SS.
 - DPL is saved in the access-rights field.
 - On processors that support Intel 64 architecture, bits 63:32 of the value saved for the base address are always zero.
 - DS and ES. On processors that support Intel 64 architecture, bits 63:32 of the values saved for the base addresses are always zero.
 - FS and GS. The base-address field is saved.
- If the register was not unusable, the values saved into the following fields are those which were in the register before the VM exit: (1) base address; (2) segment limit; and (3) bits 7:0 and bits 15:12 in access rights.
- Bits 31:17 and 11:8 in the access-rights field are always cleared. Bit 16 is set to 1 if and only if the segment is unusable.

The contents of the GDTR and IDTR registers are saved into the corresponding base-address and limit fields.

29.3.3 Saving RIP, RSP, RFLAGS, and SSP

The contents of the RIP, RSP, RFLAGS, and SSP (shadow-stack pointer) registers are saved as follows:

- The value saved in the RIP field is determined by the nature and cause of the VM exit:
 - If the VM exit occurred in enclave mode, the value saved is the AEP of interrupted enclave thread (the remaining items do not apply).
 - If the VM exit occurs due to by an attempt to execute an instruction that causes VM exits unconditionally or that has been configured to cause a VM exit via the VM-execution controls, the value saved references that instruction.

- If the VM exit is caused by an occurrence of an INIT signal, a start-up IPI (SIPI), or system-management interrupt (SMI), the value saved is that which was in RIP before the event occurred.
- If the VM exit occurs due to the 1-setting of either the “interrupt-window exiting” VM-execution control or the “NMI-window exiting” VM-execution control, the value saved is that which would be in the register had the VM exit not occurred.
- If the VM exit is due to an external interrupt, non-maskable interrupt (NMI), or hardware exception (as defined in Section 29.2.2), the value saved is the return pointer that would have been saved (either on the stack had the event been delivered through a trap or interrupt gate,¹ or into the old task-state segment had the event been delivered through a task gate).
- If the VM exit is due to a triple fault, the value saved is the return pointer that would have been saved (either on the stack had the event been delivered through a trap or interrupt gate, or into the old task-state segment had the event been delivered through a task gate) had delivery of the double fault not encountered the nested exception that caused the triple fault.
- If the VM exit is due to a software exception (due to an execution of INT3 or INTO) or a privileged software exception (due to an execution of INT1), the value saved references the INT3, INTO, or INT1 instruction that caused that exception.
- Suppose that the VM exit is due to a task switch that was caused by execution of CALL, IRET, or JMP or by execution of a software interrupt (INT *n*), software exception (due to execution of INT3 or INTO), or privileged software exception (due to execution of INT1) that encountered a task gate in the IDT. The value saved references the instruction that caused the task switch (CALL, IRET, JMP, INT *n*, INT3, INTO, INT1).
- Suppose that the VM exit is due to a task switch that was caused by a task gate in the IDT that was encountered for any reason except the direct access by a software interrupt or software exception. The value saved is that which would have been saved in the old task-state segment had the task switch completed normally.
- If the VM exit is due to an execution of MOV to CR8 or WRMSR that reduced the value of bits 7:4 of VTPR (see Section 31.1.1) below that of TPR threshold VM-execution control field (see Section 31.1.2), the value saved references the instruction following the MOV to CR8 or WRMSR.
- If the VM exit was caused by APIC-write emulation (see Section 31.4.3.2) that results from an APIC access as part of instruction execution, the value saved references the instruction following the one whose execution caused the APIC-write emulation.
- The contents of the RSP register are saved into the RSP field.
- With the exception of the resume flag (RF; bit 16), the contents of the RFLAGS register is saved into the RFLAGS field. RFLAGS.RF is saved as follows:
 - If the VM exit occurred in enclave mode, the value saved is 0 (the remaining items do not apply).
 - If the VM exit is caused directly by an event that would normally be delivered through the IDT, the value saved is that which would appear in the saved RFLAGS image (either that which would be saved on the stack had the event been delivered through a trap or interrupt gate² or into the old task-state segment had the event been delivered through a task gate) had the event been delivered through the IDT. See below for VM exits due to task switches caused by task gates in the IDT.
 - If the VM exit is caused by a triple fault, the value saved is that which the logical processor would have in RF in the RFLAGS register had the triple fault taken the logical processor to the shutdown state.
 - If the VM exit is caused by a task switch (including one caused by a task gate in the IDT), the value saved is that which would have been saved in the RFLAGS image in the old task-state segment (TSS) had the task switch completed normally without exception.

1. The reference here is to the full value of RIP before any truncation that would occur had the stack width been only 32 bits or 16 bits.

2. The reference here is to the full value of RFLAGS before any truncation that would occur had the stack width been only 32 bits or 16 bits.

- If the VM exit is caused by an attempt to execute an instruction that unconditionally causes VM exits or one that was configured to do with a VM-execution control, the value saved is 0.¹
- For APIC-access VM exits and for VM exits caused by EPT violations, EPT misconfigurations, page-modification log-full events, or SPP-related events, the value saved depends on whether the VM exit occurred during delivery of an event through the IDT:
 - If the VM exit stored 0 for bit 31 for IDT-vectoring information field (because the VM exit did not occur during delivery of an event through the IDT; see Section 29.2.4), the value saved is 1.
 - If the VM exit stored 1 for bit 31 for IDT-vectoring information field (because the VM exit did occur during delivery of an event through the IDT), the value saved is the value that would have appeared in the saved RFLAGS image had the event been delivered through the IDT (see above).
- For all other VM exits, the value saved is the value RFLAGS.RF had before the VM exit occurred.
- If the processor supports the 1-setting of the “load CET” VM-entry control, the contents of the SSP register are saved into the SSP field.

29.3.4 Saving Non-Register State

Information corresponding to guest non-register state is saved as follows:

- The activity-state field is saved with the logical processor’s activity state before the VM exit.² See Section 29.1 for details of how events leading to a VM exit may affect the activity state. If the VM exit occurred during user-interrupt notification processing (see Section 8.5.2) and the logical processor would have entered the HLT state following user-interrupt notification processing, the saved activity state is “HLT”.
- The interruptibility-state field is saved to reflect the logical processor’s interruptibility before the VM exit.
 - See Section 29.1 for details of how events leading to a VM exit may affect this state.
 - VM exits that end outside system-management mode (SMM) save bit 2 (blocking by SMI) as 0 regardless of the state of such blocking before the VM exit.
 - Bit 3 (blocking by NMI) is treated specially if the “virtual NMIs” VM-execution control is 1. In this case, the value saved for this field does not indicate the blocking of NMIs but rather the state of virtual-NMI blocking.
 - Bit 4 (enclave interruption) is set to 1 if the VM exit occurred while the logical processor was in enclave mode.

Such VM exits includes those caused by interrupts, non-maskable interrupts, system-management interrupts, INIT signals, and exceptions occurring in enclave mode as well as exceptions encountered during the delivery of such events incident to enclave mode.

A VM exit also sets this bit if it was due to or incident to delivery of an event that was either (1) made pending or injected by VM entry while the guest interruptibility-state field sets this bit; or (2) pending following an execution of RSM that occurred while bit 1 was set in the byte at offset 7EE0H in the state save image in SMRAM.
- The pending debug exceptions field is saved as clear for all VM exits except the following:
 - A VM exit caused by an INIT signal, a machine-check exception, or a system-management interrupt (SMI).
 - A VM exit with basic exit reason “TPR below threshold”,³ “virtualized EOI”, “APIC write”, “monitor trap flag”, or “bus-lock detected.”
 - A VM exit due to trace-address pre-translation (TAPT; see Section 27.5.4) or due to accesses related to PEBS on processors with the “EPT-friendly” enhancement (see Section 21.9.5). Such VM exits can have

1. This is true even if RFLAGS.RF was 1 before the instruction was executed. If, in response to such a VM exit, a VM monitor re-enters the guest to re-execute the instruction that caused the VM exit (for example, after clearing the VM-execution control that caused the VM exit), the instruction may encounter a code breakpoint that has already been processed. A VM monitor can avoid this by setting the guest value of RFLAGS.RF to 1 before resuming guest software.
2. If this activity state was an inactive state resulting from execution of a specific instruction (HLT or MWAIT), the value saved for RIP by that VM exit will reference the following instruction.
3. This item includes VM exits that occur as a result of certain VM entries (Section 28.7.7).

basic exit reason “APIC access,” “EPT violation,” “EPT misconfiguration,” “page-modification log full,” or “SPP-related event.” When due to TAPT or PEBS, these VM exits (with the exception of those due to EPT misconfigurations) set bit 16 of the exit qualification, indicating that they are asynchronous to instruction execution and not part of event delivery.

- VM exits that are not caused by debug exceptions and that occur while there is MOV-SS blocking of debug exceptions.

For VM exits that do not clear the field, the value saved is determined as follows:

- Each of bits 3:0 may be set if it corresponds to a matched breakpoint. This may be true even if the corresponding breakpoint is not enabled in DR7.
- Suppose that a VM exit is due to an INIT signal, a machine-check exception, or an SMI; or that a VM exit has basic exit reason “TPR below threshold” or “monitor trap flag.” In this case, the value saved sets bits corresponding to the causes of any debug exceptions that were pending at the time of the VM exit.

If the VM exit occurs immediately after VM entry, the value saved may match that which was loaded on VM entry (see Section 28.7.3). Otherwise, the following items apply:

- Bit 12 (enabled breakpoint) is set to 1 in any of the following cases:
 - If there was at least one matched data or I/O breakpoint that was enabled in DR7.
 - If it had been set on VM entry, causing there to be valid pending debug exceptions (see Section 28.7.3) and the VM exit occurred before those exceptions were either delivered or lost.
 - If the XBEGIN instruction was executed immediately before the VM exit and advanced debugging of RTM transactional regions had been enabled (see Section 17.3.7, “RTM-Enabled Debugger Support,” of Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1). (This does not apply to VM exits with basic exit reason “monitor trap flag.”)
 - If a bus lock was asserted while CPL > 0 and OS bus-lock detection was enabled.

In other cases, bit 12 is cleared to 0.

- Bit 14 (BS) is set if RFLAGS.TF = 1 in either of the following cases:
 - IA32_DEBUGCTL.BTF = 0 and the cause of a pending debug exception was the execution of a single instruction.
 - IA32_DEBUGCTL.BTF = 1 and the cause of a pending debug exception was a taken branch.
- Bit 16 (RTM) is set if a debug exception (#DB) or a breakpoint exception (#BP) occurred inside an RTM region while advanced debugging of RTM transactional regions had been enabled. (This does not apply to VM exits with basic exit reason “monitor trap flag.”)
- Suppose that a VM exit is due to another reason (but not a debug exception) and occurs while there is MOV-SS blocking of debug exceptions. In this case, the value saved sets bits corresponding to the causes of any debug exceptions that were pending at the time of the VM exit. If the VM exit occurs immediately after VM entry (no instructions were executed in VMX non-root operation), the value saved may match that which was loaded on VM entry (see Section 28.7.3). Otherwise, the following items apply:
 - Bit 12 (enabled breakpoint) is set to 1 if there was at least one matched data or I/O breakpoint that was enabled in DR7. Bit 12 is also set if it had been set on VM entry, causing there to be valid pending debug exceptions (see Section 28.7.3) and the VM exit occurred before those exceptions were either delivered or lost. In other cases, bit 12 is cleared to 0.
 - The setting of bit 14 (BS) is implementation-specific. However, it is not set if RFLAGS.TF = 0 or IA32_DEBUGCTL.BTF = 1.
- The reserved bits in the field are cleared.
- If the “save VMX-preemption timer value” VM-exit control is 1, the value of timer is saved into the VMX-preemption timer-value field. This is the value loaded from this field on VM entry as subsequently decremented (see Section 27.5.1). VM exits due to timer expiration save the value 0. Other VM exits may also save the value 0 if the timer expired during VM exit. (If the “save VMX-preemption timer value” VM-exit control is 0, VM exit does not modify the value of the VMX-preemption timer-value field.)
- If the logical processor supports the 1-setting of the “enable EPT” VM-execution control, values are saved into the four (4) PDPTE fields as follows:

- If the “enable EPT” VM-execution control is 1 and the logical processor was using PAE paging at the time of the VM exit, the PDPTe values currently in use are saved:¹
 - The values saved into bits 11:9 of each of the fields is undefined.
 - If the value saved into one of the fields has bit 0 (present) clear, the value saved into bits 63:1 of that field is undefined. That value need not correspond to the value that was loaded by VM entry or to any value that might have been loaded in VMX non-root operation.
 - If the value saved into one of the fields has bit 0 (present) set, the value saved into bits 63:12 of the field is a guest-physical address.
- If the “enable EPT” VM-execution control is 0 or the logical processor was not using PAE paging at the time of the VM exit, the values saved are undefined.

29.4 SAVING MSRS

After processor state is saved to the guest-state area, values of MSRs may be stored into the VM-exit MSR-store area (see Section 26.7.2). Specifically each entry in that area (up to the number specified in the VM-exit MSR-store count) is processed in order by storing the value of the MSR indexed by bits 31:0 (as they would be read by RDMSR) into bits 127:64. Processing of an entry fails in either of the following cases:

- The value of bits 31:8 is 000008H, meaning that the indexed MSR is one that allows access to an APIC register when the local APIC is in x2APIC mode.
- The value of bits 31:0 indicates an MSR that can be read only in system-management mode (SMM) and the VM exit will not end in SMM. (IA32_SMBASE is an MSR that can be read only in SMM.)
- The value of bits 31:0 indicates an MSR that cannot be saved on VM exits for model-specific reasons. A processor may prevent certain MSRs (based on the value of bits 31:0) from being stored on VM exits, even if they can normally be read by RDMSR. Such model-specific behavior is documented in Chapter 2, “Model-Specific Registers (MSRs),” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4.
- Bits 63:32 of the entry are not all 0.
- An attempt to read the MSR indexed by bits 31:0 would cause a general-protection exception if executed via RDMSR with CPL = 0.

A VMX abort occurs if processing fails for any entry. See Section 29.7.

29.5 LOADING HOST STATE

Processor state is updated on VM exits in the following ways:

- Some state is loaded from or otherwise determined by the contents of the host-state area.
- Some state is determined by VM-exit controls.
- Some state is established in the same way on every VM exit.
- The page-directory pointers are loaded based on the values of certain control registers.

This loading may be performed in any order.

On processors that support Intel 64 architecture, the full values of each 64-bit field loaded (for example, the base address for GDTR) is loaded regardless of the mode of the logical processor before and after the VM exit.

The loading of host state is detailed in Section 29.5.1 to Section 29.5.5. These sections reference VMCS fields that correspond to processor state. Unless otherwise stated, these references are to fields in the host-state area.

1. A logical processor uses PAE paging if CRO.PG = 1, CR4.PAE = 1 and IA32_EFER.LMA = 0. See Section 5.4 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A. “Enable EPT” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM exit functions as if the “enable EPT” VM-execution control were 0. See Section 26.6.2.

A logical processor is in IA-32e mode after a VM exit only if the “host address-space size” VM-exit control is 1. If the logical processor was in IA-32e mode before the VM exit and this control is 0, a VMX abort occurs. See Section 29.7.

In addition to loading host state, VM exits clear address-range monitoring (Section 29.5.6).

After the state loading described in this section, VM exits may load MSRs from the VM-exit MSR-load area (see Section 29.6). This loading occurs only after the state loading described in this section.

29.5.1 Loading Host Control Registers, Debug Registers, MSRs

VM exits load new values for controls registers, debug registers, and some MSRs:

- CR0, CR3, and CR4 are loaded from the CR0 field, the CR3 field, and the CR4 field, respectively, with the following exceptions:
 - The following bits are not modified:
 - For CR0, ET, CD, NW; bits 63:32 (on processors that support Intel 64 architecture), 28:19, 17, and 15:6; and any bits that are fixed in VMX operation (see Section 25.8).¹
 - For CR3, bits 63:MAXPHYADDR, where MAXPHYADDR is defined as follows:
 - Usually, MAXPHYADDR is the processor’s supported physical-address width as enumerated in CPUID.80000008H:EAX[7:0] (this width is at most 52).
 - If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM.²
 - This item applies only to processors that support Intel 64 architecture.
 - For CR4, any bits that are fixed in VMX operation (see Section 25.8).
 - CR4.PAE is set to 1 if the “host address-space size” VM-exit control is 1.
 - CR4.PCIDE is set to 0 if the “host address-space size” VM-exit control is 0.
 - DR7 is set to 400H.
 - If the “clear UINV” VM-exit control is 1, VM exit clears UINV.
 - The following MSRs are established as follows:
 - The IA32_DEBUGCTL MSR is cleared to 00000000_00000000H.
 - The IA32_SYSENTER_CS MSR is loaded from the IA32_SYSENTER_CS field. Since that field has only 32 bits, bits 63:32 of the MSR are cleared to 0.
 - The IA32_SYSENTER_ESP and IA32_SYSENTER_EIP MSRs are loaded from the IA32_SYSENTER_ESP and IA32_SYSENTER_EIP fields, respectively.
- If the processor does not support the Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are cleared to 0.
- If the processor supports the Intel 64 architecture with $N < 64$ linear-address bits, each of bits 63:N is set to the value of bit $N-1$.³
- The following steps are performed on processors that support Intel 64 architecture:
 - The MSRs FS.base and GS.base are loaded from the base-address fields for FS and GS, respectively (see Section 29.5.2).

1. Bits 28:19, 17, and 15:6 of CR0 and CR0.ET are unchanged by executions of MOV to CR0. CR0.ET is always 1 and the other bits are always 0.

2. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

3. Software can determine the number N by executing CPUID with 80000008H in EAX. The number of linear-address bits supported is returned in bits 15:8 of EAX.

- The LMA and LME bits in the IA32_EFER MSR are each loaded with the setting of the “host address-space size” VM-exit control.
- If the “load IA32_PERF_GLOBAL_CTRL” VM-exit control is 1, the IA32_PERF_GLOBAL_CTRL MSR is loaded from the IA32_PERF_GLOBAL_CTRL field. Bits that are reserved in that MSR are maintained with their reserved values.
- If the “load IA32_PAT” VM-exit control is 1, the IA32_PAT MSR is loaded from the IA32_PAT field. Bits that are reserved in that MSR are maintained with their reserved values.
- If the “load IA32_EFER” VM-exit control is 1, the IA32_EFER MSR is loaded from the IA32_EFER field. Bits that are reserved in that MSR are maintained with their reserved values.
- If the “clear IA32_BNDCFGS” VM-exit control is 1, the IA32_BNDCFGS MSR is cleared to 00000000_00000000H; otherwise, it is not modified.
- If the “clear IA32_RTIT_CTL” VM-exit control is 1, the IA32_RTIT_CTL MSR is cleared to 00000000_00000000H; otherwise, it is not modified.
- If the “load CET” VM-exit control is 1, the IA32_S_CET and IA32_INTERRUPT_SSP_TABLE_ADDR MSRs are loaded from the IA32_S_CET and IA32_INTERRUPT_SSP_TABLE_ADDR fields, respectively.
If the processor does not support the Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are cleared to 0.
If the processor supports the Intel 64 architecture with $N < 64$ linear-address bits, each of bits 63:N is set to the value of bit N-1.
- If the “load PKRS” VM-exit control is 1, the IA32_PKRS MSR is loaded from the IA32_PKRS field. Bits 63:32 of that MSR are maintained with zeroes.

With the exception of FS.base and GS.base, any of these MSRs is subsequently overwritten if it appears in the VM-exit MSR-load area. See Section 29.6.

29.5.2 Loading Host Segment and Descriptor-Table Registers

Each of the registers CS, SS, DS, ES, FS, GS, and TR is loaded as follows (see below for the treatment of LDTR):

- The selector is loaded from the selector field. The segment is unusable if its selector is loaded with zero. The checks specified in Section 28.2.3 limit the selector values that may be loaded. In particular, CS and TR are never loaded with zero and are thus never unusable. SS can be loaded with zero only on processors that support Intel 64 architecture and only if the VM exit is to 64-bit mode (64-bit mode allows use of segments marked unusable).
- The base address is set as follows:
 - CS. Cleared to zero.
 - SS, DS, and ES. Undefined if the segment is unusable; otherwise, cleared to zero.
 - FS and GS. Undefined (but, on processors that support Intel 64 architecture, canonical) if the segment is unusable and the VM exit is not to 64-bit mode; otherwise, loaded from the base-address field.
If the processor supports the Intel 64 architecture and the processor supports $N < 64$ linear-address bits, each of bits 63:N is set to the value of bit N-1.¹ The values loaded for base addresses for FS and GS are also manifest in the FS.base and GS.base MSRs.
 - TR. Loaded from the host-state area. If the processor supports the Intel 64 architecture and the processor supports $N < 64$ linear-address bits, each of bits 63:N is set to the value of bit N-1.
- The segment limit is set as follows:
 - CS. Set to FFFFFFFFH (corresponding to a descriptor limit of FFFFFFFH and a G-bit setting of 1).
 - SS, DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to FFFFFFFFH.

1. Software can determine the number N by executing CPUID with 80000008H in EAX. The number of linear-address bits supported is returned in bits 15:8 of EAX.

- TR. Set to 00000067H.
- The type field and S bit are set as follows:
 - CS. Type set to 11 and S set to 1 (execute/read, accessed, non-conforming code segment).
 - SS, DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, type set to 3 and S set to 1 (read/write, accessed, expand-up data segment).
 - TR. Type set to 11 and S set to 0 (busy 32-bit task-state segment).
- The DPL is set as follows:
 - CS, SS, and TR. Set to 0. The current privilege level (CPL) will be 0 after the VM exit completes.
 - DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to 0.
- The P bit is set as follows:
 - CS, TR. Set to 1.
 - SS, DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to 1.
- On processors that support Intel 64 architecture, CS.L is loaded with the setting of the “host address-space size” VM-exit control. Because the value of this control is also loaded into IA32_EFER.LMA (see Section 29.5.1), no VM exit is ever to compatibility mode (which requires IA32_EFER.LMA = 1 and CS.L = 0).
- D/B.
 - CS. Loaded with the inverse of the setting of the “host address-space size” VM-exit control. For example, if that control is 0, indicating a 32-bit guest, CS.D/B is set to 1.
 - SS. Set to 1.
 - DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to 1.
 - TR. Set to 0.
- G.
 - CS. Set to 1.
 - SS, DS, ES, FS, and GS. Undefined if the segment is unusable; otherwise, set to 1.
 - TR. Set to 0.

The host-state area does not contain a selector field for LDTR. LDTR is established as follows on all VM exits: the selector is cleared to 0000H, the segment is marked unusable and is otherwise undefined.

The base addresses for GDTR and IDTR are loaded from the GDTR base-address field and the IDTR base-address field, respectively. If the processor supports the Intel 64 architecture and the processor supports $N < 64$ linear-address bits, each of bits 63:N of each base address is set to the value of bit N–1 of that base address. The GDTR and IDTR limits are each set to FFFFH.

29.5.3 Loading Host RIP, RSP, RFLAGS, and SSP

RIP and RSP are loaded from the RIP field and the RSP field, respectively. RFLAGS is cleared, except bit 1, which is always set.

If the “load CET” VM-exit control is 1, SSP (shadow-stack pointer) is loaded from the SSP field.

29.5.4 Checking and Loading Host Page-Directory-Pointer-Table Entries

If CR0.PG = 1, CR4.PAE = 1, and IA32_EFER.LMA = 0, the logical processor uses **PAE paging**. See Section 5.4 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.¹ When in PAE paging is in use, the physical address in CR3 references a table of **page-directory-pointer-table entries** (PDPTEs). A MOV to CR3

1. On processors that support Intel 64 architecture, the physical-address extension may support more than 36 physical-address bits. Software can determine a processor’s physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

when PAE paging is in use checks the validity of the PDPTes and, if they are valid, loads them into the processor (into internal, non-architectural registers).

A VM exit is to a VMM that uses PAE paging if (1) bit 5 (corresponding to CR4.PAE) is set in the CR4 field in the host-state area of the VMCS; and (2) the “host address-space size” VM-exit control is 0. Such a VM exit may check the validity of the PDPTes referenced by the CR3 field in the host-state area of the VMCS. Such a VM exit must check their validity if either (1) PAE paging was not in use before the VM exit; or (2) the value of CR3 is changing as a result of the VM exit. A VM exit to a VMM that does not use PAE paging must not check the validity of the PDPTes.

A VM exit that checks the validity of the PDPTes uses the same checks that are used when CR3 is loaded with MOV to CR3 when PAE paging is in use. If MOV to CR3 would cause a general-protection exception due to the PDPTes that would be loaded (e.g., because a reserved bit is set), a VMX abort occurs (see Section 29.7). If a VM exit to a VMM that uses PAE does not cause a VMX abort, the PDPTes are loaded into the processor as would MOV to CR3, using the value of CR3 being load by the VM exit.

29.5.5 Updating Non-Register State

VM exits affect the non-register state of a logical processor as follows:

- A logical processor is always in the active state after a VM exit.
- Event blocking is affected as follows:
 - There is no blocking by STI or by MOV SS after a VM exit.
 - VM exits caused directly by non-maskable interrupts (NMIs) cause blocking by NMI (see Table 26-3). Other VM exits do not affect blocking by NMI. (See Section 29.1 for the case in which an NMI causes a VM exit indirectly.)
- There are no pending debug exceptions after a VM exit.

Section 30.4 describes how the VMX architecture controls how a logical processor manages information in the TLBs and paging-structure caches. The following items detail how VM exits invalidate cached mappings:

- If the “enable VPID” VM-execution control is 0, the logical processor invalidates linear mappings and combined mappings associated with VPID 0000H (for all PCIDs); combined mappings for VPID 0000H are invalidated for all EPTRTA values (EPTRTA is the value of bits 51:12 of EPTP).
- VM exits are not required to invalidate any guest-physical mappings, nor are they required to invalidate any linear mappings or combined mappings if the “enable VPID” VM-execution control is 1.

29.5.6 Clearing Address-Range Monitoring

The Intel 64 and IA-32 architectures allow software to monitor a specified address range using the MONITOR and MWAIT instructions. See Section 10.10.4 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A. VM exits clear any address-range monitoring that may be in effect.

29.6 LOADING MSRS

VM exits may load MSRs from the VM-exit MSR-load area (see Section 26.7.2). Specifically each entry in that area (up to the number specified in the VM-exit MSR-load count) is processed in order by loading the MSR indexed by bits 31:0 with the contents of bits 127:64 as they would be written by WRMSR.

Processing of an entry fails in any of the following cases:

- The value of bits 31:0 is either C0000100H (the IA32_FS_BASE MSR) or C0000101H (the IA32_GS_BASE MSR).
- The value of bits 31:8 is 0000008H, meaning that the indexed MSR is one that allows access to an APIC register when the local APIC is in x2APIC mode.
- The value of bits 31:0 indicates an MSR that can be written only in system-management mode (SMM) and the VM exit will not end in SMM. (IA32_SMM_MONITOR_CTL is an MSR that can be written only in SMM.)

- The value of bits 31:0 indicates an MSR that cannot be loaded on VM exits for model-specific reasons. A processor may prevent loading of certain MSRs even if they can normally be written by WRMSR. Such model-specific behavior is documented in Chapter 2, “Model-Specific Registers (MSRs),” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4.
- Bits 63:32 are not all 0.
- An attempt to write bits 127:64 to the MSR indexed by bits 31:0 of the entry would cause a general-protection exception if executed via WRMSR with CPL = 0.¹

If processing fails for any entry, a VMX abort occurs. See Section 29.7.

If any MSR is being loaded in such a way that would architecturally require a TLB flush, the TLBs are updated so that, after VM exit, the logical processor does not use any translations that were cached before the transition.

29.7 VMX ABORTS

A problem encountered during a VM exit leads to a **VMX abort**. A VMX abort takes a logical processor into a shut-down state as described below.

A VMX abort does not modify the VMCS data in the VMCS region of any active VMCS. The contents of these data are thus suspect after the VMX abort.

On a VMX abort, a logical processor saves a nonzero 32-bit VMX-abort indicator field at byte offset 4 in the VMCS region of the VMCS whose misconfiguration caused the failure (see Section 26.2). The following values are used:

1. There was a failure in saving guest MSRs (see Section 29.4).
2. Host checking of the page-directory-pointer-table entries (PDPTes) failed (see Section 29.5.4).
3. The current VMCS has been corrupted (through writes to the corresponding VMCS region) in such a way that the logical processor cannot complete the VM exit properly.
4. There was a failure on loading host MSRs (see Section 29.6).
5. There was a machine-check event during VM exit (see Section 29.8).
6. The logical processor was in IA-32e mode before the VM exit and the “host address-space size” VM-exit control was 0 (see Section 29.5).

Some of these causes correspond to failures during the loading of state from the host-state area. Because the loading of such state may be done in any order (see Section 29.5) a VM exit that might lead to a VMX abort for multiple reasons (for example, the current VMCS may be corrupt and the host PDPTes might not be properly configured). In such cases, the VMX-abort indicator could correspond to any one of those reasons.

A logical processor never reads the VMX-abort indicator in a VMCS region and writes it only with one of the non-zero values mentioned above. The VMX-abort indicator allows software on one logical processor to diagnose the VMX-abort on another. For this reason, it is recommended that software running in VMX root operation zero the VMX-abort indicator in the VMCS region of any VMCS that it uses.

After saving the VMX-abort indicator, operation of a logical processor experiencing a VMX abort depends on whether the logical processor is in SMX operation:²

- If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs. The error code used is 000DH, indicating “VMX abort.” See the Intel® Trusted Execution Technology Measured Launched Environment Programming Guide.

1. Note the following about processors that support Intel 64 architecture. If CR0.PG = 1, WRMSR to the IA32_EFER MSR causes a general-protection exception if it would modify the LME bit. Since CR0.PG is always 1 in VMX operation, the IA32_EFER MSR should not be included in the VM-exit MSR-load area for the purpose of modifying the LME bit.

2. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENTER]. A logical processor is outside SMX operation if GETSEC[SENTER] has not been executed or if GETSEC[SEXIT] was executed after the last execution of GETSEC[SENTER]. See Chapter 7, “Safer Mode Extensions Reference,” in Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2D.

- If the logical processor is outside SMX operation, it issues a special bus cycle (to notify the chipset) and enters the **VMX-abort shutdown state**. RESET is the only event that wakes a logical processor from the VMX-abort shutdown state. The following events do not affect a logical processor in this state: machine-check events; INIT signals; external interrupts; non-maskable interrupts (NMIs); start-up IPIs (SIPIs); and system-management interrupts (SMIs).

29.8 MACHINE-CHECK EVENTS DURING VM EXIT

If a machine-check event occurs during VM exit, one of the following occurs:

- The machine-check event is handled as if it occurred before the VM exit:
 - If CR4.MCE = 0, operation of the logical processor depends on whether the logical processor is in SMX operation:²
 - If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs. The error code used is 000CH, indicating “unrecoverable machine-check condition.”
 - If the logical processor is outside SMX operation, it goes to the shutdown state.
 - If CR4.MCE = 1, a machine-check exception (#MC) is generated:
 - If bit 18 (#MC) of the exception bitmap is 0, the exception is delivered through the guest IDT.
 - If bit 18 of the exception bitmap is 1, the exception causes a VM exit.
- The machine-check event is handled after VM exit completes:
 - If the VM exit ends with CR4.MCE = 0, operation of the logical processor depends on whether the logical processor is in SMX operation:
 - If the logical processor is in SMX operation, an Intel® TXT shutdown condition occurs with error code 000CH (unrecoverable machine-check condition).
 - If the logical processor is outside SMX operation, it goes to the shutdown state.
 - If the VM exit ends with CR4.MCE = 1, a machine-check exception (#MC) is delivered through the host IDT.
- A VMX abort is generated (see Section 29.7). The logical processor blocks events as done normally in VMX abort. The VMX abort indicator is 5, for “machine-check event during VM exit.”

The first option is not used if the machine-check event occurs after any host state has been loaded. The second option is used only if VM entry is able to load all host state.

29.9 USER-INTERRUPT RECOGNITION AFTER VM EXIT

A VM exit results in recognition of a pending user interrupt if it completes with CR4.UINTR = IA32_EFER.LMA = 1 and with UIRR ≠ 0; otherwise, no pending user interrupt is recognized.

23. Updates to Chapter 30, Volume 3C

Change bars and violet text show changes to Chapter 30 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

Changes to this chapter:

- Added physical and guest-physical addresses in Section 30.3.1, "EPT Overview".
- In Section 30.3.3.1, "EPT Misconfigurations", updated the definition for the reserved bit to MAXPHYADDR or above.
- Updated the range of reserved bits to 63:MAXPHYADDR for entry of SPPL4E, SPPL3E or SPPL2E in Section 30.3.4.2, "Determining an Access's Sub-Page Write Permission".
- Added footnote to clarify "M" as an abbreviation for MAXPHYADDR in
 - Table 30-1, "Format of an EPT PML5 Entry (PML5E) that References an EPT PML4 Table"
 - Table 30-2, "Format of an EPT PML4 Entry (PML4E) that References an EPT Page-Directory-Pointer Table"
 - Table 30-3, "Format of an EPT Page-Directory-Pointer-Table Entry (PDPTE) that Maps a 1-GBYTE Page"
 - Table 30-4, "Format of an EPT Page-Directory-Pointer-Table Entry (PDPTE) that References an EPT Page Directory"
 - Table 30-5, "Format of an EPT Page-Directory Entry (PDE) that Maps a 2-MByte Page"
 - Table 30-6, "Format of an EPT Page-Directory Entry (PDE) that References an EPT Page Table"
 - Table 30-7, "Format of an EPT Page-Table Entry that Maps a 4-KByte Page"
 - Figure 30-1, "Formats of EPTP and EPT Paging-Structure Entries"

CHAPTER 30

VMX SUPPORT FOR ADDRESS TRANSLATION

The architecture for VMX operation includes two features that support address translation: virtual-processor identifiers (VPIDs) and the extended page-table mechanism (EPT). VPIDs are a mechanism for managing translations of linear addresses. EPT defines a layer of address translation that augments the translation of linear addresses.

Section 30.1 details the architecture of VPIDs. Section 30.3 provides the details of EPT. Section 30.4 explains how a logical processor may cache information from the paging structures, how it may use that cached information, and how software can managed the cached information.

30.1 VIRTUAL PROCESSOR IDENTIFIERS (VPIDS)

The original architecture for VMX operation required VMX transitions to flush the TLBs and paging-structure caches. This ensured that translations cached for the old linear-address space would not be used after the transition.

Virtual-processor identifiers (**VPIDs**) introduce to VMX operation a facility by which a logical processor may cache information for multiple linear-address spaces. When VPIDs are used, VMX transitions may retain cached information and the logical processor switches to a different linear-address space.

Section 30.4 details the mechanisms by which a logical processor manages information cached for multiple address spaces. A logical processor may tag some cached information with a 16-bit VPID. This section specifies how the current VPID is determined at any point in time:

- The current VPID is 0000H in the following situations:
 - Outside VMX operation. (This includes operation in system-management mode under the default treatment of SMIs and SMM with VMX operation; see Section 33.14.)
 - In VMX root operation.
 - In VMX non-root operation when the “enable VPID” VM-execution control is 0.
- If the logical processor is in VMX non-root operation and the “enable VPID” VM-execution control is 1, the current VPID is the value of the VPID VM-execution control field in the VMCS. (VM entry ensures that this value is never 0000H; see Section 28.2.1.1.)

VPIDs and PCIDs (see Section 5.10.1) can be used concurrently. When this is done, the processor associates cached information with both a VPID and a PCID. Such information is used only if the current VPID and PCID **both** match those associated with the cached information.

30.2 HYPERVISOR-MANAGED LINEAR-ADDRESS TRANSLATION (HLAT)

Hypervisor-managed linear-address translation (HLAT) is a feature that changes the way in which linear addresses are translated in VMX non-root operation. Instead of ordinary paging, translation uses a modified process called **HLAT paging**.

HLAT paging is used only if the “enable HLAT” VM-execution control is 1. HLAT paging is used only for the paging modes 4-level paging and 5-level paging. Because HLAT paging is a modification of ordinary paging, details of the feature are given in Section 5.5, which describes the operation of 4-level paging and 5-level paging.

30.3 THE EXTENDED PAGE TABLE MECHANISM (EPT)

The extended page-table mechanism (**EPT**) is a feature that can be used to support the virtualization of physical memory. When EPT is in use, certain addresses that would normally be treated as physical addresses (and used to access memory) are instead treated as **guest-physical addresses**. Guest-physical addresses are translated by traversing a set of **EPT paging structures** to produce physical addresses that are used to access memory.

- Section 30.3.1 gives an overview of EPT.
- Section 30.3.2 describes operation of EPT-based address translation.
- Section 30.3.3 discusses VM exits that may be caused by EPT.
- Section 30.3.7 describes interactions between EPT and memory typing.

30.3.1 EPT Overview

EPT is used when the “enable EPT” VM-execution control is 1.¹ It translates the guest-physical addresses used in VMX non-root operation and those used by VM entry for event injection.

The translation from guest-physical addresses to physical addresses is determined by a set of **EPT paging structures**. The EPT paging structures are similar to those used to translate linear addresses while the processor is in IA-32e mode. Section 30.3.2 gives the details of the EPT paging structures.

If CR0.PG = 1, linear addresses are translated through paging structures referenced through control register CR3.² While the “enable EPT” VM-execution control is 1, these are called **guest paging structures**. There are no guest paging structures if CR0.PG = 0.³

When the “enable EPT” VM-execution control is 1, the identity of **guest-physical addresses** depends on the value of CR0.PG:

- If CR0.PG = 0, each linear address is treated as a guest-physical address.
- If CR0.PG = 1, guest-physical addresses are those derived from the contents of control register CR3 and the guest paging structures. (This includes the values of the PDPTes, which logical processors store in internal, non-architectural registers.) The latter includes (in page-table entries and in other paging-structure entries for which bit 7—PS—is 1) the addresses to which linear addresses are translated by the guest paging structures.

If CR0.PG = 1, the translation of a linear address to a physical address requires multiple translations of guest-physical addresses using EPT. Assume, for example, that CR4.PAE = CR4.PSE = 0. The translation of a 32-bit linear address then operates as follows:

- Bits 31:22 of the linear address select an entry in the guest page directory located at the guest-physical address in CR3. The guest-physical address of the guest page-directory entry (PDE) is translated through EPT to determine the guest PDE’s physical address.
- Bits 21:12 of the linear address select an entry in the guest page table located at the guest-physical address in the guest PDE. The guest-physical address of the guest page-table entry (PTE) is translated through EPT to determine the guest PTE’s physical address.
- Bits 11:0 of the linear address is the offset in the page frame located at the guest-physical address in the guest PTE. The guest-physical address determined by this offset is translated through EPT to determine the physical address to which the original linear address translates.

In addition to translating a guest-physical address to a physical address, EPT specifies the privileges that software is allowed when accessing the address. Attempts at disallowed accesses are called **EPT violations** and cause VM exits. See Section 30.3.3.

A processor uses EPT to translate guest-physical addresses only when those addresses are used to access memory. This principle implies the following:

- The MOV to CR3 instruction loads CR3 with a guest-physical address. Whether that address is translated through EPT depends on whether PAE paging is being used.⁴

1. “Enable EPT” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, the logical processor operates as if the “enable EPT” VM-execution control were 0. See Section 26.6.2.
2. If HLAT paging is enabled, the processor uses the HLATP VMCS field instead of CR3. See Section 5.5.1. For simplicity, the remainder of this section refers only to CR3.
3. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG can be 0 in VMX non-root operation only if the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
4. A logical processor uses PAE paging if CR0.PG = 1, CR4.PAE = 1 and IA32_EFER.LMA = 0. See Section 5.4 in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

- If PAE paging is not being used, the instruction does not use that address to access memory and does **not** cause it to be translated through EPT. (If CR0.PG = 1, the address will be translated through EPT on the next memory accessing using a linear address.)
- If PAE paging is being used, the instruction loads the four (4) page-directory-pointer-table entries (PDPTEs) from that address and it **does** cause the address to be translated through EPT.
- Section 5.4.1 identifies executions of MOV to CR0 and MOV to CR4 that load the PDPTEs from the guest-physical address in CR3. Such executions cause that address to be translated through EPT.
- The PDPTEs contain guest-physical addresses. The instructions that load the PDPTEs (see above) do not use those addresses to access memory and do **not** cause them to be translated through EPT. The address in a PDPTE will be translated through EPT on the next memory accessing using a linear address that uses that PDPTE.

The widths of physical and guest-physical addresses are limited. CPUID.80000008H:EAX[7:0] reports the physical-address width supported by the processor. This width is at most 52 and limits the width of both physical and guest-physical addresses:

- **Physical addresses.** The limit on physical addresses is denoted MAXPHYADDR and is derived from CPUID.80000008H:EAX[7:0]. If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM.¹
For example, if CPUID.80000008H:EAX[7:0] = 48, IA32_TME_ACTIVATE[39:36] = 4, and TME has been configured, MAXPHYADDR is 44 outside SEAM (but remains 48 in SEAM).
- **Guest-physical addresses.** The width of these addresses is limited by the value enumerated by CPUID.80000008H:EAX[7:0] without any regard to TME or SEAM.

30.3.2 EPT Translation Mechanism

The EPT translation mechanism can be configured in either of two modes: **4-level EPT** or **5-level EPT**. 4-level EPT accesses at most 4 EPT paging-structure entries (an EPT page-walk length of 4) to translate a guest-physical address and uses only bits 47:0 of each guest-physical address. In contrast, 5-level EPT may access up to 5 EPT paging-structure entries (an EPT page-walk length of 5) and uses guest-physical address bits 56:0.²

The EPT page-walk length is configured using the extended-page-table pointer (EPTP), a VM-execution control field (see Table 26-9 in Section 26.6.11). Specifically, bits 5:3 contain a value one less than EPT page-walk length. Thus, a value of 3 configures 4-level EPT, while a value of 4 configures 5-level EPT.³

The remainder of this section describes the translation process used by 4-level EPT and 5-level EPT. Because the processes used by the two EPT modes are similar, they are described together in the following items (with any differences identified):

- With 5-level EPT, 4-KByte naturally aligned EPT PML5 table is located at the physical address specified in bits 51:12 of the EPTP. An EPT PML5 table comprises 512 64-bit entries (EPT PML5Es). An EPT PML5E is selected using the physical address defined as follows:
 - Bits 63:52 are all 0.
 - Bits 51:12 are from the EPTP.
 - Bits 11:3 are bits 56:48 of the guest-physical address.⁴
 - Bits 2:0 are all 0.

1. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.
2. Physical addresses and guest-physical addresses are architecturally limited to 52 bits (e.g., by paging), so in practice bits 56:52 are zero. See Section 30.3.1
3. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine what EPT page-walk lengths are supported.
4. Bits 56:52 of each guest-physical address are necessarily zero because guest-physical addresses are architecturally limited to 52 bits.

Because an EPT PML5E is identified using bits 56:48 of the guest-physical address, it controls access to a 256-TByte region of the guest-physical-address space. The format of an EPT PML5E is given in Table 30-1.

Table 30-1. Format of an EPT PML5 Entry (PML5E) that References an EPT PML4 Table

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 256-TByte region controlled by this entry.
1	Write access; indicates whether writes are allowed to the 256-TByte region controlled by this entry.
2	If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 256-TByte region controlled by this entry. If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 256-TByte region controlled by this entry.
7:3	Reserved (must be 0).
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 256-TByte region controlled by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
9	Ignored.
10	Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 256-TByte region controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored.
M-1:12	Physical address of 4-KByte aligned EPT PML4 table referenced by this entry. ¹
51:M	Reserved (must be 0).
63:52	Ignored.

NOTES:

1. M is an abbreviation for MAXPHYADDR. See Section 30.3.1.

- With 4-level EPT, bits 51:48 of the guest-physical address must all be zero; otherwise, an EPT violation occurs (see Section 30.3.3).
- A 4-KByte naturally aligned EPT PML4 table is located at the physical address specified in the EPTP (for 4-level EPT) or in the EPT PML5E (for 5-level EPT). An EPT PML4 table comprises 512 64-bit entries (EPT PML4Es). An EPT PML4E is selected using the physical address defined as follows:

- Bits 63:52 are all 0.
- Bits 51:12 are from the EPTP (for 4-level EPT) or from bits 51:12 of the EPT PML4E (for 5-level EPT).
- Bits 11:3 are bits 47:39 of the guest-physical address.
- Bits 2:0 are all 0.

Because an EPT PML4E is identified using bits 47:39 of the guest-physical address, it controls access to a 512-GByte region of the guest-physical-address space. The format of an EPT PML4E is given in Table 30-2.

- A 4-KByte naturally aligned EPT page-directory-pointer table is located at the physical address specified in bits 51:12 of the EPT PML4E. An EPT page-directory-pointer table comprises 512 64-bit entries (EPT PDPTEs). An EPT PDPTE is selected using the physical address defined as follows:
- Bits 63:52 are all 0.
- Bits 51:12 are from the EPT PML4E.
- Bits 11:3 are bits 38:30 of the guest-physical address.
- Bits 2:0 are all 0.

Table 30-2. Format of an EPT PML4 Entry (PML4E) that References an EPT Page-Directory-Pointer Table

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 512-GByte region controlled by this entry.
1	Write access; indicates whether writes are allowed to the 512-GByte region controlled by this entry.
2	If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 512-GByte region controlled by this entry. If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 512-GByte region controlled by this entry.
7:3	Reserved (must be 0).
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 512-GByte region controlled by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
9	Ignored.
10	Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 512-GByte region controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored.
M-1:12	Physical address of 4-KByte aligned EPT page-directory-pointer table referenced by this entry. ¹
51:M	Reserved (must be 0).
63:52	Ignored.

NOTES:

1. M is an abbreviation for MAXPHYADDR. See Section 30.3.1.

Because an EPT PDPTE is identified using bits 47:30 of the guest-physical address, it controls access to a 1-GByte region of the guest-physical-address space. Use of the EPT PDPTE depends on the value of bit 7 in that entry:¹

- If bit 7 of the EPT PDPTE is 1, the EPT PDPTE maps a 1-GByte page. The final physical address is computed as follows:
 - Bits 63:52 are all 0.
 - Bits 51:30 are from the EPT PDPTE.
 - Bits 29:0 are from the original guest-physical address.

The format of an EPT PDPTE that maps a 1-GByte page is given in Table 30-3.

- If bit 7 of the EPT PDPTE is 0, a 4-KByte naturally aligned EPT page directory is located at the physical address specified in bits 51:12 of the EPT PDPTE. The format of an EPT PDPTE that references an EPT page directory is given in Table 30-4.

1. Not all processors allow bit 7 of an EPT PDPTE to be set to 1. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine whether this is allowed.

Table 30-3. Format of an EPT Page-Directory-Pointer-Table Entry (PDPTE) that Maps a 1-GByte Page

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 1-GByte page referenced by this entry.
1	Write access; indicates whether writes are allowed to the 1-GByte page referenced by this entry.
2	If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 1-GByte page controlled by this entry. If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 1-GByte page controlled by this entry.
5:3	EPT memory type for this 1-GByte page (see Section 30.3.7).
6	Ignore PAT memory type for this 1-GByte page (see Section 30.3.7).
7	Must be 1 (otherwise, this entry references an EPT page directory).
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 1-GByte page referenced by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
9	If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 1-GByte page referenced by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
10	Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 1-GByte page controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored.
29:12	Reserved (must be 0).
M-1:30	Physical address of the 1-GByte page referenced by this entry. ¹
51:M	Reserved (must be 0).
56:52	Ignored.
57	Verify guest paging. If the “guest-paging verification” VM-execution control is 1, indicates limits on the guest paging structures used to access the 1-GByte page controlled by this entry (see Section 30.3.3.2). If that control is 0, this bit is ignored.
58	Paging-write access. If the “EPT paging-write control” VM-execution control is 1, indicates that guest paging may update the 1-GByte page controlled by this entry (see Section 30.3.3.2). If that control is 0, this bit is ignored.
59	Ignored.
60	Supervisor shadow stack. If bit 7 of EPTP is 1, indicates whether supervisor shadow stack accesses are allowed to guest-physical addresses in the 1-GByte page mapped by this entry (see Section 30.3.3.2). Ignored if bit 7 of EPTP is 0.
62:61	Ignored.
63	Suppress #VE. If the “EPT-violation #VE” VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 27.5.7.1). If “EPT-violation #VE” VM-execution control is 0, this bit is ignored.

NOTES:

1. M is an abbreviation for MAXPHYADDR. See Section 30.3.1.

Table 30-4. Format of an EPT Page-Directory-Pointer-Table Entry (PDPTE) that References an EPT Page Directory

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 1-GByte region controlled by this entry.
1	Write access; indicates whether writes are allowed to the 1-GByte region controlled by this entry.
2	If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 1-GByte region controlled by this entry. If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 1-GByte region controlled by this entry.
7:3	Reserved (must be 0).
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 1-GByte region controlled by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
9	Ignored.
10	Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 1-GByte region controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored.
M-1:12	Physical address of 4-KByte aligned EPT page directory referenced by this entry. ¹
51:M	Reserved (must be 0).
63:52	Ignored.

NOTES:

1. M is an abbreviation for MAXPHYADDR. See Section 30.3.1.

An EPT page-directory comprises 512 64-bit entries (PDEs). An EPT PDE is selected using the physical address defined as follows:

- Bits 63:52 are all 0.
- Bits 51:12 are from the EPT PDPTE.
- Bits 11:3 are bits 29:21 of the guest-physical address.
- Bits 2:0 are all 0.

Because an EPT PDE is identified using bits 47:21 of the guest-physical address, it controls access to a 2-MByte region of the guest-physical-address space. Use of the EPT PDE depends on the value of bit 7 in that entry:

- If bit 7 of the EPT PDE is 1, the EPT PDE maps a 2-MByte page. The final physical address is computed as follows:
 - Bits 63:52 are all 0.
 - Bits 51:21 are from the EPT PDE.
 - Bits 20:0 are from the original guest-physical address.

The format of an EPT PDE that maps a 2-MByte page is given in Table 30-5.

- If bit 7 of the EPT PDE is 0, a 4-KByte naturally aligned EPT page table is located at the physical address specified in bits 51:12 of the EPT PDE. The format of an EPT PDE that references an EPT page table is given in Table 30-6.

An EPT page table comprises 512 64-bit entries (PTEs). An EPT PTE is selected using a physical address defined as follows:

- Bits 63:52 are all 0.

Table 30-5. Format of an EPT Page-Directory Entry (PDE) that Maps a 2-MByte Page

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 2-MByte page referenced by this entry.
1	Write access; indicates whether writes are allowed to the 2-MByte page referenced by this entry.
2	If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 2-MByte page controlled by this entry. If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 2-MByte page controlled by this entry.
5:3	EPT memory type for this 2-MByte page (see Section 30.3.7).
6	Ignore PAT memory type for this 2-MByte page (see Section 30.3.7).
7	Must be 1 (otherwise, this entry references an EPT page table).
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 2-MByte page referenced by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
9	If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 2-MByte page referenced by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
10	Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 2-MByte page controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored.
20:12	Reserved (must be 0).
M-1:21	Physical address of the 2-MByte page referenced by this entry. ¹
51:M	Reserved (must be 0).
56:52	Ignored.
57	Verify guest paging. If the “guest-paging verification” VM-execution control is 1, indicates limits on the guest paging structures used to access the 2-MByte page controlled by this entry (see Section 30.3.3.2). If that control is 0, this bit is ignored.
58	Paging-write access. If the “EPT paging-write control” VM-execution control is 1, indicates that guest paging may update the 2-MByte page controlled by this entry (see Section 30.3.3.2). If that control is 0, this bit is ignored.
59	Ignored.
60	Supervisor shadow stack. If bit 7 of EPTP is 1, indicates whether supervisor shadow stack accesses are allowed to guest-physical addresses in the 2-MByte page mapped by this entry (see Section 30.3.3.2). Ignored if bit 7 of EPTP is 0.
62:61	Ignored.
63	Suppress #VE. If the “EPT-violation #VE” VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 27.5.7.1). If “EPT-violation #VE” VM-execution control is 0, this bit is ignored.

NOTES:

1. M is an abbreviation for MAXPHYADDR. See Section 30.3.1.

— Bits 51:12 are from the EPT PDE.

- Bits 11:3 are bits 20:12 of the guest-physical address.
- Bits 2:0 are all 0.
- Because an EPT PTE is identified using bits 47:12 of the guest-physical address, every EPT PTE maps a 4-KByte page. The final physical address is computed as follows:
 - Bits 63:52 are all 0.
 - Bits 51:12 are from the EPT PTE.
 - Bits 11:0 are from the original guest-physical address.

The format of an EPT PTE is given in Table 30-7.

An EPT paging-structure entry is **present** if any of bits 2:0 is 1; otherwise, the entry is **not present**. The processor ignores bits 62:3 and uses the entry neither to reference another EPT paging-structure entry nor to produce a physical address. A reference using a guest-physical address whose translation encounters an EPT paging-structure that is not present causes an EPT violation (see Section 30.3.3.2). (If the “EPT-violation #VE” VM-execution control is 1, the EPT violation is convertible to a virtualization exception only if bit 63 is 0; see Section 27.5.7.1. If the “EPT-violation #VE” VM-execution control is 0, this bit is ignored.)

Table 30-6. Format of an EPT Page-Directory Entry (PDE) that References an EPT Page Table

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 2-MByte region controlled by this entry.
1	Write access; indicates whether writes are allowed to the 2-MByte region controlled by this entry.
2	If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 2-MByte region controlled by this entry. If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 2-MByte region controlled by this entry.
6:3	Reserved (must be 0).
7	Must be 0 (otherwise, this entry maps a 2-MByte page).
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 2-MByte region controlled by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
9	Ignored.
10	Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 2-MByte region controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored.
M-1:12	Physical address of 4-KByte aligned EPT page table referenced by this entry. ¹
51:M	Reserved (must be 0).
63:52	Ignored.

NOTES:

1. M is an abbreviation for MAXPHYADDR. See Section 30.3.1.

NOTE

If the “mode-based execute control for EPT” VM-execution control is 1, an EPT paging-structure entry is present if any of bits 2:0 **or bit 10** is 1. If bits 2:0 are all 0 but bit 10 is 1, the entry is used normally to reference another EPT paging-structure entry or to produce a physical address.

The discussion above describes how the EPT paging structures reference each other and how the logical processor traverses those structures when translating a guest-physical address. It does not cover all details of the translation process. Additional details are provided as follows:

- Situations in which the translation process may lead to VM exits (sometimes before the process completes) are described in Section 30.3.3.
- Interactions between the EPT translation mechanism and memory typing are described in Section 30.3.7.

Figure 30-1 gives a summary of the formats of the EPTP and the EPT paging-structure entries. For the EPT paging structure entries, it identifies separately the format of entries that map pages, those that reference other EPT paging structures, and those that do neither because they are not present; bits 2:0 and bit 7 are highlighted because they determine how a paging-structure entry is used. (Figure 30-1 does not comprehend the fact that, if the “mode-based execute control for EPT” VM-execution control is 1, an entry is present if any of bits 2:0 or bit 10 is 1.)

30.3.3 EPT-Induced VM Exits

Accesses using guest-physical addresses may cause VM exits due to EPT misconfigurations, EPT violations, and page-modification log-full events. An **EPT misconfiguration** occurs when, in the course of translating a guest-physical address, the logical processor encounters an EPT paging-structure entry that contains an unsupported value (see Section 30.3.3.1). An **EPT violation** occurs when there is no EPT misconfiguration but the EPT paging-structure entries disallow an access using the guest-physical address (see Section 30.3.3.2). A **page-modification log-full event** occurs when the logical processor determines a need to create a page-modification log entry and the current log is full (see Section 30.3.6).

These events occur only due to an attempt to access memory with a guest-physical address. Loading CR3 with a guest-physical address with the MOV to CR3 instruction can cause neither an EPT configuration nor an EPT violation until that address is used to access a paging structure.¹

If the “EPT-violation #VE” VM-execution control is 1, certain EPT violations may cause virtualization exceptions instead of VM exits. See Section 27.5.7.1.

30.3.3.1 EPT Misconfigurations

An EPT misconfiguration occurs if translation of a guest-physical address encounters an EPT paging-structure entry that meets any of the following conditions:

- Bit 0 of the entry is clear (indicating that data reads are not allowed) and any of the following hold:
 - Bit 1 is set (indicating that data writes are allowed).
 - The processor does not support execute-only translations and either of the following hold:
 - Bit 2 is set (indicating that instruction fetches are allowed).²
 - The “mode-based execute control for EPT” VM-execution control is 1 and bit 10 is set (indicating that instruction fetches are allowed from user-mode linear addresses).
- Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP to determine whether execute-only translations are supported (see Appendix A.10).
- The “EPT paging-write control” VM-execution control is 1, the entry maps a page, and bit 58 is set (indicating that paging writes are allowed).
- The entry is present (see Section 30.3.2) and of the following holds:

1. If the logical processor is using PAE paging—because CR0.PG = CR4.PAE = 1 and IA32_EFER.LMA = 0—the MOV to CR3 instruction loads the PDPTs from memory using the guest-physical address being loaded into CR3. In this case, therefore, the MOV to CR3 instruction may cause an EPT misconfiguration, an EPT violation, or a page-modification log-full event.

2. If the “mode-based execute control for EPT” VM-execution control is 1, setting bit 2 indicates that instruction fetches are allowed from supervisor-mode linear addresses.

Table 30-7. Format of an EPT Page-Table Entry that Maps a 4-KByte Page

Bit Position(s)	Contents
0	Read access; indicates whether reads are allowed from the 4-KByte page referenced by this entry.
1	Write access; indicates whether writes are allowed to the 4-KByte page referenced by this entry.
2	If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 4-KByte page controlled by this entry. If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 4-KByte page controlled by this entry.
5:3	EPT memory type for this 4-KByte page (see Section 30.3.7).
6	Ignore PAT memory type for this 4-KByte page (see Section 30.3.7).
7	Ignored.
8	If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 4-KByte page referenced by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
9	If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 4-KByte page referenced by this entry (see Section 30.3.5). Ignored if bit 6 of EPTP is 0.
10	Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 4-KByte page controlled by this entry. If that control is 0, this bit is ignored.
11	Ignored.
M-1:12	Physical address of the 4-KByte page referenced by this entry. ¹
51:M	Reserved (must be 0).
56:52	Ignored.
57	Verify guest paging. If the “guest-paging verification” VM-execution control is 1, indicates limits on the guest paging structures used to access the 4-KByte page controlled by this entry (see Section 30.3.3.2). If that control is 0, this bit is ignored.
58	Paging-write access. If the “EPT paging-write control” VM-execution control is 1, indicates that guest paging may update the 4-KByte page controlled by this entry (see Section 30.3.3.2). If that control is 0, this bit is ignored.
59	Ignored.
60	Supervisor shadow stack. If bit 7 of EPTP is 1, indicates whether supervisor shadow stack accesses are allowed to guest-physical addresses in the 4-KByte page mapped by this entry (see Section 30.3.3.2). Ignored if bit 7 of EPTP is 0.
61	Sub-page write permissions. If the “sub-page write permissions for EPT” VM-execution control is 1, writes to individual 128-byte regions of the 4-KByte page referenced by this entry may be allowed even if the page would normally not be writable (see Section 30.3.4). If “sub-page write permissions for EPT” VM-execution control is 0, this bit is ignored.
62	Ignored.
63	Suppress #VE. If the “EPT-violation #VE” VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 27.5.7.1). If “EPT-violation #VE” VM-execution control is 0, this bit is ignored.

NOTES:

1. M is an abbreviation for MAXPHYADDR. See Section 30.3.1.

- A reserved bit is set. This includes the setting of a bit in the range 51:12 in position MAXPHYADDR or above (see Section 30.3.1). See Section 30.3.2 for details of which bits are reserved in which EPT paging-structure entries.
- The entry is the last one used to translate a guest physical address (either an EPT PDE with bit 7 set to 1 or an EPT PTE) and the value of bits 5:3 (EPT memory type) is 2, 3, or 7 (these values are reserved).

EPT misconfigurations result when an EPT paging-structure entry is configured with settings reserved for future functionality. Software developers should be aware that such settings may be used in the future and that an EPT paging-structure entry that causes an EPT misconfiguration on one processor might not do so in the future.

30.3.3.2 EPT Violations

An EPT violation may occur during an access using a guest-physical address whose translation does not cause an EPT misconfiguration. An EPT violation occurs in any of the following situations:

- Translation of the guest-physical address encounters an EPT paging-structure entry that is not present (see Section 30.3.2).
- The access is a data read and, for any byte to be read, bit 0 (read access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte. Reads by the logical processor of guest paging structures to translate a linear address are considered to be data reads.

Figure 30-1. Formats of EPTP and EPT Paging-Structure Entries

NOTES:

1. **M** is an abbreviation for MAXPHYADDR. See Section 30.3.1.
2. Supervisor shadow-stack control.
3. See Section 26.6.11 for details of the EPTP.
4. Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 0, this bit is ignored.
5. Execute access. If the “mode-based execute control for EPT” VM-execution control is 1, this bit controls execute access for supervisor-mode linear addresses.

6. If the “mode-based execute control for EPT” VM-execution control is 1, an EPT paging-structure entry is present if any of bits 2:0 or bit 10 is 1. This table does not comprehend that fact.
7. Suppress #VE. If the “EPT-violation #VE” VM-execution control is 0, this bit is ignored.
8. Supervisor shadow-stack page. If bit 7 of the EPTP is 0, this bit is ignored.
9. Paging-write access. If the “EPT paging-write control” VM-execution control is 0, this bit is ignored.
10. Verify guest paging. If the “guest-paging verification” VM-execution control is 0, this bit is ignored.
11. Sub-page write permissions. If the “sub-page write permissions for EPT” VM-execution control is 0, this bit is ignored.

- The access is a data write and, for any byte to be written, bit 1 (write access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte. Writes by the logical processor to guest paging structures to update accessed and dirty flags are considered to be data writes.

If bit 6 of the EPT pointer (EPTP) is 1 (enabling accessed and dirty flags for EPT), processor accesses to guest paging-structure entries are treated as writes with regard to EPT violations. Thus, if bit 1 is clear in any of the EPT paging-structure entries used to translate the guest-physical address of a guest paging-structure entry, an attempt to use that entry to translate a linear address causes an EPT violation.

(This does not apply to loads of the PDPT registers by the MOV to CR instruction for PAE paging; see Section 5.4.1. Those loads of guest PDPTes are treated as reads and do not cause EPT violations due to a guest-physical address not being writable.)

Processor writes to guest paging structures to update accessed and dirty flags are called **paging writes**.

(When accessed and dirty flags for EPT are enabled all processor accesses to guest paging structures are considered paging writes.) If the “EPT paging-write control” VM-execution control is 1, clearing the write-access bit in the EPT paging-structure entry that maps a page does not prevent a paging write if bit 58 (paging-write access) in that entry is 1. (EPT paging-structure entries that reference other EPT paging structures do not use bit 58, and it remains the case that they must set the write-access bit for paging writes to be allowed.)

If the “sub-page write permissions for EPT” VM-execution control is 1, data writes to a guest-physical address that would cause an EPT violation (as indicated above) do not do so in certain situations. If the guest-physical address is mapped using a 4-KByte page and bit 61 (sub-page write permissions) of the EPT PTE used to map the page is 1, writes to certain 128-byte sub-pages may be allowed. See Section 30.3.4 for details.

- The access is an instruction fetch and the EPT paging structures prevent execute access to any of the bytes being fetched. Whether this occurs depends upon the setting of the “mode-based execute control for EPT” VM-execution control:
 - If the control is 0, an instruction fetch from a byte is prevented if bit 2 (execute access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.
 - If the control is 1, an instruction fetch from a byte is prevented in either of the following cases:
 - Paging maps the linear address of the byte as a supervisor-mode address and bit 2 (execute access for supervisor-mode linear addresses) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.
Paging maps a linear address as a supervisor-mode address if the U/S flag (bit 2) is 0 in at least one of the paging-structure entries controlling the translation of the linear address.
 - Paging maps the linear address of the byte as a user-mode address and bit 10 (execute access for user-mode linear addresses) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.
Paging maps a linear address as a user-mode address if the U/S flag is 1 in all of the paging-structure entries controlling the translation of the linear address. If paging is disabled (CR0.PG = 0), every linear address is a user-mode address.
- If supervisor shadow-stack control is enabled (by setting bit 7 of EPTP), the access is a supervisor shadow-stack access, and the EPT paging-structure entries used to translate the guest-physical address of the access disallow supervisor shadow-stack accesses. Such an access is disallowed if any of the following hold:
 - Bit 0 (read access) is clear in any EPT paging-structure entry used to translate the guest-physical address of the access.

- Bit 1 (write access) is clear in any EPT paging-structure entry that references an EPT paging structure in the translation of the guest-physical address. (Clearing bit 1 in the EPT paging-structure entry that maps the page of the guest-physical address does not disallow shadow-stack reads and writes.)
- Bit 60 (supervisor-shadow stack access) is clear in the EPT paging-structure entry that maps the page of the guest-physical address.

Supervisor shadow-stack control and the supervisor-shadow stack access bits in EPT paging-structure entries do not affect other accesses (including user shadow-stack accesses).

- If the “guest-paging verification” and “EPT paging-write control” VM-execution controls are both 1, **guest-paging verification** is performed for certain accesses related to translation of a linear address.

Specifically, guest-paging verification may apply to an access using a guest-physical address to the guest paging-structure entry that maps a page for the linear address (see Chapter 5, “Paging”). It applies if bit 57 (verify guest paging) is set in the EPT paging-structure entry that maps a page for that guest-physical address.

When guest-paging verification occurs, there is an EPT violation if bit 58 (paging-write access) is clear in the EPT paging-structure entry that was used to map a page for the guest-physical address of any guest paging-structure entry that was used during translation of the original linear address.¹

See Section 30.3.3.3 for details regarding the prioritization of such EPT violations relative to any page faults that may occur due to the original reference to the linear address being translated.

30.3.3.3 Prioritization of EPT Misconfigurations and EPT Violations

The translation of a linear address to a physical address requires one or more translations of guest-physical addresses using EPT (see Section 30.3.1). This section specifies the relative priority of EPT-induced VM exits with respect to each other and to other events that may be encountered when accessing memory using a linear address.

For an access to a guest-physical address, determination of whether an EPT misconfiguration or an EPT violation occurs is based on an iterative process:²

1. An EPT paging-structure entry is read (initially, this is an EPT PML5 entry or an EPT PML4 entry):
 - a. If the entry is not present (see Section 30.3.2), an EPT violation occurs.
 - b. If the entry is present but its contents are not configured properly (see Section 30.3.3.1), an EPT misconfiguration occurs.
 - c. If the entry is present and its contents are configured properly, operation depends on whether the entry references another EPT paging structure (or if instead it is an EPT PDPTE or EPT PDE with bit 7 set to 1, or an EPT PTE):
 - i) If the entry does reference another EPT paging structure, an entry from that structure is accessed; step 1 is executed for that other entry.
 - ii) Otherwise, the entry is used to produce the ultimate physical address (the translation of the original guest-physical address); step 2 is executed.
2. Once the ultimate physical address is determined, the privileges determined by the EPT paging-structure entries are evaluated:
 - a. If the access to the guest-physical address is not allowed by these privileges (see Section 30.3.3.2), an EPT violation occurs.
 - b. If the access to the guest-physical address is allowed by these privileges, memory is accessed using the ultimate physical address.

If CR0.PG = 1, the translation of a linear address is also an iterative process, with the processor first accessing an entry in the guest paging structure referenced by the guest-physical address in CR3,³ then accessing an entry in

-
1. When there is a restart of HLAT paging (see Section 5.5), the guest paging-structure entries used by HLAT paging (prior to the restart) are not relevant to guest-paging verification.
 2. This is a simplification of the more detailed description given in Section 30.3.2.
 3. If PAE paging is in use, the processor instead uses the guest-physical address in the appropriate PDPTE register. If HLAT paging is enabled, the processor instead uses the HLATP VMCS field. For simplicity, the remainder of this section refers only to CR3.

another guest paging structure referenced by the guest-physical address in the first guest paging-structure entry, etc. Each guest-physical address is itself translated using EPT and may cause an EPT-induced VM exit. The following items detail how page faults and EPT-induced VM exits are recognized during this iterative process:

1. An attempt is made to access a guest paging-structure entry with a guest-physical address (initially, the address in CR3).
 - a. If the access fails because of an EPT misconfiguration or an EPT violation (see above), an EPT-induced VM exit occurs.
 - b. If the access does not cause an EPT-induced VM exit, the translation continues. If guest-paging verification is enabled (see Section 30.3.3.2), the processor notes whether the EPT paging-structure entry used to map a page for the guest-physical address set bit 58 (paging write). Then, bit 0 (the present flag) of the guest paging-structure entry is consulted:
 - i) If the present flag is 0 or any reserved bit is set, a page fault occurs.
 - ii) If the present flag is 1, no reserved bit is set, operation depends on whether the entry references another guest paging structure (whether it is a guest PDE with PS = 1 or a guest PTE):
 - If the entry does reference another guest paging structure, an entry from that structure is accessed; step 1 is executed for that other entry.
 - Otherwise, the entry is used to produce the ultimate guest-physical address (the translation of the original linear address); step 2 is executed.
2. Once the ultimate guest-physical address is determined, the privileges determined by the guest paging-structure entries are evaluated:
 - a. If the access to the linear address is not allowed by these privileges (e.g., it was a write to a read-only page), a page fault occurs.
 - b. If the access to the linear address is allowed by these privileges, an attempt is made to access memory at the ultimate guest-physical address:
 - i) If the access fails because of an EPT misconfiguration or an EPT violation (see above), an EPT-induced VM exit occurs. It is at this point that guest-paging verification occurs (if enabled), using the paging-write bits that were noted at occurrences of step 1b above (see Section 30.3.3.2 for details of guest-paging verification).
 - ii) If the access does not cause an EPT-induced VM exit, memory is accessed using the ultimate physical address (the translation, using EPT, of the ultimate guest-physical address).

If CR0.PG = 0, a linear address is treated as a guest-physical address and is translated using EPT (see above). This process, if it completes without an EPT violation or EPT misconfiguration, produces a physical address and determines the privileges allowed by the EPT paging-structure entries. If these privileges do not allow the access to the physical address (see Section 30.3.3.2), an EPT violation occurs. Otherwise, memory is accessed using the physical address.

30.3.4 Sub-Page Write Permissions

Section 30.3.3.2 explained how EPT enforces the access rights for guest-physical addresses using EPT violations. Since these access rights are determined using the EPT paging-structure entries that are used to translate a guest-physical address, their granularity is limited to that which is used to map pages (1-GByte, 2-MByte, or 4-KByte).

The **sub-page write-permission** feature allows the control of write accesses to guest-physical addresses to be controlled at finer granularity. Sub-page write permissions allow write accesses to be controlled at the granularity of naturally aligned 128-byte **sub-pages**. Specifically, the feature allows writes to selected sub-pages of 4-KByte page that would otherwise not be writable.

Sub-page write permissions are enabled setting the “sub-page write permissions for EPT” VM-execution control to 1. The remainder of this section describes changes to processor operation with this control setting.

Section 30.3.4.1 identifies the data accesses that are eligible for sub-page write permissions. Section 30.3.4.2 explains how the processor determines whether to allow such an access.

30.3.4.1 Write Accesses That Are Eligible for Sub-Page Write Permissions

A guest-physical address is eligible for sub-page write permissions if writes to it would be disallowed following Section 30.3.3.2: bit 1 (write access) is clear in any of the EPT paging-structure entries used to translate the guest-physical address. Guest-physical addresses to which writes would be disallowed for other reasons (e.g., the translation encounters an EPT paging-structure entry that is not present) are not eligible for sub-page write permissions.

In addition, a guest-physical address is eligible for sub-page write permissions only if it is mapped using a 4-KByte page and bit 61 (sub-page write permissions) of the EPT PTE used to map the page is 1. (Guest-physical addresses mapped with larger pages are not eligible for sub-page write permissions.)

For some memory accesses, the processor ignores bit 61 in an EPT PTE used to map a 4-KByte page and does not apply sub-page write permissions to the access. (In such a case, the access causes an EPT violation when indicated by the conditions given in Section 30.3.3.2.) Sub-page write permissions never apply to the following accesses:

- A write access performed within a transactional region.
- A write access by an enclave to an address within the enclave's ELRANGE. (Sub-page write permissions may apply to write accesses by an enclaves to addresses outside its ELRANGE.)
- A write access to the enclave page cache (EPC) by an Intel SGX instruction.
- A write access to a guest paging structure to update an accessed or dirty flag.
- Processor accesses to guest paging-structure entries when accessed and dirty flags for EPT are enabled (such accesses are treated as writes with regard to EPT violations).

There are additional accesses to which sub-page write permissions might not be applied (behavior is model-specific). The following items enumerate examples:

- A write access that crosses two 4-KByte pages. In this case, sub-page permissions may be applied to neither or to only one of the pages. (There is no write to either page unless the write is allowed to both pages.)
- A write access by an instruction that performs multiple write accesses (sub-page write permissions are intended principally for basic instructions such as AND, MOV, OR, TEST, XCHG, and XOR).

If a guest-physical address is eligible for sub-page write permissions, the processor determines whether to allow write to the address using the process described in Section 30.3.4.2.

If a guest-physical address is eligible for sub-page write permissions and that address translates to an address on the APIC-access page (see Section 31.4), the processor may treat a write access to the address as if the “virtualize APIC accesses” VM-execution control were 0. For that reason, it is recommended that software not configure any guest-physical address that translates to an address on the APIC-access page to be eligible for sub-page write permissions.

30.3.4.2 Determining an Access's Sub-Page Write Permission

Sub-page write permissions control write accesses individually to each of the 32 128-byte sub-pages of a 4-KByte page. Bits 11:7 of guest-physical address identify the sub-page.

For each guest-physical address eligible for sub-page write permissions, there is a 64-bit **sub-page permission vector (SPP vector)**. All addresses on a 4-KByte page use the same SPP vector. If an address's sub-page number (bits 11:7 of the address) is *S*, writes to address are allowed if and only if bit 2*S* of the sub-page permission is set to 1. (The bits at odd positions in a SPP vector are not used and must be zero.)

Each page's SPP vector is located in memory. For a write to a guest-physical address eligible for sub-page write permissions, the processor uses the following process to locate the address's SPP vector:

1. The SPPTP (sub-page-permission-table pointer) VM-execution control field contains the physical address of the 4-KByte root SPP table (SSPL4 table). Bits 47:39 of the guest-physical address identify a 64-bit entry in that table, called an SPPL4E.
2. A 4-KByte SPPL3 table is located at the physical address in the selected SPPL4E. Bits 38:30 of the guest-physical address identify a 64-bit entry in that table, called an SPPL3E.
3. A 4-KByte SPPL2 table is located at the physical address in the selected SPPL3E. Bits 29:21 of the guest-physical address identify a 64-bit entry in that table, called an SPPL2E.

4. A 4-KByte SPP-vector table (SSPL1 table) is located at the physical address in the selected SPPL2E. Bits 20:12 of the guest-physical address identify the 64-bit SPP vector for the address. As noted earlier, bit 2S of the sub-page permission vector determines whether the address may be written, where S is the value of address bits 11:7.

(The memory type used to access these tables is reported in bits 53:50 of the IA32_VMX_BASIC MSR. See Appendix A.1.)

A write access to multiple 128-byte sub-pages on a single 4-KByte page is allowed only if the indicated bit in the page's SPP vector for each of those sub-pages is set to 1. The following items apply to cases in which an access writes to two 4-KByte pages:

- If a write to either page would be disallowed according to Section 30.3.3.2, the access might be disallowed even if the guest-physical address of that page is eligible for sub-page write permissions. (This behavior is model-specific.)
- The access is allowed only if, for each page, either (1) a write to the page would be allowed following Section 30.3.3.2; or (2) both (a) the guest-physical address of that page is eligible for sub-page write permissions; and (b) the page's sub-page vector allows the write (as described above).

Bit 0 of each entry (SPPL4E, SPPL3E, or SPPL2E) is the entry's **valid** bit. If the process above accesses an entry in which this bit is 0, the process stops and the logical processor incurs an **SPP miss**.

In each entry (SPPL4E, SPPL3E, or SPPL2E), bits 11:1 are reserved, as are bits 63:MAXPHYADDR (see Section 30.3.1). If the process above accesses an entry in which the valid bit is 1 and in which some reserved bit is set, the process stops and the logical processor incurs an **SPP misconfiguration**. Bits in an SPP vector in odd positions are also reserved; an SPP misconfiguration occurs also any of those bits are set in the final SPP vector.

SPP misses and SPP misconfigurations are called **SPP-related events** and cause VM exits.

30.3.5 Accessed and Dirty Flags for EPT

The Intel 64 architecture supports **accessed and dirty flags** in ordinary paging-structure entries (see Section 5.8). Some processors also support corresponding flags in EPT paging-structure entries. Software should read the VMX capability MSR IA32_VMX_EPT_VPID_CAP (see Appendix A.10) to determine whether the processor supports this feature.

Software can enable accessed and dirty flags for EPT using bit 6 of the extended-page-table pointer (EPTP), a VM-execution control field (see Table 26-9 in Section 26.6.11). If this bit is 1, the processor will set the accessed and dirty flags for EPT as described below. In addition, setting this flag causes processor accesses to guest paging-structure entries to be treated as writes (see below and Section 30.3.3.2).

For any EPT paging-structure entry that is used during guest-physical-address translation, bit 8 is the accessed flag. For a EPT paging-structure entry that maps a page (as opposed to referencing another EPT paging structure), bit 9 is the dirty flag.

Whenever the processor uses an EPT paging-structure entry as part of guest-physical-address translation, it sets the accessed flag in that entry (if it is not already set).

Whenever there is a write to a guest-physical address, the processor sets the dirty flag (if it is not already set) in the EPT paging-structure entry that identifies the final physical address for the guest-physical address (either an EPT PTE or an EPT paging-structure entry in which bit 7 is 1).

When accessed and dirty flags for EPT are enabled, processor accesses to guest paging-structure entries are treated as writes (see Section 30.3.3.2). Thus, such an access will cause the processor to set the dirty flag in the EPT paging-structure entry that identifies the final physical address of the guest paging-structure entry.

(This does not apply to loads of the PDPTE registers for PAE paging by the MOV to CR instruction; see Section 5.4.1. Those loads of guest PDPTEs are treated as reads and do not cause the processor to set the dirty flag in any EPT paging-structure entry.)

These flags are "sticky," meaning that, once set, the processor does not clear them; only software can clear them.

A processor may cache information from the EPT paging-structure entries in TLBs and paging-structure caches (see Section 30.4). This fact implies that, if software changes an accessed flag or a dirty flag from 1 to 0, the processor might not set the corresponding bit in memory on a subsequent access using an affected guest-physical address.

30.3.6 Page-Modification Logging

When accessed and dirty flags for EPT are enabled, software can track writes to guest-physical addresses using a feature called **page-modification logging**.

Software can enable page-modification logging by setting the “enable PML” VM-execution control (see Table 26-7 in Section 26.6.2). When this control is 1, the processor adds entries to the **page-modification log** as described below. The page-modification log is a 4-KByte region of memory located at the physical address in the PML address VM-execution control field. The page-modification log consists of 512 64-bit entries; the PML index VM-execution control field indicates the next entry to use.

Before allowing a guest-physical access, the processor may determine that it first needs to set an accessed or dirty flag for EPT (see Section 30.3.5). When this happens, the processor examines the PML index. If the PML index is not in the range 0–511, there is a **page-modification log-full event** and a VM exit occurs. In this case, the accessed or dirty flag is not set, and the guest-physical access that triggered the event does not occur.

If instead the PML index is in the range 0–511, the processor proceeds to update accessed or dirty flags for EPT as described in Section 30.3.5. If the processor updated a dirty flag for EPT (changing it from 0 to 1), it then operates as follows:

1. The guest-physical address of the access is written to the page-modification log. Specifically, the guest-physical address is written to physical address determined by adding 8 times the PML index to the PML address. Bits 11:0 of the value written are always 0 (the guest-physical address written is thus 4-KByte aligned).
2. The PML index is decremented by 1 (this may cause the value to transition from 0 to FFFFH).

Because the processor decrements the PML index with each log entry, the value may transition from 0 to FFFFH. At that point, no further logging will occur, as the processor will determine that the PML index is not in the range 0–511 and will generate a page-modification log-full event (see above).

30.3.7 EPT and Memory Typing

This section specifies how a logical processor determines the memory type use for a memory access while EPT is in use. (See Chapter 13, “Memory Cache Control,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, for details of memory typing in the Intel 64 architecture.) Section 30.3.7.1 explains how the memory type is determined for accesses to the EPT paging structures. Section 30.3.7.2 explains how the memory type is determined for an access using a guest-physical address that is translated using EPT.

30.3.7.1 Memory Type Used for Accessing EPT Paging Structures

This section explains how the memory type is determined for accesses to the EPT paging structures. The determination is based first on the value of bit 30 (cache disable—CD) in control register CR0:

- If CR0.CD = 0, the memory type used for any such reference is the EPT paging-structure memory type, which is specified in bits 2:0 of the extended-page-table pointer (EPTP), a VM-execution control field (see Section 26.6.11). A value of 0 indicates the uncacheable type (UC), while a value of 6 indicates the write-back type (WB). Other values are reserved.
- If CR0.CD = 1, the memory type used for any such reference is uncacheable (UC).

The MTRRs have no effect on the memory type used for an access to an EPT paging structure.

30.3.7.2 Memory Type Used for Translated Guest-Physical Addresses

The **effective memory type** of a memory access using a guest-physical address (an access that is translated using EPT) is the memory type that is used to access memory. The effective memory type is based on the value of bit 30 (cache disable—CD) in control register CR0; the **last** EPT paging-structure entry used to translate the guest-physical address (either an EPT PDE with bit 7 set to 1 or an EPT PTE); and the PAT memory type (see below):

- The **PAT memory type** depends on the value of CR0.PG:
 - If CR0.PG = 0, the PAT memory type is WB (writeback).¹

- If CR0.PG = 1, the PAT memory type is the memory type selected from the IA32_PAT MSR as specified in Section 13.12.3, “Selecting a Memory Type from the PAT.”¹
- The **EPT memory type** is specified in bits 5:3 of the last EPT paging-structure entry: 0 = UC; 1 = WC; 4 = WT; 5 = WP; and 6 = WB. Other values are reserved and cause EPT misconfigurations (see Section 30.3.3).
- If CR0.CD = 0, the effective memory type depends upon the value of bit 6 of the last EPT paging-structure entry:
 - If the value is 0, the effective memory type is the combination of the EPT memory type and the PAT memory type specified in Table 13-7 in Section 13.5.2.2, using the EPT memory type in place of the MTRR memory type.
 - If the value is 1, the memory type used for the access is the EPT memory type. The PAT memory type is ignored.
- If CR0.CD = 1, the effective memory type is UC.

The MTRRs have no effect on the memory type used for an access to a guest-physical address.

30.4 CACHING TRANSLATION INFORMATION

Processors supporting Intel® 64 and IA-32 architectures may accelerate the address-translation process by caching on the processor data from the structures in memory that control that process. Such caching is discussed in Section 5.10, “Caching Translation Information,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A. The current section describes how this caching interacts with the VMX architecture.

The VPID and EPT features of the architecture for VMX operation augment this caching architecture. EPT defines the guest-physical address space and defines translations to that address space (from the linear-address space) and from that address space (to the physical-address space). Both features control the ways in which a logical processor may create and use information cached from the paging structures.

Section 30.4.1 describes the different kinds of information that may be cached. Section 30.4.2 specifies when such information may be cached and how it may be used. Section 30.4.3 details how software can invalidate cached information.

30.4.1 Information That May Be Cached

Section 5.10, “Caching Translation Information,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, identifies two kinds of translation-related information that may be cached by a logical processor: **translations**, which are mappings from linear page numbers to physical page frames, and **paging-structure caches**, which map the upper bits of a linear page number to information from the paging-structure entries used to translate linear addresses matching those upper bits.

The same kinds of information may be cached when VPIDs and EPT are in use. A logical processor may cache and use such information based on its function. Information with different functionality is identified as follows:

- **Linear mappings.**² There are two kinds:
 - Linear translations. Each of these is a mapping from a linear page number to the physical page frame to which it translates, along with information about access privileges and memory typing.

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG can be 0 in VMX non-root operation only if the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

1. Table 13-11 in Section 13.12.3, “Selecting a Memory Type from the PAT,” illustrates how the PAT memory type is selected based on the values of the PAT, PCD, and PWT bits in a page-table entry (or page-directory entry with PS = 1). For accesses to a guest paging-structure entry X, the PAT memory type is selected from the table by using a value of 0 for the PAT bit with the values of PCD and PWT from the paging-structure entry Y that references X (or from CR3 if X is in the root paging structure). With PAE paging, the PAT memory type for accesses to the PDPTes is WB.

2. Earlier versions of this manual used the term “VPID-tagged” to identify linear mappings.

- Linear paging-structure-cache entries. Each of these is a mapping from the upper portion of a linear address to the physical address of the paging structure used to translate the corresponding region of the linear-address space, along with information about access privileges. For example, bits 47:39 of a linear address would map to the address of the relevant page-directory-pointer table.

Linear mappings do not contain information from any EPT paging structure.

- **Guest-physical mappings.**¹ There are two kinds:

- Guest-physical translations. Each of these is a mapping from a guest-physical page number to the physical page frame to which it translates, along with information about access privileges and memory typing.
- Guest-physical paging-structure-cache entries. Each of these is a mapping from the upper portion of a guest-physical address to the physical address of the EPT paging structure used to translate the corresponding region of the guest-physical address space, along with information about access privileges.

The information in guest-physical mappings about access privileges and memory typing is derived from EPT paging structures.

- **Combined mappings.**² There are two kinds:

- Combined translations. Each of these is a mapping from a linear page number to the physical page frame to which it translates, along with information about access privileges and memory typing.
- Combined paging-structure-cache entries. Each of these is a mapping from the upper portion of a linear address to the physical address of the paging structure used to translate the corresponding region of the linear-address space, along with information about access privileges.

The information in combined mappings about access privileges and memory typing is derived from both guest paging structures and EPT paging structures.

Guest-physical mappings and combined mappings may also include SPP vectors and information about the data structures used to locate SPP vectors (see Section 30.3.4.2).

30.4.2 Creating and Using Cached Translation Information

The following items detail the creation of the mappings described in the previous section:³

- The following items describe the creation of mappings while EPT is not in use (including execution outside VMX non-root operation):
 - Linear mappings may be created. They are derived from the paging structures referenced (directly or indirectly) by the current value of CR3 and are associated with the current VPID and the current PCID.
 - No linear mappings are created with information derived from paging-structure entries that are not present (bit 0 is 0) or that set reserved bits. For example, if a PTE is not present, no linear mapping are created for any linear page number whose translation would use that PTE.
 - No guest-physical or combined mappings are created while EPT is not in use.
- The following items describe the creation of mappings while EPT is in use:
 - Guest-physical mappings may be created. They are derived from the EPT paging structures referenced (directly or indirectly) by bits 51:12 of the current EPTP. These 40 bits contain the address of the EPT root table (a EPT PML4 table with 4-level EPT or a EPT PML5 table with 5-level EPT); the notation **EPTRTA** refers to those 40 bits. Newly created guest-physical mappings are associated with the current EPTRTA.
 - Combined mappings may be created. They are derived from the EPT paging structures referenced (directly or indirectly) by the current EPTRTA. If CR0.PG = 1, they are also derived from the paging structures referenced (directly or indirectly) by the current value of CR3. They are associated with the current VPID,

1. Earlier versions of this manual used the term “EPTP-tagged” to identify guest-physical mappings.

2. Earlier versions of this manual used the term “dual-tagged” to identify combined mappings.

3. This section associated cached information with the current VPID and PCID. If PCIDs are not supported or are not being used (e.g., because CR4.PCIDE = 0), all the information is implicitly associated with PCID 000H; see Section 5.10.1, “Process-Context Identifiers (PCIDs),” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

the current PCID, and the current EPTRTA.¹ No combined paging-structure-cache entries are created if CR0.PG = 0.²

- No guest-physical mappings or combined mappings are created with information derived from EPT paging-structure entries that are not present (see Section 30.3.2) or that are misconfigured (see Section 30.3.3.1).
- No combined mappings are created with information derived from guest paging-structure entries that are not present or that set reserved bits.
- No linear mappings are created while EPT is in use.

The following items detail the use of the various mappings:

- If EPT is not in use (e.g., when outside VMX non-root operation), a logical processor may use cached mappings as follows:
 - For accesses using linear addresses, it may use linear mappings associated with the current VPID and the current PCID. It may also use global TLB entries (linear mappings) associated with the current VPID and any PCID.
 - No guest-physical or combined mappings are used while EPT is not in use.
- If EPT is in use, a logical processor may use cached mappings as follows:
 - For accesses using linear addresses, it may use combined mappings associated with the current VPID, the current PCID, and the current EPTRTA. It may also use global TLB entries (combined mappings) associated with the current VPID, the current EPTRTA, and any PCID.
 - For accesses using guest-physical addresses, it may use guest-physical mappings associated with the current EPTRTA.
 - No linear mappings are used while EPT is in use.

30.4.3 Invalidating Cached Translation Information

Software modifications of paging structures (including EPT paging structures and the data structures used to locate SPP vectors) may result in inconsistencies between those structures and the mappings cached by a logical processor. Certain operations invalidate information cached by a logical processor and can be used to eliminate such inconsistencies.

30.4.3.1 Operations that Invalidate Cached Mappings

The following operations invalidate cached mappings as indicated:

- Operations that architecturally invalidate entries in the TLBs or paging-structure caches independent of VMX operation (e.g., the INVLPG and INVPCID instructions) invalidate linear mappings and combined mappings.³ They are required to do so only for the current VPID (but, for combined mappings, all EPTRTAs). Linear mappings for the current VPID are invalidated even if EPT is in use.⁴ Combined mappings for the current VPID are invalidated even if EPT is not in use.⁵

1. At any given time, a logical processor may be caching combined mappings for a VPID and a PCID that are associated with different EPTRTAs. Similarly, it may be caching combined mappings for an EPTRTA that are associated with different VPIDs and PCIDs.
2. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG can be 0 in VMX non-root operation only if the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
3. See Section 5.10.4, “Invalidation of TLBs and Paging-Structure Caches,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, for an enumeration of operations that architecturally invalidate entries in the TLBs and paging-structure caches independent of VMX operation.
4. While no linear mappings are created while EPT is in use, a logical processor may retain, while EPT is in use, linear mappings (for the same VPID as the current one) there were created earlier, when EPT was not in use.
5. While no combined mappings are created while EPT is not in use, a logical processor may retain, while EPT is in not use, combined mappings (for the same VPID as the current one) there were created earlier, when EPT was in use.

- An EPT violation invalidates any guest-physical mappings (associated with the current EPTRTA) that would be used to translate the guest-physical address that caused the EPT violation. If that guest-physical address was the translation of a linear address, the EPT violation also invalidates any combined mappings for that linear address associated with the current PCID, the current VPID and the current EPTRTA.
- If the “enable VPID” VM-execution control is 0, VM entries and VM exits invalidate linear mappings and combined mappings associated with VPID 0000H (for all PCIDs). Combined mappings for VPID 0000H are invalidated for all EPTRTAs.
- Execution of the INVVPID instruction invalidates linear mappings and combined mappings. Invalidation is based on instruction operands, called the INVVPID type and the INVVPID descriptor. Four INVVPID types are currently defined:
 - **Individual-address.** If the INVVPID type is 0, the logical processor invalidates linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor and that would be used to translate the linear address specified in of the INVVPID descriptor. Linear mappings and combined mappings for that VPID and linear address are invalidated for all PCIDs and, for combined mappings, all EPTRTAs. (The instruction may also invalidate mappings associated with other VPIDs and for other linear addresses.)
 - **Single-context.** If the INVVPID type is 1, the logical processor invalidates all linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor. Linear mappings and combined mappings for that VPID are invalidated for all PCIDs and, for combined mappings, all EPTRTAs. (The instruction may also invalidate mappings associated with other VPIDs.)
 - **All-context.** If the INVVPID type is 2, the logical processor invalidates linear mappings and combined mappings associated with all VPIDs except VPID 0000H and with all PCIDs. (The instruction may also invalidate linear mappings with VPID 0000H.) Combined mappings are invalidated for all EPTRTAs.
 - **Single-context-retaining-globals.** If the INVVPID type is 3, the logical processor invalidates linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor. Linear mappings and combined mappings for that VPID are invalidated for all PCIDs and, for combined mappings, all EPTRTAs. The logical processor is **not** required to invalidate information that was used for **global** translations (although it may do so). See Section 5.10, “Caching Translation Information,” for details regarding global translations. (The instruction may also invalidate mappings associated with other VPIDs.)

See Chapter 32 for details of the INVVPID instruction. See Section 30.4.3.3 for guidelines regarding use of this instruction.

- Execution of the INVEPT instruction invalidates guest-physical mappings and combined mappings. Invalidation is based on instruction operands, called the INVEPT type and the INVEPT descriptor. Two INVEPT types are currently defined:
 - **Single-context.** If the INVEPT type is 1, the logical processor invalidates all guest-physical mappings and combined mappings associated with the EPTRTA specified in the INVEPT descriptor. Combined mappings for that EPTRTA are invalidated for all VPIDs and all PCIDs. (The instruction may invalidate mappings associated with other EPTRTAs.)
 - **All-context.** If the INVEPT type is 2, the logical processor invalidates guest-physical mappings and combined mappings associated with all EPTRTAs (and, for combined mappings, for all VPIDs and PCIDs).

See Chapter 32 for details of the INVEPT instruction. See Section 30.4.3.4 for guidelines regarding use of this instruction.

- A power-up or a reset invalidates all linear mappings, guest-physical mappings, and combined mappings.

30.4.3.2 Operations that Need Not Invalidate Cached Mappings

The following items detail cases of operations that are not required to invalidate certain cached mappings:

- Operations that architecturally invalidate entries in the TLBs or paging-structure caches independent of VMX operation are not required to invalidate any guest-physical mappings.
- The INVVPID instruction is not required to invalidate any guest-physical mappings.
- The INVEPT instruction is not required to invalidate any linear mappings.

- VMX transitions are not required to invalidate any guest-physical mappings. If the “enable VPID” VM-execution control is 1, VMX transitions are not required to invalidate any linear mappings or combined mappings.
- The VMXOFF and VMXON instructions are not required to invalidate any linear mappings, guest-physical mappings, or combined mappings.

A logical processor may invalidate any cached mappings at any time. For this reason, the operations identified above may invalidate the indicated mappings despite the fact that doing so is not required.

30.4.3.3 Guidelines for Use of the INVVPID Instruction

The need for VMM software to use the INVVPID instruction depends on how that software is virtualizing memory.

If EPT is not in use, it is likely that the VMM is virtualizing the guest paging structures. Such a VMM may configure the VMCS so that all or some of the operations that invalidate entries the TLBs and the paging-structure caches (e.g., the INVLPG instruction) cause VM exits. If VMM software is emulating these operations, it may be necessary to use the INVVPID instruction to ensure that the logical processor’s TLBs and the paging-structure caches are appropriately invalidated.

Requirements of when software should use the INVVPID instruction depend on the specific algorithm being used for page-table virtualization. The following items provide guidelines for software developers:

- Emulation of the INVLPG instruction may require execution of the INVVPID instruction as follows:
 - The INVVPID type is individual-address (0).
 - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.
 - The linear address in the INVVPID descriptor is that of the operand of the INVLPG instruction being emulated.
- Some instructions invalidate all entries in the TLBs and paging-structure caches—except for global translations. An example is the MOV to CR3 instruction. (See Section 5.10, “Caching Translation Information,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, for details regarding global translations.) Emulation of such an instruction may require execution of the INVVPID instruction as follows:
 - The INVVPID type is single-context-retaining-globals (3).
 - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.
- Some instructions invalidate all entries in the TLBs and paging-structure caches—including for global translations. An example is the MOV to CR4 instruction if the value of value of bit 4 (page global enable—PGE) is changing. Emulation of such an instruction may require execution of the INVVPID instruction as follows:
 - The INVVPID type is single-context (1).
 - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.

If EPT is not in use, the logical processor associates all mappings it creates with the current VPID, and it will use such mappings to translate linear addresses. For that reason, a VMM should not use the same VPID for different non-EPT guests that use different page tables. Doing so may result in one guest using translations that pertain to the other.

If EPT is in use, the instructions enumerated above might not be configured to cause VM exits and the VMM might not be emulating them. In that case, executions of the instructions by guest software properly invalidate the required entries in the TLBs and paging-structure caches (see Section 30.4.3.1); execution of the INVVPID instruction is not required.

If EPT is in use, the logical processor associates all mappings it creates with the value of bits 51:12 of current EPTP. If a VMM uses different EPTP values for different guests, it may use the same VPID for those guests. Doing so cannot result in one guest using translations that pertain to the other.

The following guidelines apply more generally and are appropriate even if EPT is in use:

- As detailed in Section 31.4.5, an access to the APIC-access page might not cause an APIC-access VM exit if software does not properly invalidate information that may be cached from the paging structures. If, at one

time, the current VPID on a logical processor was a non-zero value X, it is recommended that software use the INVVPID instruction with the “single-context” INVVPID type and with VPID X in the INVVPID descriptor before a VM entry on the same logical processor that establishes VPID X and either (a) the “virtualize APIC accesses” VM-execution control was changed from 0 to 1; or (b) the value of the APIC-access address was changed.

- Software can use the INVVPID instruction with the “all-context” INVVPID type immediately after execution of the VMXON instruction or immediately prior to execution of the VMXOFF instruction. Either prevents potentially undesired retention of information cached from paging structures between separate uses of VMX operation.

30.4.3.4 Guidelines for Use of the INVEPT Instruction

The following items provide guidelines for use of the INVEPT instruction to invalidate information cached from the EPT paging structures.

- Software should use the INVEPT instruction with the “single-context” INVEPT type after making any of the following changes to an EPT paging-structure entry (the INVEPT descriptor should contain an EPTP value that references — directly or indirectly — the modified EPT paging structure):
 - Changing any of the privilege bits 2:0 from 1 to 0.¹
 - Changing the physical address in bits 51:12.
 - Clearing bit 8 (the accessed flag) if accessed and dirty flags for EPT will be enabled.
 - For an EPT PDPTE or an EPT PDE, changing bit 7 (which determines whether the entry maps a page).
 - For the **last** EPT paging-structure entry used to translate a guest-physical address (an EPT PDPTE with bit 7 set to 1, an EPT PDE with bit 7 set to 1, or an EPT PTE), changing either bits 5:3 or bit 6. (These bits determine the effective memory type of accesses using that EPT paging-structure entry; see Section 30.3.7.)
 - For the **last** EPT paging-structure entry used to translate a guest-physical address (an EPT PDPTE with bit 7 set to 1, an EPT PDE with bit 7 set to 1, or an EPT PTE), clearing bit 9 (the dirty flag) if accessed and dirty flags for EPT will be enabled.
- Software should use the INVEPT instruction with the “single-context” INVEPT type before a VM entry with an EPTP value X such that $X[6] = 1$ (accessed and dirty flags for EPT are enabled) if the logical processor had earlier been in VMX non-root operation with an EPTP value Y such that $Y[6] = 0$ (accessed and dirty flags for EPT are not enabled) and $Y[51:12] = X[51:12]$.
- Software should use the INVEPT instruction with the “single-context” INVEPT type before a VM entry with an EPTP value X if the logical processor had earlier been in VMX non-root operation with an EPTP value Y such that $Y[5:3] \neq X[5:3]$ (different EPT page-walk length) and $Y[51:12] = X[51:12]$.
- Software may use the INVEPT instruction after modifying a present EPT paging-structure entry (see Section 30.3.2) to change any of the privilege bits 2:0 from 0 to 1.² Failure to do so may cause an EPT violation that would not otherwise occur. Because an EPT violation invalidates any mappings that would be used by the access that caused the EPT violation (see Section 30.4.3.1), an EPT violation will not recur if the original access is performed again, even if the INVEPT instruction is not executed.
- Because a logical processor does not cache any information derived from EPT paging-structure entries that are not present (see Section 30.3.2) or misconfigured (see Section 30.3.3.1), it is not necessary to execute INVEPT following modification of an EPT paging-structure entry that had been not present or misconfigured.
- As detailed in Section 31.4.5, an access to the APIC-access page might not cause an APIC-access VM exit if software does not properly invalidate information that may be cached from the EPT paging structures. If EPT was in use on a logical processor at one time with EPTP X, it is recommended that software use the INVEPT instruction with the “single-context” INVEPT type and with EPTP X in the INVEPT descriptor before a VM entry on the same logical processor that enables EPT with EPTP X and either (a) the “virtualize APIC accesses” VM-execution control was changed from 0 to 1; or (b) the value of the APIC-access address was changed.

1. If the “mode-based execute control for EPT” VM-execution control is 1, software should use the INVEPT instruction after changing privilege bit 10 from 1 to 0.

2. If the “mode-based execute control for EPT” VM-execution control is 1, software may use the INVEPT instruction after modifying a present EPT paging-structure entry to change privilege bit 10 from 0 to 1.

- Software can use the INVEPT instruction with the “all-context” INVEPT type immediately after execution of the VMXON instruction or immediately prior to execution of the VMXOFF instruction. Either prevents potentially undesired retention of information cached from EPT paging structures between separate uses of VMX operation.

In a system containing more than one logical processor, software must account for the fact that information from an EPT paging-structure entry may be cached on logical processors other than the one that modifies that entry. The process of propagating the changes to a paging-structure entry is commonly referred to as “TLB shutdown.” A discussion of TLB shutdown appears in Section 5.10.5, “Propagation of Paging-Structure Changes to Multiple Processors,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

24. Updates to Chapter 31, Volume 3C

Change bars and violet text show changes to Chapter 31 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

Changes to this chapter:

- In Section 31.1.6.2, "IPI Virtualization Using Virtual-Interrupt Posting", added footnote for physical address width in the pseudocode of IPI virtualization.
- In Section 31.2.1, "Evaluation of Pending Virtual Interrupts", added content in the pseudocode for SEAM. Information for when virtual interrupts will be delivered in SEAM was included.
- In Section 31.2.2, "Virtual-Interrupt Delivery", added content in the pseudocode for SEAM.

CHAPTER 31

APIC VIRTUALIZATION AND VIRTUAL INTERRUPTS

The VMCS includes controls that enable the virtualization of interrupts and the Advanced Programmable Interrupt Controller (APIC).

When these controls are used, the processor will emulate many accesses to the APIC, track the state of the virtual APIC, and deliver virtual interrupts — all in VMX non-root operation without a VM exit.¹

The processor tracks the state of the virtual APIC using a virtual-APIC page identified by the virtual-machine monitor (VMM). Section 31.1 discusses the virtual-APIC page and how the processor uses it to track the state of the virtual APIC.

The following are the VM-execution controls relevant to APIC virtualization and virtual interrupts (see Section 26.6 for information about the locations of these controls):

- **Virtual-interrupt delivery.** This control enables the evaluation and delivery of pending virtual interrupts (Section 31.2). It also enables the emulation of writes (memory-mapped or MSR-based, as enabled) to the APIC registers that control interrupt prioritization.
- **Use TPR shadow.** This control enables emulation of accesses to the APIC's task-priority register (TPR) via CR8 (Section 31.3) and, if enabled, via the memory-mapped or MSR-based interfaces.
- **Virtualize APIC accesses.** This control enables virtualization of memory-mapped accesses to the APIC (Section 31.4) by causing VM exits on accesses to a VMM-specified APIC-access page. Some of the other controls, if set, may cause some of these accesses to be emulated rather than causing VM exits.
- **Virtualize x2APIC mode.** This control enables virtualization of MSR-based accesses to the APIC (Section 31.5).
- **APIC-register virtualization.** This control allows memory-mapped and MSR-based reads of most APIC registers (as enabled) by satisfying them from the virtual-APIC page. It directs memory-mapped writes to the APIC-access page to the virtual-APIC page, following them by VM exits for VMM emulation.
- **Process posted interrupts.** This control allows software to post virtual interrupts in a data structure and send a notification to another logical processor; upon receipt of the notification, the target processor will process the posted interrupts by copying them into the virtual-APIC page (Section 31.6).
- **IPI virtualization.** This control enables the virtualization of interprocessor interrupts (Section 31.1.6).

"Virtualize APIC accesses", "virtualize x2APIC mode", "virtual-interrupt delivery", and "APIC-register virtualization" are all secondary processor-based VM-execution controls; if bit 31 of the primary processor-based VM-execution controls is 0, the processor operates as if these controls were all 0. "IPI virtualization" is a tertiary processor-based VM-execution control; if bit 17 of the primary processor-based VM-execution controls is 0, the processor operates as if "IPI virtualization" were 0. See Section 26.6.2.

31.1 VIRTUAL APIC STATE

The **virtual-APIC page** is a 4-KByte region of memory that the processor uses to virtualize certain accesses to APIC registers and to manage virtual interrupts. The physical address of the virtual-APIC page is the **virtual-APIC address**, a 64-bit VM-execution control field in the VMCS (see Section 26.6.8).

Depending on the settings of certain VM-execution controls, the processor may virtualize certain fields on the virtual-APIC page with functionality analogous to that performed by the local APIC. Section 31.1.1 identifies and defines these fields. Section 31.1.2, Section 31.1.3, Section 31.1.4, and Section 31.1.5 detail the actions taken to virtualize updates to some of these fields.

With the exception of fields corresponding to virtualized APIC registers (defined in Section 31.1.1), software may modify the virtual-APIC page referenced by the current VMCS of a logical processor in VMX non-root operation. (This is an exception to the general requirement given in Section 26.11.4.)

1. In most cases, it is not necessary for a virtual-machine monitor (VMM) to inject virtual interrupts as part of VM entry.

31.1.1 Virtualized APIC Registers

Depending on the setting of certain VM-execution controls, a logical processor may virtualize certain accesses to APIC registers using the following fields on the virtual-APIC page:

- **Virtual task-priority register (VTPR):** the 32-bit field located at offset 080H on the virtual-APIC page.
- **Virtual processor-priority register (VPPR):** the 32-bit field located at offset 0A0H on the virtual-APIC page.
- **Virtual end-of-interrupt register (VEOI):** the 32-bit field located at offset 0B0H on the virtual-APIC page.
- **Virtual interrupt-service register (VISR):** the 256-bit value comprising eight non-contiguous 32-bit fields at offsets 100H, 110H, 120H, 130H, 140H, 150H, 160H, and 170H on the virtual-APIC page. Bit x of the VISR is at bit position $(x \& 1FH)$ at offset $(100H \mid ((x \& E0H) \gg 1))$. The processor uses only the low 4 bytes of each of the 16-byte fields at offsets 100H, 110H, 120H, 130H, 140H, 150H, 160H, and 170H.
- **Virtual interrupt-request register (VIRR):** the 256-bit value comprising eight non-contiguous 32-bit fields at offsets 200H, 210H, 220H, 230H, 240H, 250H, 260H, and 270H on the virtual-APIC page. Bit x of the VIRR is at bit position $(x \& 1FH)$ at offset $(200H \mid ((x \& E0H) \gg 1))$. The processor uses only the low 4 bytes of each of the 16-Byte fields at offsets 200H, 210H, 220H, 230H, 240H, 250H, 260H, and 270H.
- **Virtual interrupt-command register (VICR_LO):** the 32-bit field located at offset 300H on the virtual-APIC page.
- **Virtual interrupt-command register (VICR_HI):** the 32-bit field located at offset 310H on the virtual-APIC page.

The VTPR field virtualizes the TPR whenever the “use TPR shadow” VM-execution control is 1. The other fields indicated above virtualize the corresponding APIC registers whenever the “virtual-interrupt delivery” VM-execution control is 1. (VICR_LO and VICR_HI also virtualize the ICR when the “IPI virtualization” VM-execution control is 1.)

31.1.2 TPR Virtualization

The processor performs **TPR virtualization** in response to the following operations: (1) virtualization of the MOV to CR8 instruction; (2) virtualization of a write to offset 080H on the APIC-access page; and (3) virtualization of the WRMSR instruction with ECX = 808H. See Section 31.3, Section 31.4.3, and Section 31.5 for details of when TPR virtualization is performed.

The following pseudocode details the behavior of TPR virtualization:

```

IF “virtual-interrupt delivery” is 0
    THEN
        IF VTPR[7:4] < TPR threshold (see Section 26.6.8)
            THEN cause VM exit due to TPR below threshold;
        FI;
    ELSE
        perform PPR virtualization (see Section 31.1.3);
        evaluate pending virtual interrupts (see Section 31.2.1);
    FI;

```

Any VM exit caused by TPR virtualization is trap-like: the instruction causing TPR virtualization completes before the VM exit occurs (for example, the value of CS:RIP saved in the guest-state area of the VMCS references the next instruction).

31.1.3 PPR Virtualization

The processor performs **PPR virtualization** in response to the following operations: (1) VM entry; (2) TPR virtualization; and (3) EOI virtualization. See Section 28.3.2.5, Section 31.1.2, and Section 31.1.4 for details of when PPR virtualization is performed.

PPR virtualization uses the guest interrupt status (specifically, SVI; see Section 26.4.2) and VTPR. The following pseudocode details the behavior of PPR virtualization:

```

IF VTPR[7:4] ≥ SVI[7:4]

```

```

    THEN VPPR := VTPR & FFH;
    ELSE VPPR := SVI & FOH;
FI;

```

PPR virtualization always clears bytes 3:1 of VPPR.

PPR virtualization is caused only by TPR virtualization, EOI virtualization, and VM entry. Delivery of a virtual interrupt also modifies VPPR, but in a different way (see Section 31.2.2). No other operations modify VPPR, even if they modify SVI, VISR, or VTPR.

31.1.4 EOI Virtualization

The processor performs **EOI virtualization** in response to the following operations: (1) virtualization of a write to offset 0B0H on the APIC-access page; and (2) virtualization of the WRMSR instruction with ECX = 80BH. See Section 31.4.3 and Section 31.5 for details of when EOI virtualization is performed. EOI virtualization occurs only if the “virtual-interrupt delivery” VM-execution control is 1.

EOI virtualization uses and updates the guest interrupt status (specifically, SVI; see Section 26.4.2). The following pseudocode details the behavior of EOI virtualization:

```

Vector := SVI;
VISR[Vector] := 0; (see Section 31.1.1 for definition of VISR)
IF any bits set in VISR
    THEN SVI := highest index of bit set in VISR
    ELSE SVI := 0;
FI;
perform PPR virtualization (see Section 31.1.3);
IF EOI_exit_bitmap[Vector] = 1 (see Section 26.6.8 for definition of EOI_exit_bitmap)
    THEN cause EOI-induced VM exit with Vector as exit qualification;
    ELSE evaluate pending virtual interrupts; (see Section 31.2.1)
FI;

```

Any VM exit caused by EOI virtualization is trap-like: the instruction causing EOI virtualization completes before the VM exit occurs (for example, the value of CS:RIP saved in the guest-state area of the VMCS references the next instruction).

31.1.5 Self-IPI Virtualization

The processor performs **self-IPI virtualization** in response to the following operations: (1) virtualization of a write to offset 300H on the APIC-access page; and (2) virtualization of the WRMSR instruction with ECX = 83FH. See Section 31.4.3 and Section 31.5 for details of when self-IPI virtualization is performed. Self-IPI virtualization occurs only if the “virtual-interrupt delivery” VM-execution control is 1.

Each operation that leads to self-IPI virtualization provides an 8-bit vector (see Section 31.4.3 and Section 31.5). Self-IPI virtualization updates the guest interrupt status (specifically, RVI; see Section 26.4.2). The following pseudocode details the behavior of self-IPI virtualization:

```

VIRR[Vector] := 1; (see Section 31.1.1 for definition of VIRR)
RVI := max{RVI, Vector};
evaluate pending virtual interrupts; (see Section 31.2.1)

```

31.1.6 IPI Virtualization

The processor performs **IPI virtualization** in response to the following operations: (1) virtualization of a write to offset 300H on the APIC-access page (Section 31.4.3); (2) virtualization of the WRMSR instruction with ECX = 830H (Section 31.5); and (3) virtualization of some executions of SENDUIPI (Section 31.7). IPI virtualization occurs only if the “IPI virtualization” VM-execution control is 1.

IPI virtualization uses virtual-interrupt posting, which is described in Section 31.1.6.1. Section 31.1.6.2 gives the details of the operation of IPI virtualization.

31.1.6.1 Virtual-Interrupt Posting

IPI virtualization is based on **virtual-interrupt posting**, a process that can direct virtual interrupts to a specific virtual processor. With virtual-interrupt posting, a hardware or software agent “posts” a virtual interrupt in a data structure (**posted-interrupt descriptor** or **PID**) and then sends an interrupt (notification) to the logical processor on which the target virtual processor is operating. When that logical processor receives the notification, it uses information in the PID to deliver the virtual interrupt to the virtual processor (see Section 31.6).

A PID is a 64-byte data structure. In an expected usage, there is one PID for each virtual processor; the virtual processor’s VMCS contains a pointer to its PID. A PID has the format shown in Table 31-1.

Table 31-1. Format of Posted-Interrupt Descriptor (PID)

Bit Position(s)	Name	Description
255:0	Posted-interrupt requests (PIR)	One bit for each interrupt vector. There is a posted-interrupt request for a vector if the corresponding bit is 1.
256	Outstanding notification (ON)	If this bit is set, there is a notification outstanding for one or more posted interrupts in bits 255:0.
257	Suppress notify (SN)	Setting this bit directs agents not to send notifications.
271:258	Reserved	Reserved.
279:272	Notify vector (NV)	Notifications will use this vector.
287:280	Reserved	Reserved.
319:288	Notify destination (NDST)	Notifications will be directed to this physical APIC ID.
511:320	Reserved	Reserved.

A hardware or software agent posts a virtual interrupt to a virtual processor with following steps:

1. Read the PIR field in the virtual processor’s PID and write it back atomically, setting the bit that corresponds to the virtual interrupt’s vector.
2. Read the notification-information field in the PID and write it back atomically, setting the ON bit if the ON and SN bits were both 0 in the value read. (Step #2 may be done atomically with step #1.)
3. If step #2 changed the ON bit from 0 to 1, send a notification. The notification is an ordinary interrupt sent to the physical APIC ID NDST with vector NV.

A processor’s response to the delivery of a notification is detailed in Section 31.6.

The use of virtual-interrupt posting for IPI virtualization is explained in Section 31.1.6.2.

31.1.6.2 IPI Virtualization Using Virtual-Interrupt Posting

Each operation that leads to IPI virtualization provides an 8-bit virtual vector V and a 32-bit virtual APIC ID T. IPI virtualization uses those values to initiate the indicated virtual IPI using the **PID-pointer table**.

The PID-pointer table is a data structure referenced by the PID-pointer table address, a field in the VMCS. Each entry in the PID-pointer table contains the following information:

- Bits 63:6 contain bits 63:6 of the 64-bit physical address of a PID (see Section 31.1.6.1).
- Bits 5:1 are reserved and must be 0.
- Bit 0 is a valid bit.

Each such address must be 64-byte aligned. The index of the last entry in the table is also a field in the VMCS.

When virtualizing an IPI, the CPU uses the virtual APIC ID T to select an entry from the PID-pointer table. It uses the address in that entry to locate a posted-interrupt descriptor (PID) and then posts a virtual interrupt with vector V in that PID. The following pseudocode details the behavior of IPI virtualization:

```

IF V < 16
    THEN APIC-write VM exit;           // illegal vector
ELSE IF T ≤ last PID-pointer index    // a field in the VMCS

```

```

THEN
    PID_ADDR := 8 bytes at (PID-pointer table address + (T << 3));
    IF PID_ADDR sets bits beyond the processor's physical-address width1 OR
        PID_ADDR[5:0] ≠ 000001b // PID pointer not valid or reserved bits set
    THEN APIC-write VM exit; // See Section 31.4.3.3
    ELSE
        PID_ADDR[0] := 0; // clear the valid bit before using as an address
        PIR := 32 bytes at PID_ADDR; // under lock
        PIR[V] := 1;
        store PIR at PID_ADDR; // release lock; corresponds to step #1 in Section 31.1.6.1
        NotifyInfo := 8 bytes at PID_ADDR + 32; // under lock
        IF NotifyInfo.ON = 0 AND NotifyInfo.SN = 0
            THEN
                NotifyInfo.ON := 1;
                SendNotify := 1;
            ELSE SendNotify := 0;
        FI;
        store NotifyInfo at PID_ADDR + 32; // release lock; corresponds to step #2 in Section 31.1.6.1
        IF SendNotify = 1
            THEN send an IPI specified by NotifyInfo.NDST and NotifyInfo.NV; // step #3 in Section 31.1.6.1
        FI;
    FI;
ELSE APIC-write VM exit; // virtual APIC ID beyond end of tables
FI;

```

The sending of the notification IPI is indicated by fields in the selected PID: NDST (PID[319:288]) and NV (PID[279:272]):

- If the local APIC is in xAPIC mode, this is the IPI that would be generated by writing NDST[15:8] (PID[303:296]) to ICR_HI[31:24] (offset 310H from IA32_APIC_BASE) and then writing NV to ICR_LO (offset 300H from IA32_APIC_BASE).
- If the local APIC is in x2APIC mode, this is the IPI that would be generated by executing WRMSR with ECX = 830H (ICR), EAX = NV, and EDX = NDST.

If the pseudocode specifies an APIC-write VM exit, this VM exit occurs as if there had been a write access to page offset 300H on the APIC-access page (see Section 31.4.3.3).

31.2 EVALUATION AND DELIVERY OF VIRTUAL INTERRUPTS

If the “virtual-interrupt delivery” VM-execution control is 1, certain actions in VMX non-root operation or during VM entry cause the processor to evaluate and deliver virtual interrupts.

Evaluation of virtual interrupts is triggered by certain actions change the state of the virtual-APIC page and is described in Section 31.2.1. This evaluation may result in recognition of a virtual interrupt. Once a virtual interrupt is recognized, the processor may deliver it within VMX non-root operation without a VM exit. Virtual-interrupt delivery is described in Section 31.2.2.

31.2.1 Evaluation of Pending Virtual Interrupts

If the “virtual-interrupt delivery” VM-execution control is 1, certain actions cause a logical processor to **evaluate pending virtual interrupts**.

The following actions cause the evaluation of pending virtual interrupts: VM entry; TPR virtualization; EOI virtualization; self-IPI virtualization; and posted-interrupt processing. See Section 28.3.2.5, Section 31.1.2, Section 31.1.4, Section 31.1.5, and Section 31.6 for details of when evaluation of pending virtual interrupts is performed. No other operations cause the evaluation of pending virtual interrupts, even if they modify RVI or VPPR.

1. Usually, the processor's physical-address width is the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), the width is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

Evaluation of pending virtual interrupts uses the guest interrupt status (specifically, RVI; see Section 26.4.2). The following pseudocode details the evaluation of pending virtual interrupts:

```

IF logical processor in SEAM and RVI < 31
    THEN RVI := 0;
FI;
IF "interrupt-window exiting" is 0 AND
RVI[7:4] > VPPR[7:4] (see Section 31.1.1 for definition of VPPR)
    THEN recognize a pending virtual interrupt;
ELSE
    do not recognize a pending virtual interrupt;
FI;

```

Once recognized, a virtual interrupt may be delivered in VMX non-root operation; see Section 31.2.2. **Note that, in SEAM, no virtual interrupt will be delivered with a vector lower than 31.**

Evaluation of pending virtual interrupts is caused only by VM entry, TPR virtualization, EOI virtualization, self-IPI virtualization, and posted-interrupt processing. No other operations do so, even if they modify RVI or VPPR. The logical processor ceases recognition of a pending virtual interrupt following the delivery of a virtual interrupt.

31.2.2 Virtual-Interrupt Delivery

If a virtual interrupt has been recognized (see Section 31.2.1), it is delivered at an instruction boundary when the following conditions all hold: (1) RFLAGS.IF = 1; (2) there is no blocking by STI; (3) there is no blocking by MOV SS or by POP SS; and (4) the "interrupt-window exiting" VM-execution control is 0.

Virtual-interrupt delivery has the same priority as that of VM exits due to the 1-setting of the "interrupt-window exiting" VM-execution control.¹ Thus, non-maskable interrupts (NMIs) and higher priority events take priority over delivery of a virtual interrupt; delivery of a virtual interrupt takes priority over external interrupts and lower priority events.

Virtual-interrupt delivery wakes a logical processor from the same inactive activity states as would an external interrupt. Specifically, it wakes a logical processor from the states entered using the HLT and MWAIT instructions. It does not wake a logical processor in the shutdown state or in the wait-for-SIPI state.

Virtual-interrupt delivery updates the guest interrupt status (both RVI and SVI; see Section 26.4.2) and delivers an event within VMX non-root operation without a VM exit. The following pseudocode details the behavior of virtual-interrupt delivery (see Section 31.1.1 for definition of VISR, VIRR, and VPPR):

```

Vector := RVI;
VISR[Vector] := 1;
SVI := Vector;
VPPR := Vector & FOH;
VIRR[Vector] := 0;
IF any bits set in VIRR
    THEN RVI := highest index of bit set in VIRR
    ELSE RVI := 0;
FI;
IF logical processor is in SEAM and RVI < 31
    THEN RVI := 0;
FI;
cease recognition of any pending virtual interrupt;
IF transactional execution is in effect
    THEN abort transactional execution and transition to a non-transactional execution;
FI;
IF logical processor is in enclave mode

```

1. A logical processor never recognizes or delivers a virtual interrupt if the "interrupt-window exiting" VM-execution control is 1. Because of this, the relative priority of virtual-interrupt delivery and VM exits due to the 1-setting of that control is not defined.

```

    THEN cause an Asynchronous Enclave Exit (AEX) (see Chapter 39, "Enclave Exiting Events")
FI;
IF CR4.UINTR = 1 AND IA32_EFER.LMA = 1 AND Vector = UINV
    THEN virtualize user-interrupt notification identification and processing (see Section 31.2.3)
    ELSE deliver interrupt with Vector through IDT;
FI;

```

31.2.3 Virtualizing User-Interrupt Notifications

Section 8.5 describes the process of user-interrupt notification identification and processing. If the "virtual-interrupt delivery" VM-execution control is 1, this process is modified as described in the following paragraphs.

The virtualized form of user-interrupt notification identification begins as described in Section 31.2.2. Following this, instead of writing zero to the EOI register in the local APIC, the logical processor performs the initial steps of EOI virtualization:

```

VISR[V] := 0;
IF any bit is set in VISR
    THEN SVI := highest index of bit set in VISR
    ELSE SVI := 0;
FI;
perform PPR virtualization (Section 31.1.3);

```

Unlike EOI virtualization resulting from a guest write to the EOI register (as defined for virtual-interrupt delivery), the logical processor does not check the EOI-exit bitmap as part of this modified form of user-interrupt notification identification, and the corresponding VM exits cannot occur.

Following this modified form of user-interrupt notification identification, the logical processor then performs user-interrupt notification processing as specified in Section 8.5.2.

A logical processor is not interruptible during this modified form of user-interrupt notification identification or between it and any subsequent user-interrupt notification processing.

If the user-interrupt notification identification that precedes user-interrupt notification processing occurred while the logical processor was in the HLT state, the logical processor returns to the HLT state following user-interrupt notification processing.

31.3 VIRTUALIZING CR8-BASED TPR ACCESSES

In 64-bit mode, software can access the local APIC's task-priority register (TPR) through CR8. Specifically, software uses the MOV from CR8 and MOV to CR8 instructions (see Section 12.8.6, "Task Priority in IA-32e Mode"). This section describes how these accesses can be virtualized.

A virtual-machine monitor can virtualize these CR8-based APIC accesses by setting the "CR8-load exiting" and "CR8-store exiting" VM-execution controls, ensuring that the accesses cause VM exits (see Section 27.1.3). Alternatively, there are methods for virtualizing some CR8-based APIC accesses without VM exits.

Normally, an execution of MOV from CR8 or MOV to CR8 that does not fault or cause a VM exit accesses the APIC's TPR. However, such an execution are treated specially if the "use TPR shadow" VM-execution control is 1. The following items provide details:

- **MOV from CR8.** The instruction loads bits 3:0 of its destination operand with bits 7:4 of VTPR (see Section 31.1.1). Bits 63:4 of the destination operand are cleared.
- **MOV to CR8.** The instruction stores bits 3:0 of its source operand into bits 7:4 of VTPR; the remainder of VTPR (bits 3:0 and bits 31:8) are cleared. Following this, the processor performs TPR virtualization (see Section 31.1.2).

31.4 VIRTUALIZING MEMORY-MAPPED APIC ACCESSSES

When the local APIC is in xAPIC mode, software accesses the local APIC's control registers using a memory-mapped interface. Specifically, software uses linear addresses that translate to physical addresses on page frame indicated by the base address in the IA32_APIC_BASE MSR (see Section 12.4.4, "Local APIC Status and Location"). This section describes how these accesses can be virtualized.

A virtual-machine monitor (VMM) can virtualize these memory-mapped APIC accesses by ensuring that any access to a linear address that would access the local APIC instead causes a VM exit. This could be done using paging or the extended page-table mechanism (EPT). Another way is by using the 1-setting of the "virtualize APIC accesses" VM-execution control.

If the "virtualize APIC accesses" VM-execution control is 1, the logical processor treats specially memory accesses using linear addresses that translate to physical addresses in the 4-KByte **APIC-access page**.^{1,2} (The APIC-access page is identified by the **APIC-access address**, a field in the VMCS; see Section 26.6.8.)

In general, an access to the APIC-access page causes an **APIC-access VM exit**. APIC-access VM exits provide a VMM with information about the access causing the VM exit. Section 31.4.1 discusses the priority of APIC-access VM exits.

Certain VM-execution controls enable the processor to virtualize certain accesses to the APIC-access page without a VM exit. In general, this virtualization causes these accesses to be made to the virtual-APIC page instead of the APIC-access page.

NOTES

Unless stated otherwise, this section characterizes only linear accesses to the APIC-access page; an access to the APIC-access page is a linear access if (1) it results from a memory access using a linear address; and (2) the access's physical address is the translation of that linear address. Section 31.4.6 discusses accesses to the APIC-access page that are not linear accesses.

The distinction between the APIC-access page and the virtual-APIC page allows a VMM to share paging structures or EPT paging structures among the virtual processors of a virtual machine (the shared paging structures referencing the same APIC-access address, which appears in the VMCS of all the virtual processors) while giving each virtual processor its own virtual APIC (the VMCS of each virtual processor will have a unique virtual-APIC address).

Section 31.4.2 discusses when and how the processor may virtualize read accesses from the APIC-access page. Section 31.4.3 does the same for write accesses. When virtualizing a write to the APIC-access page, the processor typically takes actions in addition to passing the write through to the virtual-APIC page.

The discussion in those sections uses the concept of an **operation** within which these memory accesses may occur. For those discussions, an "operation" can be an iteration of a REP-prefixed string instruction, an execution of any other instruction, or delivery of an event through the IDT.

The 1-setting of the "virtualize APIC accesses" VM-execution control may also affect accesses to the APIC-access page that do not result directly from linear addresses. This is discussed in Section 31.4.6.

Special treatment may apply to Intel SGX instructions or if the logical processor is in enclave mode. See Section 41.5.3 for details.

1. Even when addresses are translated using EPT (see Section 30.3), the determination of whether an APIC-access VM exit occurs depends on an access's physical address, not its guest-physical address. Even when CR0.PG = 0, ordinary memory accesses by software use linear addresses; the fact that CR0.PG = 0 means only that the identity translation is used to convert linear addresses to physical (or guest-physical) addresses.
2. If EPT is enabled and there is write to a guest-physical address that translates to an address on the APIC-access page that is eligible for sub-page write permissions (see Section 30.3.4.1), the processor may treat the write as if the "virtualize APIC accesses" VM-execution control were 0 (and not apply the treatment specified in this section). For that reason, it is recommended that software not configure any guest-physical address that translates to an address on the APIC-access page to be eligible for sub-page write permissions.

31.4.1 Priority of APIC-Access VM Exits

The following items specify the priority of APIC-access VM exits relative to other events.

- The priority of an APIC-access VM exit due to a memory access is below that of any page fault or EPT violation that that access may incur. That is, an access does not cause an APIC-access VM exit if it would cause a page fault or an EPT violation.
- A memory access does not cause an APIC-access VM exit until after the accessed flags are set in the paging structures (including EPT paging structures, if enabled).
- A write access does not cause an APIC-access VM exit until after the dirty flags are set in the appropriate paging structure and EPT paging structure (if enabled).
- With respect to all other events, any APIC-access VM exit due to a memory access has the same priority as any page fault or EPT violation that the access could cause. (This item applies to other events that the access may generate as well as events that may be generated by other accesses by the same operation.)

These principles imply, among other things, that an APIC-access VM exit may occur during the execution of a repeated string instruction (including `INS` and `OUTS`). Suppose, for example, that the first n iterations (n may be 0) of such an instruction do not access the APIC-access page and that the next iteration does access that page. As a result, the first n iterations may complete and be followed by an APIC-access VM exit. The instruction pointer saved in the VMCS references the repeated string instruction and the values of the general-purpose registers reflect the completion of n iterations.

31.4.2 Virtualizing Reads from the APIC-Access Page

A read access from the APIC-access page causes an APIC-access VM exit if any of the following are true:

- The “use TPR shadow” VM-execution control is 0.
- The access is for an instruction fetch.
- The access is more than 32 bits in size.
- The access is part of an operation for which the processor has already virtualized a write to the APIC-access page.
- The access is not entirely contained within the low 4 bytes of a naturally aligned 16-byte region. That is, bits 3:2 of the access’s address are 0, and the same is true of the address of the highest byte accessed.

If none of the above are true, whether a read access is virtualized depends on the setting of the “APIC-register virtualization” and “virtual-interrupt delivery” VM-execution controls:

- A read access is virtualized if its page offset is 080H (task priority) regardless of the settings of the “APIC-register virtualization” and “virtual-interrupt delivery” VM-execution controls.
- If the “virtual-interrupt delivery” VM-execution control is 1, a read access is virtualized if its page offset is 0B0H (end of interrupt) or 300H (interrupt command — low).
- If “APIC-register virtualization” is 1, a read access is virtualized if it is entirely within one of the following ranges of offsets:
 - 020H–023H (local APIC ID);
 - 030H–033H (local APIC version);
 - 080H–083H (task priority);
 - 0B0H–0B3H (end of interrupt);
 - 0D0H–0D3H (logical destination);
 - 0E0H–0E3H (destination format);
 - 0F0H–0F3H (spurious-interrupt vector);
 - 100H–103H, 110H–113H, 120H–123H, 130H–133H, 140H–143H, 150H–153H, 160H–163H, or 170H–173H (in-service);
 - 180H–183H, 190H–193H, 1A0H–1A3H, 1B0H–1B3H, 1C0H–1C3H, 1D0H–1D3H, 1E0H–1E3H, or 1F0H–1F3H (trigger mode);

- 200H–203H, 210H–213H, 220H–223H, 230H–233H, 240H–243H, 250H–253H, 260H–263H, or 270H–273H (interrupt request);
- 280H–283H (error status);
- 300H–303H or 310H–313H (interrupt command);
- 320H–323H, 330H–333H, 340H–343H, 350H–353H, 360H–363H, or 370H–373H (LVT entries);
- 380H–383H (initial count); or
- 3E0H–3E3H (divide configuration).

In all other cases, the access causes an APIC-access VM exit.

A read access from the APIC-access page that is virtualized returns data from the corresponding page offset on the virtual-APIC page.¹

31.4.3 Virtualizing Writes to the APIC-Access Page

Whether a write access to the APIC-access page is virtualized depends on the settings of the VM-execution controls and the page offset of the access. Section 31.4.3.1 details when APIC-write virtualization occurs.

Unlike reads, writes to the local APIC have side effects; because of this, virtualization of writes to the APIC-access page may require emulation specific to the access's page offset (which identifies the APIC register being accessed). Section 31.4.3.2 describes this **APIC-write emulation**.

For some page offsets, it is necessary for software to complete the virtualization after a write completes. In these cases, the processor causes an **APIC-write VM exit** to invoke VMM software. Section 31.4.3.3 discusses APIC-write VM exits.

31.4.3.1 Determining Whether a Write Access is Virtualized

A write access to the APIC-access page causes an APIC-access VM exit if any of the following are true:

- The "use TPR shadow" VM-execution control is 0.
- The access is more than 32 bits in size.
- The access is part of an operation for which the processor has already virtualized a write (with a different page offset or a different size) to the APIC-access page.
- The access is not entirely contained within the low 4 bytes of a naturally aligned 16-byte region. That is, bits 3:2 of the access's address are 0, and the same is true of the address of the highest byte accessed.

If none of the above are true, whether a write access is virtualized depends on the settings of the "APIC-register virtualization", "virtual-interrupt delivery", and "IPI virtualization" VM-execution controls:

- A write access is virtualized if its page offset is 080H (task priority) regardless of the settings of the "APIC-register virtualization" and "virtual-interrupt delivery" VM-execution controls.
- If the "virtual-interrupt delivery" VM-execution control is 1, a write access is virtualized if its page offset is 0B0H (end of interrupt) or 300H (interrupt command — low).
- If the "IPI virtualization" VM-execution control is 1, a write access is virtualized if its page offset is 300H.
- If the "APIC-register virtualization" VM-execution control is 1, a write access is virtualized if it is entirely within one the following ranges of offsets:
 - 020H–023H (local APIC ID);
 - 080H–083H (task priority);
 - 0B0H–0B3H (end of interrupt);
 - 0D0H–0D3H (logical destination);
 - 0E0H–0E3H (destination format);

1. The memory type used for accesses that read from the virtual-APIC page is reported in bits 53:50 of the IA32_VMX_BASIC MSR (see Appendix A.1).

- 0F0H–0F3H (spurious-interrupt vector);
- 280H–283H (error status);
- 300H–303H or 310H–313H (interrupt command);
- 320H–323H, 330H–333H, 340H–343H, 350H–353H, 360H–363H, or 370H–373H (LVT entries);
- 380H–383H (initial count); or
- 3E0H–3E3H (divide configuration).

In all other cases, the access causes an APIC-access VM exit.

The processor virtualizes a write access to the APIC-access page by writing data to the corresponding page offset on the virtual-APIC page.¹ Following this, the processor performs certain actions after completion of the operation of which the access was a part.² APIC-write emulation is described in Section 31.4.3.2.

31.4.3.2 APIC-Write Emulation

If the processor virtualizes a write access to the APIC-access page, it performs additional actions after completion of an operation of which the access was a part. These actions are called **APIC-write emulation**.

The details of APIC-write emulation depend upon the page offset of the virtualized write access:³

- 080H (task priority). The processor clears bytes 3:1 of VTPR and then causes TPR virtualization (Section 31.1.2).
- 0B0H (end of interrupt). If the “virtual-interrupt delivery” VM-execution control is 1, the processor clears VEOI and then causes EOI virtualization (Section 31.1.4); otherwise, the processor causes an APIC-write VM exit (Section 31.4.3.3).
- 300H (interrupt command — low). If the “virtual-interrupt delivery” VM-execution control is 1, the processor checks the value of VICR_LO to determine whether the following are all true:
 - Reserved bits (31:20, 17:16, 13) and bit 12 (delivery status) are all 0.
 - Bits 19:18 (destination shorthand) are 01B (self).
 - Bit 15 (trigger mode) is 0 (edge).
 - Bits 10:8 (delivery mode) are 000B (fixed).
 - Bits 7:4 (the upper half of the vector) are **not** 0000B.

If all of the items above are true, the processor performs self-IPI virtualization using the 8-bit vector in byte 0 of VICR_LO (Section 31.1.5).

If the “virtual-interrupt delivery” VM-execution control is 0, or if any of the items above are false, behavior depends on the setting of the “IPI virtualization” VM-execution control:

- If the “IPI virtualization” VM-execution control is 1, the processor checks the value of VICR_LO to determine whether the following are all true:
 - Reserved bits (31:20, 17:16, 13) and bit 12 (delivery status) are all 0.
 - Bits 19:18 (destination shorthand) are 00B (no shorthand).
 - Bit 15 (trigger mode) is 0 (edge).
 - Bit 11 (destination mode) is 0 (physical).
 - Bits 10:8 (delivery mode) are 000B (fixed).

1. The memory type used for accesses that write to the virtual-APIC page is reported in bits 53:50 of the IA32_VMX_BASIC MSR (see Appendix A.1).

2. Recall that, for the purposes of this discussion, an operation is an iteration of a REP-prefixed string instruction, an execution of any other instruction, or delivery of an event through the IDT.

3. For any operation, there can be only one page offset for which a write access was virtualized. This is because a write access is not virtualized if the processor has already virtualized a write access for the same operation with a different page offset.

If all of the items above are true, the processor performs IPI virtualization using the 8-bit vector in byte 0 of VICR_LO and the 8-bit APIC ID in VICR_HI[31:24] (Section 31.1.6); otherwise, the processor causes an APIC-write VM exit.

- If the “IPI virtualization” VM-execution control is 0, the processor causes an APIC-write VM exit.
- 310H–313H (interrupt command — high). The processor clears bytes 2:0 of VICR_HI. No other virtualization or VM exit occurs.
- Any other page offset. The processor causes an APIC-write VM exit.

APIC-write emulation takes priority over system-management interrupts (SMIs), INIT signals, and lower priority events. APIC-write emulation is not blocked if RFLAGS.IF = 0 or by the MOV SS, POP SS, or STI instructions.

If an operation causes a fault after a write access to the APIC-access page and before APIC-write emulation, and that fault is delivered without a VM exit, APIC-write emulation occurs after the fault is delivered and before the fault handler can execute. If an operation causes a VM exit (perhaps due to a fault) after a write access to the APIC-access page and before APIC-write emulation, the APIC-write emulation does not occur.

31.4.3.3 APIC-Write VM Exits

In certain cases, VMM software must be invoked to complete the virtualization of a write access to the APIC-access page. In this case, APIC-write emulation causes an **APIC-write VM exit**. (Section 31.4.3.2 details the cases that causes APIC-write VM exits.)

APIC-write VM exits are invoked by APIC-write emulation, and APIC-write emulation occurs after an operation that performs a write access to the APIC-access page. Because of this, every APIC-write VM exit is trap-like: it occurs after completion of the operation containing the write access that caused the VM exit (for example, the value of CS:RIP saved in the guest-state area of the VMCS references the next instruction).

The basic exit reason for an APIC-write VM exit is “APIC write.” The exit qualification is the page offset of the write access that led to the VM exit.

As noted in Section 31.5, execution of WRMSR with ECX = 83FH (self-IPI MSR) can lead to an APIC-write VM exit if the “virtual-interrupt delivery” VM-execution control is 1; the exit qualification for the APIC-write VM exit is 3F0H. As noted in Section 31.1.6 and in Section 31.7, IPI virtualization and execution of SENDUIPI may lead to APIC-write VM exits; these VM exits produce an exit qualification of 300H.

31.4.4 Instruction-Specific Considerations

Certain instructions that use linear address may cause page faults even though they do not use those addresses to access memory. The APIC-virtualization features may affect these instructions as well:

- **CLFLUSH, CLFLUSHOPT.** With regard to faulting, the processor operates as if each of these instructions reads from the linear address in its source operand. If that address translates to one on the APIC-access page, the instruction may cause an APIC-access VM exit. If it does not, it will flush the corresponding cache line on the virtual-APIC page instead of the APIC-access page.
- **ENTER.** With regard to faulting, the processor operates if ENTER writes to the byte referenced by the final value of the stack pointer (even though it does not if its size operand is non-zero). If that value translates to an address on the APIC-access page, the instruction may cause an APIC-access VM exit. If it does not, it will cause the APIC-write emulation appropriate to the address’s page offset.
- **MASKMOVQ and MASKMOVDQU.** Even if the instruction’s mask is zero, the processor may operate with regard to faulting as if MASKMOVQ or MASKMOVDQU writes to memory (the behavior is implementation-specific). In such a situation, an APIC-access VM exit may occur.
- **MONITOR.** With regard to faulting, the processor operates as if MONITOR reads from the effective address in RAX. If the resulting linear address translates to one on the APIC-access page, the instruction may cause an

APIC-access VM exit.¹ If it does not, it will monitor the corresponding address on the virtual-APIC page instead of the APIC-access page.

- **PREFETCH.** An execution of the PREFETCH instruction that would result in an access to the APIC-access page does not cause an APIC-access VM exit. Such an access may prefetch data; if so, it is from the corresponding address on the virtual-APIC page.

Virtualization of accesses to the APIC-access page is principally intended for basic instructions such as AND, MOV, OR, TEST, XCHG, and XOR. Use of an instruction that normally operates on floating-point, SSE, AVX, or AVX-512 registers may cause an APIC-access VM exit unconditionally regardless of the page offset it accesses on the APIC-access page.

31.4.5 Issues Pertaining to Page Size and TLB Management

The 1-setting of the “virtualize APIC accesses” VM-execution is guaranteed to apply only if translations to the APIC-access address use a 4-KByte page. The following items provide details:

- If EPT is not in use, any linear address that translates to an address on the APIC-access page should use a 4-KByte page. Any access to a linear address that translates to the APIC-access page using a larger page may operate as if the “virtualize APIC accesses” VM-execution control were 0.
- If EPT is in use, any guest-physical address that translates to an address on the APIC-access page should use a 4-KByte page. Any access to a linear address that translates to a guest-physical address that in turn translates to the APIC-access page using a larger page may operate as if the “virtualize APIC accesses” VM-execution control were 0. (This is true also for guest-physical accesses to the APIC-access page; see Section 31.4.6.1.)

In addition, software should perform appropriate TLB invalidation when making changes that may affect APIC-virtualization. The specifics depend on whether VPIDs or EPT is being used:

- **VPIDs being used but EPT not being used.** Suppose that there is a VPID that has been used before and that software has since made either of the following changes: (1) set the “virtualize APIC accesses” VM-execution control when it had previously been 0; or (2) changed the paging structures so that some linear address translates to the APIC-access address when it previously did not. In that case, software should execute INVVPID (see “INVVPID— Invalidate Translations Based on VPID” in Section 32.3) before performing on the same logical processor and with the same VPID.²
- **EPT being used.** Suppose that there is an EPTP value that has been used before and that software has since made either of the following changes: (1) set the “virtualize APIC accesses” VM-execution control when it had previously been 0; or (2) changed the EPT paging structures so that some guest-physical address translates to the APIC-access address when it previously did not. In that case, software should execute INVEPT (see “INVEPT— Invalidate Translations Derived from EPT” in Section 32.3) before performing on the same logical processor and with the same EPTP value.³
- **Neither VPIDs nor EPT being used.** No invalidation is required.

Failure to perform the appropriate TLB invalidation may result in the logical processor operating as if the “virtualize APIC accesses” VM-execution control were 0 in responses to accesses to the affected address. (No invalidation is necessary if neither VPIDs nor EPT is being used.)

31.4.6 APIC Accesses Not Directly Resulting From Linear Addresses

Section 31.4 has described the treatment of accesses that use linear addresses that translate to addresses on the APIC-access page. This section considers memory accesses that do not result directly from linear addresses.

1. This chapter uses the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For IA-32 processors, this notation refers to the 32-bit forms of those registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to lower 32 bits of the indicated register.
2. INVVPID should use either (1) the all-contexts INVVPID type; (2) the single-context INVVPID type with the VPID in the INVVPID descriptor; or (3) the individual-address INVVPID type with the linear address and the VPID in the INVVPID descriptor.
3. INVEPT should use either (1) the global INVEPT type; or (2) the single-context INVEPT type with the EPTP value in the INVEPT descriptor.

- An access is called a **guest-physical access** if (1) CR0.PG = 1;¹ (2) the “enable EPT” VM-execution control is 1;² (3) the access’s physical address is the result of an EPT translation; and (4) either (a) the access was not generated by a linear address; or (b) the access’s guest-physical address is not the translation of the access’s linear address. Section 31.4.6.1 discusses the treatment of guest-physical accesses to the APIC-access page.
- An access is called a **physical access** if (1) either (a) the “enable EPT” VM-execution control is 0; or (b) the access’s physical address is not the result of a translation through the EPT paging structures; and (2) either (a) the access is not generated by a linear address; or (b) the access’s physical address is not the translation of its linear address. Section 31.4.6.2 discusses the treatment of physical accesses to the APIC-access page.

31.4.6.1 Guest-Physical Accesses to the APIC-Access Page

Guest-physical accesses include the following when guest-physical addresses are being translated using EPT:

- Reads from the guest paging structures when translating a linear address (such an access uses a guest-physical address that is not the translation of that linear address).
- Loads of the page-directory-pointer-table entries by MOV to CR when the logical processor is using (or that causes the logical processor to use) PAE paging (see Section 5.4).
- Updates to the accessed and dirty flags in the guest paging structures when using a linear address (such an access uses a guest-physical address that is not the translation of that linear address).
- Memory accesses by Intel Processor Trace when the “Intel PT uses guest physical addresses” VM-execution control is 1 (see Section 27.5.4).

Every guest-physical access using a guest-physical address that translates to an address on the APIC-access page causes an APIC-access VM exit. Such accesses are never virtualized regardless of the page offset.

The following items specify the priority relative to other events of APIC-access VM exits caused by guest-physical accesses to the APIC-access page.

- The priority of an APIC-access VM exit caused by a guest-physical access to memory is below that of any EPT violation that that access may incur. That is, a guest-physical access does not cause an APIC-access VM exit if it would cause an EPT violation.
- With respect to all other events, any APIC-access VM exit caused by a guest-physical access has the same priority as any EPT violation that the guest-physical access could cause.

31.4.6.2 Physical Accesses to the APIC-Access Page

Physical accesses include the following:

- If the “enable EPT” VM-execution control is 0:
 - Reads from the paging structures when translating a linear address.
 - Loads of the page-directory-pointer-table entries by MOV to CR when the logical processor is using (or that causes the logical processor to use) PAE paging (see Section 5.4).
 - Updates to the accessed and dirty flags in the paging structures.
- If the “enable EPT” VM-execution control is 1, accesses to the EPT paging structures (including updates to the accessed and dirty flags for EPT).
- Any of the following accesses made by the processor to support VMX non-root operation:
 - Accesses to the VMCS region.
 - Accesses to data structures referenced (directly or indirectly) by physical addresses in VM-execution control fields in the VMCS. These include the I/O bitmaps, the MSR bitmaps, and the virtual-APIC page.
- Accesses that effect transitions into and out of SMM.³ These include the following:

1. If the capability MSR IA32_VMX_CR0_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG must be 1 unless the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
2. “Enable EPT” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VMX non-root operation functions as if the “enable EPT” VM-execution control were 0. See Section 26.6.2.

- Accesses to SMRAM during SMI delivery and during execution of RSM.
- Accesses during SMM VM exits (including accesses to MSEG) and during VM entries that return from SMM.

A physical access to the APIC-access page may or may not cause an APIC-access VM exit. If it does not cause an APIC-access VM exit, it may access the APIC-access page or the virtual-APIC page. Physical write accesses to the APIC-access page may or may not cause APIC-write emulation or APIC-write VM exits.

The priority of an APIC-access VM exit caused by physical access is not defined relative to other events that the access may cause.

It is recommended that software not set the APIC-access address to any of the addresses used by physical memory accesses (identified above). For example, it should not set the APIC-access address to the physical address of any of the active paging structures if the “enable EPT” VM-execution control is 0.

31.5 VIRTUALIZING MSR-BASED APIC ACCESSES

When the local APIC is in x2APIC mode, software accesses the local APIC’s control registers using the MSR interface. Specifically, software uses the RDMSR and WRMSR instructions, setting ECX (identifying the MSR being accessed) to values in the range 800H–8FFH (see Section 12.12, “Extended XAPIC (x2APIC)”). This section describes how these accesses can be virtualized.

A virtual-machine monitor can virtualize these MSR-based APIC accesses by configuring the MSR bitmaps (see Section 26.6.9) to ensure that the accesses cause VM exits (see Section 27.1.3). Alternatively, there are methods for virtualizing some MSR-based APIC accesses without VM exits.

Normally, an execution of RDMSR or WRMSR that does not fault or cause a VM exit accesses the MSR indicated in ECX. However, such an execution treats some values of ECX in the range 800H–8FFH specially if the “virtualize x2APIC mode” VM-execution control is 1. The following items provide details:

- **RDMSR.** The instruction’s behavior depends on the setting of the “APIC-register virtualization” VM-execution control.
 - If the “APIC-register virtualization” VM-execution control is 0, behavior depends upon the value of ECX.
 - If ECX contains 808H (indicating the TPR MSR), the instruction reads the 8 bytes from offset 080H on the virtual-APIC page (VTPR and the 4 bytes above it) into EDX:EAX. This occurs even if the local APIC is not in x2APIC mode (no general-protection fault occurs because the local APIC is not x2APIC mode).
 - If ECX contains any other value in the range 800H–8FFH, the instruction operates normally. If the local APIC is in x2APIC mode and ECX indicates a readable APIC register, EDX and EAX are loaded with the value of that register. If the local APIC is not in x2APIC mode or ECX does not indicate a readable APIC register, a general-protection fault occurs.
 - If “APIC-register virtualization” is 1 and ECX contains a value in the range 800H–8FFH, the instruction reads the 8 bytes from offset X on the virtual-APIC page into EDX:EAX, where $X = (ECX \& FFH) \ll 4$. This occurs even if the local APIC is not in x2APIC mode (no general-protection fault occurs because the local APIC is not in x2APIC mode).
- **WRMSR.** The instruction’s behavior depends on the value of ECX and the setting of the “virtual-interrupt delivery” and “IPI virtualization” VM-execution controls.

Special processing applies in the following cases: (1) ECX contains 808H (indicating the TPR MSR); (2) ECX contains 80BH (indicating the EOI MSR) and the “virtual-interrupt delivery” VM-execution control is 1; (3) ECX contains 83FH (indicating the self-IPI MSR) and the “virtual-interrupt delivery” VM-execution control is 1; and (4) ECX contains 830H (indicating the ICR MSR) and the “IPI virtualization” VM-execution control is 1.

If special processing applies, no general-protection exception is produced due to the fact that the local APIC is in xAPIC mode. However, WRMSR does perform the normal reserved-bit checking:

- If ECX contains 808H or 83FH, a general-protection fault occurs if either EDX or EAX[31:8] is non-zero.
- If ECX contains 80BH, a general-protection fault occurs if either EDX or EAX is non-zero.

3. Technically, these accesses do not occur in VMX non-root operation. They are included here for clarity.

- If ECX contains 830H, a general-protection fault occurs if any of bits 31:20, 17:16, or 13 of EAX is non-zero. If there is no fault, WRMSR stores EDX:EAX at offset X on the virtual-APIC page, where $X = (ECX \& FFH) \ll 4$. Following this, the processor performs an operation depending on the value of ECX:
- If ECX contains 808H, the processor performs TPR virtualization (see Section 31.1.2).
- If ECX contains 80BH, the processor performs EOI virtualization (see Section 31.1.4).
- If ECX contains 83FH, the processor then checks the value of EAX[7:4] and proceeds as follows:
 - If the value is non-zero, the logical processor performs self-IPI virtualization with the 8-bit vector in EAX[7:0] (see Section 31.1.5).
 - If the value is zero, the logical processor causes an APIC-write VM exit as if there had been a write access to page offset 3F0H on the APIC-access page (see Section 31.4.3.3).
- If ECX contains 830H, the processor then checks the value of VICR to determine whether the following are all true:
 - Bits 19:18 (destination shorthand) are 00B (no shorthand).
 - Bit 15 (trigger mode) is 0 (edge).
 - Bit 12 (unused) is 0.
 - Bit 11 (destination mode) is 0 (physical).
 - Bits 10:8 (delivery mode) are 000B (fixed).

If all of the items above are true, the processor performs IPI virtualization using the 8-bit vector in byte 0 of VICR and the 32-bit APIC ID in VICR[63:32] (see Section 31.1.6). Otherwise, the logical processor causes an APIC-write VM exit (see Section 31.4.3.3).

If special processing does not apply, the instruction operates normally. If the local APIC is in x2APIC mode and ECX indicates a writable APIC register, the value in EDX:EAX is written to that register. If the local APIC is not in x2APIC mode or ECX does not indicate a writable APIC register, a general-protection fault occurs.

31.6 POSTED-INTERRUPT PROCESSING

Posted-interrupt processing is a feature by which a processor processes the virtual interrupts by recording them as pending on the virtual-APIC page.

Posted-interrupt processing is enabled by setting the “process posted interrupts” VM-execution control. The processing is performed in response to the arrival of an interrupt with the **posted-interrupt notification vector**. In response to such an interrupt, the processor processes virtual interrupts recorded in a data structure called a **posted-interrupt descriptor (PID)**. The posted-interrupt notification vector and the address of the PID are fields in the VMCS; see Section 26.6.8.

If the “process posted interrupts” VM-execution control is 1, a logical processor uses a 64-byte posted-interrupt descriptor located at the posted-interrupt descriptor address. Table 31-2 gives the format of a PID:¹

Table 31-2. Format of Posted-Interrupt Descriptor (PID)

Bit Position(s)	Name	Description
255:0	Posted-interrupt requests (PIR)	One bit for each interrupt vector. There is a posted-interrupt request for a vector if the corresponding bit is 1.
256	Outstanding notification (ON)	If this bit is set, there is a notification outstanding for one or more posted interrupts in bits 255:0.
511:257	Reserved or used for virtual-interrupt posting	Some of these bits are used by virtual-interrupt posting (Section 31.1.6.1). Posted-interrupt processing does not use or modify these bits.

1. Table 31-1 gives the same format; it is repeated here for the reader, omitting fields that are not used by posted-interrupt processing.

Use of the PID differs from that of other data structures that are referenced by pointers in a VMCS. There is a general requirement that software ensure that each such data structure is modified only when no logical processor with a current VMCS that references it is in VMX non-root operation. That requirement does not apply to the posted-interrupt descriptor. There is a requirement, however, that such modifications be done using locked read-modify-write instructions or other atomic operations.

If the “external-interrupt exiting” VM-execution control is 1, any unmasked external interrupt causes a VM exit (see Section 27.2). If the “process posted interrupts” VM-execution control is also 1, this behavior is changed and the processor handles an external interrupt as follows:¹

1. The local APIC is acknowledged; this provides the processor core with an interrupt vector, called here the **physical vector**.
2. If the physical vector equals the posted-interrupt notification vector, the logical processor continues to the next step. Otherwise, a VM exit occurs as it would normally due to an external interrupt; the vector is saved in the VM-exit interruption-information field.
3. The processor clears the outstanding-notification bit in the posted-interrupt descriptor. This is done atomically so as to leave the remainder of the descriptor unmodified (e.g., with a locked AND operation).
4. The processor writes zero to the EOI register in the local APIC; this dismisses the interrupt with the posted-interrupt notification vector from the local APIC.
5. The logical processor performs a logical-OR of PIR into VIRR and clears PIR. No other agent can read or write a PIR bit (or group of bits) between the time it is read (to determine what to OR into VIRR) and when it is cleared.
6. The logical processor sets RVI to be the maximum of the old value of RVI and the highest index of all bits that were set in PIR; if no bit was set in PIR, RVI is left unmodified.
7. The logical processor evaluates pending virtual interrupts as described in Section 31.2.1.

The logical processor performs the steps above in an uninterruptible manner. If step #7 leads to recognition of a virtual interrupt, the processor may deliver that interrupt immediately.

Steps #1 to #7 above occur when the interrupt controller delivers an unmasked external interrupt to the CPU core. The following items consider certain cases of interrupt delivery:

- Interrupt delivery can occur between iterations of a REP-prefixed instruction (after at least one iteration has completed but before all iterations have completed). If this occurs, the following items characterize processor state after posted-interrupt processing completes and before guest execution resumes:
 - RIP references the REP-prefixed instruction;
 - RCX, RSI, and RDI are updated to reflect the iterations completed; and
 - RFLAGS.RF = 1.
- Interrupt delivery can occur when the logical processor is in the active, HLT, or MWAIT states. If the logical processor had been in the active or MWAIT state before the arrival of the interrupt, it is in the active state following completion of step #7; if it had been in the HLT state, it returns to the HLT state after step #7 (if a pending virtual interrupt was recognized, the logical processor may immediately wake from the HLT state).
- Interrupt delivery can occur while the logical processor is in enclave mode. If the logical processor had been in enclave mode before the arrival of the interrupt, an Asynchronous Enclave Exit (AEX) may occur before the steps #1 to #7 (see Chapter 39, “Enclave Exiting Events”). If no AEX occurs before step #1 and a VM exit occurs at step #2, an AEX occurs before the VM exit is delivered.

1. VM entry ensures that the “process posted interrupts” VM-execution control is 1 only if the “external-interrupt exiting” VM-execution control is also 1. See Section 28.2.1.1.

31.7 VIRTUALIZING SENDUIPI

The user-interrupt feature includes the SENDUIPI instruction that software operating with CPL = 3 can use to send user interrupts to another software thread (“user IPIs”). The SENDUIPI instruction has the following high-level operation:

- read selected entry from user-interrupt target table;
- use address in entry to read the referenced user posted-interrupt descriptor (UPID);
- update certain fields in UPID;
- if necessary, send ordinary IPI indicated in UPID’s notification information;

The last step uses two fields in the UPID: an 8-bit notification vector (UPID.NV) and a 32-bit notification destination (an APIC ID, UPID.NDST). Outside of VMX non-root operation, the processor implements the last step as follows:

- If the local APIC is in xAPIC mode, it writes UPID.NDST[15:8] to ICR_HI[31:24] (offset 310H from IA32_APIC_BASE) and then writes UPID.NV to ICR_LO (offset 300H).
- If the local APIC is in x2APIC mode, it performs the control-register write that would be done by an execution of WRMSR with ECX = 310H (ICR), EAX = UPID.NV, and EDX = UPID.NDST.

In VMX non-root operation, implementation of the step depends on the settings of the “use TPR shadow,” “virtualize APIC accesses,” and “IPI virtualization” VM-execution controls:¹

1. If the “use TPR shadow” VM-execution control is 0, the behavior is not modified: the logical processor sends the specified IPI by writing to the local APIC’s ICR as specified above (based on the current mode of the local APIC).
2. If the “use TPR shadow” VM-execution control is 1 and the “virtualize APIC accesses” VM-execution control is 0, the logical processor virtualizes the sending of an x2APIC-mode IPI with the following steps:
 - a. The 64-bit value Z is written to offset 300H on the virtual-APIC page (VICR), where Z[7:0] = UPID.NV (the 8-bit virtual vector), Z[63:32] = UPID.NDST (the 32-bit virtual APIC ID) and Z[31:8] = 000000H (indicating a physically addressed fixed-mode IPI).
 - b. If the “IPI virtualization” VM-execution control is 1, IPI virtualization (Section 31.1.6) is performed using the vector UPID.NV and the 32-bit virtual APIC ID UPID.NDST.
3. If the “use TPR shadow” and “virtualize APIC accesses” VM-execution controls are both 1, the logical processor virtualizes the sending of an xAPIC-mode IPI by performing the following steps:
 - a. The 32-bit value X is written to offset 310H on the virtual-APIC page (VICR_HI), where X[31:24] = UPID.NDST[15:8] (the 8-bit virtual APIC ID) and X[23:0] = 000000H.²
 - b. The 32-bit value Y is written to offset 300H on the virtual-APIC page (VICR_LO), where Y[7:0] = UPID.NV (the 8-bit virtual vector) and Y[31:8] = 000000H (indicating a physically addressed fixed-mode IPI).
 - c. If the “IPI virtualization” VM-execution control is 1, IPI virtualization is performed using the vector UPID.NV and the APIC ID UPID.NDST[15:8]. IPI virtualization will use only the 8-bit APIC ID from bits 15:8 of the UPID’s destination field (the 8-bit value written earlier to bits 31:24 of VICR_HI).
4. If the “use TPR shadow” VM-execution control is 1 and the “IPI virtualization” VM-execution control is 0, an APIC-write VM exit occurs as if there had been a write access to page offset 300H on the APIC-access page (see Section 31.4.3.3).

1. The setting of the “virtualize x2APIC mode” VM-execution control does not affect this operation.

2. For xAPIC mode (which is virtualized if the “virtualize APIC accesses” VM-execution control is 1), the destination APIC ID is in byte 1 (**not** byte 0) of the UPID’s 4-byte NDST field.

25. Updates to Chapter 32, Volume 3C

Change bars and violet text show changes to Chapter 32 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

Changes to this chapter:

- Updated the following instructions in Section 32.3, “VMX Instructions” for processors that support SEAM:
 - INVEPT— Invalidate Translations Derived from EPT. Reference to Chapter 28 was added.
 - VMCLEAR—Clear Virtual-Machine Control Structure. Operation section and Protected Mode Exceptions section were updated.
 - VMPTRLD—Load Pointer to Virtual-Machine Control Structure. A footnote for the processor’s physical-address width was added in the Operation section.
 - VMXOFF—Leave VMX Operation. Operation, Protected Mode Exceptions, and 64-Bit Mode Exceptions sections were updated.
 - VMXON—Enter VMX Operation. A footnote for the processor’s physical-address width was added in the Operation section.

32.1 OVERVIEW

This chapter describes the virtual-machine extensions (VMX) for the Intel 64 and IA-32 architectures. VMX is intended to support virtualization of processor hardware and a system software layer acting as a host to multiple guest software environments. The virtual-machine extensions (VMX) includes five instructions that manage the virtual-machine control structure (VMCS), four instructions that manage VMX operation, two TLB-management instructions, and two instructions for use by guest software. Additional details of VMX are described in Chapter 25 through Chapter 31.

The behavior of the VMCS-maintenance instructions is summarized below:

- **VMPTRLD** — This instruction takes a single 64-bit source operand that is in memory. It makes the referenced VMCS active and current, loading the current-VMCS pointer with this operand and establishes the current VMCS based on the contents of VMCS-data area in the referenced VMCS region. Because this makes the referenced VMCS active, a logical processor may start maintaining on the processor some of the VMCS data for the VMCS.
- **VMPTRST** — This instruction takes a single 64-bit destination operand that is in memory. The current-VMCS pointer is stored into the destination operand.
- **VMCLEAR** — This instruction takes a single 64-bit operand that is in memory. The instruction sets the launch state of the VMCS referenced by the operand to “clear”, renders that VMCS inactive, and ensures that data for the VMCS have been written to the VMCS-data area in the referenced VMCS region. If the operand is the same as the current-VMCS pointer, that pointer is made invalid.
- **VMREAD** — This instruction reads a component from a VMCS (the encoding of that field is given in a register operand) and stores it into a destination operand that may be a register or in memory.
- **VMWRITE** — This instruction writes a component to a VMCS (the encoding of that field is given in a register operand) from a source operand that may be a register or in memory.

The behavior of the VMX management instructions is summarized below:

- **VMLAUNCH** — This instruction launches a virtual machine managed by the VMCS. A VM entry occurs, transferring control to the VM.
- **VMRESUME** — This instruction resumes a virtual machine managed by the VMCS. A VM entry occurs, transferring control to the VM.
- **VMXOFF** — This instruction causes the processor to leave VMX operation.
- **VMXON** — This instruction takes a single 64-bit source operand that is in memory. It causes a logical processor to enter VMX root operation and to use the memory referenced by the operand to support VMX operation.

The behavior of the VMX-specific TLB-management instructions is summarized below:

- **INVEPT** — This instruction invalidates entries in the TLBs and paging-structure caches that were derived from extended page tables (EPT).
- **INVVPID** — This instruction invalidates entries in the TLBs and paging-structure caches based on a Virtual-Processor Identifier (VPID).

None of the instructions above can be executed in compatibility mode; they generate invalid-opcode exceptions if executed in compatibility mode.

The behavior of the guest-available instructions is summarized below:

- **VMCALL** — This instruction allows software in VMX non-root operation to call the VMM for service. A VM exit occurs, transferring control to the VMM.
- **VMFUNC** — This instruction allows software in VMX non-root operation to invoke a VM function (processor functionality enabled and configured by software in VMX root operation) without a VM exit.

32.2 CONVENTIONS

The operation sections for the VMX instructions in Section 32.3 use the pseudo-function VMExit, which indicates that the logical processor performs a VM exit.

The operation sections also use the pseudo-functions VMsucceed, VMfail, VMfailInvalid, and VMfailValid. These pseudo-functions signal instruction success or failure by setting or clearing bits in RFLAGS and, in some cases, by writing the VM-instruction error field. The following pseudocode fragments detail these functions:

VMsucceed:

```
CF := 0;
PF := 0;
AF := 0;
ZF := 0;
SF := 0;
OF := 0;
```

VMfail(ErrorNumber):

```
IF VMCS pointer is valid
    THEN VMfailValid(ErrorNumber);
    ELSE VMfailInvalid;
FI;
```

VMfailInvalid:

```
CF := 1;
PF := 0;
AF := 0;
ZF := 0;
SF := 0;
OF := 0;
```

VMfailValid(ErrorNumber)// executed only if there is a current VMCS

```
CF := 0;
PF := 0;
AF := 0;
ZF := 1;
SF := 0;
OF := 0;
Set the VM-instruction error field to ErrorNumber;
```

The different VM-instruction error numbers are enumerated in Section 32.4, “VM Instruction Error Numbers.”

32.3 VMX INSTRUCTIONS

This section provides detailed descriptions of the VMX instructions.

Processors that support SEAM also support the following SEAM instructions: SEAMCALL, SEAMOPS, SEAMRET, and TDCALL. These instructions are specified in Section 34.5, “SEAM Instruction Reference”.

INVEPT— Invalidate Translations Derived from EPT

Opcode/ Instruction	Op/En	Description
66 0F 38 80 INVEPT r64, m128	RM	Invalidates EPT-derived entries in the TLBs and paging-structure caches (in 64-bit mode).
66 0F 38 80 INVEPT r32, m128	RM	Invalidates EPT-derived entries in the TLBs and paging-structure caches (outside 64-bit mode).

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
RM	ModRM:reg (r)	ModRM:r/m (r)	NA	NA

Description

Invalidates mappings in the translation lookaside buffers (TLBs) and paging-structure caches that were derived from extended page tables (EPT). (See Chapter 30, “VMX Support for Address Translation.”) Invalidation is based on the **INVEPT type** specified in the register operand and the **INVEPT descriptor** specified in the memory operand.

Outside IA-32e mode, the register operand is always 32 bits, regardless of the value of CS.D; in 64-bit mode, the register operand has 64 bits (the instruction cannot be executed in compatibility mode).

The INVEPT types supported by a logical processors are reported in the IA32_VMX_EPT_VPID_CAP MSR (see Appendix A, “VMX Capability Reporting Facility”). There are two INVEPT types currently defined:

- Single-context invalidation. If the INVEPT type is 1, the logical processor invalidates all mappings associated with bits 51:12 of the EPT pointer (EPTP) specified in the INVEPT descriptor. It may invalidate other mappings as well.
- Global invalidation: If the INVEPT type is 2, the logical processor invalidates mappings associated with all EPTPs.

If an unsupported INVEPT type is specified, the instruction fails.

INVEPT invalidates all the specified mappings for the indicated EPTP(s) regardless of the VPID and PCID values with which those mappings may be associated.

The INVEPT descriptor comprises 128 bits and contains a 64-bit EPTP value in bits 63:0 (see Figure 32-1).

Figure 32-1. INVEPT Descriptor

Operation

```

IF (not in VMX operation) or (CR0.PE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)
    THEN #UD;
ELSIF in VMX non-root operation
    THEN VM exit;
ELSIF CPL > 0
    THEN #GP(0);
ELSE

```

```

INVEPT_TYPE := value of register operand;
IF IA32_VMX_EPT_VPID_CAP MSR indicates that processor does not support INVEPT_TYPE
    THEN VMfail(Invalid operand to INVEPT/INVVPID);
    ELSE    // INVEPT_TYPE must be 1 or 2
        INVEPT_DESC := value of memory operand;
        EPTP := INVEPT_DESC[63:0];
        CASE INVEPT_TYPE OF
            1:    // single-context invalidation
                IF VM entry with the "enable EPT" VM execution control set to 1 (see Section 28.2.1.1)
                    would fail due to the EPTP value
                    THEN VMfail(Invalid operand to INVEPT/INVVPID);
                    ELSE
                        Invalidate mappings associated with EPTP[51:12];

Flags Affected

See the operation section and Section 32.2.

Protected Mode Exceptions

#GP(0)	If the current privilege level is not 0. If the memory operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains an unusable segment. If the source operand is located in an execute-only code segment.
#PF(fault-code)	If a page fault occurs in accessing the memory operand.
#SS(0)	If the memory operand effective address is outside the SS segment limit. If the SS register contains an unusable segment.
#UD	If not in VMX operation. If the logical processor does not support EPT (IA32_VMX_PROCBASED_CTLX2[33]=0). If the logical processor supports EPT (IA32_VMX_PROCBASED_CTLX2[33]=1) but does not support the INVEPT instruction (IA32_VMX_EPT_VPID_CAP[20]=0).

Real-Address Mode Exceptions

#UD	The INVEPT instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD	The INVEPT instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD	The INVEPT instruction is not recognized in compatibility mode.

64-Bit Mode Exceptions

#GP(0)	If the current privilege level is not 0. If the memory operand is in the CS, DS, ES, FS, or GS segments and the memory address is in a non-canonical form.
#PF(fault-code)	If a page fault occurs in accessing the memory operand.
#SS(0)	If the memory operand is in the SS segment and the memory address is in a non-canonical form.
#UD	If not in VMX operation. If the logical processor does not support EPT (IA32_VMX_PROCBASED_CTL2[33]=0). If the logical processor supports EPT (IA32_VMX_PROCBASED_CTL2[33]=1) but does not support the INVEPT instruction (IA32_VMX_EPT_VPID_CAP[20]=0).

INVVPID— Invalidate Translations Based on VPID

Opcode/ Instruction	Op/En	Description
66 0F 38 81 INVVPID r64, m128	RM	Invalidates entries in the TLBs and paging-structure caches based on VPID (in 64-bit mode).
66 0F 38 81 INVVPID r32, m128	RM	Invalidates entries in the TLBs and paging-structure caches based on VPID (outside 64-bit mode).

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
RM	ModRM:reg (r)	ModRM:r/m (r)	NA	NA

Description

Invalidates mappings in the translation lookaside buffers (TLBs) and paging-structure caches based on **virtual-processor identifier** (VPID). (See Chapter 30, “VMX Support for Address Translation.”) Invalidation is based on the **INVVPID type** specified in the register operand and the **INVVPID descriptor** specified in the memory operand.

Outside IA-32e mode, the register operand is always 32 bits, regardless of the value of CS.D; in 64-bit mode, the register operand has 64 bits (the instruction cannot be executed in compatibility mode).

The INVVPID types supported by a logical processors are reported in the IA32_VMX_EPT_VPID_CAP MSR (see Appendix A, “VMX Capability Reporting Facility”). There are four INVVPID types currently defined:

- Individual-address invalidation: If the INVVPID type is 0, the logical processor invalidates mappings for the linear address and VPID specified in the INVVPID descriptor. In some cases, it may invalidate mappings for other linear addresses (or other VPIDs) as well.
- Single-context invalidation: If the INVVPID type is 1, the logical processor invalidates all mappings tagged with the VPID specified in the INVVPID descriptor. In some cases, it may invalidate mappings for other VPIDs as well.
- All-contexts invalidation: If the INVVPID type is 2, the logical processor invalidates all mappings tagged with all VPIDs except VPID 0000H. In some cases, it may invalidate translations with VPID 0000H as well.
- Single-context invalidation, retaining global translations: If the INVVPID type is 3, the logical processor invalidates all mappings tagged with the VPID specified in the INVVPID descriptor except global translations. In some cases, it may invalidate global translations (and mappings with other VPIDs) as well. See the “Caching Translation Information” section in Chapter 5 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A, for information about global translations.

If an unsupported INVVPID type is specified, the instruction fails.

INVVPID invalidates all the specified mappings for the indicated VPID(s) regardless of the EPTP and PCID values with which those mappings may be associated.

The INVVPID descriptor comprises 128 bits and consists of a VPID and a linear address as shown in Figure 32-2.

VMCALL—Call to VM Monitor

Opcode/ Instruction	Op/En	Description
OF 01 C1 VMCALL	Z0	Call to VM monitor by causing VM exit.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
Z0	NA	NA	NA	NA

Description

This instruction allows guest software can make a call for service into an underlying VM monitor. The details of the programming interface for such calls are VMM-specific; this instruction does nothing more than cause a VM exit, registering the appropriate exit reason.

Use of this instruction in VMX root operation invokes an SMM monitor (see Section 33.15.2). This invocation will activate the dual-monitor treatment of system-management interrupts (SMIs) and system-management mode (SMM) if it is not already active (see Section 33.15.6).

Operation

```

IF not in VMX operation
    THEN #UD;
ELSIF in VMX non-root operation
    THEN VM exit;
ELSIF (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)
    THEN #UD;
ELSIF CPL > 0 or in SEAM root operation
    THEN #GP(0);
ELSIF in SMM or the logical processor does not support the dual-monitor treatment of SMIs and SMM or the valid bit in the IA32_SMM_MONITOR_CTL MSR is clear
    THEN VMfail (VMCALL executed in VMX root operation);
ELSIF dual-monitor treatment of SMIs and SMM is active
    THEN perform an SMM VM exit (see Section 33.15.2);
ELSIF current-VMCS pointer is not valid
    THEN VMfailInvalid;
ELSIF launch state of current VMCS is not clear
    THEN VMfailValid(VMCALL with non-clear VMCS);
ELSIF VM-exit control fields are not valid (see Section 33.15.6.1)
    THEN VMfailValid (VMCALL with invalid VM-exit control fields);
ELSE
    enter SMM;
    read revision identifier in MSEG;
    IF revision identifier does not match that supported by processor
        THEN
            leave SMM;
            VMfailValid(VMCALL with incorrect MSEG revision identifier);
        ELSE
            read SMM-monitor features field in MSEG (see Section 33.15.6.1);
            IF features field is invalid
                THEN
                    leave SMM;

```

VMfailValid(VMCALL with invalid SMM-monitor features);
ELSE activate dual-monitor treatment of SMLs and SMM (see Section 33.15.6);

VMCLEAR—Clear Virtual-Machine Control Structure

Opcode/ Instruction	Op/En	Description
66 0F C7 /6 VMCLEAR m64	M	Copy VMCS data to VMCS region in memory.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
M	ModRM:r/m (r)	NA	NA	NA

Description

This instruction applies to the VMCS whose VMCS region resides at the physical address contained in the instruction operand. The instruction ensures that VMCS data for that VMCS (some of these data may be currently maintained on the processor) are copied to the VMCS region in memory. It also initializes parts of the VMCS region (for example, it sets the launch state of that VMCS to clear). See Chapter 26, “Virtual Machine Control Structures.”

The operand of this instruction is always 64 bits and is always in memory. If the operand is the current-VMCS pointer, then that pointer is made invalid (set to FFFFFFFF_FFFFFFFFH).

Note that the VMCLEAR instruction might not explicitly write any VMCS data to memory; the data may be already resident in memory before the VMCLEAR is executed.

Operation

IF (register operand) or (not in VMX operation) or (CR0.PE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)

THEN #UD;

ELSIF in VMX non-root operation

THEN VM exit;

ELSIF CPL > 0

THEN #GP(0);

ELSE

addr := contents of 64-bit in-memory operand;

IF addr is not 4KB-aligned OR

addr sets any bits beyond the processor's physical-address width^{1,2}

THEN VMfail(VMCLEAR with invalid physical address);

ELSIF addr = VMXON pointer

THEN VMfail(VMCLEAR with VMXON pointer);

ELSE

ensure that data for VMCS referenced by the operand is in memory;

initialize implementation-specific data in VMCS region;

launch state of VMCS referenced by the operand := “clear”

IF operand addr = current-VMCS pointer

THEN current-VMCS pointer := FFFFFFFF_FFFFFFFFH;

FI;

VMsucceed;

1. If IA32_VMX_BASIC[48] is read as 1, VMfail occurs if addr sets any bits in the range 63:32; see Appendix A.1.

2. Usually, the processor's physical-address width is the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), the width is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

VMFUNC—Invoke VM function

Opcode/ Instruction	Op/En	Description
NP 0F 01 D4 VMFUNC	Z0	Invoke VM function specified in EAX.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
Z0	NA	NA	NA	NA

Description

This instruction allows software in VMX non-root operation to invoke a VM function, which is processor functionality enabled and configured by software in VMX root operation. The value of EAX selects the specific VM function being invoked.

The behavior of each VM function (including any additional fault checking) is specified in Section 27.5.6, “VM Functions.”

Operation

Perform functionality of the VM function specified in EAX;

Flags Affected

Depends on the VM function specified in EAX. See Section 27.5.6, “VM Functions.”

Protected Mode Exceptions (not including those defined by specific VM functions)

#UD If executed outside VMX non-root operation.
 If “enable VM functions” VM-execution control is 0.
 If $EAX \geq 64$.

Real-Address Mode Exceptions

Same exceptions as in protected mode.

Virtual-8086 Exceptions

Same exceptions as in protected mode.

Compatibility Mode Exceptions

Same exceptions as in protected mode.

64-Bit Mode Exceptions

Same exceptions as in protected mode.

VMLAUNCH/VMRESUME—Launch/Resume Virtual Machine

Opcode/ Instruction	Op/En	Description
OF 01 C2 VMLAUNCH	Z0	Launch virtual machine managed by current VMCS.
OF 01 C3 VMRESUME	Z0	Resume virtual machine managed by current VMCS.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
Z0	NA	NA	NA	NA

Description

Effects a VM entry managed by the current VMCS.

- VMLAUNCH fails if the launch state of current VMCS is not “clear”. If the instruction is successful, it sets the launch state to “launched.”
- VMRESUME fails if the launch state of the current VMCS is not “launched.”

If VM entry is attempted, the logical processor performs a series of consistency checks as detailed in Chapter 28, “VM Entries.” Failure to pass checks on the VMX controls or on the host-state area passes control to the instruction following the VMLAUNCH or VMRESUME instruction. If these pass but checks on the guest-state area fail, the logical processor loads state from the host-state area of the VMCS, passing control to the instruction referenced by the RIP field in the host-state area.

VM entry is not allowed when events are blocked by MOV SS or POP SS. Neither VMLAUNCH nor VMRESUME should be used immediately after either MOV to SS or POP to SS.

Operation

```

IF (not in VMX operation) or (CR0.PE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)
    THEN #UD;

VMPTRLD—Load Pointer to Virtual-Machine Control Structure

Opcode/ Instruction	Op/En	Description
NP OF C7 /6 VMPTRLD m64	M	Loads the current VMCS pointer from memory.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
M	ModRM:r/m (r)	NA	NA	NA

Description

Marks the current-VMCS pointer valid and loads it with the physical address in the instruction operand. The instruction fails if its operand is not properly aligned, sets unsupported physical-address bits, or is equal to the VMXON pointer. In addition, the instruction fails if the 32 bits in memory referenced by the operand do not match the VMCS revision identifier supported by this processor.¹

The operand of this instruction is always 64 bits and is always in memory.

Operation

IF (register operand) or (not in VMX operation) or (CR0.PE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)
THEN #UD;

ELSIF in VMX non-root operation

THEN VMexit;

ELSIF CPL > 0

THEN #GP(0);

ELSE

addr := contents of 64-bit in-memory source operand;

IF addr is not 4KB-aligned OR

addr sets any bits beyond the physical-address width^{2,3}

THEN VMfail(VMPTRLD with invalid physical address);

ELSIF addr = VMXON pointer

THEN VMfail(VMPTRLD with VMXON pointer);

ELSE

rev := 32 bits located at physical address addr;

IF rev[30:0] ≠ VMCS revision identifier supported by processor OR

rev[31] = 1 AND processor does not support 1-setting of “VMCS shadowing”

THEN VMfail(VMPTRLD with incorrect VMCS revision identifier);

ELSE

current-VMCS pointer := addr;

VMsucceed;

FI;

FI;

1. Software should consult the VMX capability MSR VMX_BASIC to discover the VMCS revision identifier supported by this processor (see Appendix A, “VMX Capability Reporting Facility”).
2. If IA32_VMX_BASIC[48] is read as 1, VMfail occurs if addr sets any bits in the range 63:32; see Appendix A.1.
3. Usually, the processor’s physical-address width is the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), the width is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

FI;

Flags Affected

See the operation section and Section 32.2.

Protected Mode Exceptions

#GP(0)	If the current privilege level is not 0. If the memory source operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains an unusable segment. If the source operand is located in an execute-only code segment.
#PF(fault-code)	If a page fault occurs in accessing the memory source operand.
#SS(0)	If the memory source operand effective address is outside the SS segment limit. If the SS register contains an unusable segment.
#UD	If operand is a register. If not in VMX operation.

Real-Address Mode Exceptions

#UD	The VMPTRLD instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD	The VMPTRLD instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD	The VMPTRLD instruction is not recognized in compatibility mode.

64-Bit Mode Exceptions

#GP(0)	If the current privilege level is not 0. If the source operand is in the CS, DS, ES, FS, or GS segments and the memory address is in a non-canonical form.
#PF(fault-code)	If a page fault occurs in accessing the memory source operand.
#SS(0)	If the source operand is in the SS segment and the memory address is in a non-canonical form.
#UD	If operand is a register. If not in VMX operation.

VMPTRST—Store Pointer to Virtual-Machine Control Structure

Opcode/ Instruction	Op/En	Description
NP OF C7 /7 VMPTRST m64	M	Stores the current VMCS pointer into memory.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
M	ModRM:r/m (w)	NA	NA	NA

Description

Stores the current-VMCS pointer into a specified memory address. The operand of this instruction is always 64 bits and is always in memory.

Operation

```

IF (register operand) or (not in VMX operation) or (CR0.PE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)
    THEN #UD;
ELSIF in VMX non-root operation
    THEN VMexit;
ELSIF CPL > 0
    THEN #GP(0);
ELSE
    64-bit in-memory destination operand := current-VMCS pointer;
    VMSucceed;
FI;

```

Flags Affected

See the operation section and Section 32.2.

Protected Mode Exceptions

#GP(0) If the current privilege level is not 0.
If the memory destination operand effective address is outside the CS, DS, ES, FS, or GS segment limit.
If the DS, ES, FS, or GS register contains an unusable segment.

#PF(fault-code) If the destination operand is located in a read-only data segment or any code segment.

#SS(0) If a page fault occurs in accessing the memory destination operand.
If the memory destination operand effective address is outside the SS segment limit.
If the SS register contains an unusable segment.

#UD If operand is a register.
If not in VMX operation.

Real-Address Mode Exceptions

#UD The VMPTRST instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD The VMPTRST instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD The VMPTRST instruction is not recognized in compatibility mode.

64-Bit Mode Exceptions

#GP(0) If the current privilege level is not 0.
 If the destination operand is in the CS, DS, ES, FS, or GS segments and the memory address is in a non-canonical form.

#PF(fault-code) If a page fault occurs in accessing the memory destination operand.

#SS(0) If the destination operand is in the SS segment and the memory address is in a non-canonical form.

#UD If operand is a register.
 If not in VMX operation.

VMREAD—Read Field from Virtual-Machine Control Structure

Opcode/ Instruction	Op/En	Description
NP OF 78 VMREAD r/m64, r64	MR	Reads a specified VMCS field (in 64-bit mode).
NP OF 78 VMREAD r/m32, r32	MR	Reads a specified VMCS field (outside 64-bit mode).

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
MR	ModRM:r/m (w)	ModRM:reg (r)	NA	NA

Description

Reads a specified field from a VMCS and stores it into a specified destination operand (register or memory). In VMX root operation, the instruction reads from the current VMCS. If executed in VMX non-root operation, the instruction reads from the VMCS referenced by the VMCS link pointer field in the current VMCS.

The VMCS field is specified by the VMCS-field encoding contained in the register source operand. Outside IA-32e mode, the source operand has 32 bits, regardless of the value of CS.D. In 64-bit mode, the source operand has 64 bits.

The effective size of the destination operand, which may be a register or in memory, is always 32 bits outside IA-32e mode (the setting of CS.D is ignored with respect to operand size) and 64 bits in 64-bit mode. If the VMCS field specified by the source operand is shorter than this effective operand size, the high bits of the destination operand are cleared to 0. If the VMCS field is longer, then the high bits of the field are not read.

Note that any faults resulting from accessing a memory destination operand can occur only after determining, in the operation section below, that the relevant VMCS pointer is valid and that the specified VMCS field is supported.

Operation

```

IF (not in VMX operation) or (CR0.PE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)
  THEN #UD;
ELSIF in VMX non-root operation AND ("VMCS shadowing" is 0 OR source operand sets bits in range 63:15 OR
VMREAD bit corresponding to bits 14:0 of source operand is 1)1
  THEN VMexit;
ELSIF CPL > 0
  THEN #GP(0);
ELSIF (in VMX root operation AND current-VMCS pointer is not valid) OR
(in VMX non-root operation AND VMCS link pointer is not valid)
  THEN VMfailInvalid;
ELSIF source operand does not correspond to any VMCS field
  THEN VMfailValid(VMREAD/VMWRITE from/to unsupported VMCS component);
ELSE
  IF in VMX root operation
    THEN destination operand := contents of field indexed by source operand in current VMCS;
    ELSE destination operand := contents of field indexed by source operand in VMCS referenced by VMCS link pointer;
  FI;
  VMSucceed;
FI;

```

1. The VMREAD bit for a source operand is defined as follows. Let *x* be the value of bits 14:0 of the source operand and let *addr* be the VMREAD-bitmap address. The corresponding VMREAD bit is in bit position *x* & 7 of the byte at physical address *addr* | (*x* » 3).

Flags Affected

See the operation section and Section 32.2.

Protected Mode Exceptions

#GP(0)	If the current privilege level is not 0. If a memory destination operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains an unusable segment. If the destination operand is located in a read-only data segment or any code segment.
#PF(fault-code)	If a page fault occurs in accessing a memory destination operand.
#SS(0)	If a memory destination operand effective address is outside the SS segment limit. If the SS register contains an unusable segment.
#UD	If not in VMX operation.

Real-Address Mode Exceptions

#UD	The VMREAD instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD	The VMREAD instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD	The VMREAD instruction is not recognized in compatibility mode.

64-Bit Mode Exceptions

#GP(0)	If the current privilege level is not 0. If the memory destination operand is in the CS, DS, ES, FS, or GS segments and the memory address is in a non-canonical form.
#PF(fault-code)	If a page fault occurs in accessing a memory destination operand.
#SS(0)	If the memory destination operand is in the SS segment and the memory address is in a non-canonical form.
#UD	If not in VMX operation.

VMRESUME—Resume Virtual Machine

See VMLAUNCH/VMRESUME—Launch/Resume Virtual Machine.

VMWRITE—Write Field to Virtual-Machine Control Structure

Opcode/ Instruction	Op/En	Description
NP OF 79 VMWRITE r64, r/m64	RM	Writes a specified VMCS field (in 64-bit mode).
NP OF 79 VMWRITE r32, r/m32	RM	Writes a specified VMCS field (outside 64-bit mode).

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
RM	ModRM:reg (r)	ModRM:r/m (r)	NA	NA

Description

Writes the contents of a primary source operand (register or memory) to a specified field in a VMCS. In VMX root operation, the instruction writes to the current VMCS. If executed in VMX non-root operation, the instruction writes to the VMCS referenced by the VMCS link pointer field in the current VMCS.

The VMCS field is specified by the VMCS-field encoding contained in the register secondary source operand. Outside IA-32e mode, the secondary source operand is always 32 bits, regardless of the value of CS.D. In 64-bit mode, the secondary source operand has 64 bits.

The effective size of the primary source operand, which may be a register or in memory, is always 32 bits outside IA-32e mode (the setting of CS.D is ignored with respect to operand size) and 64 bits in 64-bit mode. If the VMCS field specified by the secondary source operand is shorter than this effective operand size, the high bits of the primary source operand are ignored. If the VMCS field is longer, then the high bits of the field are cleared to 0.

Note that any faults resulting from accessing a memory source operand occur after determining, in the operation section below, that the relevant VMCS pointer is valid but before determining if the destination VMCS field is supported.

Operation

IF (not in VMX operation) or (CR0.PE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)

THEN #UD;

ELSIF in VMX non-root operation AND (“VMCS shadowing” is 0 OR secondary source operand sets bits in range 63:15 OR VMWRITE bit corresponding to bits 14:0 of secondary source operand is 1)¹

THEN VMexit;

ELSIF CPL > 0

THEN #GP(0);

ELSIF (in VMX root operation AND current-VMCS pointer is not valid) OR

(in VMX non-root operation AND VMCS-link pointer is not valid)

THEN VMfailInvalid;

ELSIF secondary source operand does not correspond to any VMCS field

THEN VMfailValid(VMREAD/VMWRITE from/to unsupported VMCS component);

ELSIF VMCS field indexed by secondary source operand is a VM-exit information field AND processor does not support writing to such fields²

THEN VMfailValid(VMWRITE to read-only VMCS component);

ELSE

1. The VMWRITE bit for a secondary source operand is defined as follows. Let *x* be the value of bits 14:0 of the secondary source operand and let *addr* be the VMWRITE-bitmap address. The corresponding VMWRITE bit is in bit position *x* & 7 of the byte at physical address *addr* | (*x* >> 3).

2. Software can discover whether these fields can be written by reading the VMX capability MSR IA32_VMX_MISC (see Appendix A.6).

IF in VMX root operation

THEN field indexed by secondary source operand in current VMCS := primary source operand;

ELSE field indexed by secondary source operand in VMCS referenced by VMCS link pointer := primary source operand;

FI;

VMsucceed;

FI;

Flags Affected

See the operation section and Section 32.2.

Protected Mode Exceptions

#GP(0)	If the current privilege level is not 0. If a memory source operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains an unusable segment. If the source operand is located in an execute-only code segment.
#PF(fault-code)	If a page fault occurs in accessing a memory source operand.
#SS(0)	If a memory source operand effective address is outside the SS segment limit. If the SS register contains an unusable segment.
#UD	If not in VMX operation.

Real-Address Mode Exceptions

#UD	The VMWRITE instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD	The VMWRITE instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD	The VMWRITE instruction is not recognized in compatibility mode.

64-Bit Mode Exceptions

#GP(0)	If the current privilege level is not 0. If the memory source operand is in the CS, DS, ES, FS, or GS segments and the memory address is in a non-canonical form.
#PF(fault-code)	If a page fault occurs in accessing a memory source operand.
#SS(0)	If the memory source operand is in the SS segment and the memory address is in a non-canonical form.
#UD	If not in VMX operation.

VMXOFF—Leave VMX Operation

Opcode/ Instruction	Op/En	Description
OF 01 C4 VMXOFF	Z0	Leaves VMX operation.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
Z0	NA	NA	NA	NA

Description

Takes the logical processor out of VMX operation, unblocks INIT signals, conditionally re-enables A20M, and clears any address-range monitoring.¹

Operation

```

IF (not in VMX operation) or (CR0.PE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)
    THEN #UD;
ELSIF in VMX non-root operation
    THEN VMexit;
ELSIF CPL > 0 or in SEAM root operation
    THEN #GP(0);
ELSIF dual-monitor treatment of SMIs and SMM is active
    THEN VMfail(VMXOFF under dual-monitor treatment of SMIs and SMM);
ELSE
    leave VMX operation;
    unblock INIT;
    IF IA32_SMM_MONITOR_CTL[2] = 02
        THEN unblock SMIs;
    IF outside SMX operation3
        THEN unblock and enable A20M;
    FI;
    IF the processor supports SEAM
        THEN ensure that data for each active SEAM VMCS is in the memory of the corresponding VMCS region;
    FI;
    clear address-range monitoring;
    VMsucceed;
FI;
    
```

Flags Affected

See the operation section and Section 32.2.

1. See the information on MONITOR/MWAIT in Chapter 10, “Multiple-Processor Management,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.
2. Setting IA32_SMM_MONITOR_CTL[bit 2] to 1 prevents VMXOFF from unblocking SMIs regardless of the value of the register’s value bit (bit 0). Not all processors allow this bit to be set to 1. Software should consult the VMX capability MSR IA32_VMX_MISC (see Appendix A.6) to determine whether this is allowed.
3. A logical processor is outside SMX operation if GETSEC[SENDER] has not been executed or if GETSEC[SEXIT] was executed after the last execution of GETSEC[SENDER]. See Chapter 6, “Safer Mode Extensions Reference.”

Protected Mode Exceptions

- #GP(0) If executed in VMX root operation with CPL > 0.
If in SEAM root operation.
- #UD If executed outside VMX operation.

Real-Address Mode Exceptions

- #UD The VMXOFF instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

- #UD The VMXOFF instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

- #UD The VMXOFF instruction is not recognized in compatibility mode.

64-Bit Mode Exceptions

- #GP(0) If executed in VMX root operation with CPL > 0.
If in SEAM root operation.
- #UD If executed outside VMX operation.

VMXON—Enter VMX Operation

Opcode/ Instruction	Op/En	Description
F3 0F C7 /6 VMXON m64	M	Enter VMX root operation.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
M	ModRM:r/m (r)	NA	NA	NA

Description

Puts the logical processor in VMX operation with no current VMCS, blocks INIT signals, disables A20M, and clears any address-range monitoring established by the MONITOR instruction.¹

The operand of this instruction is a 4KB-aligned physical address (the VMXON pointer) that references the VMXON region, which the logical processor may use to support VMX operation. This operand is always 64 bits and is always in memory.

Operation

IF (register operand) or (CR0.PE = 0) or (CR4.VMXE = 0) or (RFLAGS.VM = 1) or (IA32_EFER.LMA = 1 and CS.L = 0)
THEN #UD;

ELSIF not in VMX operation

THEN

IF (CPL > 0) or (in A20M mode) or

(the values of CR0 and CR4 are not supported in VMX operation; see Section 25.8) or

(bit 0 (lock bit) of IA32_FEATURE_CONTROL MSR is clear) or

(in SMX operation² and bit 1 of IA32_FEATURE_CONTROL MSR is clear) or

(outside SMX operation and bit 2 of IA32_FEATURE_CONTROL MSR is clear)

THEN #GP(0);

ELSE

addr := contents of 64-bit in-memory source operand;

IF addr is not 4KB-aligned or

addr sets any bits beyond the physical-address width^{3,4}

THEN VMfailInvalid;

ELSE

rev := 32 bits located at physical address addr;

IF rev[30:0] ≠ VMCS revision identifier supported by processor OR rev[31] = 1

THEN VMfailInvalid;

ELSE

1. See the information on MONITOR/MWAIT in Chapter 10, “Multiple-Processor Management,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A.

2. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENTER]. A logical processor is outside SMX operation if GETSEC[SENTER] has not been executed or if GETSEC[SEXIT] was executed after the last execution of GETSEC[SENTER]. See Chapter 7, “Safer Mode Extensions Reference.”

3. If IA32_VMX_BASIC[48] is read as 1, VMfailInvalid occurs if addr sets any bits in the range 63:32; see Appendix A.1.

4. Usually, the processor’s physical-address width is the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), the width is reduced by the value of IA32_TME_ACTIVATE[39:36]. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

```

        current-VMCS pointer := FFFFFFFF_FFFFFFFFH;
        enter VMX operation;
        block INIT signals;
        block and disable A20M;
        clear address-range monitoring;
        IF the processor supports Intel PT but does not allow it to be used in VMX operation1
            THEN IA32_RTIT_CTL.TraceEn := 0;
        FI;
        VMsucceed;
    FI;
FI;
    FI;
    ELSIF in VMX non-root operation
        THEN VMexit;
    ELSIF CPL > 0
        THEN #GP(0);
        ELSE VMfail("VMXON executed in VMX root operation");
    FI;
FI;

```

Flags Affected

See the operation section and Section 32.2.

Protected Mode Exceptions

#GP(0)	If executed outside VMX operation with CPL>0 or with invalid CR0 or CR4 fixed bits. If executed in A20M mode. If the memory source operand effective address is outside the CS, DS, ES, FS, or GS segment limit. If the DS, ES, FS, or GS register contains an unusable segment. If the source operand is located in an execute-only code segment. If the value of the IA32_FEATURE_CONTROL MSR does not support entry to VMX operation in the current processor mode.
#PF(fault-code)	If a page fault occurs in accessing the memory source operand.
#SS(0)	If the memory source operand effective address is outside the SS segment limit. If the SS register contains an unusable segment.
#UD	If operand is a register. If executed with CR4.VMXE = 0.

Real-Address Mode Exceptions

#UD	The VMXON instruction is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD	The VMXON instruction is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD	The VMXON instruction is not recognized in compatibility mode.

1. Software should read the VMX capability MSR IA32_VMX_MISC to determine whether the processor allows Intel PT to be used in VMX operation (see Appendix A.6).

64-Bit Mode Exceptions

#GP(0)	If executed outside VMX operation with CPL > 0 or with invalid CR0 or CR4 fixed bits. If executed in A20M mode. If the source operand is in the CS, DS, ES, FS, or GS segments and the memory address is in a non-canonical form. If the value of the IA32_FEATURE_CONTROL MSR does not support entry to VMX operation in the current processor mode.
#PF(fault-code)	If a page fault occurs in accessing the memory source operand.
#SS(0)	If the source operand is in the SS segment and the memory address is in a non-canonical form.
#UD	If operand is a register. If executed with CR4.VMXE = 0.

32.4 VM INSTRUCTION ERROR NUMBERS

For certain error conditions, the VM-instruction error field is loaded with an error number to indicate the source of the error. Table 32-1 lists VM-instruction error numbers.

Table 32-1. VM-Instruction Error Numbers

Error Number	Description
1	VMCALL executed in VMX root operation
2	VMCLEAR with invalid physical address
3	VMCLEAR with VMXON pointer
4	VMLAUNCH with non-clear VMCS
5	VMRESUME with non-launched VMCS
6	VMRESUME after VMXOFF (VMXOFF and VMXON between VMLAUNCH and VMRESUME) ^a
7	VM entry with invalid control field(s) ^{b,c}
8	VM entry with invalid host-state field(s) ^b
9	VMPTRLD with invalid physical address
10	VMPTRLD with VMXON pointer
11	VMPTRLD with incorrect VMCS revision identifier
12	VMREAD/VMWRITE from/to unsupported VMCS component
13	VMWRITE to read-only VMCS component
15	VMXON executed in VMX root operation
16	VM entry with invalid executive-VMCS pointer ^b
17	VM entry with non-launched executive VMCS ^b
18	VM entry with executive-VMCS pointer not VMXON pointer (when attempting to deactivate the dual-monitor treatment of SMIs and SMM) ^b
19	VMCALL with non-clear VMCS (when attempting to activate the dual-monitor treatment of SMIs and SMM)
20	VMCALL with invalid VM-exit control fields
22	VMCALL with incorrect MSEG revision identifier (when attempting to activate the dual-monitor treatment of SMIs and SMM)
23	VMXOFF under dual-monitor treatment of SMIs and SMM
24	VMCALL with invalid SMM-monitor features (when attempting to activate the dual-monitor treatment of SMIs and SMM)

Table 32-1. VM-Instruction Error Numbers (Contd.)

Error Number	Description
25	VM entry with invalid VM-execution control fields in executive VMCS (when attempting to return from SMM) ^{b,c}
26	VM entry with events blocked by MOV SS.
28	Invalid operand to INVEPT/INVVPID.

NOTES:

- a. Earlier versions of this manual described this error as “VMRESUME with a corrupted VMCS”.
- b. VM-entry checks on control fields and host-state fields may be performed in any order. Thus, an indication by error number of one cause does not imply that there are not also other errors. Different processors may give different error numbers for the same VMCS.
- c. Error number 7 is not used for VM entries that return from SMM that fail due to invalid VM-execution control fields in the executive VMCS. Error number 25 is used for these cases.

26. Updates to Chapter 33, Volume 3C

Change bars and violet text show changes to Chapter 33 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

Changes to this chapter:

- In Section 33.15.4.1, "Checks on the Executive-VMCS Pointer Field", added footnote reference for the processor's physical-address width.

This chapter describes aspects of IA-64 and IA-32 architecture used in system management mode (SMM).

SMM provides an alternate operating environment that can be used to monitor and manage various system resources for more efficient energy usage, to control system hardware, and/or to run proprietary code. It was introduced into the IA-32 architecture in the Intel386 SL processor (a mobile specialized version of the Intel386 processor). It is also available in the Pentium M, Pentium 4, Intel Xeon, P6 family, and Pentium and Intel486 processors (beginning with the enhanced versions of the Intel486 SL and Intel486 processors).

33.1 SYSTEM MANAGEMENT MODE OVERVIEW

SMM is a special-purpose operating mode provided for handling system-wide functions like power management, system hardware control, or proprietary OEM-designed code. It is intended for use only by system firmware, not by applications software or general-purpose systems software. The main benefit of SMM is that it offers a distinct and easily isolated processor environment that operates transparently to the operating system or executive and software applications.

When SMM is invoked through a system management interrupt (SMI), the processor saves the current state of the processor (the processor's context), then switches to a separate operating environment defined by a new address space. The system management software executive (SMI handler) starts execution in that environment, and the critical code and data of the SMI handler reside in a physical memory region (SMRAM) within that address space. While in SMM, the processor executes SMI handler code to perform operations such as powering down unused disk drives or monitors, executing proprietary code, or placing the whole system in a suspended state. When the SMI handler has completed its operations, it executes a resume (RSM) instruction. This instruction causes the processor to reload the saved context of the processor, switch back to protected or real mode, and resume executing the interrupted application or operating-system program or task.

The following SMM mechanisms make it transparent to applications programs and operating systems:

- The only way to enter SMM is by means of an SMI.
- The processor executes SMM code in a separate address space that can be made inaccessible from the other operating modes.
- Upon entering SMM, the processor saves the context of the interrupted program or task.
- All interrupts normally handled by the operating system are disabled upon entry into SMM.
- The RSM instruction can be executed only in SMM.

Section 33.3 describes transitions into and out of SMM. The execution environment after entering SMM is in real-address mode with paging disabled ($CR0.PE = CR0.PG = 0$). In this initial execution environment, the SMI handler can address up to 4 GBytes of memory and can execute all I/O and system instructions. Section 33.5 describes in detail the initial SMM execution environment for an SMI handler and operation within that environment. The SMI handler may subsequently switch to other operating modes while remaining in SMM.

NOTES

Software developers should be aware that, even if a logical processor was using the physical-address extension (PAE) mechanism (introduced in the P6 family processors) or was in IA-32e mode before an SMI, this will not be the case after the SMI is delivered. This is because delivery of an SMI disables paging (see Table 33-4). (This does not apply if the dual-monitor treatment of SMIs and SMM is active; see Section 33.15.)

33.1.1 System Management Mode and VMX Operation

Traditionally, SMM services system management interrupts and then resumes program execution (back to the software stack consisting of executive and application software; see Section 33.2 through Section 33.13).

A virtual machine monitor (VMM) using VMX can act as a host to multiple virtual machines and each virtual machine can support its own software stack of executive and application software. On processors that support VMX, virtual-machine extensions may use system-management interrupts (SMIs) and system-management mode (SMM) in one of two ways:

- **Default treatment.** System firmware handles SMIs. The processor saves architectural states and critical states relevant to VMX operation upon entering SMM. When the firmware completes servicing SMIs, it uses RSM to resume VMX operation.
- **Dual-monitor treatment.** Two VM monitors collaborate to control the servicing of SMIs: one VMM operates outside of SMM to provide basic virtualization in support for guests; the other VMM operates inside SMM (while in VMX operation) to support system-management functions. The former is referred to as **executive monitor**, the latter **SMM-transfer monitor (STM)**.¹

The default treatment is described in Section 33.14, “Default Treatment of SMIs and SMM with VMX Operation and SMX Operation.” Dual-monitor treatment of SMM is described in Section 33.15, “Dual-Monitor Treatment of SMIs and SMM.”

33.2 SYSTEM MANAGEMENT INTERRUPT (SMI)

The only way to enter SMM is by signaling an SMI through the SMI# pin on the processor or through an SMI message received through the APIC bus. The SMI is a nonmaskable external interrupt that operates independently from the processor’s interrupt- and exception-handling mechanism and the local APIC. The SMI takes precedence over an NMI and a maskable interrupt. SMM is non-reentrant; that is, the SMI is disabled while the processor is in SMM.

NOTES

In the Pentium 4, Intel Xeon, and P6 family processors, when a processor that is designated as an application processor during an MP initialization sequence is waiting for a startup IPI (SIPI), it is in a mode where SMIs are masked. However if a SMI is received while an application processor is in the wait for SIPI mode, the SMI will be pended. The processor then responds on receipt of a SIPI by immediately servicing the pended SMI and going into SMM before handling the SIPI.

An SMI may be blocked for one instruction following execution of STI, MOV to SS, or POP into SS.

33.3 SWITCHING BETWEEN SMM AND THE OTHER PROCESSOR OPERATING MODES

Figure 2-3 shows how the processor moves between SMM and the other processor operating modes (protected, real-address, and virtual-8086). Signaling an SMI while the processor is in real-address, protected, or virtual-8086 modes always causes the processor to switch to SMM. Upon execution of the RSM instruction, the processor always returns to the mode it was in when the SMI occurred.

33.3.1 Entering SMM

The processor always handles an SMI on an architecturally defined “interruptible” point in program execution (which is commonly at an IA-32 architecture instruction boundary). When the processor receives an SMI, it waits for all instructions to retire and for all stores to complete. The processor then saves its current context in SMRAM (see Section 33.4), enters SMM, and begins to execute the SMI handler.

1. The dual-monitor treatment may not be supported by all processors. Software should consult the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1) to determine whether it is supported.

Upon entering SMM, the processor signals external hardware that SMI handling has begun. The signaling mechanism used is implementation dependent. For the P6 family processors, an SMI acknowledge transaction is generated on the system bus and the multiplexed status signal EXF4 is asserted each time a bus transaction is generated while the processor is in SMM. For the Pentium and Intel486 processors, the SMIACK# pin is asserted.

An SMI has a greater priority than debug exceptions and external interrupts. Thus, if an NMI, maskable hardware interrupt, or a debug exception occurs at an instruction boundary along with an SMI, only the SMI is handled. Subsequent SMI requests are not acknowledged while the processor is in SMM. The first SMI interrupt request that occurs while the processor is in SMM (that is, after SMM has been acknowledged to external hardware) is latched and serviced when the processor exits SMM with the RSM instruction. The processor will latch only one SMI while in SMM.

See Section 33.5 for a detailed description of the execution environment when in SMM.

33.3.2 Exiting From SMM

The only way to exit SMM is to execute the RSM instruction. The RSM instruction is only available to the SMI handler; if the processor is not in SMM, attempts to execute the RSM instruction result in an invalid-opcode exception (#UD) being generated.

The RSM instruction restores the processor's context by loading the state save image from SMRAM back into the processor's registers. The processor then returns an SMIACK transaction on the system bus and returns program control back to the interrupted program.

NOTES

On processors that support the shadow-stack feature, RSM loads the SSP register from the state save image in SMRAM (see Table 33-3). The value is made canonical by sign-extension before loading it into SSP.

On processors that support Intel® SGX, RSM consults the "incident to enclave mode" bit in SMRAM (see Table 33-3). If it is set, a subsequent VM exit due to an event pending following RSM will indicate that it was incident to enclave mode. See Section 29.2.1 for details.

Upon successful completion of the RSM instruction, the processor signals external hardware that SMM has been exited. For the P6 family processors, an SMI acknowledge transaction is generated on the system bus and the multiplexed status signal EXF4 is no longer generated on bus cycles. For the Pentium and Intel486 processors, the SMIACK# pin is desasserted.

If the processor detects invalid state information saved in the SMRAM, it enters the shutdown state and generates a special bus cycle to indicate it has entered shutdown state. Shutdown happens only in the following situations:

- A reserved bit in control register CR4 is set to 1 on a write to CR4. This error should not happen unless SMI handler code modifies reserved areas of the SMRAM saved state map (see Section 33.4.1). CR4 is saved in the state map in a reserved location and cannot be read or modified in its saved state.
- An illegal combination of bits is written to control register CR0, in particular PG set to 1 and PE set to 0, or NW set to 1 and CD set to 0.
- CR4.PCIDE would be set to 1 and IA32_EFER.LMA to 0.
- (For the Pentium and Intel486 processors only.) If the address stored in the SMBASE register when an RSM instruction is executed is not aligned on a 32-KByte boundary. This restriction does not apply to the P6 family processors.
- CR4.CET would be set to 1 and CR0.WP to 0.

In the shutdown state, Intel processors stop executing instructions until a RESET#, INIT# or NMI# is asserted. While Pentium family processors recognize the SMI# signal in shutdown state, P6 family and Intel486 processors do not. Intel does not support using SMI# to recover from shutdown states for any processor family; the response of processors in this circumstance is not well defined. On Pentium 4 and later processors, shutdown will inhibit INTR and A20M but will not change any of the other inhibits. On these processors, NMIs will be inhibited if no action is taken in the SMI handler to uninhibit them (see Section 33.8).

If the processor is in the HALT state when the SMI is received, the processor handles the return from SMM slightly differently (see Section 33.10). Also, the SMBASE address can be changed on a return from SMM (see Section 33.11).

33.4 SMRAM

Upon entering SMM, the processor switches to a new address space. Because paging is disabled upon entering SMM, this initial address space maps all memory accesses to the low 4 GBytes of the processor's physical address space. The SMI handler's critical code and data reside in a memory region referred to as system-management RAM (SMRAM). The processor uses a pre-defined region within SMRAM to save the processor's pre-SMI context. SMRAM can also be used to store system management information (such as the system configuration and specific information about powered-down devices) and OEM-specific information.

The default SMRAM size is 64 KBytes beginning at a base physical address in physical memory called the SMBASE (see Figure 33-1). The SMBASE default value following a hardware reset is 30000H. The processor looks for the first instruction of the SMI handler at the address [SMBASE + 8000H]. It stores the processor's state in the area from [SMBASE + FE00H] to [SMBASE + FFFFH]. See Section 33.4.1 for a description of the mapping of the state save area.

The system logic is minimally required to decode the physical address range for the SMRAM from [SMBASE + 8000H] to [SMBASE + FFFFH]. A larger area can be decoded if needed. The size of this SMRAM can be between 32 KBytes and 4 GBytes.

The location of the SMRAM can be changed by changing the SMBASE value (see Section 33.11). It should be noted that all processors in a multiple-processor system are initialized with the same SMBASE value (30000H). Initialization software must sequentially place each processor in SMM and change its SMBASE so that it does not overlap those of other processors.

The actual physical location of the SMRAM can be in system memory or in a separate RAM memory. The processor generates an SMI acknowledge transaction (P6 family processors) or asserts the SMIACK# pin (Pentium and Intel486 processors) when the processor receives an SMI (see Section 33.3.1).

System logic can use the SMI acknowledge transaction or the assertion of the SMIACK# pin to decode accesses to the SMRAM and redirect them (if desired) to specific SMRAM memory. If a separate RAM memory is used for SMRAM, system logic should provide a programmable method of mapping the SMRAM into system memory space when the processor is not in SMM. This mechanism will enable start-up procedures to initialize the SMRAM space (that is, load the SMI handler) before executing the SMI handler during SMM.

33.4.1 SMRAM State Save Map

When an IA-32 processor that does not support Intel 64 architecture initially enters SMM, it writes its state to the state save area of the SMRAM. The state save area begins at [SMBASE + 8000H + 7FFFH] and extends down to [SMBASE + 8000H + 7E00H]. Table 33-1 shows the state save map. The offset in column 1 is relative to the SMBASE value plus 8000H. Reserved spaces should not be used by software.

Some of the registers in the SMRAM state save area (marked YES in column 3) may be read and changed by the SMI handler, with the changed values restored to the processor registers by the RSM instruction. Some register images are read-only, and must not be modified (modifying these registers will result in unpredictable behavior). An SMI handler should not rely on any values stored in an area that is marked as reserved.

Figure 33-1. SMRAM Usage

Table 33-1. SMRAM State Save Map

Offset (Added to SMBASE + 8000H)	Register	Writable?
7FFCH	CR0	No
7FF8H	CR3	No
7FF4H	EFLAGS	Yes
7FF0H	EIP	Yes
7FECH	EDI	Yes
7FE8H	ESI	Yes
7FE4H	EBP	Yes
7FE0H	ESP	Yes
7FDCH	EBX	Yes
7FD8H	EDX	Yes
7FD4H	ECX	Yes
7FD0H	EAX	Yes
7FCCH	DR6	No
7FC8H	DR7	No
7FC4H	TR ¹	No
7FC0H	Reserved	No
7FBCH	GS ¹	No
7FB8H	FS ¹	No
7FB4H	DS ¹	No
7FB0H	SS ¹	No
7FACH	CS ¹	No
7FA8H	ES ¹	No
7FA4H	I/O State Field, see Section 33.7	No
7FA0H	I/O Memory Address Field, see Section 33.7	No
7F9FH-7F03H	Reserved	No
7F02H	Auto HALT Restart Field (Word)	Yes

Table 33-1. SMRAM State Save Map (Contd.)

Offset (Added to SMBASE + 8000H)	Register	Writable?
7F00H	I/O Instruction Restart Field (Word)	Yes
7EFCH	SMM Revision Identifier Field (Doubleword)	No
7EF8H	SMBASE Field (Doubleword)	Yes
7EF7H - 7E00H	Reserved	No

NOTE:

1. The two most significant bytes are reserved.

The following registers are saved (but not readable) and restored upon exiting SMM:

- Control register CR4. (This register is cleared to all 0s when entering SMM).
- The hidden segment descriptor information stored in segment registers CS, DS, ES, FS, GS, and SS.

If an SMI request is issued for the purpose of powering down the processor, the values of all reserved locations in the SMM state save must be saved to nonvolatile memory.

The following state is not automatically saved and restored following an SMI and the RSM instruction, respectively:

- Debug registers DR0 through DR3.
- The x87 FPU registers.
- The MTRRs.
- Control register CR2.
- The model-specific registers (for the P6 family and Pentium processors) or test registers TR3 through TR7 (for the Pentium and Intel486 processors).
- The state of the trap controller.
- The machine-check architecture registers.
- The APIC internal interrupt state (ISR, IRR, etc.).
- The microcode update state.

If an SMI is used to power down the processor, a power-on reset will be required before returning to SMM, which will reset much of this state back to its default values. So an SMI handler that is going to trigger power down should first read these registers listed above directly, and save them (along with the rest of RAM) to nonvolatile storage. After the power-on reset, the continuation of the SMI handler should restore these values, along with the rest of the system's state. Anytime the SMI handler changes these registers in the processor, it must also save and restore them.

NOTES

A small subset of the MSRs (such as, the time-stamp counter and performance-monitoring counters) are not arbitrarily writable and therefore cannot be saved and restored. SMM-based power-down and restoration should only be performed with operating systems that do not use or rely on the values of these registers.

Operating system developers should be aware of this fact and ensure that their operating-system assisted power-down and restoration software is immune to unexpected changes in these register values.

33.4.1.1 SMRAM State Save Map and Intel 64 Architecture

When the processor initially enters SMM, it writes its state to the state save area of the SMRAM. The state save area on an Intel 64 processor at [SMBASE + 8000H + 7FFFH] and extends to [SMBASE + 8000H + 7C00H].

Support for Intel 64 architecture is reported by CPUID.80000001:EDX[29] = 1. The layout of the SMRAM state save map is shown in Table 33-3.

Additionally, the SMRAM state save map shown in Table 33-3 also applies to processors with the following CPUID signatures listed in Table 33-2, irrespective of the value in CPUID.80000001H:EDX[29].

Table 33-2. Processor Signatures and 64-bit SMRAM State Save Map Format

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_17H	Intel Xeon Processor 5200, 5400 series, Intel Core 2 Quad processor Q9xxx, Intel Core 2 Duo processors E8000, T9000,
06_0FH	Intel Xeon Processor 3000, 3200, 5100, 5300, 7300 series, Intel Core 2 Quad, Intel Core 2 Extreme, Intel Core 2 Duo processors, Intel Pentium dual-core processors
06_1CH	45 nm Intel Atom® processors

7DD4H	LDT Base (Upper 32 bits)	No
7DD0H	GDT Base (Upper 32 bits)	No
7DCFH - 7C00H	Reserved	No

NOTE:

1. The two most significant bytes are reserved.

33.4.2 SMRAM Caching

An IA-32 processor does not automatically write back and invalidate its caches before entering SMM or before exiting SMM. Because of this behavior, care must be taken in the placement of the SMRAM in system memory and

in the caching of the SMRAM to prevent cache incoherence when switching back and forth between SMM and protected mode operation. Any of the following three methods of locating the SMRAM in system memory will guarantee cache coherency.

- Place the SMRAM in a dedicated section of system memory that the operating system and applications are prevented from accessing. Here, the SMRAM can be designated as cacheable (WB, WT, or WC) for optimum processor performance, without risking cache incoherence when entering or exiting SMM.
- Place the SMRAM in a section of memory that overlaps an area used by the operating system (such as the video memory), but designate the SMRAM as uncacheable (UC). This method prevents cache access when in SMM to maintain cache coherency, but the use of uncacheable memory reduces the performance of SMM code.
- Place the SMRAM in a section of system memory that overlaps an area used by the operating system and/or application code, but explicitly flush (write back and invalidate) the caches upon entering and exiting SMM mode. This method maintains cache coherency, but incurs the overhead of two complete cache flushes.

For Pentium 4, Intel Xeon, and P6 family processors, a combination of the first two methods of locating the SMRAM is recommended. Here the SMRAM is split between an overlapping and a dedicated region of memory. Upon entering SMM, the SMRAM space that is accessed overlaps video memory (typically located in low memory). This SMRAM section is designated as UC memory. The initial SMM code then jumps to a second SMRAM section that is located in a dedicated region of system memory (typically in high memory). This SMRAM section can be cached for optimum processor performance.

For systems that explicitly flush the caches upon entering SMM (the third method described above), the cache flush can be accomplished by asserting the FLUSH# pin at the same time as the request to enter SMM (generally initiated by asserting the SMI# pin). The priorities of the FLUSH# and SMI# pins are such that the FLUSH# is serviced first. To guarantee this behavior, the processor requires that the following constraints on the interaction of FLUSH# and SMI# be met. In a system where the FLUSH# and SMI# pins are synchronous and the set up and hold times are met, then the FLUSH# and SMI# pins may be asserted in the same clock. In asynchronous systems, the FLUSH# pin must be asserted at least one clock before the SMI# pin to guarantee that the FLUSH# pin is serviced first.

Upon leaving SMM (for systems that explicitly flush the caches), the WBINVD instruction should be executed prior to leaving SMM to flush the caches.

NOTES

In systems based on the Pentium processor that use the FLUSH# pin to write back and invalidate cache contents before entering SMM, the processor will prefetch at least one cache line in between when the Flush Acknowledge cycle is run and the subsequent recognition of SMI# and the assertion of SMIACK#.

It is the obligation of the system to ensure that these lines are not cached by returning KEN# inactive to the Pentium processor.

33.4.2.1 System Management Range Registers (SMRR)

SMI handler code and data stored by SMM code resides in SMRAM. The SMRR interface is an enhancement in Intel 64 architecture to limit cacheable reference of addresses in SMRAM to code running in SMM. The SMRR interface can be configured only by code running in SMM. Details of SMRR is described in Section 13.11.2.4.

33.5 SMI HANDLER EXECUTION ENVIRONMENT

Section 33.5.1 describes the initial execution environment for an SMI handler. An SMI handler may re-configure its execution environment to other supported operating modes. Section 33.5.2 discusses modifications an SMI handler can make to its execution environment. Section 33.5.3 discusses Control-flow Enforcement Technology (CET) interactions in the environment.

33.5.1 Initial SMM Execution Environment

After saving the current context of the processor, the processor initializes its core registers to the values shown in Table 33-4. Upon entering SMM, the PE and PG flags in control register CR0 are cleared, which places the processor in an environment similar to real-address mode. The differences between the SMM execution environment and the real-address mode execution environment are as follows:

- The addressable address space ranges from 0 to FFFFFFFFH (4 GBytes).
- The normal 64-KByte segment limit for real-address mode is increased to 4 GBytes.
- The default operand and address sizes are set to 16 bits, which restricts the addressable SMRAM address space to the 1-MByte real-address mode limit for native real-address-mode code. However, operand-size and address-size override prefixes can be used to access the address space beyond the 1-MByte.

Table 33-4. Processor Register Initialization in SMM

Register	Contents
General-purpose registers	Undefined
EFLAGS	00000002H
EIP	00008000H
CS selector	SMM Base shifted right 4 bits (default 3000H)
CS base	SMM Base (default 30000H)
DS, ES, FS, GS, SS Selectors	0000H
DS, ES, FS, GS, SS Bases	00000000H
DS, ES, FS, GS, SS Limits	0FFFFFFFH
CR0	PE, EM, TS, and PG flags set to 0; others unmodified
CR4	Cleared to zero
DR6	Undefined
DR7	00000400H

- Near jumps and calls can be made to anywhere in the 4-GByte address space if a 32-bit operand-size override prefix is used. Due to the real-address-mode style of base-address formation, a far call or jump cannot transfer control to a segment with a base address of more than 20 bits (1 MByte). However, since the segment limit in SMM is 4 GBytes, offsets into a segment that go beyond the 1-MByte limit are allowed when using 32-bit operand-size override prefixes. Any program control transfer that does not have a 32-bit operand-size override prefix truncates the EIP value to the 16 low-order bits.
- Data and the stack can be located anywhere in the 4-GByte address space, but can be accessed only with a 32-bit address-size override if they are located above 1 MByte. As with the code segment, the base address for a data or stack segment cannot be more than 20 bits.

The value in segment register CS is automatically set to the default of 30000H for the SMBASE shifted 4 bits to the right; that is, 3000H. The EIP register is set to 8000H. When the EIP value is added to shifted CS value (the SMBASE), the resulting linear address points to the first instruction of the SMI handler.

The other segment registers (DS, SS, ES, FS, and GS) are cleared to 0 and their segment limits are set to 4 GBytes. In this state, the SMRAM address space may be treated as a single flat 4-GByte linear address space. If a segment register is loaded with a 16-bit value, that value is then shifted left by 4 bits and loaded into the segment base (hidden part of the segment register). The limits and attributes are not modified.

Maskable hardware interrupts, exceptions, NMI interrupts, SMI interrupts, A20M interrupts, single-step traps, breakpoint traps, and INIT operations are inhibited when the processor enters SMM. Maskable hardware interrupts, exceptions, single-step traps, and breakpoint traps can be enabled in SMM if the SMM execution environment provides and initializes an interrupt table and the necessary interrupt and exception handlers (see Section 33.6).

33.5.2 SMI Handler Operating Mode Switching

Within SMM, an SMI handler may change the processor's operating mode (e.g., to enable PAE paging, enter 64-bit mode, etc.) after it has made proper preparation and initialization to do so. For example, if switching to 32-bit protected mode, the SMI handler should follow the guidelines provided in Chapter 11, "Processor Management and Initialization." If the SMI handler does wish to change operating mode, it is responsible for executing the appropriate mode-transition code after each SMI.

It is recommended that the SMI handler make use of all means available to protect the integrity of its critical code and data. In particular, it should use the system-management range register (SMRR) interface if it is available (see Section 11.11.2.4). The SMRR interface can protect only the first 4 GBytes of the physical address space. The SMI handler should take that fact into account if it uses operating modes that allow access to physical addresses beyond that 4-GByte limit (e.g., PAE paging or 64-bit mode).

Execution of the RSM instruction restores the pre-SMI processor state from the SMRAM state-state map (see Section 33.4.1) into which it was stored when the processor entered SMM. (The SMBASE field in the SMRAM state-save map does not determine the state following RSM but rather the initial environment following the next entry to SMM.) Any required change to operating mode is performed by the RSM instruction; there is no need for the SMI handler to change modes explicitly prior to executing RSM.

33.5.3 Control-flow Enforcement Technology Interactions

On processors that support CET shadow stacks, when the processor enters SMM, the processor saves the SSP register to the SMRAM state save area (see Table 33-3) and clears CR4.CET to 0. Thus, the initial execution environment of the SMI handler has CET disabled and all of the CET state of the interrupted program is still in the machine. An SMM that uses CET is required to save the interrupted program's CET state and restore the CET state prior to exiting SMM.

33.6 EXCEPTIONS AND INTERRUPTS WITHIN SMM

When the processor enters SMM, all hardware interrupts are disabled in the following manner:

- The IF flag in the EFLAGS register is cleared, which inhibits maskable hardware interrupts from being generated.
- The TF flag in the EFLAGS register is cleared, which disables single-step traps.
- Debug register DR7 is cleared, which disables breakpoint traps. (This action prevents a debugger from accidentally breaking into an SMI handler if a debug breakpoint is set in normal address space that overlays code or data in SMRAM.)
- NMI, SMI, and A20M interrupts are blocked by internal SMM logic. (See Section 33.8 for more information about how NMIs are handled in SMM.)

Software-invoked interrupts and exceptions can still occur, and maskable hardware interrupts can be enabled by setting the IF flag. Intel recommends that SMM code be written in so that it does not invoke software interrupts (with the INT *n*, INTO, INT1, INT3, or BOUND instructions) or generate exceptions.

If the SMI handler requires interrupt and exception handling, an SMM interrupt table and the necessary exception and interrupt handlers must be created and initialized from within SMM. Until the interrupt table is correctly initialized (using the LIDT instruction), exceptions and software interrupts will result in unpredictable processor behavior.

The following restrictions apply when designing SMM interrupt and exception-handling facilities:

- The interrupt table should be located at linear address 0 and must contain real-address mode style interrupt vectors (4 bytes containing CS and IP).
- Due to the real-address mode style of base address formation, an interrupt or exception cannot transfer control to a segment with a base address of more than 20 bits.
- An interrupt or exception cannot transfer control to a segment offset of more than 16 bits (64 KBytes).

- When an exception or interrupt occurs, only the 16 least-significant bits of the return address (EIP) are pushed onto the stack. If the offset of the interrupted procedure is greater than 64 KBytes, it is not possible for the interrupt/exception handler to return control to that procedure. (One solution to this problem is for a handler to adjust the return address on the stack.)
- The SMBASE relocation feature affects the way the processor will return from an interrupt or exception generated while the SMI handler is executing. For example, if the SMBASE is relocated to above 1 MByte, but the exception handlers are below 1 MByte, a normal return to the SMI handler is not possible. One solution is to provide the exception handler with a mechanism for calculating a return address above 1 MByte from the 16-bit return address on the stack, then use a 32-bit far call to return to the interrupted procedure.
- If an SMI handler needs access to the debug trap facilities, it must ensure that an SMM accessible debug handler is available and save the current contents of debug registers DR0 through DR3 (for later restoration). Debug registers DR0 through DR3 and DR7 must then be initialized with the appropriate values.
- If an SMI handler needs access to the single-step mechanism, it must ensure that an SMM accessible single-step handler is available, and then set the TF flag in the EFLAGS register.
- If the SMI design requires the processor to respond to maskable hardware interrupts or software-generated interrupts while in SMM, it must ensure that SMM accessible interrupt handlers are available and then set the IF flag in the EFLAGS register (using the STI instruction). Software interrupts are not blocked upon entry to SMM, so they do not need to be enabled.

33.7 MANAGING SYNCHRONOUS AND ASYNCHRONOUS SYSTEM MANAGEMENT INTERRUPTS

When coding for a multiprocessor system or a system with Intel HT Technology, it was not always possible for an SMI handler to distinguish between a synchronous SMI (triggered during an I/O instruction) and an asynchronous SMI. To facilitate the discrimination of these two events, incremental state information has been added to the SMM state save map.

Processors that have an SMM revision ID of 30004H or higher have the incremental state information described below.

33.7.1 I/O State Implementation

Within the extended SMM state save map, a bit (IO_SMI) is provided that is set only when an SMI is either taken immediately after a *successful* I/O instruction or is taken after a *successful* iteration of a REP I/O instruction (the *successful* notion pertains to the processor point of view; not necessarily to the corresponding platform function). When set, the IO_SMI bit provides a strong indication that the corresponding SMI was synchronous. In this case, the SMM State Save Map also supplies the port address of the I/O operation. The IO_SMI bit and the I/O Port Address may be used in conjunction with the information logged by the platform to confirm that the SMI was indeed synchronous.

The IO_SMI bit by itself is a strong indication, not a guarantee, that the SMI is synchronous. This is because an asynchronous SMI might coincidentally be taken after an I/O instruction. In such a case, the IO_SMI bit would still be set in the SMM state save map.

Information characterizing the I/O instruction is saved in two locations in the SMM State Save Map (Table 33-5). The IO_SMI bit also serves as a valid bit for the rest of the I/O information fields. The contents of these I/O information fields are not defined when the IO_SMI bit is not set.

Table 33-5. I/O Instruction Information in the SMM State Save Map

State (SMM Rev. ID: 30004H or higher)	Format									
	31	16	15	8	7	4	3	1	0	

Table 33-5. I/O Instruction Information in the SMM State Save Map

I/O State Field SMRAM offset 7FA4	I/O Port	Reserved	I/O Type	I/O Length	IO_SMI
	31				0
I/O Memory Address Field SMRAM offset 7FA0	I/O Memory Address				

When IO_SMI is set, the other fields may be interpreted as follows:

- I/O length:
 - 001 – Byte
 - 010 – Word
 - 100 – Dword
- I/O instruction type (Table 33-6)

Table 33-6. I/O Instruction Type Encodings

Instruction	Encoding
IN Immediate	1001
IN DX	0001
OUT Immediate	1000
OUT DX	0000
INS	0011
OUTS	0010
REP INS	0111
REP OUTS	0110

33.8 NMI HANDLING WHILE IN SMM

NMI interrupts are blocked upon entry to the SMI handler. If an NMI request occurs during the SMI handler, it is latched and serviced after the processor exits SMM. Only one NMI request will be latched during the SMI handler. If an NMI request is pending when the processor executes the RSM instruction, the NMI is serviced before the next instruction of the interrupted code sequence. This assumes that NMIs were not blocked before the SMI occurred. If NMIs were blocked before the SMI occurred, they are blocked after execution of RSM.

Although NMI requests are blocked when the processor enters SMM, they may be enabled through software by executing an IRET instruction. If the SMI handler requires the use of NMI interrupts, it should invoke a dummy interrupt service routine for the purpose of executing an IRET instruction. Once an IRET instruction is executed, NMI interrupt requests are serviced in the same “real mode” manner in which they are handled outside of SMM.

Also, for the Pentium processor, exceptions that invoke a trap or fault handler will enable NMI interrupts from inside of SMM. This behavior is implementation specific for the Pentium processor and is not part of the IA-32 architecture.

33.9 SMM REVISION IDENTIFIER

The SMM revision identifier field is used to indicate the version of SMM and the SMM extensions that are supported by the processor (see Figure 33-2). The SMM revision identifier is written during SMM entry and can be examined in SMRAM space at offset 7EFCH. The lower word of the SMM revision identifier refers to the version of the base SMM architecture.

Figure 33-2. SMM Revision Identifier

The upper word of the SMM revision identifier refers to the extensions available. If the I/O instruction restart flag (bit 16) is set, the processor supports the I/O instruction restart (see Section 33.12); if the SMBASE relocation flag (bit 17) is set, SMRAM base address relocation is supported (see Section 33.11).

33.10 AUTO HALT RESTART

If the processor is in a HALT state (due to the prior execution of a HLT instruction) when it receives an SMI, the processor records the fact in the auto HALT restart flag in the saved processor state (see Figure 33-3). (This flag is located at offset 7F02H and bit 0 in the state save area of the SMRAM.)

If the processor sets the auto HALT restart flag upon entering SMM (indicating that the SMI occurred when the processor was in the HALT state), the SMI handler has two options:

- It can leave the auto HALT restart flag set, which instructs the RSM instruction to return program control to the HLT instruction. This option in effect causes the processor to re-enter the HALT state after handling the SMI. (This is the default operation.)
- It can clear the auto HALT restart flag, which instructs the RSM instruction to return program control to the instruction following the HLT instruction.

Figure 33-3. Auto HALT Restart Field

These options are summarized in Table 33-7. If the processor was not in a HALT state when the SMI was received (the auto HALT restart flag is cleared), setting the flag to 1 will cause unpredictable behavior when the RSM instruction is executed.

Table 33-7. Auto HALT Restart Flag Values

Value of Flag After Entry to SMM	Value of Flag When Exiting SMM	Action of Processor When Exiting SMM
0	0	Returns to next instruction in interrupted program or task.
0	1	Unpredictable.
1	0	Returns to next instruction after HLT instruction.
1	1	Returns to HALT state.

If the HLT instruction is restarted, the processor will generate a memory access to fetch the HLT instruction (if it is

not in the internal cache), and execute a HLT bus transaction. This behavior results in multiple HLT bus transactions for the same HLT instruction.

33.10.1 Executing the HLT Instruction in SMM

The HLT instruction should not be executed during SMM, unless interrupts have been enabled by setting the IF flag in the EFLAGS register. If the processor is halted in SMM, the only event that can remove the processor from this state is a maskable hardware interrupt or a hardware reset.

33.11 SMBASE RELOCATION

The default base address for the SMRAM is 30000H. This value is contained in an internal processor register called the SMBASE register. Software can relocate the SMRAM by setting the SMBASE field in the saved state map (at offset 7EF8H) to a new value (see Figure 33-4). The RSM instruction reloads the internal SMBASE register with the value in the SMBASE field each time it exits SMM. All subsequent SMI requests will use the new SMBASE value to find the starting address for the SMI handler (at SMBASE + 8000H) and the SMRAM state save area (from SMBASE + FE00H to SMBASE + FFFFH). (The processor resets the value in its internal SMBASE register to 30000H on a RESET, but does not change it on an INIT.)

Figure 33-4. SMBASE Relocation Field

In multiple-processor systems, initialization software must adjust the SMBASE value for each processor so that the SMRAM state save areas for each processor do not overlap. (For Pentium and Intel486 processors, the SMBASE values must be aligned on a 32-KByte boundary or the processor will enter shutdown state during the execution of a RSM instruction.)

If the SMBASE relocation flag in the SMM revision identifier field is set, it indicates the ability to relocate the SMBASE (see Section 33.9).

33.12 I/O INSTRUCTION RESTART

If the I/O instruction restart flag in the SMM revision identifier field is set (see Section 33.9), the I/O instruction restart mechanism is present on the processor. This mechanism allows an interrupted I/O instruction to be re-executed upon returning from SMM mode. For example, if an I/O instruction is used to access a powered-down I/O device, a chipset supporting this device can intercept the access and respond by asserting SMI#. This action invokes the SMI handler to power-up the device. Upon returning from the SMI handler, the I/O instruction restart mechanism can be used to re-execute the I/O instruction that caused the SMI.

The I/O instruction restart field (at offset 7F00H in the SMM state-save area, see Figure 33-5) controls I/O instruction restart. When an RSM instruction is executed, if this field contains the value FFH, then the EIP register is modified to point to the I/O instruction that received the SMI request. The processor will then automatically re-execute the I/O instruction that the SMI trapped. (The processor saves the necessary machine state to ensure that re-execution of the instruction is handled coherently.)

Figure 33-5. I/O Instruction Restart Field

If the I/O instruction restart field contains the value 00H when the RSM instruction is executed, then the processor begins program execution with the instruction following the I/O instruction. (When a repeat prefix is being used, the next instruction may be the next I/O instruction in the repeat loop.) Not re-executing the interrupted I/O instruction is the default behavior; the processor automatically initializes the I/O instruction restart field to 00H upon entering SMM. Table 33-8 summarizes the states of the I/O instruction restart field.

Table 33-8. I/O Instruction Restart Field Values

Value of Flag After Entry to SMM	Value of Flag When Exiting SMM	Action of Processor When Exiting SMM
00H	00H	Does not re-execute trapped I/O instruction.
00H	FFH	Re-executes trapped I/O instruction.

The I/O instruction restart mechanism does not indicate the cause of the SMI. It is the responsibility of the SMI handler to examine the state of the processor to determine the cause of the SMI and to determine if an I/O instruction was interrupted and should be restarted upon exiting SMM. If an SMI interrupt is signaled on a non-I/O instruction boundary, setting the I/O instruction restart field to FFH prior to executing the RSM instruction will likely result in a program error.

33.12.1 Back-to-Back SMI Interrupts When I/O Instruction Restart Is Being Used

If an SMI interrupt is signaled while the processor is servicing an SMI interrupt that occurred on an I/O instruction boundary, the processor will service the new SMI request before restarting the originally interrupted I/O instruction. If the I/O instruction restart field is set to FFH prior to returning from the second SMI handler, the EIP will point to an address different from the originally interrupted I/O instruction, which will likely lead to a program error. To avoid this situation, the SMI handler must be able to recognize the occurrence of back-to-back SMI interrupts when I/O instruction restart is being used and ensure that the handler sets the I/O instruction restart field to 00H prior to returning from the second invocation of the SMI handler.

33.13 SMM MULTIPLE-PROCESSOR CONSIDERATIONS

The following should be noted when designing multiple-processor systems:

- Any processor in a multiprocessor system can respond to an SMI.
- Each processor needs its own SMRAM space. This space can be in system memory or in a separate RAM.
- The SMRAMs for different processors can be overlapped in the same memory space. The only stipulation is that each processor needs its own state save area and its own dynamic data storage area. (Also, for the Pentium and Intel486 processors, the SMBASE address must be located on a 32-KByte boundary.) Code and static data can be shared among processors. Overlapping SMRAM spaces can be done more efficiently with the P6 family processors because they do not require that the SMBASE address be on a 32-KByte boundary.
- The SMI handler will need to initialize the SMBASE for each processor.
- Processors can respond to local SMIs through their SMI# pins or to SMIs received through the APIC interface. The APIC interface can distribute SMIs to different processors.
- Two or more processors can be executing in SMM at the same time.

- When operating Pentium processors in dual processing (DP) mode, the SMI $\overline{ACT}\#$ pin is driven only by the MRM processor and should be sampled with ADS#. For additional details, see Chapter 14 of the Pentium Processor Family User's Manual, Volume 1.

SMM is not re-entrant, because the SMRAM State Save Map is fixed relative to the SMBASE. If there is a need to support two or more processors in SMM mode at the same time then each processor should have dedicated SMRAM spaces. This can be done by using the SMBASE Relocation feature (see Section 33.11).

33.14 DEFAULT TREATMENT OF SMIS AND SMM WITH VMX OPERATION AND SMX OPERATION

Under the default treatment, the interactions of SMIs and SMM with VMX operation are few. This section details those interactions. It also explains how this treatment affects SMX operation.

33.14.1 Default Treatment of SMI Delivery

Ordinary SMI delivery saves processor state into SMRAM and then loads state based on architectural definitions. Under the default treatment, processors that support VMX operation perform SMI delivery as follows:

```

enter SMM;
save the following internal to the processor:
    CR4.VMXE
    an indication of whether the logical processor was in VMX operation (root or non-root)
IF the logical processor is in VMX operation
    THEN
        save current VMCS pointer internal to the processor;
        leave VMX operation;
        save VMX-critical state defined below;
FI;
IF the logical processor supports SMX operation
    THEN
        save internal to the logical processor an indication of whether the Intel® TXT private space is locked;
        IF the TXT private space is unlocked
            THEN lock the TXT private space;
        FI;
FI;
CR4.VMXE := 0;
perform ordinary SMI delivery:
    save processor state in SMRAM;
    set processor state to standard SMM values;1
    invalidate linear mappings and combined mappings associated with VPID 0000H (for all PCIDs); combined mappings for VPID 0000H
are invalidated for all EPT $\overline{RTA}$  values (EPT $\overline{RTA}$  is the value of bits 51:12 of EPTP; see Section 30.4);
  
```

The pseudocode above makes reference to the saving of **VMX-critical state**. This state consists of the following: (1) SS.DPL (the current privilege level); (2) RFLAGS.VM²; (3) the state of blocking by STI and by MOV SS (see Table 26-3 in Section 26.4.2); (4) the state of virtual-NMI blocking (only if the processor is in VMX non-root operation and the "virtual NMIs" VM-execution control is 1); and (5) an indication of whether an MTF VM exit is pending (see Section 27.5.2). These data may be saved internal to the processor or in the VMCS region of the current

-
1. This causes the logical processor to block INIT signals, NMIs, and SMIs.
 2. Section 33.14 and Section 33.15 use the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For processors that do not support Intel 64 architecture, this notation refers to the 32-bit forms of these registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to the lower 32 bits of the register.

VMCS. Processors that do not support SMI recognition while there is blocking by STI or by MOV SS need not save the state of such blocking.

If the logical processor supports the 1-setting of the “enable EPT” VM-execution control and the logical processor was in VMX non-root operation at the time of an SMI, it saves the value of that control into bit 0 of the 32-bit field at offset SMBASE + 8000H + 7EE0H (SMBASE + FEE0H; see Table 33-3).¹ If the logical processor was not in VMX non-root operation at the time of the SMI, it saves 0 into that bit. If the logical processor saves 1 into that bit (it was in VMX non-root operation and the “enable EPT” VM-execution control was 1), it saves the value of the EPT pointer (EPTP) into the 64-bit field at offset SMBASE + 8000H + 7ED8H (SMBASE + FED8H).

Because SMI delivery causes a logical processor to leave VMX operation, all the controls associated with VMX non-root operation are disabled in SMM and thus cannot cause VM exits while the logical processor in SMM.

33.14.2 Default Treatment of RSM

Ordinary execution of RSM restores processor state from SMRAM. Under the default treatment, processors that support VMX operation perform RSM as follows:

```

IF VMXE = 1 in CR4 image in SMRAM
    THEN fail and enter shutdown state;
ELSE
    restore state normally from SMRAM;
    invalidate linear mappings and combined mappings associated with all VPIDs and all PCIDs; combined mappings are invalidated
for all EPTPTA values (EPTPTA is the value of bits 51:12 of EPTP; see Section 30.4);
    IF the logical processor supports SMX operation and the Intel® TXT private space was unlocked at the time of the last SMI (as
saved)
        THEN unlock the TXT private space;
    FI;
    CR4.VMXE := value stored internally;
    IF internal storage indicates that the logical processor
    had been in VMX operation (root or non-root)
        THEN
            enter VMX operation (root or non-root);
            restore VMX-critical state as defined in Section 33.14.1;
            set to their fixed values any bits in CR0 and CR4 whose values must be fixed in VMX operation (see Section 25.8);2
            IF RFLAGS.VM = 0 AND (in VMX root operation OR the “unrestricted guest” VM-execution control is 0)3
                THEN
                    CS.RPL := SS.DPL;
                    SS.RPL := SS.DPL;
            FI;
            restore current VMCS pointer;
        FI;
    leave SMM;
    IF logical processor will be in VMX operation or in SMX operation after RSM
        THEN block A20M and leave A20M mode;
    FI;
FI;

```

-
1. “Enable EPT” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, SMI functions as the “enable EPT” VM-execution control were 0. See Section 26.6.2.
 2. If the RSM is to VMX non-root operation and both the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls will be 1, CR0.PE and CR0.PG retain the values that were loaded from SMRAM regardless of what is reported in the capability MSR IA32_VMX_CR0_FIXED0.
 3. “Unrestricted guest” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, VM entry functions as if the “unrestricted guest” VM-execution control were 0. See Section 26.6.2.

RSM unblocks SMIs. It restores the state of blocking by NMI (see Table 26-3 in Section 26.4.2) as follows:

- If the RSM is not to VMX non-root operation or if the “virtual NMIs” VM-execution control will be 0, the state of NMI blocking is restored normally.
- If the RSM is to VMX non-root operation and the “virtual NMIs” VM-execution control will be 1, NMIs are not blocked after RSM. The state of virtual-NMI blocking is restored as part of VMX-critical state.

INIT signals are blocked after RSM if and only if the logical processor will be in VMX root operation.

If RSM returns a logical processor to VMX non-root operation, it re-establishes the controls associated with the current VMCS. If the “interrupt-window exiting” VM-execution control is 1, a VM exit occurs immediately after RSM if the enabling conditions apply. The same is true for the “NMI-window exiting” VM-execution control. Such VM exits occur with their normal priority. See Section 27.2.

If an MTF VM exit was pending at the time of the previous SMI, an MTF VM exit is pending on the instruction boundary following execution of RSM. The following items detail the treatment of MTF VM exits that may be pending following RSM:

- System-management interrupts (SMIs), INIT signals, and higher priority events take priority over these MTF VM exits. These MTF VM exits take priority over debug-trap exceptions and lower priority events.
- These MTF VM exits wake the logical processor if RSM caused the logical processor to enter the HLT state (see Section 33.10). They do not occur if the logical processor just entered the shutdown state.

33.14.3 Protection of CR4.VMXE in SMM

Under the default treatment, CR4.VMXE is treated as a reserved bit while a logical processor is in SMM. Any attempt by software running in SMM to set this bit causes a general-protection exception. In addition, software cannot use VMX instructions or enter VMX operation while in SMM.

33.14.4 VMXOFF and SMI Unblocking

The VMXOFF instruction can be executed only with the default treatment (see Section 33.15.1) and only outside SMM. If SMIs are blocked when VMXOFF is executed, VMXOFF unblocks them unless IA32_SMM_MONITOR_CTL[bit 2] is 1 (see Section 33.15.5 for details regarding this MSR).¹ Section 33.15.7 identifies a case in which SMIs may be blocked when VMXOFF is executed.

Not all processors allow this bit to be set to 1. Software should consult the VMX capability MSR IA32_VMX_MISC (see Appendix A.6) to determine whether this is allowed.

33.15 DUAL-MONITOR TREATMENT OF SMIs AND SMM

Dual-monitor treatment is activated through the cooperation of the **executive monitor** (the VMM that operates outside of SMM to provide basic virtualization) and the **SMM-transfer monitor (STM)**; the VMM that operates inside SMM—while in VMX operation—to support system-management functions). Control is transferred to the STM through VM exits; VM entries are used to return from SMM.

The dual-monitor treatment may not be supported by all processors. Software should consult the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1) to determine whether it is supported.

33.15.1 Dual-Monitor Treatment Overview

The dual-monitor treatment uses an executive monitor and an SMM-transfer monitor (STM). Transitions from the executive monitor or its guests to the STM are called **SMM VM exits** and are discussed in Section 33.15.2. SMM

1. Setting IA32_SMM_MONITOR_CTL[bit 2] to 1 prevents VMXOFF from unblocking SMIs regardless of the value of the register’s valid bit (bit 0).

VM exits are caused by SMIs as well as executions of VMCALL in VMX root operation. The latter allow the executive monitor to call the STM for service.

The STM runs in VMX root operation and uses VMX instructions to establish a VMCS and perform VM entries to its own guests. This is done all inside SMM (see Section 33.15.3). The STM returns from SMM, not by using the RSM instruction, but by using a VM entry that returns from SMM. Such VM entries are described in Section 33.15.4.

Initially, there is no STM and the default treatment (Section 33.14) is used. The dual-monitor treatment is not used until it is enabled and activated. The steps to do this are described in Section 33.15.5 and Section 33.15.6.

It is not possible to leave VMX operation under the dual-monitor treatment; VMXOFF will fail if executed. The dual-monitor treatment must be deactivated first. The STM deactivates dual-monitor treatment using a VM entry that returns from SMM with the “deactivate dual-monitor treatment” VM-entry control set to 1 (see Section 33.15.7).

The executive monitor configures any VMCS that it uses for VM exits to the executive monitor. SMM VM exits, which transfer control to the STM, use a different VMCS. Under the dual-monitor treatment, each logical processor uses a separate VMCS called the **SMM-transfer VMCS**. When the dual-monitor treatment is active, the logical processor maintains another VMCS pointer called the **SMM-transfer VMCS pointer**. The SMM-transfer VMCS pointer is established when the dual-monitor treatment is activated.

33.15.2 SMM VM Exits

An SMM VM exit is a VM exit that begins outside SMM and that ends in SMM.

Unlike other VM exits, SMM VM exits can begin in VMX root operation. SMM VM exits result from the arrival of an SMI outside SMM or from execution of VMCALL in VMX root operation outside SMM. Execution of VMCALL in VMX root operation causes an SMM VM exit only if the valid bit is set in the IA32_SMM_MONITOR_CTL MSR (see Section 33.15.5).

Execution of VMCALL in VMX root operation causes an SMM VM exit even under the default treatment. This SMM VM exit activates the dual-monitor treatment (see Section 33.15.6).

Differences between SMM VM exits and other VM exits are detailed in Sections 33.15.2.1 through 33.15.2.5. Differences between SMM VM exits that activate the dual-monitor treatment and other SMM VM exits are described in Section 33.15.6.

33.15.2.1 Architectural State Before a VM Exit

System-management interrupts (SMIs) that cause SMM VM exits always do so directly. They do not save state to SMRAM as they do under the default treatment.

33.15.2.2 Updating the Current-VMCS and Executive-VMCS Pointers

SMM VM exits begin by performing the following steps:

1. The executive-VMCS pointer field in the SMM-transfer VMCS is loaded as follows:
 - If the SMM VM exit commenced in VMX non-root operation, it receives the current-VMCS pointer.
 - If the SMM VM exit commenced in VMX root operation, it receives the VMXON pointer.
2. The current-VMCS pointer is loaded with the value of the SMM-transfer VMCS pointer.

The last step ensures that the current VMCS is the SMM-transfer VMCS. VM-exit information is recorded in that VMCS, and VM-entry control fields in that VMCS are updated. State is saved into the guest-state area of that VMCS. The VM-exit controls and host-state area of that VMCS determine how the VM exit operates.

33.15.2.3 Recording VM-Exit Information

SMM VM exits differ from other VM exit with regard to the way they record VM-exit information. The differences follow.

- **Exit reason.**

- Bits 15:0 of this field contain the basic exit reason. The field is loaded with the reason for the SMM VM exit: I/O SMI (an SMI arrived immediately after retirement of an I/O instruction), other SMI, or VMCALL. See Appendix C, “VMX Basic Exit Reasons.”
- SMM VM exits are the only VM exits that may occur in VMX root operation. Because the SMM-transfer monitor may need to know whether it was invoked from VMX root or VMX non-root operation, this information is stored in bit 29 of the exit-reason field (see Table 26-19 in Section 26.9.1). The bit is set by SMM VM exits from VMX root operation.
- If the SMM VM exit occurred in VMX non-root operation and an MTF VM exit was pending, bit 28 of the exit-reason field is set; otherwise, it is cleared.
- Bits 27:16 and bits 31:30 are cleared.
- **Exit qualification.** For an SMM VM exit due an SMI that arrives immediately after the retirement of an I/O instruction, the exit qualification contains information about the I/O instruction that retired immediately before the SMI. It has the format given in Table 33-9.

Table 33-9. Exit Qualification for SMIs That Arrive Immediately After the Retirement of an I/O Instruction

Bit Position(s)	Contents
2:0	Size of access: 0 = 1-byte 1 = 2-byte 3 = 4-byte Other values not used.
3	Direction of the attempted access (0 = OUT, 1 = IN)
4	String instruction (0 = not string; 1 = string)
5	REP prefixed (0 = not REP; 1 = REP)
6	Operand encoding (0 = DX, 1 = immediate)
15:7	Reserved (cleared to 0)
31:16	Port number (as specified in the I/O instruction)
63:32	Reserved (cleared to 0). These bits exist only on processors that support Intel 64 architecture.

- **Guest linear address.** This field is used for VM exits due to SMIs that arrive immediately after the retirement of an INS or OUTS instruction for which the relevant segment (ES for INS; DS for OUTS unless overridden by an instruction prefix) is usable. The field receives the value of the linear address generated by ES:(E)DI (for INS) or segment:(E)SI (for OUTS; the default segment is DS but can be overridden by a segment override prefix) at the time the instruction started. If the relevant segment is not usable, the value is undefined. On processors that support Intel 64 architecture, bits 63:32 are clear if the logical processor was not in 64-bit mode before the VM exit.
- **I/O RCX, I/O RSI, I/O RDI, and I/O RIP.** For an SMM VM exit due an SMI that arrives immediately after the retirement of an I/O instruction, these fields receive the values that were in RCX, RSI, RDI, and RIP, respectively, before the I/O instruction executed. Thus, the value saved for I/O RIP addresses the I/O instruction.

33.15.2.4 Saving Guest State

SMM VM exits save the contents of the SMBASE register into the corresponding field in the guest-state area.

The value of the VMX-preemption timer is saved into the corresponding field in the guest-state area if the “save VMX-preemption timer value” VM-exit control is 1. That field becomes undefined if, in addition, either the SMM VM exit is from VMX root operation or the SMM VM exit is from VMX non-root operation and the “activate VMX-preemption timer” VM-execution control is 0.

33.15.2.5 Updating State

If an SMM VM exit is from VMX non-root operation and the “Intel PT uses guest physical addresses” VM-execution control is 1, the IA32_RTIT_CTL MSR is cleared to 00000000_00000000H.¹ This is done even if the “clear IA32_RTIT_CTL” VM-exit control is 0.

SMM VM exits affect the non-register state of a logical processor as follows:

- SMM VM exits cause non-maskable interrupts (NMIs) to be blocked; they may be unblocked through execution of IRET or through a VM entry (depending on the value loaded for the interruptibility state and the setting of the “virtual NMIs” VM-execution control).
- SMM VM exits cause SMIs to be blocked; they may be unblocked by a VM entry that returns from SMM (see Section 33.15.4).

SMM VM exits invalidate linear mappings and combined mappings associated with VPID 0000H for all PCIDs. Combined mappings for VPID 0000H are invalidated for all EPTRTA values (EPTRTA is the value of bits 51:12 of EPTP; see Section 30.4). (Ordinary VM exits are not required to perform such invalidation if the “enable VPID” VM-execution control is 1; see Section 29.5.5.)

33.15.3 Operation of the SMM-Transfer Monitor

Once invoked, the SMM-transfer monitor (STM) is in VMX root operation and can use VMX instructions to configure VMCSs and to cause VM entries to virtual machines supported by those structures. As noted in Section 33.15.1, the VMXOFF instruction cannot be used under the dual-monitor treatment and thus cannot be used by the STM.

The RSM instruction also cannot be used under the dual-monitor treatment. As noted in Section 27.1.3, it causes a VM exit if executed in SMM in VMX non-root operation. If executed in VMX root operation, it causes an invalid-opcode exception. The STM uses VM entries to return from SMM (see Section 33.15.4).

33.15.4 VM Entries that Return from SMM

The SMM-transfer monitor (STM) returns from SMM using a VM entry with the “entry to SMM” VM-entry control clear. VM entries that return from SMM reverse the effects of an SMM VM exit (see Section 33.15.2).

VM entries that return from SMM may differ from other VM entries in that they do not necessarily enter VMX non-root operation. If the executive-VMCS pointer field in the current VMCS contains the VMXON pointer, the logical processor remains in VMX root operation after VM entry.

For differences between VM entries that return from SMM and other VM entries see Sections 33.15.4.1 through 33.15.4.10.

33.15.4.1 Checks on the Executive-VMCS Pointer Field

VM entries that return from SMM perform the following checks on the executive-VMCS pointer field in the current VMCS:

- Bits 11:0 must be 0.
- The pointer must not set any bits beyond the processor’s physical-address width.^{2,3}

1. In this situation, the value of this MSR was saved earlier into the guest-state area. All VM exits save this MSR if the 1-setting of the “load IA32_RTIT_CTL” VM-entry control is supported (see Section 29.3.1), which must be the case if the “Intel PT uses guest physical addresses” VM-execution control is 1 (see Section 28.2.1.1).

2. Usually, the processor’s physical-address width is the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), the width is reduced by the value of IA32_TME_ACTIVATE[39:36]. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

3. If IA32_VMX_BASIC[48] is read as 1, this pointer must not set any bits in the range 63:32; see Appendix A.1.

- The 32 bits located in memory referenced by the physical address in the pointer must contain the processor's VMCS revision identifier (see Section 26.2).

The checks above are performed before the checks described in Section 33.15.4.2 and before any of the following checks:

- If the "deactivate dual-monitor treatment" VM-entry control is 0 and the executive-VMCS pointer field does not contain the VMXON pointer, the launch state of the executive VMCS (the VMCS referenced by the executive-VMCS pointer field) must be launched (see Section 26.11.3).
- If the "deactivate dual-monitor treatment" VM-entry control is 1, the executive-VMCS pointer field must contain the VMXON pointer (see Section 33.15.7).¹

33.15.4.2 Checks on VM-Execution Control Fields

VM entries that return from SMM differ from other VM entries with regard to the checks performed on the VM-execution control fields specified in Section 28.2.1.1. They do not apply the checks to the current VMCS. Instead, VM-entry behavior depends on whether the executive-VMCS pointer field contains the VMXON pointer:

- If the executive-VMCS pointer field contains the VMXON pointer (the VM entry remains in VMX root operation), the checks are not performed at all.
- If the executive-VMCS pointer field does not contain the VMXON pointer (the VM entry enters VMX non-root operation), the checks are performed on the VM-execution control fields in the executive VMCS (the VMCS referenced by the executive-VMCS pointer field in the current VMCS). These checks are performed after checking the executive-VMCS pointer field itself (for proper alignment).

Other VM entries ensure that, if "activate VMX-preemption timer" VM-execution control is 0, the "save VMX-preemption timer value" VM-exit control is also 0. This check is not performed by VM entries that return from SMM.

33.15.4.3 Checks on VM-Entry Control Fields

VM entries that return from SMM differ from other VM entries with regard to the checks performed on the VM-entry control fields specified in Section 28.2.1.3.

Specifically, if the executive-VMCS pointer field contains the VMXON pointer (the VM entry remains in VMX root operation), the VM-entry interruption-information field must not indicate injection of a pending MTF VM exit (see Section 28.6.2). Specifically, the following cannot all be true for that field:

- the valid bit (bit 31) is 1
- the interruption type (bits 10:8) is 7 (other event); and
- the vector (bits 7:0) is 0 (pending MTF VM exit).

33.15.4.4 Checks on the Guest State Area

Section 28.3.1 specifies checks performed on fields in the guest-state area of the VMCS. Some of these checks are conditioned on the settings of certain VM-execution controls (e.g., "virtual NMIs" or "unrestricted guest").

VM entries that return from SMM modify these checks based on whether the executive-VMCS pointer field contains the VMXON pointer:²

- If the executive-VMCS pointer field contains the VMXON pointer (the VM entry remains in VMX root operation), the checks are performed as all relevant VM-execution controls were 0. (As a result, some checks may not be performed at all.)
- If the executive-VMCS pointer field does not contain the VMXON pointer (the VM entry enters VMX non-root operation), this check is performed based on the settings of the VM-execution controls in the executive VMCS (the VMCS referenced by the executive-VMCS pointer field in the current VMCS).

1. The STM can determine the VMXON pointer by reading the executive-VMCS pointer field in the current VMCS after the SMM VM exit that activates the dual-monitor treatment.

2. The STM can determine the VMXON pointer by reading the executive-VMCS pointer field in the current VMCS after the SMM VM exit that activates the dual-monitor treatment.

For VM entries that return from SMM, the activity-state field must not indicate the wait-for-SIPI state if the executive-VMCS pointer field contains the VMXON pointer (the VM entry is to VMX root operation).

33.15.4.5 Loading Guest State

VM entries that return from SMM load the SMBASE register from the SMBASE field.

VM entries that return from SMM invalidate linear mappings and combined mappings associated with all VPIDs. Combined mappings are invalidated for all EPTRTA values (EPTRTA is the value of bits 51:12 of EPTP; see Section 30.4). (Ordinary VM entries are required to perform such invalidation only for VPID 0000H and are not required to do even that if the “enable VPID” VM-execution control is 1; see Section 28.3.2.5.)

33.15.4.6 VMX-Preemption Timer

A VM entry that returns from SMM activates the VMX-preemption timer only if the executive-VMCS pointer field does not contain the VMXON pointer (the VM entry enters VMX non-root operation) and the “activate VMX-preemption timer” VM-execution control is 1 in the executive VMCS (the VMCS referenced by the executive-VMCS pointer field). In this case, VM entry starts the VMX-preemption timer with the value in the VMX-preemption timer-value field in the current VMCS.

33.15.4.7 Updating the Current-VMCS and SMM-Transfer VMCS Pointers

Successful VM entries (returning from SMM) load the SMM-transfer VMCS pointer with the current-VMCS pointer. Following this, they load the current-VMCS pointer from a field in the current VMCS:

- If the executive-VMCS pointer field contains the VMXON pointer (the VM entry remains in VMX root operation), the current-VMCS pointer is loaded from the VMCS-link pointer field.
- If the executive-VMCS pointer field does not contain the VMXON pointer (the VM entry enters VMX non-root operation), the current-VMCS pointer is loaded with the value of the executive-VMCS pointer field.

If the VM entry successfully enters VMX non-root operation, the VM-execution controls in effect after the VM entry are those from the new current VMCS. This includes any structures external to the VMCS referenced by VM-execution control fields.

The updating of these VMCS pointers occurs before event injection. Event injection is determined, however, by the VM-entry control fields in the VMCS that was current when the VM entry commenced.

33.15.4.8 VM Exits Induced by VM Entry

Section 28.6.1.2 describes how the event-delivery process invoked by event injection may lead to a VM exit. Section 28.7.3 to Section 28.7.7 describe other situations that may cause a VM exit to occur immediately after a VM entry.

Whether these VM exits occur is determined by the VM-execution control fields in the current VMCS. For VM entries that return from SMM, they can occur only if the executive-VMCS pointer field does not contain the VMXON pointer (the VM entry enters VMX non-root operation).

In this case, determination is based on the VM-execution control fields in the VMCS that is current after the VM entry. This is the VMCS referenced by the value of the executive-VMCS pointer field at the time of the VM entry (see Section 33.15.4.7). This VMCS also controls the delivery of such VM exits. Thus, VM exits induced by a VM entry returning from SMM are to the executive monitor and not to the STM.

33.15.4.9 SMI Blocking

VM entries that return from SMM determine the blocking of system-management interrupts (SMIs) as follows:

- If the “deactivate dual-monitor treatment” VM-entry control is 0, SMIs are blocked after VM entry if and only if the bit 2 in the interruptibility-state field is 1.
- If the “deactivate dual-monitor treatment” VM-entry control is 1, the blocking of SMIs depends on whether the logical processor is in SMX operation:¹
 - If the logical processor is in SMX operation, SMIs are blocked after VM entry.

- If the logical processor is outside SMX operation, SMIs are unblocked after VM entry.

VM entries that return from SMM and that do not deactivate the dual-monitor treatment may leave SMIs blocked. This feature exists to allow the STM to invoke functionality outside of SMM without unblocking SMIs.

33.15.4.10 Failures of VM Entries That Return from SMM

Section 28.8 describes the treatment of VM entries that fail during or after loading guest state. Such failures record information in the VM-exit information fields and load processor state as would be done on a VM exit. The VMCS used is the one that was current before the VM entry commenced. Control is thus transferred to the STM and the logical processor remains in SMM.

33.15.5 Enabling the Dual-Monitor Treatment

Code and data for the SMM-transfer monitor (STM) reside in a region of SMRAM called the **monitor segment** (MSEG). Code running in SMM determines the location of MSEG and establishes its content. This code is also responsible for enabling the dual-monitor treatment.

SMM code enables the dual-monitor treatment and specifies the location of MSEG by writing to the IA32_SMM_MONITOR_CTL MSR (index 9BH). The MSR has the following format:

- Bit 0 is the register's valid bit. The STM may be invoked using VMCALL only if this bit is 1. Because VMCALL is used to activate the dual-monitor treatment (see Section 33.15.6), the dual-monitor treatment cannot be activated if the bit is 0. This bit is cleared when the logical processor is reset.
- Bit 1 is reserved.
- Bit 2 determines whether executions of VMXOFF unblock SMIs under the default treatment of SMIs and SMM. Executions of VMXOFF unblock SMIs unless bit 2 is 1 (the value of bit 0 is irrelevant). See Section 33.14.4. Certain leaf functions of the GETSEC instruction clear this bit (see Chapter 7, "Safer Mode Extensions Reference," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2D).
- Bits 11:3 are reserved.
- Bits 31:12 contain a value that, when shifted left 12 bits, is the physical address of MSEG (the MSEG base address).
- Bits 63:32 are reserved.

The following items detail use of this MSR:

- The IA32_SMM_MONITOR_CTL MSR is supported only on processors that support the dual-monitor treatment.¹ On other processors, accesses to the MSR using RDMSR or WRMSR generate a general-protection fault (#GP(0)).
- A write to the IA32_SMM_MONITOR_CTL MSR using WRMSR generates a general-protection fault (#GP(0)) if executed outside of SMM or if an attempt is made to set any reserved bit. An attempt to write to the IA32_SMM_MONITOR_CTL MSR fails if made as part of a VM exit that does not end in SMM or part of a VM entry that does not begin in SMM.
- Reads from the IA32_SMM_MONITOR_CTL MSR using RDMSR are allowed any time RDMSR is allowed. The MSR may be read as part of any VM exit.
- The dual-monitor treatment can be activated only if the valid bit in the MSR is set to 1.

1. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENDER]. A logical processor is outside SMX operation if GETSEC[SENDER] has not been executed or if GETSEC[SEXIT] was executed after the last execution of GETSEC[SENDER]. See Chapter 7, "Safer Mode Extensions Reference," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2D.

1. Software should consult the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1) to determine whether the dual-monitor treatment is supported.

The 32 bytes located at the MSEG base address are called the **MSEG header**. The format of the MSEG header is given in Table 33-10 (each field is 32 bits).

Table 33-10. Format of MSEG Header

Byte Offset	Field
0	MSEG-header revision identifier
4	SMM-transfer monitor features
8	GDTR limit
12	GDTR base offset
16	CS selector
20	EIP offset
24	ESP offset
28	CR3 offset

To ensure proper behavior in VMX operation, software should maintain the MSEG header in writeback cacheable memory. Future implementations may allow or require a different memory type.¹ Software should consult the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1).

SMM code should enable the dual-monitor treatment (by setting the valid bit in IA32_SMM_MONITOR_CTL MSR) only after establishing the content of the MSEG header as follows:

- Bytes 3:0 contain the **MSEG revision identifier**. Different processors may use different MSEG revision identifiers. These identifiers enable software to avoid using an MSEG header formatted for one processor on a processor that uses a different format. Software can discover the MSEG revision identifier that a processor uses by reading the VMX capability MSR IA32_VMX_MISC (see Appendix A.6).
- Bytes 7:4 contain the **SMM-transfer monitor features** field. Bits 31:1 of this field are reserved and must be zero. Bit 0 of the field is the **IA-32e mode SMM feature bit**. It indicates whether the logical processor will be in IA-32e mode after the STM is activated (see Section 33.15.6).
- Bytes 31:8 contain fields that determine how processor state is loaded when the STM is activated (see Section 33.15.6.5). SMM code should establish these fields so that activating of the STM invokes the STM's initialization code.

33.15.6 Activating the Dual-Monitor Treatment

The dual-monitor treatment may be enabled by SMM code as described in Section 33.15.5. The dual-monitor treatment is activated only if it is enabled and only by the executive monitor. The executive monitor activates the dual-monitor treatment by executing VMCALL in VMX root operation.

When VMCALL activates the dual-monitor treatment, it causes an SMM VM exit. Differences between this SMM VM exit and other SMM VM exits are discussed in Sections 33.15.6.1 through 33.15.6.6. See also “VMCALL—Call to VM Monitor” in Chapter 32.

33.15.6.1 Initial Checks

An execution of VMCALL attempts to activate the dual-monitor treatment if (1) the processor supports the dual-monitor treatment;² (2) the logical processor is in VMX root operation; (3) the logical processor is outside SMM and

1. Alternatively, software may map the MSEG header with the UC memory type; this may be necessary, depending on how memory is organized. Doing so is strongly discouraged unless necessary as it will cause the performance of transitions using those structures to suffer significantly. In addition, the processor will continue to use the memory type reported in the VMX capability MSR IA32_VMX_BASIC with exceptions noted in Appendix A.1.

the valid bit is set in the IA32_SMM_MONITOR_CTL MSR; (4) the logical processor is not in virtual-8086 mode and not in compatibility mode; (5) CPL = 0; and (6) the dual-monitor treatment is not active.

Such an execution of VMCALL begins with some initial checks. These checks are performed before updating the current-VMCS pointer and the executive-VMCS pointer field (see Section 33.15.2.2).

The VMCS that manages SMM VM exit caused by this VMCALL is the current VMCS established by the executive monitor. The VMCALL performs the following checks on the current VMCS in the order indicated:

1. There must be a current VMCS pointer.
2. The launch state of the current VMCS must be clear.
3. The VM-exit controls in the current VMCS must be set properly:
 - Reserved bits in the primary VM-exit controls must be set properly. Software may consult the VMX capability MSRs to determine the proper setting (see Appendix A.4.1).
 - If the “activate secondary controls” primary VM-exit control is 1, reserved bits in the secondary VM-exit controls must be cleared. Software may consult the VMX capability MSRs to determine which bits are reserved (see Appendix A.4.2).
 - If the “activate secondary controls” primary VM-exit control is 0 (or if the processor does not support the 1-setting of that control), no checks are performed on the secondary VM-exit controls. The logical processor operates as if all the secondary VM-exit controls were 0.

If any of these checks fail, subsequent checks are skipped and VMCALL fails. If all these checks succeed, the logical processor uses the IA32_SMM_MONITOR_CTL MSR to determine the base address of MSEG. The following checks are performed in the order indicated:

1. The logical processor reads the 32 bits at the base of MSEG and compares them to the processor’s MSEG revision identifier.
2. The logical processor reads the SMM-transfer monitor features field:
 - Bit 0 of the field is the IA-32e mode SMM feature bit, and it indicates whether the logical processor will be in IA-32e mode after the SMM-transfer monitor (STM) is activated.
 - If the VMCALL is executed on a processor that does not support Intel 64 architecture, the IA-32e mode SMM feature bit must be 0.
 - If the VMCALL is executed in 64-bit mode, the IA-32e mode SMM feature bit must be 1.
 - Bits 31:1 of this field are currently reserved and must be zero.

If any of these checks fail, subsequent checks are skipped and the VMCALL fails.

33.15.6.2 Updating the Current-VMCS and Executive-VMCS Pointers

Before performing the steps in Section 33.15.2.2, SMM VM exits that activate the dual-monitor treatment begin by loading the SMM-transfer VMCS pointer with the value of the current-VMCS pointer.

33.15.6.3 Saving Guest State

As noted in Section 33.15.2.4, SMM VM exits save the contents of the SMBASE register into the corresponding field in the guest-state area. While this is true also for SMM VM exits that activate the dual-monitor treatment, the VMCS used for those VM exits exists outside SMRAM.

The SMM-transfer monitor (STM) can also discover the current value of the SMBASE register by using the RDMSR instruction to read the IA32_SMBASE MSR (MSR address 9EH). The following items detail use of this MSR:

- The MSR is supported only if IA32_VMX_MISC[15] = 1 (see Appendix A.6).
- A write to the IA32_SMBASE MSR using WRMSR generates a general-protection fault (#GP(0)). An attempt to write to the IA32_SMBASE MSR fails if made as part of a VM exit or part of a VM entry.

-
2. Software should consult the VMX capability MSR IA32_VMX_BASIC (see Appendix A.1) to determine whether the dual-monitor treatment is supported.

- A read from the IA32_SMBASE MSR using RDMSR generates a general-protection fault (#GP(0)) if executed outside of SMM. An attempt to read from the IA32_SMBASE MSR fails if made as part of a VM exit that does not end in SMM.

33.15.6.4 Saving MSRs

The VM-exit MSR-store area is not used by SMM VM exits that activate the dual-monitor treatment. No MSRs are saved into that area.

33.15.6.5 Loading Host State

The VMCS that is current during an SMM VM exit that activates the dual-monitor treatment was established by the executive monitor. It does not contain the VM-exit controls and host state required to initialize the STM. For this reason, such SMM VM exits do not load processor state as described in Section 29.5. Instead, state is set to fixed values or loaded based on the content of the MSEG header (see Table 33-10):

- CR0 is set to as follows:
 - PG, NE, ET, MP, and PE are all set to 1.
 - CD and NW are left unchanged.
 - All other bits are cleared to 0.
- CR3 is set as follows:
 - Bits 63:32 are cleared on processors that support IA-32e mode.
 - Bits 31:12 are set to bits 31:12 of the sum of the MSEG base address and the CR3-offset field in the MSEG header.
 - Bits 11:5 and bits 2:0 are cleared (the corresponding bits in the CR3-offset field in the MSEG header are ignored).
 - Bits 4:3 are set to bits 4:3 of the CR3-offset field in the MSEG header.
- CR4 is set as follows:
 - MCE, PGE, CET, PCIDE, and LA57 are cleared.
 - PAE is set to the value of the IA-32e mode SMM feature bit.
 - If the IA-32e mode SMM feature bit is clear, PSE is set to 1 if supported by the processor; if the bit is set, PSE is cleared.
 - All other bits are unchanged.
- DR7 is set to 400H.
- The IA32_DEBUGCTL MSR is cleared to 00000000_00000000H.
- The registers CS, SS, DS, ES, FS, and GS are loaded as follows:
 - All registers are usable.
 - CS.selector is loaded from the corresponding field in the MSEG header (the high 16 bits are ignored), with bits 2:0 cleared to 0. If the result is 0000H, CS.selector is set to 0008H.
 - The selectors for SS, DS, ES, FS, and GS are set to CS.selector+0008H. If the result is 0000H (if the CS selector was FFF8H), these selectors are instead set to 0008H.
 - The base addresses of all registers are cleared to zero.
 - The segment limits for all registers are set to FFFFFFFFH.
 - The AR bytes for the registers are set as follows:
 - CS.Type is set to 11 (execute/read, accessed, non-conforming code segment).
 - For SS, DS, ES, FS, and GS, the Type is set to 3 (read/write, accessed, expand-up data segment).
 - The S bits for all registers are set to 1.
 - The DPL for each register is set to 0.

- The P bits for all registers are set to 1.
- On processors that support Intel 64 architecture, CS.L is loaded with the value of the IA-32e mode SMM feature bit.
- CS.D is loaded with the inverse of the value of the IA-32e mode SMM feature bit.
- For each of SS, DS, ES, FS, and GS, the D/B bit is set to 1.
- The G bits for all registers are set to 1.
- LDTR is unusable. The LDTR selector is cleared to 0000H, and the register is otherwise undefined (although the base address is always canonical)
- GDTR.base is set to the sum of the MSEG base address and the GDTR base-offset field in the MSEG header (bits 63:32 are always cleared on processors that support IA-32e mode). GDTR.limit is set to the corresponding field in the MSEG header (the high 16 bits are ignored).
- IDTR.base is unchanged. IDTR.limit is cleared to 0000H.
- RIP is set to the sum of the MSEG base address and the value of the RIP-offset field in the MSEG header (bits 63:32 are always cleared on logical processors that support IA-32e mode).
- RSP is set to the sum of the MSEG base address and the value of the RSP-offset field in the MSEG header (bits 63:32 are always cleared on logical processor that supports IA-32e mode).
- RFLAGS is cleared, except bit 1, which is always set.
- The logical processor is left in the active state.
- Event blocking after the SMM VM exit is as follows:
 - There is no blocking by STI or by MOV SS.
 - There is blocking by non-maskable interrupts (NMIs) and by SMIs.
- There are no pending debug exceptions after the SMM VM exit.
- For processors that support IA-32e mode, the IA32_EFER MSR is modified so that LME and LMA both contain the value of the IA-32e mode SMM feature bit.

If any of CR3[63:5], CR4.PAE, CR4.PSE, or IA32_EFER.LMA is changing, the TLBs are updated so that, after VM exit, the logical processor does not use translations that were cached before the transition. This is not necessary for changes that would not affect paging due to the settings of other bits (for example, changes to CR4.PSE if IA32_EFER.LMA was 1 before and after the transition).

33.15.6.6 Loading MSRs

The VM-exit MSR-load area is not used by SMM VM exits that activate the dual-monitor treatment. No MSRs are loaded from that area.

33.15.7 Deactivating the Dual-Monitor Treatment

The SMM-transfer monitor may deactivate the dual-monitor treatment and return the processor to default treatment of SMIs and SMM (see Section 33.14). It does this by executing a VM entry with the “deactivate dual-monitor treatment” VM-entry control set to 1.

As noted in Section 28.2.1.3 and Section 33.15.4.1, an attempt to deactivate the dual-monitor treatment fails in the following situations: (1) the processor is not in SMM; (2) the “entry to SMM” VM-entry control is 1; or (3) the executive-VMCS pointer does not contain the VMXON pointer (the VM entry is to VMX non-root operation).

As noted in Section 33.15.4.9, VM entries that deactivate the dual-monitor treatment ignore the SMI bit in the interruptibility-state field of the guest-state area. Instead, the blocking of SMIs following such a VM entry depends on whether the logical processor is in SMX operation:¹

1. A logical processor is in SMX operation if GETSEC[SEXIT] has not been executed since the last execution of GETSEC[SENTER]. A logical processor is outside SMX operation if GETSEC[SENTER] has not been executed or if GETSEC[SEXIT] was executed after the last execution of GETSEC[SENTER]. See Chapter 7, “Safer Mode Extensions Reference,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2D.

- If the logical processor is in SMX operation, SMIs are blocked after VM entry. SMIs may later be unblocked by the VMXOFF instruction (see Section 33.14.4) or by certain leaf functions of the GETSEC instruction (see Chapter 7, “Safer Mode Extensions Reference,” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2D).
- If the logical processor is outside SMX operation, SMIs are unblocked after VM entry.

33.16 SMI AND PROCESSOR EXTENDED STATE MANAGEMENT

On processors that support processor extended states using XSAVE/XRSTOR (see Chapter 13, “Managing State Using the XSAVE Feature Set,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1), the processor does not save any XSAVE/XRSTOR related state on an SMI. It is the responsibility of the SMI handler code to properly preserve the state information (including CR4.OSXSAVE, XCR0, and possibly processor extended states using XSAVE/XRSTOR). Therefore, the SMI handler must follow the rules described in Chapter 13, “Managing State Using the XSAVE Feature Set,” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1.

33.17 MODEL-SPECIFIC SYSTEM MANAGEMENT ENHANCEMENT

This section describes enhancement of system management features that apply only to the 4th generation Intel Core processors. These features are model-specific. BIOS and SMM handler must use CPUID to enumerate Display-Family_DisplayModel signature when programming with these interfaces.

33.17.1 SMM Handler Code Access Control

The BIOS may choose to restrict the address ranges of code that SMM handler executes. When SMM handler code execution check is enabled, an attempt by the SMM handler to execute outside the ranges specified by SMRR (see Section 33.4.2.1) will cause the assertion of an unrecoverable machine check exception (MCE).

The interface to enable SMM handler code access check resides in a per-package scope model-specific register MSR_SMM_FEATURE_CONTROL at address 4E0H. An attempt to access MSR_SMM_FEATURE_CONTROL outside of SMM will cause a #GP. Writes to MSR_SMM_FEATURE_CONTROL is further protected by configuration interface of MSR_SMM_MCA_CAP at address 17DH.

Details of the interface of MSR_SMM_FEATURE_CONTROL and MSR_SMM_MCA_CAP are described in Table 2-29 in Chapter 2, “Model-Specific Registers (MSRs),” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4.

33.17.2 SMI Delivery Delay Reporting

Entry into the system management mode occurs at instruction boundary. In situations where a logical processor is executing an instruction involving a long flow of internal operations, servicing an SMI by that logical processor will be delayed. Delayed servicing of SMI of each logical processor due to executing long flows of internal operation in a physical processor can be queried via a package-scope register MSR_SMM_DELAYED at address 4E2H.

The interface to enable reporting of SMI delivery delay due to long internal flows resides in a per-package scope model-specific register MSR_SMM_DELAYED. An attempt to access MSR_SMM_DELAYED outside of SMM will cause a #GP. Availability to MSR_SMM_DELAYED is protected by configuration interface of MSR_SMM_MCA_CAP at address 17DH.

Details of the interface of MSR_SMM_DELAYED and MSR_SMM_MCA_CAP are described in Table 2-29 in Chapter 2, “Model-Specific Registers (MSRs),” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4.

33.17.3 Blocked SMI Reporting

A logical processor may have entered into a state and blocked from servicing other interrupts (including SMI). Logical processors in a physical processor that are blocked in serving SMI can be queried in a package-scope register MSR_SMM_BLOCKED at address 4E3H. An attempt to access MSR_SMM_BLOCKED outside of SMM will cause a #GP.

Details of the interface of MSR_SMM_BLOCKED is described in Table 2-29 in Chapter 2, “Model-Specific Registers (MSRs),” of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4.

27. Updates to Chapter 34, Volume 3C

Change bars and violet text show changes to Chapter 34 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

Changes to this chapter:

- Inserted new Chapter 34, "Secure Arbitration Mode (SEAM)" and re-numbered subsequent chapters.

CHAPTER 34

SECURE ARBITRATION MODE (SEAM)

This chapter specifies secure arbitration mode (SEAM), an extension of the virtual machines extensions architecture (VMX) that allows running secure virtual machines.

The SEAM architecture is used as a foundation for Trusted Domains Extensions (TDX) architecture. For details about TDX, see *Intel® Trust Domain Extensions (Intel® TDX) — An overview of the Intel TDX technology*.

34.1 MODES OF OPERATION

The SEAM architecture defines a protected mode of operation called SEAM, which is an extension of VMX operation. Like VMX operation, SEAM includes root and non-root operations:

- **SEAM root operation** is the SEAM extension of VMX root operation. The software running in SEAM root operation is called a **SEAM module**. There are two sub-modes to SEAM root operation:
 - **Loader mode**: At most one logical processor can execute in this sub-mode at any time.
 - **Module mode**: Multiple logical processors can execute in this sub-mode in parallel.
- **SEAM non-root operation** is the SEAM extension of VMX non-root operation. The software running in this SEAM non-root operation is called **SEAM guest**. Multiple logical processors can execute in this mode concurrently.

Certain platform operations may be required to enable SEAM; until they are performed, SEAM may be globally disabled. Once SEAM is enabled, it may or may not be ready for execution in loader mode or in module mode (again, possibly based on certain platform operations). Details regarding this enabling are provided in the *Intel® Trust Domain CPU Architectural Extensions*.

The following diagram shows the VMX and SEAM software components, the modes in which they operate, and the transitions between these execution modes.

Figure 34-1. SEAM Modes of Operation

34.1.1 SEAM Calls

Processor transitions from VMX root operation to SEAM root operation are called **SEAM calls**. SEAM calls are initiated by executing the SEAMCALL instruction. A SEAM call operates in a manner similar to that of SMM VM exits (see Section 33.15.2) in response to execution of the VMCALL instruction in VMX root operation. A SEAM call uses a **SEAM-transfer VMCS** that resides within the SEAM range of the physical-address space (see Section 34.4.1).

SEAM calls use RAX[63] to determine the SEAM root operation sub-mode to be entered. When RAX[63] is 0, the transition is into module-mode SEAM root operation; otherwise, it is into loader-mode SEAM root operation. An attempt to enter loader-mode SEAM root operation fails if another logical processor is in SEAM having entered in loader mode.

34.1.2 SEAM Returns

Processor transitions from SEAM root operation back to VMX root operation are called **SEAM returns**. SEAM returns are initiated by executing the SEAMRET instruction. A SEAM return operates in a manner similar to that of VM entries that return from SMM (see Section 33.15.4). Like SEAM calls, SEAM returns use a SEAM-transfer VMCS.

A SEAM return from loader-mode SEAM root operation ensures that all data for any VMCS that the logical processor used in SEAM (including the SEAM-transfer VMCS) are in memory; in addition, there is no current VMCS after such a SEAM return.

34.1.3 SEAM Host-Guest Transitions

Processor transitions between SEAM root operation and SEAM non-root operation are similar to processor transition between VMX root operation and VMX non-root operation. A VMCS used to transition between SEAM root and non-root operation, and to control SEAM non-root operation, is called **SEAM-guest VMCS**.

A SEAM-guest VMCS supports SEAM-specific fields and controls. In general, those fields and controls are ignored outside SEAM.

The SEAM-specific VMCS fields are the following:

- **SEAM-guest KeyID**. This is a VM-execution control field that contains the key identifier (KeyID) assigned for the key with which the SEAM guest's private pages are encrypted in memory.
- **SEAM shared EPT pointer**. This is a VM-execution control field that contains the physical address of the base of shared EPT PML4 table or PML5 table (depending on how EPT is configured).

The SEAM-specific VMX controls are the following:

- **SEAM guest-physical address width**. This is a VM-execution control that determines, for SEAM non-root operation, the width of guest-physical addresses translated by EPT and also the position of the SHARED bit in guest-physical addresses. See Section 34.4.
- **Allow SEAM-guest telemetry**. This is a VM-entry control that allows collection of core telemetry in SEAM non-root operation.

Any processor that supports SEAM also supports the SEAM-specific VMCS fields and controls identified above. Support for the SEAM-specific VMX controls above is enumerated normally by the IA32_VMX_PROCBASED_CTLSS3 MSR (for "SEAM guest-physical address width") and by IA32_VMX_ENTRY_CTLSS MSR (for "allow SEAM-guest telemetry").

SEAM guests must run with EPT enabled. VM entry in SEAM root operation will fail if the "enable EPT" VM-execution control is not set in the SEAM-guest VMCS.

34.2 SEAM AND TME-MK

SEAM interoperates with multi-key total memory encryption (TME-MK). This section explains the specifics of TME-MK related to that interoperation.

The current configuration of TME-MK can be inferred from the contents of the IA32_TME_ACTIVATE MSR (MSR address 982H). The following fields are relevant:

- If `IA32_TME_ACTIVATE[1:0] = 11B`, total-memory encryption (TME) is active.
- `IA32_TME_ACTIVATE.MK_TME_KEYID_BITS[35:32]` specifies the number of bits in a physical address that are interpreted as a key identifier (KeyID). If TME is active and this value is greater than 0, TME-MK is active.
- `IA32_TME_ACTIVATE.TDX_RESERVED_KEYID_BITS[39:36]` specifies the number of KeyID bits that can be used only in SEAM-private KeyIDs (see Section 34.3.2). This value never exceeds `IA32_TME_ACTIVATE.MK_TME_KEYID_BITS`.

Let m be the value enumerated by `CPUID.80000008H:EAX[7:0]`; $k = \text{IA32\_TME\_ACTIVATE.MK\_TME\_KEYID\_BITS}$; and $p = \text{IA32\_TME\_ACTIVATE.TDX\_RESERVED\_KEYID\_BITS}$. Then in any physical address, bits $m-1:m-k$ form a key identifier that is used to select an encryption key (only bits $(m-k)-1:0$ are used to address memory). The `PCONFIG` instruction can be used to specify the encryption key associated with each key identifier. A k -bit key identifier is a **SEAM-private KeyID** if it sets any of bits $k-1:k-p$; thus, a physical address contains a SEAM-private KeyID if it sets any of bits $m-1:m-p$.

The `IA32_MKTME_KEYID_PARTITIONING` MSR (MSR address 87H) enumerates the number of key identifiers available for use:

- `IA32_MKTME_KEYID_PARTITIONING.NUM_MKTME_KIDS[31:0]` enumerates the number of TME-MK key identifiers available for general use. These are numbered 1 to `NUM_MKTME_KIDS` (0 is not considered a TME-MK key identifier).
- `IA32_MKTME_KEYID_PARTITIONING.NUM_TDX_PRIV_KIDS[63:32]` enumerates the number of SEAM-private key identifiers. These are numbered `NUM_MKTME_KIDS + 1` to `NUM_MKTME_KIDS + NUM_TDX_PRIV_KIDS`.

34.3 OPERATION IN SEAM

This section provides details of both SEAM root operation and SEAM non-root operation.

34.3.1 SEAM Root Operation

Processor behavior in SEAM root operation is similar to processor behavior in VMX root operation, with the following differences:

- Software can execute `SEAMRET` and `SEAMOPS`. (Execution of these instructions outside SEAM root operation results in a `#UD` exception.) As noted in Section 34.1.2, execution of `SEAMRET` causes a SEAM return to VMX root operation. `SEAMOPS` is described in *Intel® Trust Domain CPU Architectural Extensions*.
- Software can access a special set of SEAM-only MSRs. An attempt to access a SEAM-only MSR outside SEAM results in a `#GP(0)` exception. (Some may be accessible only in SEAM root operation.) The full set of SEAM-only MSRs is specified in *Intel® Trust Domain CPU Architectural Extensions*.
- An attempt to execute the `VMXOFF` instruction or the `VMCALL` instruction in SEAM root operation results in a `#GP(0)` exception. Software in SEAM cannot leave VMX operation, nor can it invoke an SMM-transfer monitor using an SMM VM exit.
- Entry to SEAM root operation (by either a SEAM call or a VM exit from SEAM non-root operation) blocks NMIs. Execution of `IRET` in SEAM root operation unblocks NMIs normally.
- System-management interrupts (SMIs), uncore machine checks and machine-check SMIs (MSMIs) are masked in SEAM root operation. If pending, they are delivered after leaving SEAM root operation.
- Triple faults and machine checks caused by poisoned cache-line consumption in SEAM root operation cause unbreakable shutdown.

34.3.2 SEAM Non-Root Operation

Processor behavior in SEAM non-root operation is largely the same as that in VMX non-root operation.

System-management interrupts (SMIs) and machine-check SMIs (MSMIs) that occur in SEAM non-root operation cause a VM exit instead of being delivered normally. The SMI or MSMI remains pending and will be delivered following the next SEAM return.

The remainder of this section explains the changes in SEAM non-root operation with regard to the use of guest-physical addresses.

As noted in Section 34.1.3, VM entry to SEAM non-root operation requires EPT to be enabled. Thus, all addresses used by guest software as physical addresses (e.g., addresses in the guest's paging structures) are treated as guest-physical addresses and are thus translated by EPT. Translation by EPT in SEAM non-root operation differs somewhat from that in ordinary VMX non-root operation.

In VMX non-root operation, the width of guest-physical addresses is either 48 bits (if 4-level EPT is in use) or 52 bits (for 5-level EPT). In SEAM non-root operation, the guest-physical address width is 48 bits if the "SEAM guest-physical address width" VM-execution control is 0 (even if 5-level EPT is in use).

If the guest-physical address width is 48, an access to a guest-physical address that sets bits in the range 51:48 causes an EPT violation. (This is not the case with 5-level EPT outside SEAM. In SEAM, this occurs with 5-level paging as long as the "SEAM guest-physical address width" VM-execution control is 0.)

The uppermost bit in a guest-physical address (bit 47 or bit 51 as appropriate) is defined to be the address's "SHARED" bit. Guest-physical addresses that clear this bit are **SEAM-guest private addresses**; those that set this bit are **SEAM-guest shared addresses**.

Certain situations in SEAM non-root operation require SEAM-guest private addresses:

- Instruction fetches are limited to SEAM-guest private addresses. An attempt to fetch an instruction from a SEAM-guest shared address results in a general-protection exception (#GP(0)).
- CR3 must contain a SEAM-guest private address. An attempt to load CR3 with a SEAM-guest shared address results in #GP(0).
- With PAE paging, each of the PDPTs registers must contain a SEAM-guest private address. An attempt to load any PDPT register with a SEAM-guest shared address results in #GP(0).
- The guest paging structures must be located at SEAM-guest private addresses. If linear-address translation encounters a paging-structure entry that references a paging structure with a SEAM-guest shared address, a page fault (#PF) occurs. The error code will set bit 3, indicating that a reserved bit was set.

Translation of guest-physical addresses differs for private and shared addresses:

- Translation of a SEAM-guest private address uses EPT paging structures located using the EPTP field in the VMCS.
 - Any physical address used to access an EPT paging structure is modified as follows. Let k be the value of `IA32_TME_ACTIVATE.MK_TME_KEYID_BITS[35:32]` and M be the value enumerated by `CPUID.80000008H:EAX[7:0]`. Before being used to access memory, bits $M-1:M-k$ of the physical address are replaced by bits $k-1:0$ of the SEAM-guest KeyID field in the VMCS.
 - The final physical address (to which the original SEAM-guest private address is being translated) is also modified in the manner described in the previous paragraph.
- Translation of a SEAM-guest shared address uses EPT paging structures located using the SEAM shared EPT pointer in the VMCS.
 - Bits 7:0 of the EPTP field (not the SEAM shared EPT pointer) control the translation of the guest-physical address.
 - Any physical address used to access an EPT paging structure should not use a SEAM-private KeyID (see Section 34.2).

If translation of a SEAM-guest shared address would access an EPT paging structure with a SEAM-private KeyID, an EPT misconfiguration occurs.

 - The final physical address (to which the original SEAM-guest shared address is being translated) also must not contain a SEAM-private KeyID; otherwise, an EPT misconfiguration occurs.

34.4 MEMORY PROTECTION

This section specifies access controls and cryptographic measures applied to protect software running in SEAM root operation (SEAM modules) and SEAM non-root operation (SEAM guests).

34.4.1 SEAM Range

The SEAM range is a physical memory range sequestered for SEAM modules. The range is allocated using range-register MSRs `IA32_SEAMRR_BASE` (index 1400H) and `IA32_SEAMRR_MASK` (index 1401H). The existence of these MSRs is enumerated by bit 15 of `IA32_MTRRCAP` (MSR address FEH). Processors that support SEAM architecture return `IA32_MTRRCAP` bit 15 as 1. For more information about these MSRs, see Chapter 2 in Volume 4 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual*.

The SEAM range is divided into a **module sub-range** and a **loader sub-range**.

Bit 11 of `IA32_SEAMRR_MASK` MSR indicates whether the SEAM range is valid and protected. When this bit is 1, the processor provides the SEAM range with cryptographic and access-control protections as follows:

- Outside SEAM root operation, accesses to the physical addresses in the SEAM range are aborted, meaning that writes are ignored and reads return values with all bits set to 1.
- The following items apply in SEAM root operation:
 - Accesses to the module sub-range of the SEAM range are allowed.
 - Accesses to the loader sub-range of the SEAM range are allowed only in loader-mode SEAM root operation; otherwise they are aborted (see above).
 - Instruction fetches from physical addresses outside the SEAM range are prevented by the processor (the response to such attempts is implementation-specific).
- The contents of the SEAM range are encrypted by the TME-MK engine. The encryption key is machine-specific. It's typically an "ephemeral" key that is generated each time the platform is restarted.

Accesses to SEAM range when `CR0.CD = 0` use the writeback (WB) memory type regardless of the MTRR and PAT registers. If `CR0.CD = 1`, accesses use the uncacheable (UC) memory type.

34.4.2 Memory Protections

Outside SEAM, registers holding physical addresses cannot be loaded with physical addresses with SEAM-private KeyIDs (see Section 34.3.2):

- Attempts to load control registers and MSRs with a physical address with a SEAM-private KeyID results in a general-protection exception. This does not apply to loads of the `IA32_RTIT_OUTPUT_BASE` MSR (using `WRMSR`, `WRMSRLIST`, `WRMSRNS`, or `XRSTORS`), as that MSR is checked at another time (see below).
- Linear-address translation without EPT that encounters a paging-structure entry with a physical address with a SEAM-private KeyID results in a page fault.
- Guest-physical-address translation with EPT that encounters an EPT paging-structure entry with a physical address with a SEAM-private KeyID results in an EPT misconfiguration.
- VM entry fails if it would use or load a physical address (from a VMCS field other than the SEAM shared EPT pointer) that contains a SEAM-private KeyID.
- The value of the physical address loaded into `IA32_RTIT_OUTPUT_BASE` MSR is checked when processor trace is enabled (when `IA32_RTIT_CTL.TraceEn` is set to 1), as is the physical address of a new output buffer when it is loaded from the table of physical addresses (ToPA).

If, despite the limitations identified above, there is an access using a physical address with a SEAM-private KeyID (perhaps because an MSR had been loaded before TME was activated), the access is aborted, meaning that writes are ignored and reads return values with all bits set to 1.

A cacheline that was written with a physical address with a SEAM-private KeyID cannot be read using a physical address with a different KeyID. The memory-protection mode supported by a particular processor is machine-dependent. For information about memory protection modes, see *Intel® Architecture Memory Protections for Confidential Compute Usages*.

34.5 SEAM INSTRUCTION REFERENCE

The SEAM architecture includes the following instructions:

- **SEAMCALL.** Execution causes a SEAM call (see Section 34.1.1) to enter SEAM root operation. It can be used by virtual-machine monitors (operating in VMX root operation) to call SEAM module services.
- **TDCALL.** Execution causes a VM exit from SEAM non-root operation to SEAM root operation. It can be used by SEAM guests to request SEAM-module services.
- **SEAMOPS.** Execution invokes SEAM-specific operation. It is used by SEAM modules to execute such operations.
- **SEAMRET.** Execution causes a SEAM return (Section 34.1.2) that leaves SEAM root operation. It is used by SEAM modules to return to the calling virtual-machine monitor.

SEAMCALL and TDCALL are described later in this section. SEAMOPS and SEAMRET can be executed only in SEAM root operation. Details are given in *Intel® Trust Domain CPU Architectural Extensions*, while the following items provide high-level information:

- **SEAMOPS.** The SEAMOPS instruction allows software running in SEAM root operation to invoke SEAM-specific operations. Some of these operations can be invoked only in loader mode.
- **SEAMRET.**
 - SEAMRET is a privileged instruction that allows software running in SEAM root operation to return to VMX root operation.
 - The instruction causes a SEAM return (see Section 34.1.2) using the SEAM-transfer VMCS. This transition is similar to VM entries that return from SMM (see Section 33.15.4).

An attempt to execute a SEAM instruction on a processor that does not support SEAM results in an invalid-opcode exception (#UD).

SEAMCALL—Enter SEAM Root Operation

Opcode	Instruction	Op/En	64-bit Mode	Compat/Leg Mode	Description
66 0F 01 CF	SEAMCALL	Z0	Invalid	Valid	Transitions to SEAM root operation.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
Z0	N/A	N/A	N/A	N/A

Description

SEAMCALL is a privileged instruction that passes control to software running in SEAM root operation. The instruction can be executed only in 64-bit mode in VMX root operation outside SEAM and outside SMM.

Execution when the SEAM range is not valid (IA32_SEAMRR_MASK MSR[11] = 0) or immediately following execution of MOV to SS or POP SS instruction results in a general-protection exception (#GP).

The instruction uses RAX[63] to select a sub-mode of SEAM root operation: if this value is 1, the instruction transitions into loader-mode SEAM root operation; otherwise, it transitions into module-mode SEAM root operation. The instruction fails with VMFailInvalid indication (see Section 34.2) if SEAM is globally disabled; or if a loader-mode SEAM root operation is called when another logical processor is in SEAM having entered in loader mode.

If there is no failure, the SEAMCALL uses the SEAM-transfer VMCS to effect a SEAM call (see Section 34.1.1). The details of such transitions are specified in the *Intel® Trust Domain CPU Architectural Extensions*.

Operation

```

IF not in VMX operation or in SMM or in SEAM or IA32_EFER.LMA = 0 or CS.L = 0
    THEN #UD;
ELSIF CPL > 0
    THEN #GP(0);
ELSIF in VMX non-root operation
    THEN VM exit;
ELSIF IA32_SEAMRR_MASK.VALID = 0 or events blocked by MOV SS
    THEN #GP(0);
ELSIF SEAM is globally disabled
    THEN VMFailInvalid;
ELSIF RAX[63] = 0
    THEN
        IF module-mode SEAM root operation is not ready for execution
            THEN VMFailInvalid;
        ELSE
            Enter module-mode SEAM root operation;
        FI;
    ELSE
        IF loader-mode SEAM root operation is not ready for execution or
           another logical processor is executing in SEAM having entered in loader mode
            THEN VMFailInvalid;
        ELSE
            Enter loader-mode SEAM root operation;
        FI;
    FI;

```

Flags Affected

See the Operation section above and Section 34.2.

Protected Mode Exceptions

#UD SEAMCALL is not recognized in protected mode.

Real-Address Mode Exceptions

#UD SEAMCALL is not recognized in real-address mode.

Virtual-8086 Mode Exceptions

#UD SEAMCALL is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

#UD SEAMCALL is not recognized in compatibility mode.

64-Bit Mode Exceptions

#GP(0) If the current privilege level is not 0.
If the SEAM range is not valid.
If events blocked by MOV SS.
#UD If executed outside VMX operation.
If executed in system-management mode (SMM).
If executed in SEAM.

TDCALL—Call SEAM Module

Op/En	Instruction	Op/En	64-bit Mode	Compat/Leg Mode	Description
66 0F 01 CC	TDCALL	Z0	Invalid	Valid	Call SEAM monitor from SEAM guest.

Instruction Operand Encoding

Op/En	Operand 1	Operand 2	Operand 3	Operand 4
Z0	N/A	N/A	N/A	N/A

Description

TDCALL is a privileged instruction that allows software running in SEAM non-root operation to call software running in SEAM root operation. The instruction can be executed only in SEAM non-root operation or VMX non-root operation.

In SEAM non-root operation or VMX non-root operation, execution causes a VM exit with exit reason 77 (TDCALL).

Operation

```
IF not in SEAM non-root operation and not in VMX non-root operation
    THEN #UD;
ELSIF CPL > 0
    THEN #GP(0);
ELSE VM exit;
FI;
```

Flags Affected

See the Operation section above and Section 34.2.

Protected Mode Exceptions

#UD If executed outside VMX non-root operation and outside SEAM non-root operation.
 #GP(0) If the current privilege level is not 0.

Real-Address Mode Exceptions

#UD If executed outside VMX non-root operation and outside SEAM non-root operation.

Virtual-8086 Mode Exceptions

#GP(0) TDCALL is not recognized in virtual-8086 mode.

Compatibility Mode Exceptions

Same as protected mode exceptions.

64-Bit Mode Exceptions

Same as protected mode exceptions.

28. Updates to Chapter 35, Volume 3C

Change bars and violet text show changes to Chapter 35 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

Changes to this chapter:

- Chapter 35, "Intel® Processor Trace" was previously numbered as 34. With the insertion of the new SEAM chapter (chapter 34), this was subsequently re-numbered.
- In Section 35.2.7.2, "Table of Physical Addresses (ToPA)", added footnote to ToPA Table Entry Format for MAXPHYADDR and updated the ToPA entry base address physical address bits for alignment violations described in ToPA Errors.
- Added PRMRR and SEAMRR protected regions to Table 35-5 in Section 35.2.7.4, "Restricted Memory Access".
- In Section 35.2.8.7, "IA32_RTIT_OUTPUT_BASE MSR" added description for processor's physical-address width, MAXPHYADDR. In addition, Table 35-8 was updated to include bit field M-1:MAXPHYADDR.

CHAPTER 35

INTEL® PROCESSOR TRACE

35.1 OVERVIEW

Intel® Processor Trace (**Intel PT**) is an extension of Intel® Architecture that captures information about software execution using dedicated hardware facilities that cause only minimal performance perturbation to the software being traced. This information is collected in **data packets**. The initial implementations of Intel PT offer **control flow tracing**, which generates a variety of packets to be processed by a software decoder. The packets include timing, program flow information (e.g., branch targets, branch taken/not taken indications) and program-induced mode related information (e.g., Intel TSX state transitions, CR3 changes). These packets may be buffered internally before being sent to the memory subsystem or other output mechanism available in the platform. Debug software can process the trace data and reconstruct the program flow.

Intel Processor Trace was first introduced in Intel® processors based on Broadwell microarchitecture and Intel Atom® processors based on Goldmont microarchitecture. Later generations include additional trace sources, including software trace instrumentation using PTWRITE, and Power Event tracing.

35.1.1 Features and Capabilities

Intel PT's control flow trace generates a variety of packets that, when combined with the binaries of a program by a post-processing tool, can be used to produce an exact execution trace. The packets record flow information such as instruction pointers (IP), indirect branch targets, and directions of conditional branches within contiguous code regions (basic blocks).

Intel PT can also be configured to log software-generated packets using PTWRITE, and packets describing processor power management events. Further, Precise Event-Based Sampling (PEBS) can be configured to log PEBS records in the Intel PT trace; see Section 21.5.5.2.

In addition, the packets record other contextual, timing, and bookkeeping information that enables both functional and performance debugging of applications. Intel PT has several control and filtering capabilities available to customize the tracing information collected and to append other processor state and timing information to enable debugging. For example, there are modes that allow packets to be filtered based on the current privilege level (CPL) or the value of CR3.

Configuration of the packet generation and filtering capabilities are programmed via a set of MSRs. The MSRs generally follow the naming convention of IA32_RTIT_*. The capability provided by these configuration MSRs are enumerated by CPUID, see Section 35.3. Details of the MSRs for configuring Intel PT are described in Section 35.2.8.

35.1.1.1 Packet Summary

After a tracing tool has enabled and configured the appropriate MSRs, the processor will collect and generate trace information in the following categories of packets (for more details on the packets, see Section 35.4):

- Packets about basic information on program execution; these include:
 - Packet Stream Boundary (PSB) packets: PSB packets act as 'heartbeats' that are generated at regular intervals (e.g., every 4K trace packet bytes). These packets allow the packet decoder to find the packet boundaries within the output data stream; a PSB packet should be the first packet that a decoder looks for when beginning to decode a trace.
 - Paging Information Packet (PIP): PIPs record modifications made to the CR3 register. This information, along with information from the operating system on the CR3 value of each process, allows the debugger to attribute linear addresses to their correct application source.
 - Time-Stamp Counter (TSC) packets: TSC packets aid in tracking wall-clock time, and contain some portion of the software-visible time-stamp counter.
 - Core Bus Ratio (CBR) packets: CBR packets contain the core:bus clock ratio.

- Mini Time Counter (MTC) packets: MTC packets provide periodic indication of the passing of wall-clock time.
- Cycle Count (CYC) packets: CYC packets provide indication of the number of processor core clock cycles that pass between packets.
- Overflow (OVF) packets: OVF packets are sent when the processor experiences an internal buffer overflow, resulting in packets being dropped. This packet notifies the decoder of the loss and can help the decoder to respond to this situation.
- Packets about control flow information:
 - Taken Not-Taken (TNT) packets: TNT packets track the “direction” of direct conditional branches (taken or not taken).
 - Target IP (TIP) packets: TIP packets record the target IP of indirect branches, exceptions, interrupts, and other branches or events. These packets can contain the IP, although that IP value may be compressed by eliminating upper bytes that match the last IP. There are various types of TIP packets; they are covered in more detail in Section 35.4.2.2.
 - Flow Update Packets (FUP): FUPs provide the source IP addresses for asynchronous events (interrupt and exceptions), as well as other cases where the source address cannot be determined from the binary.
 - MODE packets: These packets provide the decoder with important processor execution information so that it can properly interpret the dis-assembled binary and trace log. MODE packets have a variety of formats that indicate details such as the execution mode (16-bit, 32-bit, or 64-bit).
- Packets inserted by software:
 - PTWRITE (PTW) packets: includes the value of the operand passed to the PTWRITE instruction (see “PTWRITE—Write Data to a Processor Trace Packet” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B).
- Packets about processor power management events:
 - MWAIT packets: Indicate successful completion of an MWAIT operation to a C-state deeper than C0.0.
 - Power State Entry (PWRE) packets: Indicate entry to a C-state deeper than C0.0.
 - Power State Exit (PWRX) packets: Indicate exit from a C-state deeper than C0.0, returning to C0.
 - Execution Stopped (EXSTOP) packets: Indicate that software execution has stopped, due to events such as P-state change, C-state change, or thermal throttling.
- Packets containing groups of processor state values:
 - Block Begin Packets (BBP): Indicate the type of state held in the following group.
 - Block Item Packets (BIP): Indicate the state values held in the group.
 - Block End Packets (BEP): Indicate the end of the current group.

35.2 INTEL® PROCESSOR TRACE OPERATIONAL MODEL

This section describes the overall Intel Processor Trace mechanism and the essential concepts relevant to how it operates.

35.2.1 Change of Flow Instruction (COFI) Tracing

A basic program block is a section of code where no jumps or branches occur. The instruction pointers (IPs) in this block of code need not be traced, as the processor will execute them from start to end without redirecting code flow. Instructions such as branches, and events such as exceptions or interrupts, can change the program flow. These instructions and events that change program flow are called Change of Flow Instructions (COFI). There are three categories of COFI:

- Direct transfer COFI.
- Indirect transfer COFI.
- Far transfer COFI.

The following subsections describe the COFI events that result in trace packet generation. Table 35-1 lists branch instruction by COFI types. For detailed description of specific instructions, see the Intel® 64 and IA-32 Architectures Software Developer's Manual.

Table 35-1. COFI Type for Branch Instructions

COFI Type	Instructions
Conditional Branch	JA, JAE, JB, JBE, JC, JCXZ, JECXZ, JRCXZ, JE, JG, JGE, JL, JLE, JNA, JNAE, JNB, JNBE, JNC, JNE, JNG, JNGE, JNL, JNLE, JNO, JNP, JNS, JNZ, JO, JP, JPE, JPO, JS, JZ, LOOP, LOOPE, LOOPNE, LOOPNZ, LOOPZ
Unconditional Direct Branch	JMP (E9 xx, EB xx), CALL (E8 xx)
Indirect Branch	JMP (FF /4), CALL (FF /2), RET (C3, C2 xx)
Far Transfers	INT1, INT3, INT <i>n</i> , INTO, IRET, IRETD, IRETQ, JMP (EA xx, FF /5), CALL (9A xx, FF /3), RET (CB, CA xx), SYSCALL, SYSRET, SYSENTER, SYSEXIT, VMLAUNCH, VMRESUME

35.2.1.1 Direct Transfer COFI

Direct Transfer COFI are relative branches. This means that their target is an IP whose offset from the current IP is embedded in the instruction bytes. It is not necessary to indicate target of these instructions in the trace output since it can be obtained through the source disassembly. Conditional branches need to indicate only whether the branch is taken or not. Unconditional branches do not need any recording in the trace output. There are two sub-categories:

- **Conditional Branch (Jcc, J*CXZ) and LOOP**

To track this type of instruction, the processor encodes a single bit (taken or not taken — TNT) to indicate the program flow after the instruction.

Jcc, J*CXZ, and LOOP can be traced with TNT bits. To improve the trace packet output efficiency, the processor will compact several TNT bits into a single packet.

- **Unconditional Direct Jumps**

There is no trace output required for direct unconditional jumps (like JMP near relative or CALL near relative) since they can be directly inferred from the application assembly. Direct unconditional jumps do not generate a TNT bit or a Target IP packet, though TIP.PGD and TIP.PGE packets can be generated by unconditional direct jumps that toggle Intel PT enables (see Section 35.2.6).

35.2.1.2 Indirect Transfer COFI

Indirect transfer instructions involve updating the IP from a register or memory location. Since the register or memory contents can vary at any time during execution, there is no way to know the target of the indirect transfer until the register or memory contents are read. As a result, the disassembled code is not sufficient to determine the target of this type of COFI. Therefore, tracing hardware must send out the destination IP in the trace packet for debug software to determine the target address of the COFI. Note that this IP may be a linear or effective address (see Section 35.3.1.1).

An indirect transfer instruction generates a Target IP Packet (TIP) that contains the target address of the branch. There are two sub-categories:

- **Near JMP Indirect and Near Call Indirect**

As previously mentioned, the target of an indirect COFI resides in the contents of either a register or memory location. Therefore, the processor must generate a packet that includes this target address to allow the decoder to determine the program flow.

- **Near RET**

When a CALL instruction executes, it pushes onto the stack the address of the next instruction following the CALL. Upon completion of the call procedure, the RET instruction is often used to pop the return address off of the call stack and redirect code flow back to the instruction following the CALL.

A RET instruction simply transfers program flow to the address it popped off the stack. Because a called procedure may change the return address on the stack before executing the RET instruction, debug software

can be misled if it assumes that code flow will return to the instruction following the last CALL. Therefore, even for near RET, a Target IP Packet may be sent.

— RET Compression

A special case is applied if the target of the RET is consistent with what would be expected from tracking the CALL stack. If it is assured that the decoder has seen the corresponding CALL (with “corresponding” defined as the CALL with matching stack depth), and the RET target is the instruction after that CALL, the RET target may be “compressed”. In this case, only a single TNT bit of “taken” is generated instead of a Target IP Packet. To ensure that the decoder will not be confused in cases of RET compression, only RETs that correspond to CALLs which have been seen since the last PSB packet may be compressed in a given logical processor. For details, see “Indirect Transfer Compression for Returns (RET)” in Section 35.4.2.2.

35.2.1.3 Far Transfer COFI

All operations that change the instruction pointer and are not near jumps are “far transfers”. This includes exceptions, interrupts, traps, TSX aborts, and instructions that do far transfers.

All far transfers will produce a Target IP (TIP) packet, which provides the destination IP address. For those far transfers that cannot be inferred from the binary source (e.g., asynchronous events such as exceptions and interrupts), the TIP will be preceded by a Flow Update packet (FUP), which provides the source IP address at which the event was taken. Table 35-23 indicates exactly which IP will be included in the FUP generated by a far transfer.

35.2.2 Software Trace Instrumentation with PTWRITE

PTWRITE provides a mechanism by which software can instrument the Intel PT trace. PTWRITE is a ring3-accessible instruction that can be passed to a register or memory variable, see “PTWRITE—Write Data to a Processor Trace Packet” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B, for details. The contents of that variable will be used as the payload for the PTW packet (see Table 35-40 “PTW Packet Definition”), inserted at the time of PTWRITE retirement, assuming PTWRITE is enabled and all other filtering conditions are met. Decode and analysis software will then be able to determine the meaning of the PTWRITE packet based on the IP of the associated PTWRITE instruction.

PTWRITE is enabled via IA32_RTIT_CTL.PTWEn[12] (see Table 35-6). Optionally, the user can use IA32_RTIT_CTL.FUPonPTW[5] to enable PTW packets to be followed by FUP packets containing the IP of the associated PTWRITE instruction. Support for PTWRITE is introduced in Intel Atom processors based on the Goldmont Plus microarchitecture.

35.2.3 Power Event Tracing

Power Event Trace is a capability that exposes core- and thread-level sleep state and power down transition information. When this capability is enabled, the trace will expose information about:

- Scenarios where software execution stops.
 - Due to sleep state entry, frequency change, or other powerdown.
 - Includes the IP, when in the tracing context.
- The requested and resolved hardware thread C-state.
 - Including indication of hardware autonomous C-state entry.
- The last and deepest core C-state achieved during a sleep session.
- The reason for C-state wake.

This information is in addition to the bus ratio (CBR) information provided by default after any powerdown, and the timing information (TSC, TMA, MTC, CYC) provided during or after a powerdown state.

Power Event Trace is enabled via IA32_RTIT_CTL.PwrEvtEn[4]. Support for Power Event Tracing is introduced in Intel Atom processors based on the Goldmont Plus microarchitecture.

35.2.4 Event Tracing

Event Trace is a capability that exposes details about the asynchronous events, when they are generated, and when their corresponding software event handler completes execution. These include:

- Interrupts, including NMI and SMI, including the interrupt vector when defined.
- Faults, exceptions including the fault vector.
 - Page faults additionally include the page fault address, when in context.
- Event handler returns, including IRET and RSM.
- VM exits and VM entries.¹
 - VM exits include the values written to the “exit reason” and “exit qualification” VMCS fields.
- INIT and SIPI events.
- TSX aborts, including the abort status returned for the RTM instructions.
- Shutdown.

Additionally, it provides indication of the status of the Interrupt Flag (IF), to indicate when interrupts are masked.

Event Trace is enabled via `IA32_RTIT_CTL.EventEn[31]`. Event Trace information is conveyed in Control Flow Event (CFE) and Event Data (EVD) packets, as well as the legacy `MODE.Exec` packet. See Section 35.4.2 for packet details. Support for Event Trace is introduced in Intel® processors based on Gracemont microarchitecture.

35.2.5 Trace Filtering

Intel Processor Trace provides filtering capabilities, by which the debug/profile tool can control what code is traced.

35.2.5.1 Filtering by Current Privilege Level (CPL)

Intel PT provides the ability to configure a logical processor to generate trace packets only when `CPL = 0`, when `CPL > 0`, or regardless of CPL.

CPL filtering ensures that no IPs or other architectural state information associated with the filtered CPL can be seen in the log. For example, if the processor is configured to trace only when `CPL > 0`, and software executes `SYSCALL` (changing the CPL to 0), the destination IP of the `SYSCALL` will be suppressed from the generated packet (see the discussion of `TIP.PGD` in Section 35.4.2.5).

It should be noted that CPL is always 0 in real-address mode and that CPL is always 3 in virtual-8086 mode. To trace code in these modes, filtering should be configured accordingly.

When software is executing in a non-enabled CPL, `ContextEn` is cleared. See Section 35.2.6.1 for details.

35.2.5.2 Filtering by CR3

Intel PT supports a CR3-filtering mechanism by which the generation of packets containing architectural states can be enabled or disabled based on the value of CR3. A debugger can use CR3 filtering to trace only a single application without context switching the state of the RTIT MSRs. For the reconstruction of traces from software with multiple threads, debug software may wish to context-switch for the state of the RTIT MSRs (if the operating system does not provide context-switch support) to separate the output for the different threads (see Section 35.3.5, “Context Switch Consideration”).

To trace for only a single CR3 value, software can write that value to the `IA32_RTIT_CR3_MATCH` MSR, and set `IA32_RTIT_CTL.CR3Filter`. When CR3 value does not match `IA32_RTIT_CR3_MATCH` and `IA32_RTIT_CTL.CR3Filter` is 1, `ContextEn` is forced to 0, and packets containing architectural states will not be generated. Some other packets can be generated when `ContextEn` is 0; see Section 35.2.6.3 for details. When CR3 does match `IA32_RTIT_CR3_MATCH` (or when `IA32_RTIT_CTL.CR3Filter` is 0), CR3 filtering does not force `ContextEn` to 0 (although it could be 0 due to other filters or modes).

1. Logging of VMX transitions depends on VMCS configuration, see Section 35.5.1.

CR3 matches IA32_RTIT_CR3_MATCH if the two registers are identical for bits 63:12, or 63:5 when in PAE paging mode; the lower 5 bits of CR3 and IA32_RTIT_CR3_MATCH are ignored. CR3 filtering is independent of the value of CR0.PG.

When CR3 filtering is in use, PIP packets may still be seen in the log if the processor is configured to trace when CPL = 0 (IA32_RTIT_CTL.OS = 1). If not, no PIP packets will be seen.

35.2.5.3 Filtering by IP

Trace packet generation with configurable filtering by IP is supported if CPUID.14H.00H:EBX[2] = 1. Intel PT can be configured to enable the generation of packets containing architectural states only when the processor is executing code within certain IP ranges. If the IP is outside of these ranges, generation of some packets is blocked.

IP filtering is enabled using the ADDRn_CFG fields in the IA32_RTIT_CTL MSR (Section 35.2.8.2), where the digit 'n' is a zero-based number that selects which address range is being configured. Each ADDRn_CFG field configures the use of the register pair IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B (Section 35.2.8.5). IA32_RTIT_ADDRn_A defines the base and IA32_RTIT_ADDRn_B specifies the limit of the range in which tracing is enabled. Thus each range, referred to as the ADDRn range, is defined by [IA32_RTIT_ADDRn_A, IA32_RTIT_ADDRn_B]. There can be multiple such ranges, software can query CPUID (Section 35.3.1) for the number of ranges supported on a processor.

Default behavior (ADDRn_CFG=0) defines no IP filter range, meaning FilterEn is always set. In this case code at any IP can be traced, though other filters, such as CR3 or CPL, could limit tracing. When ADDRn_CFG is set to enable IP filtering (see Section 35.3.1), tracing will commence when a taken branch or event is seen whose target address is in the ADDRn range.

While inside a tracing region and with FilterEn is set, leaving the tracing region may only be detected once a taken branch or event with a target outside the range is retired. If an ADDRn range is entered or exited by executing the next sequential instruction, rather than by a control flow transfer, FilterEn may not toggle immediately. See Section 35.2.6.5 for more details on FilterEn.

Note that these address range base and limit values are inclusive, such that the range includes the first and last instruction whose first instruction byte is in the ADDRn range.

Depending upon processor implementation, IP filtering may be based on linear or effective address. This can cause different behavior between implementations if CSbase is not equal to zero or in real mode. See Section 35.3.1.1 for details. Software can query CPUID to determine filters are based on linear or effective address (Section 35.3.1).

Note that some packets, such as MTC (Section 35.3.7) and other timing packets, do not depend on FilterEn. For details on which packets depend on FilterEn, and hence are impacted by IP filtering, see Section 35.4.1.

TraceStop

The ADDRn ranges can also be configured to cause tracing to be disabled upon entry to the specified region. This is intended for cases where unexpected code is executed, and the user wishes to immediately stop generating packets in order to avoid overwriting previously written packets.

The TraceStop mechanism works much the same way that IP filtering does, and uses the same address comparison logic. The TraceStop region base and limit values are programmed into one or more ADDRn ranges, but IA32_RTIT_CTL.ADDRn_CFG is configured with the TraceStop encoding. Like FilterEn, TraceStop is detected when a taken branch or event lands in a TraceStop region.

Further, TraceStop requires that TriggerEn=1 at the beginning of the branch/event, and ContextEn=1 upon completion of the branch/event. When this happens, the CPU will set IA32_RTIT_STATUS.Stopped, thereby clearing TriggerEn and hence disabling packet generation. This may generate a TIP.PGD packet with the target IP of the branch or event that entered the TraceStop region. Finally, a TraceStop packet will be inserted, to indicate that the condition was hit.

If a TraceStop condition is encountered during buffer overflow (Section 35.3.8), it will not be dropped, but will instead be signaled once the overflow has resolved.

Note that a TraceStop event does not guarantee that all internally buffered packets are flushed out of internal buffers. To ensure that this has occurred, the user should clear TraceEn.

To resume tracing after a TraceStop event, the user must first disable Intel PT by clearing IA32_RTIT_CTL.TraceEn before the IA32_RTIT_STATUS.Stopped bit can be cleared. At this point Intel PT can be reconfigured, and tracing resumed.

Note that the IA32_RTIT_STATUS.Stopped bit can also be set using the ToPA STOP bit. See Section 35.2.7.2.

IP Filtering Example

The following table gives an example of IP filtering behavior. Assume that IA32_RTIT_ADDRn_A = the IP of RangeBase, and that IA32_RTIT_ADDRn_B = the IP of RangeLimit, while IA32_RTIT_CTL.ADDRn_CFG = 0x1 (enable ADDRn range as a FilterEn range).

Table 35-2. IP Filtering Packet Example

Code Flow	Packets
<pre> Bar: jmp RangeBase // jump into filter range RangeBase: jcc Foo // not taken add eax, 1 Foo: jmp RangeLimit+1 // jump out of filter range RangeLimit: nop jcc Bar </pre>	<pre> TIP.PGE(RangeBase) TNT(0) TIP.PGD(RangeLimit+1) </pre>

IP Filtering and TraceStop

It is possible for the user to configure IP filter range(s) and TraceStop range(s) that overlap. In this case, code executing in the non-overlapping portion of either range will behave as would be expected from that range. Code executing in the overlapping range will get TraceStop behavior.

35.2.6 Packet Generation Enable Controls

Intel Processor Trace includes a variety of controls that determine whether a packet is generated. In general, most packets are sent only if Packet Enable (**PacketEn**) is set. PacketEn is an internal state maintained in hardware in response to software configurable enable controls, PacketEn is not visible to software directly. The relationship of PacketEn to the software-visible controls in the configuration MSRs is described in this section.

35.2.6.1 Packet Enable (PacketEn)

When PacketEn is set, the processor is in the mode that Intel PT is monitoring. PacketEn is composed of other states according to this relationship:

```
PacketEn := TriggerEn AND ContextEn AND FilterEn AND BranchEn
```

These constituent controls are detailed in the following subsections.

PacketEn ultimately determines when the processor is tracing. When PacketEn is set, all control flow packets are enabled. When PacketEn is clear, no control flow packets are generated, though other packets (timing and book-keeping packets) may still be sent. See Section 35.2.7 for details of PacketEn and packet generation.

Note that, on processors that do not support IP filtering (i.e., CPUID.14H.00H:EBX[2] = 0), FilterEn is treated as always set.

35.2.6.2 Trigger Enable (TriggerEn)

Trigger Enable (**TriggerEn**) is the primary indicator that trace packet generation is active. TriggerEn is set when IA32_RTIT_CTL.TraceEn is set, and cleared by any of the following conditions:

- TraceEn is cleared by software.

- A TraceStop condition is encountered and IA32_RTIT_STATUS.Stopped is set.
- IA32_RTIT_STATUS.Error is set due to an operational error (see Section 35.3.10).

Software can discover the current TriggerEn value by reading the IA32_RTIT_STATUS.TriggerEn bit. When TriggerEn is clear, tracing is inactive and no packets are generated.

35.2.6.3 Context Enable (ContextEn)

Context Enable (**ContextEn**) indicates whether the processor is in the state or mode that software configured hardware to trace. For example, if execution with CPL = 0 code is not being traced (IA32_RTIT_CTL.OS = 0), then ContextEn will be 0 when the processor is in CPL0.

Software can discover the current ContextEn value by reading the IA32_RTIT_STATUS.ContextEn bit. ContextEn is defined as follows:

```
ContextEn = !((IA32_RTIT_CTL.OS = 0 AND CPL = 0) OR
(IA32_RTIT_CTL.USER = 0 AND CPL > 0) OR (IS_IN_A_PRODUCTION_ENCLAVE1) OR
(IA32_RTIT_CTL.CR3Filter = 1 AND IA32_RTIT_CR3_MATCH does not match CR3))
```

If the clearing of ContextEn causes PacketEn to be cleared, a Packet Generation Disable (TIP.PGD) packet is generated, but its IP payload is suppressed. If the setting of ContextEn causes PacketEn to be set, a Packet Generation Enable (TIP.PGE) packet is generated.

When ContextEn is 0, control flow packets (TNT, FUP, TIP.*, MODE.*) are not generated, and no Linear Instruction Pointers (LIPs) are exposed. However, some packets, such as MTC and PSB (see Section 35.4.2.16 and Section 35.4.2.17), may still be generated while ContextEn is 0. For details of which packets are generated only when ContextEn is set, see Section 35.4.1.

The processor does not update ContextEn when TriggerEn = 0.

The value of ContextEn will toggle only when TriggerEn = 1.

35.2.6.4 Branch Enable (BranchEn)

This value is based purely on the IA32_RTIT_CTL.BranchEn value. If **BranchEn** is not set, then relevant COFI packets (TNT, TIP*, FUP, MODE.*) are suppressed. Other packets related to timing (TSC, TMA, MTC, CYC), as well as PSB, will be generated normally regardless. Further, PIP and VMCS continue to be generated, as indicators of what software is running.

35.2.6.5 Filter Enable (FilterEn)

Filter Enable indicates that the Instruction Pointer (IP) is within the range of IPs that Intel PT is configured to watch. Software can get the state of Filter Enable by a RDMSR of IA32_RTIT_STATUS.FilterEn. For details on configuration and use of IP filtering, see Section 35.2.5.3.

On clearing of FilterEn that also clears PacketEn, a Packet Generation Disable (TIP.PGD) will be generated, but unlike the ContextEn case, the IP payload may not be suppressed. For direct, unconditional branches, as well as for indirect branches (including RETs), the PGD generated by leaving the tracing region and clearing FilterEn will contain the target IP. This means that IPs from outside the configured range can be exposed in the trace, as long as they are within context.

When FilterEn is 0, control flow packets are not generated (e.g., TNT, TIP). However, some packets, such as PIP, MTC, and PSB, may still be generated while FilterEn is clear. For details on packet enable dependencies, see Section 35.4.1.

After TraceEn is set, FilterEn is set to 1 at all times if there is no IP filter range configured by software (IA32_RTIT_CTL.ADDRn_CFG != 1, for all n), or if the processor does not support IP filtering (i.e., CPUID.14H.00H:EBX[2] = 0). FilterEn will toggle only when TraceEn=1 and ContextEn=1, and when at least one range is configured for IP filtering.

1. Trace packets generation is disabled in a production enclave, see Section 35.2.9.5. See the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D, about differences between a production enclave and a debug enclave.

35.2.7 Trace Output

Intel PT output should be viewed independently from trace content and filtering mechanisms. The options available for trace output can vary across processor generations and platforms.

Trace output is written out using one of the following output schemes, as configured by the ToPA and FabricEn bit fields of IA32_RTIT_CTL (see Section 35.2.8.2):

- A single, contiguous region of physical address space.
- A collection of variable-sized regions of physical memory. These regions are linked together by tables of pointers to those regions, referred to as Table of Physical Addresses (**ToPA**). The trace output stores bypass the caches and the TLBs, but are not serializing. This is intended to minimize the performance impact of the output.
- A platform-specific trace transport subsystem.

Regardless of the output scheme chosen, Intel PT stores bypass the processor caches by default. This ensures that they don't consume precious cache space, but they do not have the serializing aspects associated with un-cacheable (UC) stores. Software should avoid using MTRRs to mark any portion of the Intel PT output region as UC, as this may override the behavior described above and force Intel PT stores to UC, thereby incurring severe performance impact.

There is no guarantee that a packet will be written to memory or other trace endpoint after some fixed number of cycles after a packet-producing instruction executes. The only way to assure that all packets generated have reached their endpoint is to clear TraceEn and follow that with a store, fence, or serializing instruction; doing so ensures that all buffered packets are flushed out of the processor.

35.2.7.1 Single Range Output

When IA32_RTIT_CTL.ToPA and IA32_RTIT_CTL.FabricEn bits are clear, trace packet output is sent to a single, contiguous memory (or MMIO if DRAM is not available) range defined by a base address in IA32_RTIT_OUTPUT_BASE (Section 35.2.8.7) and mask value in IA32_RTIT_OUTPUT_MASK_PTRS (Section 35.2.8.8). The current write pointer in this range is also stored in IA32_RTIT_OUTPUT_MASK_PTRS. This output range is circular, meaning that when the writes wrap around the end of the buffer they begin again at the base address.

This output method is best suited for cases where Intel PT output is either:

- Configured to be directed to a sufficiently large contiguous region of DRAM.
- Configured to go to an MMIO debug port, in order to route Intel PT output to a platform-specific trace endpoint (e.g., JTAG). In this scenario, a specific range of addresses is written in a circular manner, and SoC will intercept these writes and direct them to the proper device. Repeated writes to the same address do not overwrite each other, but are accumulated by the debugger, and hence no data is lost by the circular nature of the buffer.

The processor will determine the address to which to write the next trace packet output byte as follows:

```
OutputBase[63:0] := IA32_RTIT_OUTPUT_BASE[63:0]
OutputMask[63:0] := ZeroExtend64(IA32_RTIT_OUTPUT_MASK_PTRS[31:0])
OutputOffset[63:0] := ZeroExtend64(IA32_RTIT_OUTPUT_MASK_PTRS[63:32])
trace_store_phys_addr := (OutputBase & ~OutputMask) + (OutputOffset & OutputMask)
```

Single-Range Output Errors

If the output base and mask are not properly configured by software, an operational error (see Section 35.3.10) will be signaled, and tracing disabled. Error scenarios with single-range output are:

- Mask value is non-contiguous.
IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTablePointer value has a 0 in a less significant bit position than the most significant bit containing a 1.
- Base address and Mask are mis-aligned, and have overlapping bits set.
IA32_RTIT_OUTPUT_BASE && IA32_RTIT_OUTPUT_MASK_PTRS[31:0] > 0.
- Illegal Output Offset
IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset is greater than the mask value IA32_RTIT_OUTPUT_MASK_PTRS[31:0].

Also note that errors can be signaled due to trace packet output overlapping with restricted memory, see Section 35.2.7.4.

35.2.7.2 Table of Physical Addresses (ToPA)

When IA32_RTIT_CTL.ToPA is set and IA32_RTIT_CTL.FabricEn is clear, the ToPA output mechanism is utilized. The ToPA mechanism uses a linked list of tables; see Figure 35-1 for an illustrative example. Each entry in the table contains some attribute bits, a pointer to an output region, and the size of the region. The last entry in the table may hold a pointer to the next table. This pointer can either point to the top of the current table (for circular array) or to the base of another table. The table size is not fixed, since the link to the next table can exist at any entry.

The processor treats the various output regions referenced by the ToPA table(s) as a unified buffer. This means that a single packet may span the boundary between one output region and the next.

The ToPA mechanism is controlled by three values maintained by the processor:

- **proc_trace_table_base.**
This is the physical address of the base of the current ToPA table. When tracing is enabled, the processor loads this value from the IA32_RTIT_OUTPUT_BASE MSR. While tracing is enabled, the processor updates the IA32_RTIT_OUTPUT_BASE MSR with changes to proc_trace_table_base, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_table_base.
- **proc_trace_table_offset.**
This indicates the entry of the current table that is currently in use. (This entry contains the address of the current output region.) When tracing is enabled, the processor loads the value from bits 31:7 (MaskOrTableOffset) of the IA32_RTIT_OUTPUT_MASK_PTRS into bits 27:3 of proc_trace_table_offset. While tracing is enabled, the processor updates IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTableOffset with changes to proc_trace_table_offset, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_table_offset.
- **proc_trace_output_offset.**
This is a pointer into the current output region and indicates the location of the next write. When tracing is enabled, the processor loads this value from bits 63:32 (OutputOffset) of the IA32_RTIT_OUTPUT_MASK_PTRS. While tracing is enabled, the processor updates IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset with changes to proc_trace_output_offset, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc_trace_output_offset.

Figure 35-1 provides an illustration (not to scale) of the table and associated pointers.

Figure 35-1. ToPA Memory Illustration

With the ToPA mechanism, the processor writes packets to the current output region (identified by `proc_trace_table_base` and the `proc_trace_table_offset`). The offset within that region to which the next byte will be written is identified by `proc_trace_output_offset`. When that region is filled with packet output (thus `proc_trace_output_offset = RegionSize-1`), `proc_trace_table_offset` is moved to the next ToPA entry, `proc_trace_output_offset` is set to 0, and packet writes begin filling the new output region specified by `proc_trace_table_offset`.

As packets are written out, each store derives its physical address as follows:

```
trace_store_phys_addr := Base address from current ToPA table entry +  
proc_trace_output_offset
```

Eventually, the regions represented by all entries in the table may become full, and the final entry of the table is reached. An entry can be identified as the final entry because it has either the END or STOP attribute. The END attribute indicates that the address in the entry does not point to another output region, but rather to another ToPA table. The STOP attribute indicates that tracing will be disabled once the corresponding region is filled. See Table 35-3 and the section that follows for details on STOP.

When an END entry is reached, the processor loads `proc_trace_table_base` with the base address held in this END entry, thereby moving the current table pointer to this new table. The `proc_trace_table_offset` is reset to 0, as is the `proc_trace_output_offset`, and packet writes will resume at the base address indicated in the first entry.

If the table has no STOP or END entry, and trace-packet generation remains enabled, eventually the maximum table size will be reached (`proc_trace_table_offset = 0FFFFFF8H`). In this case, the `proc_trace_table_offset` and `proc_trace_output_offset` are reset to 0 (wrapping back to the beginning of the current table) once the last output region is filled.

It is important to note that processor updates to the IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS MSRs are asynchronous to instruction execution. Thus, reads of these MSRs while Intel PT is enabled may return stale values. Like all IA32_RTIT_* MSRs, the values of these MSRs should not be trusted or saved unless trace packet generation is first disabled by clearing IA32_RTIT_CTL.TraceEn. This ensures that the output MSR values account for all packets generated to that point, after which the processor will cease updating the output MSR values until tracing resumes.¹

The processor may cache internally any number of entries from the current table or from tables that it references (directly or indirectly). If tracing is enabled, the processor may ignore or delay detection of modifications to these tables. To ensure that table changes are detected by the processor in a predictable manner, software should clear TraceEn before modifying the current table (or tables that it references) and only then re-enable packet generation.

Single Output Region ToPA Implementation

The first processor generation to implement Intel PT supports only ToPA configurations with a single ToPA entry followed by an END entry that points back to the first entry (creating one circular output buffer). Such processors enumerate CPUID.14H.00H:ECX.MENTRY[1] = 0 and CPUID.14H.00H:ECX.TOPAOUT[0] = 1.

If CPUID.14H.00H:ECX.MENTRY[1] = 0, ToPA tables can hold only one output entry, which must be followed by an END=1 entry which points back to the base of the table. Hence only one contiguous block can be used as output.

The lone output entry can have INT or STOP set, but nonetheless must be followed by an END entry as described above. Note that, if INT=1, the PMI will actually be delivered before the region is filled.

ToPA Table Entry Format

The format of ToPA table entries is shown in Figure 35-2. The size of the address field is determined by the processor’s physical-address width MAXPHYADDR.²

Figure 35-2. Layout of ToPA Table Entry

Table 35-3 describes the details of the ToPA table entry fields. If reserved bits are set to 1, an error is signaled.

1. Although WRMSR is a serializing instruction, the execution of WRMSR that forces packet writes by clearing TraceEn does not itself cause these writes to be globally observed.

2. Usually, MAXPHYADDR is the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

Table 35-3. ToPA Table Entry Fields

ToPA Entry Field	Description
Output Region Base Physical Address	If END=0, this is the base physical address of the output region specified by this entry. Note that all regions must be aligned based on their size. Thus a 2M region must have bits 20:12 clear. If the region is not properly aligned, an operational error will be signaled when the entry is reached. If END=1, this is the 4K-aligned base physical address of the next ToPA table (which may be the base of the current table, or the first table in the linked list if a circular buffer is desired). If the processor supports only a single ToPA output region (see above), this address must be the value currently in the IA32_RTIT_OUTPUT_BASE MSR.
Size	Indicates the size of the associated output region. Encodings are: 0: 4K, 1: 8K, 2: 16K, 3: 32K, 4: 64K, 5: 128K, 6: 256K, 7: 512K, 8: 1M, 9: 2M, 10: 4M, 11: 8M, 12: 16M, 13: 32M, 14: 64M, 15: 128M This field is ignored if END=1.
STOP	When the output region indicated by this entry is filled, software should disable packet generation. This will be accomplished by setting IA32_RTIT_STATUS.Stopped, which clears TriggerEn. This bit must be 0 if END=1; otherwise it is treated as reserved bit violation (see ToPA Errors).
INT	When the output region indicated by this entry is filled, signal PerfMon LVT interrupt. Note that if both INT and STOP are set in the same entry, the STOP will happen before the INT. Thus the interrupt handler should expect that the IA32_RTIT_STATUS.Stopped bit will be set, and will need to be reset before tracing can be resumed. This bit must be 0 if END=1; otherwise it is treated as reserved bit violation (see ToPA Errors).
END	If set, indicates that this is an END entry, and thus the address field points to a table base rather than an output region base. If END=1, INT and STOP must be set to 0; otherwise it is treated as reserved bit violation (see ToPA Errors). The Size field is ignored in this case. If the processor supports only a single ToPA output region (see above), END must be set in the second table entry.

ToPA STOP

Each ToPA entry has a STOP bit. If this bit is set, the processor will set the IA32_RTIT_STATUS.Stopped bit when the corresponding trace output region is filled. This will clear TriggerEn and thereby cease packet generation. See Section 35.2.8.4 for details on IA32_RTIT_STATUS.Stopped. This sequence is known as “ToPA Stop”.

No TIP.PGD packet will be seen in the output when the ToPA stop occurs, since the disable happens only when the region is already full. When this occurs, output ceases after the last byte of the region is filled, which may mean that a packet is cut off in the middle. Any packets remaining in internal buffers are lost and cannot be recovered.

When ToPA stop occurs, the IA32_RTIT_OUTPUT_BASE MSR will hold the base address of the table whose entry had STOP=1. IA32_RTIT_OUTPUT_MASK_PTRS.MaskOrTableOffset will hold the index value for that entry, and the IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset should be set to the size of the region minus one.

Note that this means the offset pointer is pointing to the next byte after the end of the region, a configuration that would produce an operational error if the configuration remained when tracing is re-enabled with IA32_RTIT_STATUS.Stopped cleared.

ToPA PMI

Each ToPA entry has an INT bit. If this bit is set, the processor will signal a performance-monitoring interrupt (PMI) when the corresponding trace output region is filled. This interrupt is not precise, and it is thus likely that writes to the next region will occur by the time the interrupt is taken.

The following steps should be taken to configure this interrupt:

1. Enable PMI via the LVT Performance Monitor register (at MMIO offset 340H in xAPIC mode; via MSR 834H in x2APIC mode). See the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3B, for more details on this register. For ToPA PMI, set all fields to 0, save for the interrupt vector, which can be selected by software.
2. Set up an interrupt handler to service the interrupt vector that a ToPA PMI can raise.

3. Set the interrupt flag by executing STI.
4. Set the INT bit in the ToPA entry of interest and enable packet generation, using the ToPA output option. Thus, TraceEn=ToPA=1 in the IA32_RTIT_CTL MSR.

Once the INT region has been filled with packet output data, the interrupt will be signaled. This PMI can be distinguished from others by checking bit 55 (Trace_ToPA_PMI) of the IA32_PERF_GLOBAL_STATUS MSR (MSR 38EH). Once the ToPA PMI handler has serviced the relevant buffer, writing 1 to bit 55 of the MSR at 390H (IA32_GLOBAL_STATUS_RESET) clears IA32_PERF_GLOBAL_STATUS.Trace_ToPA_PMI.

Intel PT is not frozen on PMI, and thus the interrupt handler will be traced (though filtering can prevent this). The Freeze_PerfMon_on_PMI and Freeze_LBRs_on_PMI settings in IA32_DEBUGCTL will be applied on ToPA PMI just as on other PMIs, and hence PerfMon counters are frozen.

Assuming the PMI handler wishes to read any buffered packets for persistent output, or wishes to modify any Intel PT MSRs, software should first disable packet generation by clearing TraceEn. This ensures that all buffered packets are written to memory and avoids tracing of the PMI handler. The configuration MSRs can then be used to determine where tracing has stopped. If packet generation is disabled by the handler, it should then be manually re-enabled before the IRET if continued tracing is desired.

In rare cases, it may be possible to trigger a second ToPA PMI before the first is handled. This can happen if another ToPA region with INT=1 is filled before, or shortly after, the first PMI is taken, perhaps due to EFLAGS.IF being cleared for an extended period of time. This can manifest in two ways: either the second PMI is triggered before the first is taken, and hence only one PMI is taken, or the second is triggered after the first is taken, and thus will be taken when the handler for the first completes. Software can minimize the likelihood of the second case by clearing TraceEn at the beginning of the PMI handler. Further, it can detect such cases by then checking the Interrupt Request Register (IRR) for PMI pending, and checking the ToPA table base and off-set pointers (in IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS) to see if multiple entries with INT=1 have been filled.

PMI Preservation

In some cases a ToPA PMI may be taken after completion of an XSAVES instruction that saves Intel PT state, and in such cases any modification of Intel PT MSRs within the PMI handler will not persist when the saved Intel PT context is later restored with XRSTORS. To account for such a scenario, the PMI Preservation feature has been added. Support for this feature is indicated by CPUID.14H.00H:EBX[6].

When IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1, PMI preservation is enabled. When a ToPA region with INT=1 is filled, a PMI is pended and the new IA32_RTIT_STATUS.PendToPAPMI[7] is set to 1. If this bit is set when Intel PT is enabled, such that IA32_RTIT_CTL.TraceEn[0] transitions from 0 to 1, a ToPA PMI is pended. This behavior ensures that any ToPA PMI that is pended during XSAVES, and hence can't be properly handled, will be re-pended when the saved PT state is restored.

When this feature is enabled, the PMI handler should take the following actions:

1. Ignore ToPA PMIs that are taken when TraceEn = 0. This indicates that the PMI was pended during Intel PT disable, and the PendToPAPMI flag will ensure that the PMI is re-pended once Intel PT is re-enabled in the same context. For this reason, the PendToPAPMI bit should be left set to 1.
2. If TraceEn=1 and the PMI can be properly handled, clear the new PendTopaPMI bit. This will ensure that additional, spurious ToPA PMIs are not taken. It is required that PendToPAPMI is cleared before the PMI LVT mask is cleared in the APIC, and before any clearing of either LBRs_FROZEN or COUNTERS_FROZEN in IA32_PERF_GLOBAL_STATUS.

ToPA PMI and Single Output Region ToPA Implementation

A processor that supports only a single ToPA output region implementation (such that only one output region is supported; see above) will attempt to signal a ToPA PMI interrupt before the output wraps and overwrites the top of the buffer. To support this functionality, the PMI handler should disable packet generation as soon as possible.

Due to PMI skid, it is possible that, in rare cases, the wrap will have occurred before the PMI is delivered. Software can avoid this by setting the STOP bit in the ToPA entry (see Table 35-3); this will disable tracing once the region is filled, and no wrap will occur. This approach has the downside of disabling packet generation so that some of the instructions that led up to the PMI will not be traced. If the PMI skid is significant enough to cause the region to fill and tracing to be disabled, the PMI handler will need to clear the IA32_RTIT_STATUS.Stopped indication before tracing can resume.

ToPA PMI and XSAVES/XRSTORS State Handling

In some cases the ToPA PMI may be taken after completion of an XSAVES instruction that switches Intel PT state, and in such cases any modification of Intel PT MSRs within the PMI handler will not persist when the saved Intel PT context is later restored with XRSTORS. To account for such a scenario, it is recommended that the Intel PT output configuration be modified by altering the ToPA tables themselves, rather than the Intel PT output MSRs. On processors that support PMI preservation (CPUID.14H.00H:EBX[6] = 1), setting IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1 will ensure that a PMI that is pending at the time PT is disabled will be recorded by setting IA32_RTIT_STATUS.PendTopaPMI[7] = 1. A PMI will then be pended when the saved PT context is later restored.

Table 35-4 depicts a recommended PMI handler algorithm for managing multi-region ToPA output and handling ToPA PMIs that may arrive between XSAVES and XRSTORS, if PMI preservation is not in use. This algorithm is flexible to allow software to choose between adding entries to the current ToPA table, adding a new ToPA table, or using the current ToPA table as a circular buffer. It assumes that the ToPA entry that triggers the PMI is not the last entry in the table, which is the recommended treatment.

Table 35-4. Algorithm to Manage Intel PT ToPA PMI and XSAVES/XRSTORS

Pseudo Code Flow
<pre> IF (IA32_PERF_GLOBAL_STATUS.ToPA) Save IA32_RTIT_CTL value; IF (IA32_RTIT_CTL.TraceEN) Disable Intel PT by clearing TraceEn; FI; IF (there is space available to grow the current ToPA table) Add one or more ToPA entries after the last entry in the ToPA table; Point new ToPA entry address field(s) to new output region base(s); ELSE Modify an upcoming ToPA entry in the current table to have END=1; IF (output should transition to a new ToPA table) Point the address of the "END=1" entry of the current table to the new table base; ELSE /* Continue to use the current ToPA table, make a circular. */ Point the address of the "END=1" entry to the base of the current table; Modify the ToPA entry address fields for filled output regions to point to new, unused output regions; /* Filled regions are those with index in the range of 0 to (IA32_RTIT_MASK_PTRS.MaskOrTableOffset -1). */ FI; FI; Restore saved IA32_RTIT_CTL.value; FI; </pre>

ToPA Errors

When a malformed ToPA entry is found, an **operational error** results (see Section 35.3.10). A malformed entry can be any of the following:

- ToPA entry reserved bit violation.**
This describes cases where a bit marked as reserved in Section 35.2.7.2 above is set to 1.
- ToPA alignment violation.**
This includes cases where illegal ToPA entry base address bits are set to 1:
 - ToPA table base address is not 4KB-aligned. The table base can be from a WRMSR to IA32_RTIT_OUTPUT_BASE, or from a ToPA entry with END=1.
 - ToPA entry base address is not aligned to the ToPA entry size (e.g., a 2MB region with base address[20:12] not equal to 0), for ToPA entries with END=0.
 - ToPA entry base address sets physical address bits [in the range 63:MAXPHYADDR](#).¹

3. **Illegal ToPA Output Offset.**
IA32_RTIT_OUTPUT_MASK_PTRS.OutputOffset is greater than or equal to the size of the current ToPA output region size.
4. **ToPA rules violations.**
These are similar to ToPA entry reserved bit violations; they are cases when a ToPA entry is encountered with illegal field combinations. They include the following:

a. Setting the STOP or INT bit on an entry with END=1.

b. Setting the END bit in entry 0 of a ToPA table.

c. On processors that support only a single ToPA entry (see above), two additional illegal settings apply:

i) ToPA table entry 1 with END=0.

ii) ToPA table entry 1 with base address not matching the table base.
- In all cases, the error will be logged by setting IA32_RTIT_STATUS.Error, thereby disabling tracing when the problematic ToPA entry is reached (when proc_trace_table_offset points to the entry containing the error). Any packet bytes that are internally buffered when the error is detected may be lost.
- Note that operational errors may also be signaled due to attempts to access restricted memory. See Section 35.2.7.4 for details.
- A tracing software have a range of flexibility using ToPA to manage the interaction of Intel PT with application buffers, see Section 35.4.2.26.
- 35.2.7.3 Trace Transport Subsystem
- When IA32_RTIT_CTL.FabricEn is set, the IA32_RTIT_CTL.ToPA bit is ignored, and trace output is written to the trace transport subsystem. The endpoints of this transport are platform-specific, and details of configuration options should refer to the specific platform documentation. The FabricEn bit is available to be set if CPUID.14H.00H:EBX[3] = 1.
- 35.2.7.4 Restricted Memory Access
- Packet output cannot be directed to any regions of memory that are restricted by the platform. In particular, all memory accesses on behalf of packet output are checked against the SMRR, PRMRR, and SEAMRR protected regions. If there is any overlap with these regions, trace data collection will not function properly. Exact processor behavior is implementation-dependent; Table 35-5 summarizes several scenarios.
- Table 35-5. Behavior on Restricted Memory Access
- | Scenario | Description |
|--|--|
| ToPA output region overlaps with SMRR, PRMRR, and SEAMRR protected regions | Stores to the restricted memory region will be dropped, and that packet data will be lost. Any attempt to read from that restricted region will return all 1s. The processor also may signal an error (Section 35.3.10) and disable tracing when the output pointer reaches the restricted region. If packet generation remains enabled, then packet output may continue once stores are no longer directed to restricted memory (on wrap, or if the output region is larger than the restricted memory region). |
| ToPA table overlaps with SMRR, PRMRR, and SEAMRR protected regions | The processor will signal an error (Section 35.3.10) and disable tracing when the ToPA write pointer (IA32_RTIT_OUTPUT_BASE + proc_trace_table_offset) enters the restricted region. |
- It should also be noted that packet output should not be routed to the 4KB APIC MMIO region, as defined by the IA32_APIC_BASE MSR. For details about the APIC, refer to the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A. No error is signaled for this case.
1. Usually, MAXPHYADDR is the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52). If IA32_TME_ACTIVATE[0]= 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM.
- 35-16 Vol. 3C

Modifications to Restricted Memory Regions

It is recommended that software disable packet generation before modifying the SMRRs to change the scope of the SMRR regions. This is because the processor reserves the right to cache any number of ToPA table entries internally, after checking them against restricted memory ranges. Once cached, the entries will not be checked again, meaning one could potentially route packet output to a newly restricted region. Software can ensure that any cached entries are written to memory by clearing IA32_RTIT_CTL.TraceEn.

35.2.8 Enabling and Configuration MSRs

35.2.8.1 General Considerations

Trace packet generation is enabled and configured by a collection of model-specific registers (MSRs), which are detailed below. Some notes on the configuration MSR behavior:

- If Intel Processor Trace is not supported by the processor (see Section 35.3.1), RDMSR or WRMSR of the IA32_RTIT_* MSRs will cause #GP.
- A WRMSR to any of the IA32_RTIT_* configuration MSRs while packet generation is enabled (IA32_RTIT_CTL.TraceEn=1) will generate a #GP exception. Packet generation must be disabled before the configuration MSRs can be changed.
Note: Software may write the same value back to IA32_RTIT_CTL without #GP, even if TraceEn=1.
- All configuration MSRs for Intel PT are duplicated per logical processor
- For each configuration MSR, any MSR write that attempts to change bits marked reserved, or utilize encodings marked reserved, will cause a #GP fault.
- All configuration MSRs for Intel PT are cleared on a warm or cold RESET.
 - If CPUID.14H.00H:EBX[2] = 1, only the TraceEn bit is cleared on warm RESET; though this may have the impact of clearing other bits in IA32_RTIT_STATUS. Other MSR values of the trace configuration MSRs are preserved on warm RESET.
- The semantics of MSR writes to trace configuration MSRs in this chapter generally apply to explicit WRMSR to these registers, using VMexit or VM entry MSR load list to these MSRs, XRSTORS with requested feature bit map including XSAVE map component of state_8 (corresponding to IA32_XSS[bit 8]), and the write to IA32_RTIT_CTL.TraceEn by XSAVES (Section 35.3.5.2).

35.2.8.2 IA32_RTIT_CTL MSR

IA32_RTIT_CTL, at address 570H, is the primary enable and control MSR for trace packet generation. Bit positions are listed in Table 35-6.

Table 35-6. IA32_RTIT_CTL MSR

Position	Bit Name	At Reset	Bit Description
0	TraceEn	0	If 1, enables tracing; else tracing is disabled. When this bit transitions from 1 to 0, all buffered packets are flushed out of internal buffers. A further store, fence, or architecturally serializing instruction may be required to ensure that packet data can be observed at the trace endpoint. See Section 35.2.8.3 for details of enabling and disabling packet generation. Note that the processor will clear this bit on #SMI (Section 35.2.9.3) and warm reset. Other MSR bits of IA32_RTIT_CTL (and other trace configuration MSRs) are not impacted by these events.
1	CYCEn	0	0: Disables CYC Packet (see Section 35.4.2.14). 1: Enables CYC Packet. This bit is reserved if CPUID.14H.00H:EBX[1] = 0.

Table 35-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
2	OS	0	0: Packet generation is disabled when CPL = 0. 1: Packet generation may be enabled when CPL = 0.
3	User	0	0: Packet generation is disabled when CPL > 0. 1: Packet generation may be enabled when CPL > 0.
4	PwrEvtEn	0	0: Power Event Trace packets are disabled. 1: Power Event Trace packets are enabled (see Section 35.2.3, “Power Event Tracing”).
5	FUPonPTW	0	0: PTW packets are not followed by FUPs. 1: PTW packets are followed by FUPs. This bit is reserved when CPUID.14H.00H:EBX[4] (“PTWRITE Supported”) is 0.
6	FabricEn	0	0: Trace output is directed to the memory subsystem, mechanism depends on IA32_RTIT_CTL.ToPA. 1: Trace output is directed to the trace transport subsystem, IA32_RTIT_CTL.ToPA is ignored. This bit is reserved if CPUID.14H.00H:ECX[3] = 0.
7	CR3Filter	0	0: Disables CR3 filtering. 1: Enables CR3 filtering. This bit is reserved if CPUID.14H.00H:EBX[0] (“CR3 Filtering Support”) is 0.
8	ToPA	0	0: Single-range output scheme enabled if CPUID.14H.00H:ECX.SNGL_RNG_OUT[2] = 1 and IA32_RTIT_CTL.FabricEn=0. 1: ToPA output scheme enabled (see Section 35.2.7.2) if CPUID.14H.00H:ECX.TOPAOUT[0] = 1, and IA32_RTIT_CTL.FabricEn=0. Note: WRMSR to IA32_RTIT_CTL that sets TraceEn but clears this bit and FabricEn would cause #GP, if CPUID.14H.00H:ECX.SNGL_RNG_OUT[2] = 0. WRMSR to IA32_RTIT_CTL that sets this bit causes #GP, if CPUID.14H.00H:ECX.TOPAOUT[0] = 0.
9	MTCEn	0	0: Disables MTC Packet (see Section 35.4.2.16). 1: Enables MTC Packet. This bit is reserved if CPUID.14H.00H:EBX[3] = 0.
10	TSCEn	0	0: Disable TSC packets. 1: Enable TSC packets (see Section 35.4.2.11).
11	DisRETC	0	0: Enable RET compression. 1: Disable RET compression (see Section 35.2.1.2).
12	PTWEn	0	0: PTWRITE packet generation disabled. 1: PTWRITE packet generation enabled (see Table 35-40 “PTW Packet Definition”). This bit is reserved when CPUID.14H.00H:EBX[4] (“PTWRITE Supported”) is 0.
13	BranchEn	0	0: Disable COFI-based packets. 1: Enable COFI-based packets: FUP, TIP, TIP.PGE, TIP.PGD, TNT, MODE.Exec, MODE.TSX. See Section 35.2.6.4 for details on BranchEn.

Table 35-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
17:14	MTCFreq	0	Defines MTC packet Frequency, which is based on the core crystal clock, or Always Running Timer (ART). MTC will be sent each time the selected ART bit toggles. The following Encodings are defined: 0: ART(0), 1: ART(1), 2: ART(2), 3: ART(3), 4: ART(4), 5: ART(5), 6: ART(6), 7: ART(7), 8: ART(8), 9: ART(9), 10: ART(10), 11: ART(11), 12: ART(12), 13: ART(13), 14: ART(14), 15: ART(15) Software must use CPUID to query the supported encodings in the processor, see Section 35.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.14H.00H:EBX[3] = 0.
18	Reserved	0	Must be 0.
22:19	CycThresh	0	CYC packet threshold, see Section 35.3.6 for details. CYC packets will be sent with the first eligible packet after N cycles have passed since the last CYC packet. If CycThresh is 0 then N=0, otherwise N is defined as $2^{(\text{CycThresh}-1)}$. The following Encodings are defined: 0: 0, 1: 1, 2: 2, 3: 4, 4: 8, 5: 16, 6: 32, 7: 64, 8: 128, 9: 256, 10: 512, 11: 1024, 12: 2048, 13: 4096, 14: 8192, 15: 16384 Software must use CPUID to query the supported encodings in the processor, see Section 35.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.14H.00H:EBX[1] = 0.
23	Reserved	0	Must be 0.
27:24	PSBFreq	0	Indicates the frequency of PSB packets. PSB packet frequency is based on the number of Intel PT packet bytes output, so this field allows the user to determine the increment of IA32_IA32_RTIT_STATUS.PacketByteCnt that should cause a PSB to be generated. Note that PSB insertion is not precise, but the average output bytes per PSB should approximate the SW selected period. The following Encodings are defined: 0: 2K, 1: 4K, 2: 8K, 3: 16K, 4: 32K, 5: 64K, 6: 128K, 7: 256K, 8: 512K, 9: 1M, 10: 2M, 11: 4M, 12: 8M, 13: 16M, 14: 32M, 15: 64M Software must use CPUID to query the supported encodings in the processor, see Section 35.3.1. Use of unsupported encodings will result in a #GP fault. This field is reserved if CPUID.14H.00H:EBX[1] = 0.
30:28	Reserved	0	Must be 0.
31	EventEn	0	0: Event Trace packets are disabled. 1: Event Trace packets are enabled. This bit is reserved when CPUID.14H.00H:EBX[7] ("Event Trace Supported") is 0.
35:32	ADDR0_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR0_A/B based on the following encodings: 0: ADDR0 range unused. 1: The [IA32_RTIT_ADDR0_A..IA32_RTIT_ADDR0_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 35.2.5.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR0_A..IA32_RTIT_ADDR0_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See 4.2.8 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.14H.01H:EAX.RANGECNT[2:0] < 1.

Table 35-6. IA32_RTIT_CTL MSR (Contd.)

Position	Bit Name	At Reset	Bit Description
39:36	ADDR1_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR1_A/B based on the following encodings: 0: ADDR1 range unused. 1: The [IA32_RTIT_ADDR1_A..IA32_RTIT_ADDR1_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 35.2.5.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR1_A..IA32_RTIT_ADDR1_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 35.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.14H.01H:EAX.RANGE CNT[2:0] < 2.
43:40	ADDR2_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR2_A/B based on the following encodings: 0: ADDR2 range unused. 1: The [IA32_RTIT_ADDR2_A..IA32_RTIT_ADDR2_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 35.2.5.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR2_A..IA32_RTIT_ADDR2_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 35.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.14H.01H:EAX.RANGE CNT[2:0] < 3.
47:44	ADDR3_CFG	0	Configures the base/limit register pair IA32_RTIT_ADDR3_A/B based on the following encodings: 0: ADDR3 range unused. 1: The [IA32_RTIT_ADDR3_A..IA32_RTIT_ADDR3_B] range defines a FilterEn range. FilterEn will only be set when the IP is within this range, though other FilterEn ranges can additionally be used. See Section 35.2.5.3 for details on IP filtering. 2: The [IA32_RTIT_ADDR3_A..IA32_RTIT_ADDR3_B] range defines a TraceStop range. TraceStop will be asserted if code branches into this range. See Section 35.4.2.10 for details on TraceStop. 3..15: Reserved (#GP). This field is reserved if CPUID.14H.01H:EAX.RANGE CNT[2:0] < 4.
54:48	Reserved	0	Reserved only for future trace content enables, or address filtering configuration enables. Must be 0.
55	DisTNT	0	0: Include TNT packets in control flow trace. 1: Omit TNT packets from control flow trace. This bit is reserved when CPUID.14H.00H:EBX[8] ("TNT Disable Supported") is 0. See Section 35.3.9 for details.
56	InjectPsbPmiOnEnable	0	1: Enables use of IA32_RTIT_STATUS bits PendPSB[6] and PendTopaPMI[7], see Section 35.2.8.4, "IA32_RTIT_STATUS MSR," for behavior of these bits. 0: IA32_RTIT_STATUS bits 6 and 7 are ignored. This field is reserved if CPUID.14H.00H:EBX[6] = 0.
59:57	Reserved	0	Reserved only for future trace content enables, or address filtering configuration enables. Must be 0.
63:60	Reserved	0	Must be 0.

35.2.8.3 Enabling and Disabling Packet Generation with TraceEn

When TraceEn transitions from 0 to 1, Intel Processor Trace is enabled, and a series of packets may be generated. These packets help ensure that the decoder is aware of the state of the processor when the trace begins, and that it can keep track of any timing or state changes that may have occurred while packet generation was disabled. A full PSB+ (see Section 35.4.2.17) will be generated if IA32_RTIT_STATUS.PacketByteCnt=0, and may be generated in other cases as well. Otherwise, timing packets will be generated, including TSC, TMA, and CBR (see Section 35.4.1.1).

In addition to the packets discussed above, if and when PacketEn (Section 35.2.6.1) transitions from 0 to 1 (which may happen immediately, depending on filtering settings), a TIP.PGE packet (Section 35.4.2.3) will be generated.

When TraceEn is set, the processor may read ToPA entries from memory and cache them internally. For this reason, software should disable packet generation before making modifications to the ToPA tables (or changing the configuration of restricted memory regions). See Section 35.7 for more details of packets that may be generated with modifications to TraceEn.

Disabling Packet Generation

Clearing TraceEn causes any packet data buffered within the logical processor to be flushed out, after which the output MSRs (IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS) will have stable values. When output is directed to memory, a store, fence, or architecturally serializing instruction may be required to ensure that the packet data is globally observed. No special packets are generated by disabling packet generation, though a TIP.PGD may result if PacketEn=1 at the time of disable.

Other Writes to IA32_RTIT_CTL

Any attempt to modify IA32_RTIT_CTL while TraceEn is set will result in a general-protection fault (#GP) unless the same write also clears TraceEn. However, writes to IA32_RTIT_CTL that do not modify any bits will not cause a #GP, even if TraceEn remains set.

35.2.8.4 IA32_RTIT_STATUS MSR

The IA32_RTIT_STATUS MSR is readable and writable by software, though some fields cannot be modified by software. See Table 35-7 for details. The WRMSR instruction ignores these bits in the source operand (attempts to modify these bits are ignored and do not cause WRMSR to fault).

This MSR can only be written when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). The processor does not modify the value of this MSR while TraceEn is 0 (software can modify it with WRMSR).

Table 35-7. IA32_RTIT_STATUS MSR

Position	Bit Name	At Reset	Bit Description
0	FilterEn	0	This bit is written by the processor, and indicates that tracing is allowed for the current IP, see Section 35.2.6.5. Writes are ignored.
1	ContextEn	0	The processor sets this bit to indicate that tracing is allowed for the current context. See Section 35.2.6.3. Writes are ignored.
2	TriggerEn	0	The processor sets this bit to indicate that tracing is enabled. See Section 35.2.6.2. Writes are ignored.
3	Reserved	0	Must be 0.
4	Error	0	The processor sets this bit to indicate that an operational error has been encountered. When this bit is set, TriggerEn is cleared to 0 and packet generation is disabled. For details, see “ToPA Errors” in Section 35.2.7.2. When TraceEn is cleared, software can write this bit. Once it is set, only software can clear it. It is not recommended that software ever set this bit, except in cases where it is restoring a prior saved state.

Table 35-7. IA32_RTIT_STATUS MSR

Position	Bit Name	At Reset	Bit Description
5	Stopped	0	The processor sets this bit to indicate that a ToPA Stop condition has been encountered. When this bit is set, TriggerEn is cleared to 0 and packet generation is disabled. For details, see “ToPA STOP” in Section 35.2.7.2. When TraceEn is cleared, software can write this bit. Once it is set, only software can clear it. It is not recommended that software ever set this bit, except in cases where it is restoring a prior saved state.
6	PendPSB	0	If IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1, the processor sets this bit when the threshold for a PSB+ to be inserted has been reached. The processor will clear this bit when the PSB+ has been inserted into the trace. If PendPSB = 1 and InjectPsbPmiOnEnable = 1 when IA32_RTIT_CTL.TraceEn[0] transitions from 0 to 1, a PSB+ will be inserted into the trace. This field is reserved if CPUID.14H.00H:EBX[6] = 0.
7	PendTopaPMI	0	If IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1, the processor sets this bit when the threshold for a ToPA PMI to be inserted has been reached. Software should clear this bit once the ToPA PMI has been handled, see “ToPA PMI” for details. If PendTopaPMI = 1 and InjectPsbPmiOnEnable = 1 when IA32_RTIT_CTL.TraceEn[0] transitions from 0 to 1, a PMI will be pended. This field is reserved if CPUID.14H.00H:EBX[6] = 0.
31:8	Reserved	0	Must be 0.
48:32	PacketByteCnt	0	This field is written by the processor, and holds a count of packet bytes that have been sent out. The processor also uses this field to determine when the next PSB packet should be inserted. Note that the processor may clear or modify this field at any time while IA32_RTIT_CTL.TraceEn=1. It will have a stable value when IA32_RTIT_CTL.TraceEn=0. See Section 35.4.2.17 for details. This field is reserved when CPUID.14H.00H:EBX[1] (“Configurable PSB and CycleAccurate Mode Supported”) is 0.
63:49	Reserved	0	Must be 0.

35.2.8.5 IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B MSRs

The role of the IA32_RTIT_ADDRn_A/B register pairs, for each n, is determined by the corresponding ADDRn_CFG fields in IA32_RTIT_CTL (see Section 35.2.8.2). The number of these register pairs is enumerated by CPUID.14H.01H:EAX.RANGEcnt[2:0].

- Processors that enumerate support for 1 range support:
 - IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
- Processors that enumerate support for 2 ranges support:
 - IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
 - IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B
- Processors that enumerate support for 3 ranges support:
 - IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
 - IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B
 - IA32_RTIT_ADDR2_A, IA32_RTIT_ADDR2_B
- Processors that enumerate support for 4 ranges support:
 - IA32_RTIT_ADDR0_A, IA32_RTIT_ADDR0_B
 - IA32_RTIT_ADDR1_A, IA32_RTIT_ADDR1_B
 - IA32_RTIT_ADDR2_A, IA32_RTIT_ADDR2_B

— IA32_RTIT_ADDR3_A, IA32_RTIT_ADDR3_B

Each register has a single 64-bit field that holds a linear address value. Writes must ensure that the address is in canonical form, otherwise a general-protection fault (#GP) fault will result.

Each MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

35.2.8.6 IA32_RTIT_CR3_MATCH MSR

The IA32_RTIT_CR3_MATCH register is compared against CR3 when IA32_RTIT_CTL.CR3Filter is 1. Bits 63:5 hold the CR3 address value to match, bits 4:0 are reserved to 0. For more details on CR3 filtering and the treatment of this register, see Section 35.2.5.2.

This MSR is accessible if CPUID.14H.00H:EBX[0], “CR3 Filtering Support”, is 1. This MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). IA32_RTIT_CR3_MATCH[4:0] are reserved and must be 0; an attempt to set those bits using WRMSR causes a #GP.

35.2.8.7 IA32_RTIT_OUTPUT_BASE MSR

This MSR is used to configure the trace output destination, when output is directed to memory (IA32_RTIT_CTL.FabricEn = 0). The size of the address field is determined by [two values related to the processor’s physical-address width, MAXPHYADDR](#):

- [M](#) is the value enumerated in CPUID.80000008H:EAX[7:0] (at most 52).
- [MAXPHYADDR](#) is typically the same as [M](#). However, if IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), [MAXPHYADDR](#) is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM.

See Table 35-8 for details.

WRMSR and XRSTORS will fault if any of bits 63:M would be set to 1; they allow setting bits M–1:MAXPHYADDR; however, if any of those bits are set outside SEAM, trace output may fail in a model-specific manner.

When the ToPA output scheme is used, the processor may update this MSR when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32_RTIT_CTL.TraceEn = 0).

Accesses to this MSR are supported only if Intel PT output to memory is supported, hence when either CPUID.14H.00H:ECX[0] or CPUID.14H.00H:ECX[2] are set. Otherwise WRMSR or RDMSR cause a general-protection fault (#GP). If supported, this MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

Table 35-8. IA32_RTIT_OUTPUT_BASE MSR

Position	Bit Name	At Reset	Bit Description
6:0	Reserved	0	Must be 0.
MAXPHYADDR-1:7	BasePhysAddr	0	The base physical address. How this address is used depends on the value of IA32_RTIT_CTL.ToPA: 0: This is the base physical address of a single, contiguous physical output region. This could be mapped to DRAM or to MMIO, depending on the value. The base address should be aligned with the size of the region, such that none of the 1s in the mask value(Section 35.2.8.8) overlap with 1s in the base address. If the base is not aligned, an operational error will result (see Section 35.3.10). 1: The base physical address of the current ToPA table. The address must be 4K aligned. Writing an address in which bits 11:7 are non-zero will not cause a #GP, but an operational error will be signaled once TraceEn is set. See “ToPA Errors” in Section 35.2.7.2, as well as Section 35.3.10.
M-1:MAXPHYADDR	Reserved	0	Should be 0 when processor trace is enabled.
63:M	Reserved	0	Must be 0.

35.2.8.8 IA32_RTIT_OUTPUT_MASK_PTRS MSR

This MSR holds any mask or pointer values needed to indicate where the next byte of trace output should be written. The meaning of the values held in this MSR depend on whether the ToPA output mechanism is in use. See Section 35.2.7.2 for details.

The processor updates this MSR while when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32_RTIT_CTL.TraceEn = 0).

Accesses to this MSR are supported only if Intel PT output to memory is supported, hence when either CPUID.14H.00H:ECX[0] or CPUID.14H.00H:ECX[2] are set. Otherwise WRMSR or RDMSR cause a general-protection fault (#GP). If supported, this MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

Table 35-9. IA32_RTIT_OUTPUT_MASK_PTRS MSR

Position	Bit Name	At Reset	Bit Description
6:0	LowerMask	7FH	Forced to 1, writes are ignored.
31:7	MaskOrTableOffset	0	The use of this field depends on the value of IA32_RTIT_CTL.ToPA: 0: This field holds bits 31:7 of the mask value for the single, contiguous physical output region. The size of this field indicates that regions can be of size 128B up to 4GB. This value (combined with the lower 7 bits, which are reserved to 1) will be ANDed with the OutputOffset field to determine the next write address. All 1s in this field should be consecutive and starting at bit 7, otherwise the region will not be contiguous, and an operational error (Section 35.3.10) will be signaled when TraceEn is set. 1: This field holds bits 27:3 of the offset pointer into the current ToPA table. This value can be added to the IA32_RTIT_OUTPUT_BASE value to produce a pointer to the current ToPA table entry, which itself is a pointer to the current output region. In this scenario, the lower 7 reserved bits are ignored. This field supports tables up to 256 MBytes in size.
63:32	OutputOffset	0	The use of this field depends on the value of IA32_RTIT_CTL.ToPA: 0: This is bits 31:0 of the offset pointer into the single, contiguous physical output region. This value will be added to the IA32_RTIT_OUTPUT_BASE value to form the physical address at which the next byte of packet output data will be written. This value must be less than or equal to the MaskOrTableOffset field, otherwise an operational error (Section 35.3.10) will be signaled when TraceEn is set. 1: This field holds bits 31:0 of the offset pointer into the current ToPA output region. This value will be added to the output region base field, found in the current ToPA table entry, to form the physical address at which the next byte of trace output data will be written. This value must be less than the ToPA entry size, otherwise an operational error (Section 35.3.10) will be signaled when TraceEn is set.

35.2.9 Interaction of Intel® Processor Trace and Other Processor Features

35.2.9.1 Intel® Transactional Synchronization Extensions (Intel® TSX)

The operation of Intel TSX is described in Chapter 14 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1. For tracing purpose, packet generation does not distinguish between hardware lock elision (HLE) and restricted transactional memory (RTM), but speculative execution does have impacts on the trace output. Specifically, packets are generated as instructions complete, even for instructions in a transactional region that is later aborted. For this reason, debugging software will need indication of the beginning and end of a transactional region; this will allow software to understand when instructions are part of a transactional region and whether that region has been committed.

To enable this, TSX information is included in a MODE packet leaf. The mode bits in the leaf are:

- **InTX:** Set to 1 on an TSX transaction begin, and cleared on transaction commit or abort.
- **TXAbort:** Set to 1 only when InTX transitions from 1 to 0 on an abort. Cleared otherwise.

If BranchEn=1, this MODE packet will be sent each time the transaction status changes. See Table 35-10 for details.

Table 35-10. TSX Packet Scenarios with BranchEn=1

TSX Event	Instruction	Packets
Transaction Begin	Either XBEGIN or XACQUIRE lock (the latter if executed transactionally)	MODE(TXAbort=0, InTX=1), FUP(CurrentIP)
Transaction Commit	Either XEND or XRELEASE lock, if transactional execution ends. This happens only on the outermost commit	MODE(TXAbort=0, InTX=0), FUP(CurrentIP)

Table 35-10. TSX Packet Scenarios with BranchEn=1

TSX Event	Instruction	Packets
Transaction Abort	XABORT or other transactional abort	MODE(TXAbort=1, InTX=0), FUP(CurrentIP), TIP(TargetIP)
Other	One of the following: ▪ Nested XBEGIN or XACQUIRE lock ▪ An outer XACQUIRE lock that doesn't begin a transaction (InTX not set) ▪ Non-outermost XEND or XRELEASE lock	None. No change to TSX mode bits for these cases.

The CurrentIP listed above is the IP of the associated instruction. The TargetIP is the IP of the next instruction to be executed; for HLE, this is the XACQUIRE lock; for RTM, this is the fallback handler.

Intel PT stores are non-transactional, and thus packet writes are not rolled back on TSX abort.

35.2.9.2 TSX and IP Filtering

A complication with tracking transactions is handling transactions that start or end outside of the tracing region. Transactions can't span across a change in ContextEn, because CPL changes and CR3 changes each cause aborts. But a transaction can start within the IP filter region and end outside it.

To assist the decoder handling this situation, MODE.TSX packets can be sent even if FilterEn=0, though there will be no FUP attached. Instead, they will merely serve to indicate to the decoder when transactions are active and when they are not. When tracing resumes (due to PacketEn=1), the last MODE.TSX preceding the TIP.PGE will indicate the current transaction status.

35.2.9.3 System Management Mode (SMM)

SMM code has special privileges that non-SMM code does not have. Intel Processor Trace can be used to trace SMM code, but special care is taken to ensure that SMM handler context is not exposed in any non-SMM trace collection. Additionally, packet output from tracing non-SMM code cannot be written into memory space that is either protected by SMRR or used by the SMM handler.

SMM is entered via a system management interrupt (SMI). SMI delivery saves the value of IA32_RTIT_CTL.TraceEn into SMRAM and then clears it, thereby disabling packet generation.

The saving and clearing of IA32_RTIT_CTL.TraceEn ensures two things:

1. All internally buffered packet data is flushed before entering SMM (see Section 35.2.8.2).
2. Packet generation ceases before entering SMM, so any tracing that was configured outside SMM does not continue into SMM. No SMM instruction pointers or other state will be exposed in the non-SMM trace.

When the RSM instruction is executed to return from SMM, the TraceEn value that was saved by SMI delivery is restored, allowing tracing to be resumed. As is done any time packet generation is enabled, ContextEn is re-evaluated, based on the values of CPL, CR3, etc., established by RSM.

Like other interrupts, delivery of an SMI produces a FUP containing the IP of the next instruction to execute. By toggling TraceEn, SMI and RSM can produce TIP.PGD and TIP.PGE packets, respectively, indicating that tracing was disabled or re-enabled. See Table 35.7 for more information about packets entering and leaving SMM.

Although #SMI and RSM change CR3, PIP packets are not generated in these cases. With #SMI tracing is disabled before the CR3 change; with RSM TraceEn is restored after CR3 is written.

TraceEn must be cleared before executing RSM, otherwise it will cause a shutdown. Further, on processors that restrict use of Intel PT with LBRs (see Section 35.3.1.2), any RSM that results in enabling of both will cause a shutdown.

Intel PT can support tracing of System Transfer Monitor operating in SMM, see Section 35.6.

35.2.9.4 Virtual-Machine Extensions (VMX)

Initial implementations of Intel Processor Trace do not support tracing in VMX operation. Such processors indicate this by returning 0 for IA32_VMX_MISC[bit 14]. On these processors, execution of the VMXON instruction clears IA32_RTIT_CTL.TraceEn and any attempt to write IA32_RTIT_CTL in VMX operation causes a general-protection exception (#GP).

Processors that support Intel Processor Trace in VMX operation return 1 for IA32_VMX_MISC[bit 14]. Details of tracing in VMX operation are described in Section 35.4.2.26.

35.2.9.5 Intel® Software Guard Extensions (Intel® SGX)

Intel SGX provides an application with the ability to instantiate a protective container (an enclave) with confidentiality and integrity (see the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D). On a processor with both Intel PT and Intel SGX enabled, when executing code within a production enclave, no control flow packets are produced by Intel PT. An enclave entry will clear ContextEn, thereby blocking control flow packet generation. A TIP.PGD packet will be generated if PacketEn=1 at the time of the entry.

Upon enclave exit, ContextEn will no longer be forced to 0. If other enables are set at the time, a TIP.PGE may be generated to indicate that tracing is resumed.

During the enclave execution, Intel PT remains enabled, and periodic or timing packets such as PSB, TSC, MTC, or CBR can still be generated. No IPs or other architectural state will be exposed.

For packet generation examples on enclave entry or exit, see Section 35.7.

Debug Enclaves

Intel SGX allows an enclave to be configured with relaxed protection of confidentiality for debug purposes, see the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D. In a debug enclave, Intel PT continues to function normally. Specifically, ContextEn is not impacted by an enclave entry or exit. Hence, the generation of ContextEn-dependent packets within a debug enclave is allowed.

35.2.9.6 SENTER/ENTERACCS and ACM

GETSEC[SENDER] and GETSEC[ENTERACCS] instructions clear TraceEn, and it is not restored when those instructions complete. SENTER also causes TraceEn to be cleared on other logical processors when they rendezvous and enter the SENTER sleep state. In these two cases, the disabling of packet generation is not guaranteed to flush internally buffered packets. Some packets may be dropped.

When executing an authenticated code module (ACM), packet generation is silently disabled during ACRAM setup. TraceEn will be cleared, but no TIP.PGD packet is generated. After completion of the module, the TraceEn value will be restored. There will be no TIP.PGE packet, but timing packets, like TSC and CBR, may be produced.

35.2.9.7 Intel® Memory Protection Extensions (Intel® MPX)

Bounds exceptions (#BR) caused by Intel MPX are treated like other exceptions, producing FUP and TIP packets that indicate the source and destination IPs.

35.3 CONFIGURATION AND PROGRAMMING GUIDELINE

35.3.1 Detection of Intel Processor Trace and Capability Enumeration

Processor support for Intel Processor Trace is indicated by CPUID.07H.00H:EBX[25]= 1. CPUID function 14H is dedicated to enumerate the resource and capability of processors that report CPUID.07H.00H:EBX[25]= 1. Different processor generations may have architecturally-defined variation in capabilities. Table 35-11 describes details of the enumerable capabilities that software must use across generations of processors that support Intel Processor Trace.

Table 35-11. CPUID.14H Enumeration of Intel Processor Trace Capabilities

CPUID.14H.00H		Name	Description Behavior
Register	Bits		
EAX	31:0	Maximum valid sub-leaf Index	Specifies the index of the maximum valid sub-leaf for this CPUID leaf.
EBX	0	CR3 Filtering Support	1: Indicates that IA32_RTIT_CTL.CR3Filter can be set to 1, and that IA32_RTIT_CR3_MATCH MSR can be accessed. See Section 35.2.8. 0: Indicates that writes that set IA32_RTIT_CTL.CR3Filter to 1, or any access to IA32_RTIT_CR3_MATCH, will generate a #GP exception.
	1	Configurable PSB and Cycle-Accurate Mode Supported	1: (a) IA32_RTIT_CTL.PSBFreq can be set to a non-zero value, in order to select the preferred PSB frequency (see below for allowed values). (b) IA32_RTIT_STATUS.PacketByteCnt can be set to a non-zero value, and will be incremented by the processor when tracing to indicate progress towards the next PSB. If trace packet generation is enabled by setting TraceEn, a PSB will only be generated if PacketByteCnt=0. (c) IA32_RTIT_CTL.CYCEn can be set to 1 to enable Cycle-Accurate Mode. See Section 35.2.8. 0: (a) Any attempt to write a non-zero value to IA32_RTIT_CTL.PSBFreq or IA32_RTIT_STATUS.PacketByteCnt will generate a #GP exception. (b) If trace packet generation is enabled by setting TraceEn, a PSB is always generated. (c) Any attempt to write a non-zero value to IA32_RTIT_CTL.CYCEn or IA32_RTIT_CTL.CycThresh will generate a #GP exception.
	2	IP Filtering and TraceStop supported, and Preserve Intel PT MSRs across warm reset	1: (a) IA32_RTIT_CTL provides at one or more ADDRn_CFG field to configure the corresponding address range MSRs for IP Filtering or IP TraceStop. Each ADDRn_CFG field accepts a value in the range of 0:2 inclusive. The number of ADDRn_CFG fields is reported by CPUID.14H.01H:EAX.RANGE CNT[2:0]. (b) At least one register pair IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B are provided to configure address ranges for IP filtering or IP TraceStop. (c) On warm reset, all Intel PT MSRs will retain their pre-reset values, though IA32_RTIT_CTL.TraceEn will be cleared. The Intel PT MSRs are listed in Section 35.2.8. 0: (a) An Attempt to write IA32_RTIT_CTL.ADDRn_CFG with non-zero encoding values will cause #GP. (b) Any access to IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B, will generate a #GP exception. (c) On warm reset, all Intel PT MSRs will be cleared.
	3	MTC Supported	1: IA32_RTIT_CTL.MTCEn can be set to 1, and MTC packets will be generated. See Section 35.2.8. 0: An attempt to set IA32_RTIT_CTL.MTCEn or IA32_RTIT_CTL.MTCFreq to a non-zero value will generate a #GP exception.
	4	PTWRITE Supported	1: Writes can set IA32_RTIT_CTL[12] (PTWEn) and IA32_RTIT_CTL[5] (FUPonPTW), and PTWRITE can generate packets. 0: Writes that set IA32_RTIT_CTL[12] or IA32_RTIT_CTL[5] will generate a #GP exception, and PTWRITE will #UD fault.
	5	Power Event Trace Supported	1: Writes can set IA32_RTIT_CTL[4] (PwrEvtEn), enabling Power Event Trace packet generation. 0: Writes that set IA32_RTIT_CTL[4] will generate a #GP exception.

Table 35-11. CPUID.14H Enumeration of Intel Processor Trace Capabilities (Contd.)

CPUID.14H.00H		Name	Description Behavior
Register	Bits		
	6	PSB and PMI Preservation Supported	1: Writes can set IA32_RTIT_CTL[56] (InjectPsbPmiOnEnable), enabling the processor to set IA32_RTIT_STATUS[7] (PendToPaPMI) and/or IA32_RTIT_STATUS[6] (PendPSB) in order to preserve ToPA PMIs and/or PSBs otherwise lost due to Intel PT disable. Writes can also set PendToPAPMI and PendPSB. 0: Writes that set IA32_RTIT_CTL[56], IA32_RTIT_STATUS[7], or IA32_RTIT_STATUS[6] will generate a #GP exception.
	7	Event Trace Supported	1: Writes can set IA32_RTIT_CTL[31] (EventEn), enabling Event Trace packet generation. 0: Writes that set IA32_RTIT_CTL[31] will generate a #GP exception.
	8	TNT Disable Supported	1: Writes can set IA32_RTIT_CTL[55] (DisTNT), disabling TNT packet generation. 0: Writes that set IA32_RTIT_CTL[55] will generate a #GP exception.
	31:9	Reserved	
ECX	0	ToPA Output Supported	1: Tracing can be enabled with IA32_RTIT_CTL.ToPA = 1, hence utilizing the ToPA output scheme (Section 35.2.7.2) IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS MSRs can be accessed. 0: Unless CPUID.14H.00H:ECX.SNGL_RNG_OUT[2] = 1, writes to IA32_RTIT_OUTPUT_BASE or IA32_RTIT_OUTPUT_MASK_PTRS MSRs will generate a #GP exception.
	1	ToPA Tables Allow Multiple Output Entries	1: ToPA tables can hold any number of output entries, up to the maximum allowed by the MaskOffsetTableOffset field of IA32_RTIT_OUTPUT_MASK_PTRS. 0: ToPA tables can hold only one output entry, which must be followed by an END=1 entry which points back to the base of the table. Further, ToPA PMIs will be delivered before the region is filled. See ToPA PMI in Section 35.2.7.2. If there is more than one output entry before the END entry, or if the END entry has the wrong base address, an operational error will be signaled (see “ToPA Errors” in Section 35.2.7.2).
	2	Single-Range Output Supported	1: Enabling tracing (TraceEn=1) with IA32_RTIT_CTL.ToPA=0 is supported. 0: Unless CPUID.14H.00H:ECX.TOPAOUT[0] = 1, writes to IA32_RTIT_OUTPUT_BASE or IA32_RTIT_OUTPUT_MASK_PTRS MSRs will generate a #GP exception.
	3	Output to Trace Transport Subsystem Supported	1: Setting IA32_RTIT_CTL.FabricEn to 1 is supported. 0: IA32_RTIT_CTL.FabricEn is reserved. Write 1 to IA32_RTIT_CTL.FabricEn will generate a #GP exception.
	30:4	Reserved	
	31	IP Payloads are LIP	1: Generated packets which contain IP payloads have LIP values, which include the CS base component. 0: Generated packets which contain IP payloads have RIP values, which are the offset from CS base.
EDX	31:0	Reserved	

If CPUID.14H.00H:EAX reports a non-zero value, additional capabilities of Intel Processor Trace are described in the sub-leaves of CPUID.14H.

Table 35-12. CPUID.14H.01H Enumeration of Intel Processor Trace Capabilities

CPUID.14H.01H		Name	Description Behavior
Register	Bits		
EAX	2:0	Number of Address Ranges	A non-zero value specifies the number ADDRn_CFG field supported in IA32_RTIT_CTL and the number of register pair IA32_RTIT_ADDRn_A/IA32_RTIT_ADDRn_B supported for IP filtering and IP TraceStop. NOTE: Currently, no processors support more than 4 address ranges.
	15:3	Reserved	
	31:16	Bitmap of supported MTC Period Encodings	The non-zero bits indicate the map of supported encoding values for the IA32_RTIT_CTL.MTCFreq field. This applies only if CPUID.14H.00H:EBX[3] = 1 (MTC Packet generation is supported), otherwise the MTCFreq field is reserved to 0. Each bit position in this field represents 1 encoding value in the 4-bit MTCFreq field (ie, bit 0 is associated with encoding value 0). For each bit: 1: MTCFreq can be assigned the associated encoding value. 0: MTCFreq cannot be assigned to the associated encoding value. A write to IA32_RTIT_CTL.MTCFreq with unsupported encoding will cause #GP fault.
EBX	15:0	Bitmap of supported Cycle Threshold values	The non-zero bits indicate the map of supported encoding values for the IA32_RTIT_CTL.CycThresh field. This applies only if CPUID.14H.00H:EBX[1] = 1 (Cycle-Accurate Mode is Supported), otherwise the CycThresh field is reserved to 0. See Section 35.2.8. Each bit position in this field represents 1 encoding value in the 4-bit CycThresh field (ie, bit 0 is associated with encoding value 0). For each bit: 1: CycThresh can be assigned the associated encoding value. 0: CycThresh cannot be assigned to the associated encoding value. A write to CycThresh with unsupported encoding will cause #GP fault.
	31:16	Bitmap of supported Configurable PSB Frequency encoding	The non-zero bits indicate the map of supported encoding values for the IA32_RTIT_CTL.PSBFreq field. This applies only if CPUID.14H.00H:EBX[1] = 1 (Configurable PSB is supported), otherwise the PSBFreq field is reserved to 0. See Section 35.2.8. Each bit position in this field represents 1 encoding value in the 4-bit PSBFreq field (ie, bit 0 is associated with encoding value 0). For each bit: 1: PSBFreq can be assigned the associated encoding value. 0: PSBFreq cannot be assigned to the associated encoding value. A write to PSBFreq with unsupported encoding will cause #GP fault.
ECX	31:0	Reserved	
EDX	31:0	Reserved	

35.3.1.1 Packet Decoding of RIP versus LIP

FUP, TIP, TIP.PGE, and TIP.PGE packets can contain an instruction pointer (IP) payload. On some processor generations, this payload will be an effective address (RIP), while on others this will be a linear address (LIP). In the former case, the payload is the offset from the current CS base address, while in the latter it is the sum of the offset and the CS base address (Note that in real mode, the CS base address is the value of CS<4, while in protected

mode the CS base address is the base linear address of the segment indicated by the CS register.). Which IP type is in use is indicated by enumeration (see CPUID.14H.00H:ECX.LIP[31] in Table 35-11).

For software that executes while the CS base address is 0 (including all software executing in 64-bit mode), the difference is indistinguishable. A trace decoder must account for cases where the CS base address is not 0 and the resolved LIP will not be evident in a trace generated on a CPU that enumerates use of RIP. This is likely to cause problems when attempting to link the trace with the associated binaries.

Note that IP comparison logic, for IP filtering and TraceStop range calculation, is based on the same IP type as these IP packets. For processors that output RIP, the IP comparison mechanism is also based on RIP, and hence on those processors RIP values should be written to IA32_RTIT_ADDRn_[AB] MSRs. This can produce differing behavior if the same trace configuration setting is run on processors reporting different IP types, i.e., CPUID.14H.00H:ECX.LIP[31]. Care should be taken to check CPUID when configuring IP filters.

35.3.1.2 Model Specific Capability Restrictions

Some processor generations impose restrictions that prevent use of LBRs/BTS/BTM/LERs when software has enabled tracing with Intel Processor Trace. On these processors, when TraceEn is set, updates of LBR, BTS, BTM, LERs are suspended but the states of the corresponding IA32_DEBUGCTL control fields remained unchanged as if it were still enabled. When TraceEn is cleared, the LBR array is reset, and LBR/BTS/BTM/LERs updates will resume. Further, reads of these registers will return 0, and writes will be dropped.

The list of MSRs whose updates/accesses are restricted follows.

- MSR_LASTBRANCH_x_TO_IP, MSR_LASTBRANCH_x_FROM_IP, MSR_LBR_INFO_x, MSR_LASTBRANCH_TOS
- MSR_LER_FROM_LIP, MSR_LER_TO_LIP
- MSR_LBR_SELECT

For processors with CPUID DisplayFamily_DisplayModel signatures of 06_3DH, 06_47H, 06_4EH, 06_4FH, 06_56H, and 06_5EH, the use of Intel PT and LBRs are mutually exclusive.

35.3.2 Enabling and Configuration of Trace Packet Generation

To configure trace packets, enable packet generation, and capture packets, software starts with using CPUID instruction to detect its feature flag, CPUID.07H.00H:EBX[25] = 1; followed by enumerating the capabilities described in Section 35.3.1.

Based on the capability queried from Section 35.3.1, software must configure a number of model-specific registers. This section describes programming considerations related to those MSRs.

35.3.2.1 Enabling Packet Generation

When configuring and enabling packet generation, the IA32_RTIT_CTL MSR should be written after any other Intel PT MSRs have been written, since writes to the other configuration MSRs cause a general-protection fault (#GP) if TraceEn = 1. If a prior trace collection context is not being restored, then software should first clear IA32_RTIT_STATUS. This is important since the Stopped, and Error fields are writable; clearing the MSR clears any values that may have persisted from prior trace packet collection contexts. See Section 35.2.8.2 for details of packets generated by setting TraceEn to 1.

If setting TraceEn to 1 causes an operational error (see Section 35.3.10), there may be a delay after the WRMSR completes before the error is signaled in the IA32_RTIT_STATUS MSR.

While packet generation is enabled, the values of some configuration MSRs (e.g., IA32_RTIT_STATUS and IA32_RTIT_OUTPUT_*) are transient, and reads may return values that are out of date. Only after packet generation is disabled (by clearing TraceEn) do reads of these MSRs return reliable values.

35.3.2.2 Disabling Packet Generation

After disabling packet generation by clearing IA32_RTIT_CTL, it is advisable to read the IA32_RTIT_STATUS MSR (Section 35.2.8.4):

- If the Error bit is set, an operational error was encountered, and the trace is most likely compromised. Software should check the source of the error (by examining the output MSR values), correct the source of the problem, and then attempt to gather the trace again. For details on operational errors, see Section 35.3.10. Software should clear IA32_RTIT_STATUS.Error before re-enabling packet generation.
- If the Stopped bit is set, software execution encountered an IP TraceStop (see Section 35.2.5.3) or the ToPA Stop condition (see “ToPA STOP” in Section 35.2.7.2) before packet generation was disabled.

35.3.3 Flushing Trace Output

Packets are first buffered internally and then written out asynchronously. To collect packet output for post-processing, a collector needs first to ensure that all packet data has been flushed from internal buffers. Software can ensure this by stopping packet generation by clearing IA32_RTIT_CTL.TraceEn (see “Disabling Packet Generation” in Section 35.2.8.2).

When software clears IA32_RTIT_CTL.TraceEn to flush out internally buffered packets, the logical processor issues an SFENCE operation which ensures that WC trace output stores will be ordered with respect to the next store, or serializing operation. A subsequent read from the same logical processor will see the flushed trace data, while a read from another logical processor should be preceded by a store, fence, or architecturally serializing operation on the tracing logical processor.

When the flush operations complete, the IA32_RTIT_OUTPUT_* MSR values indicate where the trace ended. While TraceEn is set, these MSRs may hold stale values. Further, if a ToPA region with INT=1 is filled, meaning a ToPA PMI has been triggered, IA32_PERF_GLOBAL_STATUS.Trace_ToPA_PMI[55] will be set by the time the flush completes.

35.3.4 Warm Reset

The MSRs software uses to program Intel Processor Trace are cleared after a power-on RESET (or cold RESET). On a warm RESET, the contents of those MSRs can retain their values from before the warm RESET with the exception that IA32_RTIT_CTL.TraceEn will be cleared (which may have the side effect of clearing some bits in IA32_RTIT_STATUS).

35.3.5 Context Switch Consideration

To facilitate construction of instruction execution traces at the granularity of a software process or thread context, software can save and restore the states of the trace configuration MSRs across the process or thread context switch boundary. The principle is the same as saving and restoring the typical architectural processor states across context switches.

35.3.5.1 Manual Trace Configuration Context Switch

The configuration can be saved and restored through a sequence of instructions of RDMSR, management of MSR content and WRMSR. To stop tracing and to ensure that all configuration MSRs contain stable values, software must clear IA32_RTIT_CTL.TraceEn before reading any other trace configuration MSRs. The recommended method for saving trace configuration context manually follows:

1. RDMSR IA32_RTIT_CTL, save value to memory
2. WRMSR IA32_RTIT_CTL with saved value from RDMSR above and TraceEn cleared
3. RDMSR all other configuration MSRs whose values had changed from previous saved value, save changed values to memory

When restoring the trace configuration context, IA32_RTIT_CTL should be restored last:

1. Read saved configuration MSR values, aside from IA32_RTIT_CTL, from memory, and restore them with WRMSR
2. Read saved IA32_RTIT_CTL value from memory, and restore with WRMSR.

35.3.5.2 Trace Configuration Context Switch Using XSAVES/XRSTORS

On processors whose XSAVE feature set supports XSAVES and XRSTORS, the Trace configuration state can be saved using XSAVES and restored by XRSTORS, in conjunction with the bit field associated with supervisory state component in IA32_XSS. See Chapter 13, “Managing State Using the XSAVE Feature Set,” of Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1.

35.3.6 Cycle-Accurate Mode

Intel PT can be run in a cycle-accurate mode which enables CYC packets (see Section 35.4.2.14) that provide low-level information in the processor core clock domain. This cycle counter data in CYC packets can be used to compute IPC (Instructions Per Cycle), or to track wall-clock time on a fine-grain level.

To enable cycle-accurate mode packet generation, software should set IA32_RTIT_CTL.CYCEn=1. It is recommended that software also set TSCEn=1 anytime cycle-accurate mode is in use. With this, all CYC-eligible packets will be preceded by a CYC packet, the payload of which indicates the number of core clock cycles since the last CYC packet. In cases where multiple CYC-eligible packets are generated in a single cycle, only a single CYC will be generated before the CYC-eligible packets, otherwise each CYC-eligible packet will be preceded by its own CYC. The CYC-eligible packets are:

- TNT, TIP, TIP.PGE, TIP.PGD, MODE.EXEC, MODE.TSX, PIP, VMCS, OVF, MTC, TSC, PTWRITE, EXSTOP

TSC packets are generated when there is insufficient information to reconstruct wall-clock time, due to tracing being disabled (TriggerEn=0), or power down scenarios like a transition to a deep-sleep MWAIT C-state. In this case, the CYC that is generated along with the TSC will indicate the number of cycles actively tracing (those powered up, with TriggerEn=1) executed between the last CYC packet and the TSC packet. And hence the amount of time spent while tracing is inactive can be inferred from the difference in time between that expected based on the CYC value, and the actual time indicated by the TSC.

Additional CYC packets may be sent stand-alone, so that the processor can ensure that the decoder is aware of the number of cycles that have passed before the internal hardware counter wraps, or is reset due to other micro-architectural condition. There is no guarantee at what intervals these standalone CYC packets will be sent, except that they will be sent before the wrap occurs. An illustration is given below.

Example 35-1. An Illustrative CYC Packet Example

Time (cycles)	Instruction Snapshot	Generated Packets	Comment
x	call %eax	CYC(?), TIP	?Elapsed cycles from the previous CYC unknown
x + 2	call %ebx	CYC(2), TIP	1 byte CYC packet; 2 cycles elapsed from the previous CYC
x + 8	jnz Foo (not taken)	CYC(6)	1 byte CYC packet
x + 9	ret (compressed)		
x + 12	jnz Bar (taken)		
x + 16	ret (uncompressed)	TNT, CYC(8), TIP	1 byte CYC packet
x + 4111		CYC(4095)	2 byte CYC packet
x + 12305		CYC(8194)	3 byte CYC packet
x + 16332	mov cr3, %ebx	CYC(4027), PIP	2 byte CYC packet

35.3.6.1 Cycle Counter

The cycle counter is implemented in hardware (independent of the time stamp counter or performance monitoring counters), and is a simple incrementing counter that does not saturate, but rather wraps. The size of the counter is implementation specific.

The cycle counter is reset to zero any time that TriggerEn is cleared, and when a CYC packet is sent. The cycle counter will continue to count when ContextEn or FilterEn are cleared, and cycle packets will still be generated. It will not count during sleep states that result in Intel PT logic being powered-down, but will count up to the point where clocks are disabled, and resume counting once they are re-enabled.

35.3.6.2 Cycle Packet Semantics

Cycle-accurate mode adheres to the following protocol:

- All packets that precede a CYC packet represent instructions or events that took place before the CYC time.
- All packets that follow a CYC packet represent instructions or events that took place at the same time as, or after, the CYC time.
- The CYC-eligible packet that immediately follows a CYC packet represents an instruction or event that took place at the same time as the CYC time.

These items above give the decoder a means to apply CYC packets to a specific instruction in the assembly stream. Most packets represent a single instruction or event, and hence the CYC packet that precedes each of those packets represents the retirement time of that instruction or event. In the case of TNT packets, up to 6 conditional branches and/or compressed RETs may be contained in the packet. In this case, the preceding CYC packet provides the retirement time of the first branch in the packet. It is possible that multiple branches retired in the same cycle as that first branch in the TNT, but the protocol will not make that obvious. Also note that a MTC packet could be generated in the same cycle as the first JCC in the TNT packet. In this case, the CYC would precede both the MTC and the TNT, and apply to both.

Note that there are times when the cycle counter will stop counting, though cycle-accurate mode is enabled. After any such scenario, a CYC packet followed by TSC packet will be sent. See Section 35.8.3.2 to understand how to interpret the payload values

Multi-packet Instructions or Events

Some operations, such as interrupts or task switches, generate multiple packets. In these cases, multiple CYC packets may be sent for the operation, preceding each CYC-eligible packet in the operation. An example, using a task switch on a software interrupt, is shown below.

Example 35-2. An Example of CYC in the Presence of Multi-Packet Operations

Time (cycles)	Instruction Snapshot	Generated Packets
x	jnz Foo (not taken)	CYC(?)
x + 2	ret (compressed)	
x + 8	jnz Bar (taken)	
x + 9	jmp %eax	TNT, CYC(9), TIP
x + 12	jnz Bar (not taken)	CYC(3)
x + 32	int3 (task gate)	TNT, FUP, CYC(10), PIP, CYC(20), MODE.Exec, TIP

35.3.6.3 Cycle Thresholds

Software can opt to reduce the frequency of cycle packets, a trade-off to save bandwidth and intrusion at the expense of precision. This is done by utilizing a cycle threshold (see Section 35.2.8.2).

IA32_RTIT_CTL.CycThresh indicates to the processor the minimum number of cycles that must pass before the next CYC packet should be sent. If this value is 0, no threshold is used, and CYC packets can be sent every cycle in which a CYC-eligible packet is generated. If this value is greater than 0, the hardware will wait until the associated

number of cycles have passed since the last CYC packet before sending another. CPUID provides the threshold options for CycThresh, see Section 35.3.1.

Note that the cycle threshold does not dictate how frequently a CYC packet will be posted, it merely assigns the maximum frequency. If the cycle threshold is 16, a CYC packet can be posted no more frequently than every 16 cycles. However, once that threshold of 16 cycles has passed, it still requires a new CYC-eligible packet to be generated before a CYC will be inserted. Table 35-13 illustrates the threshold behavior.

Table 35-13. An Illustrative CYC Packet Example

Time (cycles)	Instruction Snapshot	Threshold			
		0	16	32	64
x	jmp %eax	CYC, TIP	CYC, TIP	CYC, TIP	CYC, TIP
x + 9	call %ebx	CYC, TIP	TIP	TIP	TIP
x + 15	call %ecx	CYC, TIP	TIP	TIP	TIP
x + 30	jmp %edx	CYC, TIP	CYC, TIP	TIP	TIP
x + 38	mov cr3, %eax	CYC, PIP	PIP	CYC, PIP	PIP
x + 46	jmp [%eax]	CYC, TIP	CYC, TIP	TIP	TIP
x + 64	call %edx	CYC, TIP	CYC, TIP	TIP	CYC, TIP
x + 71	jmp %edx	CYC, TIP	TIP	CYC, TIP	TIP

35.3.7 Decoder Synchronization (PSB+)

The PSB packet (Section 35.4.2.17) serves as a synchronization point for a trace-packet decoder. It is a pattern in the trace log for which the decoder can quickly scan to align packet boundaries. No legal packet combination can result in such a byte sequence. As such, it serves as the starting point for packet decode. To decode a trace log properly, the decoder needs more than simply to be aligned: it needs to know some state and potentially some timing information as well. The decoder should never need to retain any information (e.g., LastIP, call stack, compound packet event) across a PSB; all compound packet events will be completed before a PSB, and any compression state will be reset.

When a PSB packet is generated, it is followed by a PSBEND packet (Section 35.4.2.18). One or more packets may be generated in between those two packets, and these inform the decoder of the current state of the processor. These packets, known collectively as PSB+, should be interpreted as “status only”, since they do not imply any change of state at the time of the PSB, nor are they associated directly with any instruction or event. Thus, the normal binding and ordering rules that apply to these packets outside of PSB+ can be ignored when these packets are between a PSB and PSBEND. They inform the decoder of the state of the processor at the time of the PSB.

PSB+ can include:

- Timestamp (TSC), if IA32_RTIT_CTL.TSCEn=1.
- Timestamp-MTC Align (TMA), if IA32_RTIT_CTL.TSCEn=1 && IA32_RTIT_CTL.MTCEn=1.
- Paging Information Packet (PIP), if ContextEn=1 and IA32_RTIT_CTL.OS=1. The non-root bit (NR) is set if the logical processor is in VMX non-root operation and the “conceal VMX from PT” VM-execution control is 0.
- VMCS packet, if either the logical is in VMX root operation or the logical processor is in VMX non-root operation and the “conceal VMX from PT” VM-execution control is 0.
- Core Bus Ratio (CBR).
- MODE.TSX, if ContextEn=1 and BranchEn = 1.
- MODE.Exec, if PacketEn=1 or (ContextEn=1 and IA32_RTIT_CTL.EventEn=1).
- Flow Update Packet (FUP), if PacketEn=1.

PSB is generated only when TriggerEn=1; hence PSB+ has the same dependencies. The ordering of packets within PSB+ is not fixed. Timing packets such as CYC and MTC may be generated between PSB and PSBEND, and their meanings are the same as outside PSB+.

A PSB+ can be lost in some scenarios. If IA32_RTIT_STATUS.TriggerEn is cleared just as the PSB threshold is reached, e.g., due to TraceEn being cleared, the PSB+ may not be generated. On processors that support PSB preservation (CPUID.14H.00H:EBX[6] = 1), setting IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1 will ensure that a PSB+ that is pending at the time PT is disabled will be recorded by setting IA32_RTIT_STATUS.PendPSB[6] = 1. A PSB will be inserted, and PendPSB cleared, when PT is later re-enabled while PendPSB = 1.

Note that an overflow can occur during PSB+, and this could cause the PSBEND packet to be lost. For this reason, the OVF packet should also be viewed as terminating PSB+. If IA32_RTIT_STATUS.TriggerEn is cleared just as the PSB threshold is reached, the PSB+ may not be generated. TriggerEn can be cleared by a WRMSR that clears IA32_RTIT_CTL.TraceEn, a VM exit that clears IA32_RTIT_CTL.TraceEn, an #SMI, or any time that either IA32_RTIT_STATUS.Stopped is set (e.g., by a TraceStop or ToPA stop condition) or IA32_RTIT_STATUS.Error is set (e.g., by an Intel PT output error). On processors that support PSB preservation (CPUID.14H.00H:EBX[6] = 1), setting IA32_RTIT_CTL.InjectPsbPmiOnEnable[56] = 1 will ensure that a PSB+ that is pending at the time PT is disabled will be recorded by setting IA32_RTIT_STATUS.PendPSB[6] = 1. A PSB will then be pended when the saved PT context is later restored.

35.3.8 Internal Buffer Overflow

In the rare circumstances when new packets need to be generated but the processor's dedicated internal buffers are all full, an "internal buffer overflow" occurs. On such an overflow packet generation ceases (as packets would need to enter the processor's internal buffer) until the overflow resolves. Once resolved, packet generation resumes.

When the buffer overflow is cleared, an OVF packet (Section 35.4.2.16) is generated, and the processor ensures that packets which follow the OVF are not compressed (IP compression or RET compression) against packets that were lost.

If IA32_RTIT_CTL.BranchEn = 1, the OVF packet will be followed by a FUP if the overflow resolves while PacketEn=1. If the overflow resolves while PacketEn = 0 no packet is generated, but a TIP.PGE will naturally be generated later, once PacketEn = 1. The payload of the FUP or TIP.PGE will be the Current IP of the first instruction upon which tracing resumes after the overflow is cleared. If the overflow resolves while PacketEn=1, only timing packets may come between the OVF and the FUP. If the overflow resolves while PacketEn=0, any other packets that are not dependent on PacketEn may come between the OVF and the TIP.PGE.

35.3.8.1 Overflow Impact on Enables

The address comparisons to ADDRn ranges, for IP filtering and TraceStop (Section 35.2.5.3), continue during a buffer overflow, and TriggerEn, ContextEn, and FilterEn may change during a buffer overflow. Like other packets, however, any TIP.PGE or TIP.PGD packets that would have been generated will be lost. Further, IA32_RTIT_STATUS.PacketByteCnt will not increment, since it is only incremented when packets are generated.

If a TraceStop event occurs during the buffer overflow, IA32_RTIT_STATUS.Stopped will still be set, tracing will cease as a result. However, the TraceStop packet, and any TIP.PGD that result from the TraceStop, may be dropped.

35.3.8.2 Overflow Impact on Timing Packets

Any timing packets that are generated during a buffer overflow will be dropped. If only a few MTC packets are dropped, a decoder should be able to detect this by noticing that the time value in the first MTC packet after the buffer overflow incremented by more than one. If the buffer overflow lasted long enough that 256 MTC packets are lost (and thus the MTC packet 'wraps' its 8-bit CTC value), then the decoder may be unable to properly understand the trace. This is not an expected scenario. No CYC packets are generated during overflow, even if the cycle counter wraps.

Note that, if cycle-accurate mode is enabled, the OVF packet will generate a CYC packet. Because the cycle counter counts during overflows, this CYC packet can provide the duration of the overflow. However, there is a risk that the cycle counter wrapped during the overflow, which could render this CYC misleading.

35.3.9 TNT Disable

Software can opt to omit TNT packets from control flow trace (BranchEn=1) by setting IA32_RTIT_CTL.DisTNT[bit 55]. This can dramatically reduce trace size. Results will vary by workload, but trace size reductions of 40-75% are typical, which will have a corresponding reduction in performance overhead and memory bandwidth consumption from Intel PT. However, omitting TNT packets means the decoder is not able to follow the full control flow trace, since conditional branch and compressed RET results won't be known. Thus, TNT Disable should be employed only for usages that do not depend on full control flow trace.

NOTE

To avoid loss of RET results with TNT Disable, software may wish to disable RET compression by setting IA32_RTIT_CTL.DisRETC[bit 11].

35.3.10 Operational Errors

Errors are detected as a result of packet output configuration problems, which can include output alignment issues, ToPA reserved bit violations, or overlapping packet output with restricted memory. See “ToPA Errors” in Section 35.2.7.2 for details on ToPA errors, and Section 35.2.7.4 for details on restricted memory errors. Operational errors are only detected and signaled when TraceEn=1.

When an operational error is detected, tracing is disabled and the error is logged. Specifically, IA32_RTIT_STATUS.Error is set, which will cause IA32_RTIT_STATUS.TriggerEn to be 0. This will disable generation of all packets. Some causes of operational errors may lead to packet bytes being dropped.

It should be noted that the timing of error detection may not be predictable. Errors are signaled when the processor encounters the problematic configuration. This could be as soon as packet generation is enabled but could also be later when the problematic entry or field needs to be used.

Once an error is signaled, software should disable packet generation by clearing TraceEn, diagnose and fix the error condition, and clear IA32_RTIT_STATUS.Error. At this point, packet generation can be re-enabled.

35.4 TRACE PACKETS AND DATA TYPES

This section details the data packets generated by Intel Processor Trace. It is useful for developers writing the interpretation code that will decode the data packets and apply it to the traced source code.

35.4.1 Packet Relationships and Ordering

This section introduces the concept of packet “binding”, which involves determining the IP in a binary disassembly at which the change indicated by a given packet applies. Some packets have the associated IP as the payload (FUP, TIP), while for others the decoder need only search for the next instance of a particular instruction (or instructions) to bind the packet (TNT). However, in many cases, the decoder will need to consider the relationship between packets, and to use this packet context to determine how to bind the packet.

Section 35.4.1.1 below provides detailed descriptions of the packets, including how packets bind to IPs in the disassembly, to other packets, or to nothing at all. Many packets listed are simple to bind, because they are generated in only a few scenarios. Those that require more consideration are typically part of “compound packet events”, such as interrupts, exceptions, and some instructions, where multiple packets are generated by a single operation (instruction or event). These compound packet events frequently begin with a FUP to indicate the source address (if it is not clear from the disassembly), and are concluded by a TIP or TIP.PGD packet that indicates the destination address (if one is provided). In this scenario, the FUP is said to be “coupled” with the TIP packet.

Other packets could be in between the coupled FUP and TIP packet. Timing packets, such as TSC, MTC, CYC, or CBR, could arrive at any time, and hence could intercede in a compound packet event. If an operation changes CR3 or the processor’s mode of execution, a state update packet (i.e., PIP or MODE) is generated. The state changes indicated by these intermediate packets should be applied at the IP of the TIP* packet. A summary of compound packet events is provided in Table 35-14; see Section 35.4.1.1 for more per-packet details and Section 35.7 for more detailed packet generation examples.

Table 35-14. Compound Packet Event Summary

Event Type	Beginning	Middle	End	Comment
Unconditional, uncompressed control-flow transfer	FUP or none	Any combination of PIP, VMCS, MODE.Exec, or none	TIP or TIP.PGD	FUP only for asynchronous events. Order of middle packets may vary. PIP/VMCS/MODE only if the operation modifies the state tracked by these respective packets.
TSX Update	MODE.TSX, and (FUP or none)	None	TIP, TIP.PGD, or none	FUP TIP/TIP.PGD only for TSX abort cases.
Overflow	OVF	PSB, PSBEND, or none	FUP or TIP.PGE	FUP if overflow resolves while ContextEn=1, else TIP.PGE.

35.4.1.1 Packet Blocks

Packet blocks are a means to dump one or more groups of state values. Packet blocks begin with a Block Begin Packet (BBP), which indicates what type of state is held within the block. Following each BBP there may be one or more Block Item Packets (BIPs), which contain the state values. The block is terminated by either a Block End Packet (BEP) or another BBP indicating the start of a new block.

The BIP packet includes an ID value that, when combined with the Type field from the BBP that preceded it, uniquely identifies the state value held in the BIP payload. The size of each BIP packet payload is provided by the Size field in the preceding BBP packet.

Each block type can have up to 32 items defined for it. There is no guarantee, however, that each block of that type will hold all 32 items. For more details on which items to expect, see documentation on the specific block type of interest.

See the BBP packet description (Section 35.4.2.26) for details on packet block generation scenarios.

Packet blocks are entirely generated within an instruction or between instructions, which dictates the types of packets (aside from BIPs) that may be seen within a packet block. Packets that indicate control flow changes, or other indication of instruction completion, cannot be generated within a block. These are listed in the following table. Other packets, including timing packets, may occur between BBP and BEP.

Table 35-15. Packets Forbidden Between BBP and BEP

TNT
TIP, TIP.PGE, TIP.PGD
MODE.Exec, MODE.TSX
PIP, VMCS
TraceStop
PSB, PSBEND
PTW
MWAIT

It is possible to encounter an internal buffer overflow in the middle of a block. In such a case, it is guaranteed that packet generation will not resume in the middle of a block, and hence the OVF packet terminates the current block. Depending on the duration of the overflow, subsequent blocks may also be lost.

Decoder Implications

When a Block Begin Packet (BBP) is encountered, the decoder will need to decode some packets within the block differently from those outside a block. The Block Item Packet (BIP) header byte has the same encoding as a TNT packet outside of a block, but must be treated as a BIP header (with following payload) within one.

When an OVF packet is encountered, the decoder should treat that as a block ending condition. Packet generation will not resume within a block.

35.4.2 Packet Definitions

The following description of packet definitions are in tabular format. Figure 35-3 explains how to interpret them. Packet bits listed as “RSVD” are not guaranteed to be 0.

Figure 35-3. Interpreting Tabular Definition of Packet Format

35.4.2.1 Taken/Not-taken (TNT) Packet

Table 35-16. TNT Packet Definition

Name	Taken/Not-taken (TNT) Packet									
Packet Format										
		7	6	5	4	3	2	1	0	
	0	1	B ₁	B ₂	B ₃	B ₄	B ₅	B ₆	0	Short TNT
	B ₁ ...B _N represent the last N conditional branch or compressed RET (Section 35.4.2.2) results, such that B ₁ is oldest and B _N is youngest. The short TNT packet can contain from 1 to 6 TNT bits. The long TNT packet can contain from 1 to 47 TNT bits.									

Table 35-16. TNT Packet Definition (Contd.)

		7	6	5	4	3	2	1	0	
0	0	0	0	0	0	0	0	1	0	Long TNT
1	1	0	1	0	0	0	0	1	1	
2	B ₄₀	B ₄₁	B ₄₂	B ₄₃	B ₄₄	B ₄₅	B ₄₆	B ₄₇		
3	B ₃₂	B ₃₃	B ₃₄	B ₃₅	B ₃₆	B ₃₇	B ₃₈	B ₃₉		
4	B ₂₄	B ₂₅	B ₂₆	B ₂₇	B ₂₈	B ₂₉	B ₃₀	B ₃₁		
5	B ₁₆	B ₁₇	B ₁₈	B ₁₉	B ₂₀	B ₂₁	B ₂₂	B ₂₃		
6	B ₈	B ₉	B ₁₀	B ₁₁	B ₁₂	B ₁₃	B ₁₄	B ₁₅		
7	1	B ₁	B ₂	B ₃	B ₄	B ₅	B ₆	B ₇		
	Irrespective of how many TNT bits is in a packet, the last valid TNT bit is followed by a trailing 1, or Stop bit, as shown above. If the TNT packet is not full (fewer than 6 TNT bits for the Short TNT, or fewer than 47 TNT bits for the Long TNT), the Stop bit moves up, and the trailing bits of the packet are filled with 0s. Examples of these “partial TNTs” are shown below. An implementation may choose to use long TNTs, short TNTs, or both.									
		7	6	5	4	3	2	1	0	
0	0	0	1	B ₁	B ₂	B ₃	B ₄	0		Short TNT
		7	6	5	4	3	2	1	0	
0	0	0	0	0	0	0	0	1	0	Long TNT
1	1	0	1	0	0	0	0	1	1	
2	B ₂₄	B ₂₅	B ₂₆	B ₂₇	B ₂₈	B ₂₉	B ₃₀	B ₃₁		
3	B ₁₆	B ₁₇	B ₁₈	B ₁₉	B ₂₀	B ₂₁	B ₂₂	B ₂₃		
4	B ₈	B ₉	B ₁₀	B ₁₁	B ₁₂	B ₁₃	B ₁₄	B ₁₅		
5	1	B ₁	B ₂	B ₃	B ₄	B ₅	B ₆	B ₇		
6	0	0	0	0	0	0	0	0	0	
7	0	0	0	0	0	0	0	0	0	
Dependencies	PacketEn && ~IA32_R-TIT_CTL.DisTNT			Generation Scenario	On a conditional branch or compressed RET, if it fills the TNT. Also, partial TNTs may be generated at any time, as a result of other packets being generated, or certain micro-architectural conditions occurring, before the TNT is full.					
Description	Provides the taken/not-taken results for the last 1..6 (Short TNT) or 1..47 (Long TNT) conditional branches (Jcc, J*CXZ, or LOOP) or compressed RETs (Section 35.4.2.2). The TNT payload bits should be interpreted as follows: 1 indicates a taken conditional branch, or a compressed RET 0 indicates a not-taken conditional branch TNT payload bits are stored internal to the processor in a TNT buffer, until either the buffer is filled or another packet is to be generated. In either case a TNT packet holding the buffered bits will be emitted, and the TNT buffer will be marked as empty.									
Application	Each valid payload bit (that is, bits between the header bits and the trailing Stop bit) applies to an upcoming conditional branch or RET instruction. Once a decoder consumes a TNT packet with N valid payload bits, these bits should be applied to (and hence provide the destination for) the next N conditional branches or RETs.									

35.4.2.2 Target IP (TIP) Packet

Table 35-17. TIP Packet Definition

Name	Target IP (TIP) Packet																																																																																																	
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td colspan="3">IPBytes</td><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td></tr><tr><td>1</td><td colspan="8">TargetIP[7:0]</td></tr><tr><td>2</td><td colspan="8">TargetIP[15:8]</td></tr><tr><td>3</td><td colspan="8">TargetIP[23:16]</td></tr><tr><td>4</td><td colspan="8">TargetIP[31:24]</td></tr><tr><td>5</td><td colspan="8">TargetIP[39:32]</td></tr><tr><td>6</td><td colspan="8">TargetIP[47:40]</td></tr><tr><td>7</td><td colspan="8">TargetIP[55:48]</td></tr><tr><td>8</td><td colspan="8">TargetIP[63:56]</td></tr></table>									7	6	5	4	3	2	1	0	0	IPBytes			0	1	1	0	1	1	TargetIP[7:0]								2	TargetIP[15:8]								3	TargetIP[23:16]								4	TargetIP[31:24]								5	TargetIP[39:32]								6	TargetIP[47:40]								7	TargetIP[55:48]								8	TargetIP[63:56]							
	7	6	5	4	3	2	1	0																																																																																										
0	IPBytes			0	1	1	0	1																																																																																										
1	TargetIP[7:0]																																																																																																	
2	TargetIP[15:8]																																																																																																	
3	TargetIP[23:16]																																																																																																	
4	TargetIP[31:24]																																																																																																	
5	TargetIP[39:32]																																																																																																	
6	TargetIP[47:40]																																																																																																	
7	TargetIP[55:48]																																																																																																	
8	TargetIP[63:56]																																																																																																	
Dependencies	PacketEn	Generation Scenario	Indirect branch (including un-compressed RET), far branch, interrupt, exception, INIT, SIPI, VM exit, VM entry, TSX abort, EENTER, EEXIT, ERESUME, AEX ¹ .																																																																																															
Description	Provides the target for some control flow transfers																																																																																																	
Application	Anytime a TIP is encountered, it indicates that control was transferred to the IP provided in the payload. The source of this control flow change, and hence the IP or instruction to which it binds, depends on the packets that precede the TIP. If a TIP is encountered and all preceding packets have already been bound, then the TIP will apply to the upcoming indirect branch, far branch, or VMRESUME. However, if there was a preceding FUP that remains unbound, it will bind to the TIP. Here, the TIP provides the target of an asynchronous event or TSX abort that occurred at the IP given in the FUP payload. Note that there may be other packets, in addition to the FUP, which will bind to the TIP packet. See the packet application descriptions for other packets for details.																																																																																																	

NOTES:

1. EENTER, EEXIT, ERESUME, AEX would be possible only for a debug enclave.

IP Compression

The IP payload in a TIP, FUP, TIP.PGE, or TIP.PGD packet can vary in size, based on the mode of execution, and the use of IP compression. IP compression is an optional compression technique the processor may choose to employ to reduce bandwidth. With IP compression, the IP to be represented in the payload is compared with the last IP sent out, via any of FUP, TIP, TIP.PGE, or TIP.PGD. If that previous IP had the same upper (most significant) address bytes, those matching bytes may be suppressed in the current packet. The processor maintains an internal state of the “Last IP” that was encoded in trace packets, thus the decoder will need to keep track of the “Last IP” state in software, to match fidelity with packets generated by hardware. “Last IP” is initialized to zero, hence if the first IP in the trace may be compressed if the upper bytes are zeroes.

The “IPBytes” field of the IP packets (FUP, TIP, TIP.PGE, TIP.PGD) serves to indicate how many bytes of payload are provided, and how the decoder should fill in any suppressed bytes. The algorithm for reconstructing the IP for a TIP/FUP packet is shown in the table below.

Table 35-18. FUP/TIP IP Reconstruction

IPBytes	Uncompressed IP Value							
	63:56	55:48	47:40	39:32	31:24	23:16	15:8	7:0
000b	None, IP is out of context							
001b	Last IP[63:16]						IP Payload[15:0]	

Table 35-18. FUP/TIP IP Reconstruction

010b	Last IP[63:32]	IP Payload[31:0]
011b	IP Payload[47] extended	IP Payload[47:0]
100b	Last IP [63:48]	IP Payload[47:0]
101b	Reserved	
110b	IP Payload[63:0]	
111b	Reserved	

The processor-internal Last IP state is guaranteed to be reset to zero when a PSB is sent out. This means that the IP that follows the PSB with either be un-compressed (011b or 110b, see Table 35-18), or compressed against zero.

At times, “IPbytes” will have a value of 0. As shown above, this does not mean that the IP payload matches the full address of the last IP, but rather that the IP for this packet was suppressed. This is used for cases where the IP that applies to the packet is out of context. An example is the TIP.PGD sent on a SYSCALL, when tracing only USR code. In that case, no TargetIP will be included in the packet, since that would expose an instruction point at CPL = 0. When the IP payload is suppressed in this manner, Last IP is not cleared, and instead refers to the last IP packet with a non-zero IPBytes field.

On processors that support a maximum linear address size of 32 bits, IP payloads may never exceed 32 bits (IPBytes <= 010b).

Indirect Transfer Compression for Returns (RET)

In addition to IP compression, TIP packets for near return (RET) instructions can also be compressed. If the RET target matches the next IP of the corresponding CALL, then the TIP packet is unneeded, since the decoder can deduce the target IP by maintaining a CALL/RET stack of its own.

When a RET is compressed, a Taken indication is added to the TNT buffer. Because the RET generates no TIP packet, it also does not update the internal Last IP value, and thus the decoder should treat it the same way. If the RET is not compressed, it will generate a TIP packet (just like when RET compression is disabled, via IA32_R-TIT_CTL.DisRETC).

A CALL/RET stack can be maintained by the decoder by doing the following:

1. Allocate space to store 64 RET targets.
2. For near CALLs, push the Next IP onto the stack. Once the stack is full, new CALLs will force the oldest entry off the end of the stack, such that only the youngest 64 entries are stored. Note that this excludes zero-length CALLs, which are direct near CALLs with displacement zero (to the next IP). These CALLs typically don't have matching RETs.
3. For near RETs, pop the top (youngest) entry off the stack. This will be the expected target of the RET.

In cases where a RET is compressed, the RET target is guaranteed to match the expected target from 3) above. If the target is not compressed, a TIP packet will be generated with the RET target, which may differ from the expected target in some cases.

The hardware ensures that packets read by the decoder will always have seen the CALL that corresponds to any compressed RET. The processor will never compress a RET across a PSB, a buffer overflow, or scenario where PacketEn=0. This means that a RET whose corresponding CALL executed while PacketEn=0, or before the last PSB, etc., will not be compressed.

If the CALL/RET stack is manipulated or corrupted by software, and thereby causes a RET to transfer control to a target that is inconsistent with the CALL/RET stack, then the RET will not be compressed, and will produce a TIP packet. This can happen, for example, if software executes a PUSH instruction to push a target onto the stack, and a later RET uses this target.

For processors that employ deferred TIPs (Section 35.4.2.3), an uncompressed RET will not be deferred, and hence will force out any accumulated TNTs or TIPs. This serves to avoid ambiguity, and make clear to the decoder whether the near RET was compressed, and hence a bit in the in-progress TNT should be consumed, or uncompressed, in which case there will be no in-progress TNT and thus a TIP should be consumed.

Note that in the unlikely case that a RET executes in a different execution mode than the associated CALL, the decoder will need to model the same behavior with its CALL stack. For instance, if a CALL executes in 64-bit mode, a 64-bit IP value will be pushed onto the software stack. If the corresponding RET executes in 32-bit mode, then only the lower 32 target bits will be popped off of the stack, which may mean that the RET does not go to the CALL's Next IP. This is architecturally correct behavior, and this RET could be compressed, thus the decoder should match this behavior.

35.4.2.3 Deferred TIPs

The processor may opt to defer sending out the TNT when TIPs are generated. Thus, rather than sending a partial TNT followed by a TIP, both packets will be deferred while the TNT accumulates more Jcc/RET results. Any number of TIP packets may be accumulated this way, such that only once the TNT is filled, or once another packet (e.g., FUP) is generated, the TNT will be sent, followed by all the deferred TIP packets, and finally terminated by the other packet(s) that forced out the TNT and TIP packets. Generation of many other packets (see list below) will force out the TNT and any accumulated TIP packets. This is an optional optimization in hardware to reduce the bandwidth consumption, and hence the performance impact, incurred by tracing.

Table 35-19. TNT Examples with Deferred TIPs

Code Flow	Packets, Non-Deferred TIPS	Packets, Deferred TIPS
0x1000 cmp %rcx, 0 0x1004 jnz Foo // not-taken 0x1008 jmp %rdx	TNT(0b0), TIP(0x1308)	
0x1308 cmp %rcx, 1 0x130c jnz Bar // not-taken 0x1310 cmp %rcx, 2 0x1314 jnz Baz // taken 0x1500 cmp %eax, 7 0x1504 jg Exit // not-taken 0x1508 jmp %r15	TNT(0b010), TIP(0x1100)	
0x1100 cmp %rbx, 1 0x1104 jg Start // not-taken 0x1108 add %rcx, %eax 0x110c ... // an asynchronous Interrupt arrives INThandler: 0xcc00 pop %rdx	TNT(0b0), FUP(0x110c), TIP(0xcc00)	TNT(0b00100), TIP(0x1308), TIP(0x1100), FUP(0x110c), TIP(0xcc00)

35.4.2.4 Packet Generation Enable (TIP.PGE) Packet

Table 35-20. TIP.PGE Packet Definition

Name	Target IP - Packet Generation Enable (TIP.PGE) Packet

Table 35-20. TIP.PGE Packet Definition

Packet Format		7	6	5	4	3	2	1	0
	0	IPBytes			1	0	0	0	1
	1	TargetIP[7:0]							
	2	TargetIP[15:8]							
	3	TargetIP[23:16]							
	4	TargetIP[31:24]							
	5	TargetIP[39:32]							
	6	TargetIP[47:40]							
	7	TargetIP[55:48]							
	8	TargetIP[63:56]							
Dependencies	PacketEn transitions to 1				Generation Scenario	Any branch instruction, control flow transfer, or MOV CR3 that sets PacketEn, a WRMSR that enables packet generation and sets PacketEn			
Description	Indicates that PacketEn has transitioned to 1. It provides the IP at which the tracing begins. This can occur due to any of the enables that comprise PacketEn transitioning from 0 to 1, as long as all the others are asserted. Examples: ▪ TriggerEn: This is set on software write to set IA32_RTIT_CTL.TraceEn as long as the Stopped and Error bits in IA32_RTIT_STATUS are clear. The IP payload will be the Next IP of the WRMSR. ▪ FilterEn: This is set when software jumps into the tracing region. This region is defined by enabling IP filtering in IA32_RTIT_CTL.ADDRn_CFG, and defining the range in IA32_RTIT_ADDRn_[AB], see. Section 35.2.5.3. The IP payload will be the target of the branch. ▪ ContextEn: This is set on a CPL change, a CR3 write or any other means of changing ContextEn. The IP payload will be the Next IP of the instruction that changes context if it is not a branch, otherwise it will be the target of the branch.								
Application	TIP.PGE packets bind to the instruction at the IP given in the payload.								

35.4.2.5 Packet Generation Disable (TIP.PGD) Packet

Table 35-21. TIP.PGD Packet Definition

Name	Target IP - Packet Generation Disable (TIP.PGD) Packet								
Packet Format		7	6	5	4	3	2	1	0
	0	IPBytes			0	0	0	0	1
	1	TargetIP[7:0]							
	2	TargetIP[15:8]							
	3	TargetIP[23:16]							
	4	TargetIP[31:24]							
	5	TargetIP[39:32]							
	6	TargetIP[47:40]							
	7	TargetIP[55:48]							
	8	TargetIP[63:56]							
Dependencies	PacketEn transitions to 0			Generation Scenario	Any branch instruction, control flow transfer, or MOV CR3 that clears PacketEn, a WRMSR that disables packet generation and clears PacketEn				

Table 35-21. TIP.PGD Packet Definition

Description	Indicates that PacketEn has transitioned to 0. It will include the IP at which the tracing ends, unless ContextEn= 0 or TraceEn=0 at the conclusion of the instruction or event that cleared PacketEn. PacketEn can be cleared due to any of the enables that comprise PacketEn transitioning from 1 to 0. Examples: ▪ TriggerEn: This is cleared on software write to clear IA32_RTIT_CTL.TraceEn, or when IA32_RTIT_STATUS.Stopped is set, or on operational error. The IP payload will be suppressed in this case, and the “IPBytes” field will have the value 0. ▪ FilterEn: This is cleared when software jumps out of the tracing region. This region is defined by enabling IP filtering in IA32_RTIT_CTL.ADDRn_CFG, and defining the range in IA32_RTIT_ADDRn_[AB], see. Section 35.2.5.3. The IP payload will depend on the type of the branch. For conditional branches, the payload is suppressed (IPBytes = 0), and in this case the destination can be inferred from the disassembly. For any other type of branch, the IP payload will be the target of the branch. ▪ ContextEn: This can happen on a CPL change, a CR3 write or any other means of changing ContextEn. See Section 35.2.5.3 for details. In this case, when ContextEn is cleared, there will be no IP payload. The “IPBytes” field will have value 0. Note that, in cases where a branch that would normally produce a TIP packet (i.e., far transfer, indirect branch, interrupt, etc) or TNT update (conditional branch or compressed RT) causes PacketEn to transition from 1 to 0, the TIP or TNT bit will be replaced with TIP.PGD. The payload of the TIP.PGD will be the target of the branch, unless the result of the instruction causes TraceEn or ContextEn to be cleared (ie, SYSCALL when IA32_RTIT_CTL.OS=0, In the case where a conditional branch clears FilterEn and hence PacketEn, there will be no TNT bit for this branch, replaced instead by the TIP.PGD.
Application	TIP.PGD can be produced by any branch instructions, as well as some non-branch instructions, that clear PacketEn. When produced by a branch, it replaces any TIP or TNT update that the branch would normally produce. In cases where there is an unbound FUP preceding the TIP.PGD, then the TIP.PGD is part of compound operation (i.e., asynchronous event or TSX abort) which cleared PacketEn. For most such cases, the TIP.PGD is simply replacing a TIP, and should be treated the same way. The TIP.PGD may or may not have an IP payload, depending on whether the operation cleared ContextEn. If there is not an associated FUP, the binding will depend on whether there is an IP payload. If there is an IP payload, then the TIP.PGD should be applied to either the next direct branch whose target matches the TIP.PGD payload, or the next branch that would normally generate a TIP or TNT packet. If there is no IP payload, then the TIP.PGD should apply to the next branch or MOV CR3 instruction.

35.4.2.6 Flow Update (FUP) Packet

Table 35-22. FUP Packet Definition

Name	Flow Update (FUP) Packet																																																																																																	
Packet Format	<table border="1"> <tr> <th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr> <tr> <td>0</td><td colspan="3">IPBytes</td><td>1</td><td>1</td><td>1</td><td>0</td><td>1</td></tr> <tr> <td>1</td><td colspan="8">IP[7:0]</td></tr> <tr> <td>2</td><td colspan="8">IP[15:8]</td></tr> <tr> <td>3</td><td colspan="8">IP[23:16]</td></tr> <tr> <td>4</td><td colspan="8">IP[31:24]</td></tr> <tr> <td>5</td><td colspan="8">IP[39:32]</td></tr> <tr> <td>6</td><td colspan="8">IP[47:40]</td></tr> <tr> <td>7</td><td colspan="8">IP[55:48]</td></tr> <tr> <td>8</td><td colspan="8">IP[63:56]</td></tr> </table>									7	6	5	4	3	2	1	0	0	IPBytes			1	1	1	0	1	1	IP[7:0]								2	IP[15:8]								3	IP[23:16]								4	IP[31:24]								5	IP[39:32]								6	IP[47:40]								7	IP[55:48]								8	IP[63:56]

Table 35-22. FUP Packet Definition

Dependencies	TriggerEn && ContextEn. (Typically depends on BranchEn and FilterEn as well, see Section 35.2.5, Section 35.4.2.21, and Section 35.4.2.22 for details.)	Generation Scenario	Asynchronous Events (interrupts, exceptions, INIT, SIPI, SMI, VM exit, #MC), PSB+, XBEGIN, XEND, XABORT, XACQUIRE, XRELEASE, EENTER, EEXIT, ERESUME, EEE, AEX, ¹ , INTO, INT1, INT3, INT <i>n</i> , a WRMSR that disables packet generation.
Description	Provides the source address for asynchronous events, and some other instructions. Is never sent alone, always sent with an associated TIP or MODE packet, and potentially others.		
Application	FUP packets provide the IP to which they bind. However, they are never standalone, but are coupled with other packets. In TSX cases, the FUP is immediately preceded by a MODE.TSX, which binds to the same IP. A TIP will follow only in the case of TSX aborts, see Section 35.4.2.8 for details. Otherwise, FUPs are part of compound packet events (see Section 35.4.1). In these compound cases, the FUP provides the source IP for an instruction or event, while a following TIP (or TIP.PGD) packet will provide the destination IP. Other packets may be included in the compound event between the FUP and TIP.		

NOTES:

1. EENTER, EEXIT, ERESUME, EEE, AEX apply only if Intel Software Guard Extensions is supported.

FUP IP Payload

Flow Update Packet gives the source address of an instruction when it is needed. In general, branch instructions do not need a FUP, because the source address is clear from the disassembly. For asynchronous events, however, the source address cannot be inferred from the source, and hence a FUP will be sent. Table 35-23 illustrates cases where FUPs are sent, and which IP can be expected in those cases.

Table 35-23. FUP Cases and IP Payload

Event	Flow Update IP	Comment
External Interrupt, NMI/SMI, Traps, Machine Check (trap-like), INIT/SIPI	Address of next instruction (Next IP) that would have been executed	Functionally, this matches the LBR FROM field value and also the EIP value which is saved onto the stack.
Exceptions/Faults, Machine check (fault-like)	Address of the instruction which took the exception/fault (Current IP)	This matches the similar functionality of LBR FROM field value and also the EIP value which is saved onto the stack.
Software Interrupt	Address of the software interrupt instruction (Current IP)	This matches the similar functionality of LBR FROM field value, but does not match the EIP value which is saved onto the stack (Next Linear Instruction Pointer - NLIP).
EENTER, EEXIT, ERESUME, Enclave Exiting Event (EEE), AEX ¹	Current IP of the instruction	This matches the LBR FROM field value and also the EIP value which is saved onto the stack.
XACQUIRE	Address of the X* instruction	
XRELEASE, XBEGIN, XEND, XABORT, other transactional abort	Current IP	
#SMI	IP that is saved into SMRAM	
WRMSR that clears TraceEn, PSB+	Current IP	

NOTES:

1. Information on EENTER, EEXIT, ERESUME, EEE, Asynchronous Enclave eXit (AEX) can be found in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D.

On a canonical fault due to sequentially fetching an instruction in non-canonical space (as opposed to jumping to non-canonical space), the IP of the fault (and thus the payload of the FUP) will be a non-canonical address. This is consistent with what is pushed on the stack for such faulting cases.

If there are post-commit task switch faults, the IP value of the FUP will be the original IP when the task switch started. This is the same value as would be seen in the LBR_FROM field. But it is a different value as is saved on the stack or VMCS.

35.4.2.7 Paging Information (PIP) Packet**Table 35-24. PIP Packet Definition**

Name	Paging Information (PIP) Packet																																																																																								
Packet Format	<table border="1"> <tr> <td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr> <tr> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr> <tr> <td>1</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr> <tr> <td>2</td><td colspan="7">CR3[11:5] or 0</td><td>RSVD/NR</td></tr> <tr> <td>3</td><td colspan="8">CR3[19:12]</td></tr> <tr> <td>4</td><td colspan="8">CR3[27:20]</td></tr> <tr> <td>5</td><td colspan="8">CR3[35:28]</td></tr> <tr> <td>6</td><td colspan="8">CR3[43:36]</td></tr> <tr> <td>7</td><td colspan="8">CR3[51:44]</td></tr> </table>									7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	0	1	0	0	0	0	1	1	2	CR3[11:5] or 0							RSVD/NR	3	CR3[19:12]								4	CR3[27:20]								5	CR3[35:28]								6	CR3[43:36]								7	CR3[51:44]

2	CR3[11:5] or 0							RSVD/NR																																																																																	
3	CR3[19:12]																																																																																								
4	CR3[27:20]																																																																																								
5	CR3[35:28]																																																																																								
6	CR3[43:36]																																																																																								
7	CR3[51:44]																																																																																								
Dependencies	TriggerEn && ContextEn && IA32_R-TIT_CTL.OS		Generation Scenario		MOV CR3, Task switch, INIT, SIPI, PSB+, VM exit, VM entry																																																																																				

Table 35-24. PIP Packet Definition

Description	The CR3 payload shown includes only the address portion of the CR3 value. For PAE paging, CR3[11:5] are thus included. For other paging modes (32-bit and 4-level paging¹), these bits are 0. This packet holds the CR3 address value. It will be generated on operations that modify CR3: ▪ MOV CR3 operation ▪ Task Switch ▪ INIT and SIPI ▪ VM exit, if “conceal VMX from PT” VM-exit control is 0 (see Section 35.5.1) ▪ VM entry, if “conceal VMX from PT” VM-entry control is 0 PIPs are not generated, despite changes to CR3, on SMI and RSM. This is due to the special behavior on these operations, see Section 35.2.9.3 for details. Note that, for some cases of task switch where CR3 is not modified, no PIP will be produced. The purpose of the PIP is to indicate to the decoder which application is running, so that it can apply the proper binaries to the linear addresses that are being traced. The PIP packet contains the new CR3 value when CR3 is written. PIPs generated by VM entries set the NR bit. PIPs generated in VMX non-root operation set the NR bit if the “conceal VMX from PT” VM-execution control is 0 (see Section 35.5.1). All other PIPs clear the NR bit.
Application	The purpose of the PIP packet is to help the decoder uniquely identify what software is running at any given time. When a PIP is encountered, a decoder should do the following: 1) If there was a prior unbound FUP (that is, a FUP not preceded by a packet such as MODE.TSX that consumes it, and it hence pairs with a TIP that has not yet been seen), then this PIP is part of a compound packet event (Section 35.4.1). Find the ending TIP and apply the new CR3/NR values to the TIP payload IP. 2) Otherwise, look for the next MOV CR3, far branch, or VMRESUME/VMLAUNCH in the disassembly, and apply the new CR3 to the next (or target) IP. For examples of the packets generated by these flows, see Section 35.7.

NOTES:

1. Earlier versions of this manual used the term “IA-32e paging” to identify 4-level paging.

35.4.2.8 MODE Packets

MODE packets keep the decoder informed of various processor modes about which it needs to know in order to properly manage the packet output, or to properly disassemble the associated binaries. MODE packets include a header and a mode byte, as shown below.

Table 35-25. General Form of MODE Packets

	7	6	5	4	3	2	1	0
0	1	0	0	1	1	0	0	1
1	Leaf ID			Mode				

The MODE Leaf ID indicates which set of mode bits are held in the lower bits.

MODE.Exec Packet**Table 35-26. MODE.Exec Packet Definition**

Name	MODE.Exec Packet								
Packet Format									
		7	6	5	4	3	2	1	0
	0	1	0	0	1	1	0	0	1
	1	0	0	0	Reserved		IF	C.S.D	(C.S.L & LMA)
	MODE Leaf ID is '000.								

Table 35-26. MODE.Exec Packet Definition

Dependencies	TriggerEn && ContextEn && FilterEn	Generation Scenario	Any operation that changes the CS.L, CS.D, or EFER.LMA, if IA32_R- TIT_CTL.BranchEn=1. Any operation that changes RFLAGS.IF, if IA32_RTIT_CTL.EventEn=1. Any TIP.PGE scenario, such that any of the mode bits tracked may have changed since the last MODE.Exec.															
Description	Indicates whether software is in 16, 32, or 64-bit mode, by providing the CS.D and (CS.L & IA32_EFER.LMA) values. Essential for the decoder to properly disassemble the associated binary. Further, if CPUID.14H.00H:EBX[7]=1 (“Event Trace Support”), it indicates when interrupts are masked by providing the RFLAGS.IF value. MODE.Exec is sent at the time of a mode change, if dependencies are met at the time, otherwise it is sent when tracing resumes. In the former case, the MODE.Exec packet is generated along with other packets that result from the operation that changes the mode, and is guaranteed to be followed by a TIP or TIP.PGE for branch operations, or a FUP for non-branch operations (CLI, STI, or POPF if EventEn=1). In cases where the mode changes while filtering dependencies are not met, the processor ensures that the decoder doesn’t lose track of the mode by sending any needed MODE.Exec once tracing resumes (preceding the TIP.PGE, if BranchEn=1). The processor may opt to suppress the MODE.Exec when tracing resumes if the mode matches that of the last MODE.Exec packet. MODE.Exec packets are generated on CS.L, CS.D, or EFER.LMA changes only if control flow tracing is enabled (BranchEn=1). This is essential for the decoder to properly disassemble the associated binary. <table><tr><td>CS.D</td><td>(CS.L & IA32_EFER.LMA)</td><td>Addressing Mode</td></tr><tr><td>1</td><td>1</td><td>N/A</td></tr><tr><td>0</td><td>1</td><td>64-bit mode</td></tr><tr><td>1</td><td>0</td><td>32-bit mode</td></tr><tr><td>0</td><td>0</td><td>16-bit mode</td></tr></table> MODE.Exec packets are generated on interrupt flag (RFLAGS.IF) changes only if event tracing is enabled (EventEn=1). The IF field in MODE.Exec packets is populated only if EventEn=1 (IF = EFLAGS.IF & EventEn).			CS.D	(CS.L & IA32_EFER.LMA)	Addressing Mode	1	1	N/A	0	1	64-bit mode	1	0	32-bit mode	0	0	16-bit mode
CS.D	(CS.L & IA32_EFER.LMA)	Addressing Mode																
1	1	N/A																
0	1	64-bit mode																
1	0	32-bit mode																
0	0	16-bit mode																
Application	MODE.Exec always precedes an IP packet (TIP, TIP.PGE, or FUP). The mode change applies to the IP address in the payload of the IP packet. When MODE.Exec is followed by a FUP, it is a stand-alone FUP and should be consumed by the MODE.Exec.																	

MODE.TSX Packet**Table 35-27. MODE.TSX Packet Definition**

Name	MODE.TSX Packet																																		
Packet Format	<table border="1"> <thead> <tr> <th></th><th>7</th><th>6</th><th>5</th><th>4</th><th>3</th><th>2</th><th>1</th><th>0</th></tr> </thead> <tbody> <tr> <td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr> <tr> <td>1</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>TXAbort</td><td>InTX</td></tr> </tbody> </table>									7	6	5	4	3	2	1	0	0	1	0	0	1	1	0	0	1	1	0	0	1	0	0	0	TXAbort	InTX
	7	6	5	4	3	2	1	0																											
0	1	0	0	1	1	0	0	1																											
1	0	0	1	0	0	0	TXAbort	InTX																											
Dependencies	TriggerEn && ContextEn		Generation Scenario	XBEGIN, XEND, XABORT, XACQUIRE, XRELEASE, if InTX changes, Asynchronous TSX Abort, PSB+																															

Table 35-27. MODE.TSX Packet Definition

Description	Indicates when a TSX transaction (either HLE or RTM) begins, commits, or aborts. Instructions executed transactionally will be “rolled back” if the transaction is aborted.		
	TXAbort	InTX	Implication
	1	1	N/A
	0	1	Transaction begins, or executing transactionally
	1	0	Transaction aborted
	0	0	Transaction committed, or not executing transactionally
Application	If PacketEn=1, MODE.TSX always immediately precedes a FUP. If the TXAbort bit is zero, then the mode change applies to the IP address in the payload of the FUP. If TXAbort=1, then the FUP will be followed by a TIP, and the mode change will apply to the IP address in the payload of the TIP. MODE.TSX packets may be generated when PacketEn=0, due to FilterEn=0. In this case, only the last MODE.TSX generated before TIP.PGE need be applied.		

35.4.2.9 TraceStop Packet

Table 35-28. TraceStop Packet Definition

Name	TraceStop Packet																																		
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr></table>									7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	1	0	0	0	0	0	1	1
	7	6	5	4	3	2	1	0																											
0	0	0	0	0	0	0	1	0																											
1	1	0	0	0	0	0	1	1																											
Dependencies	TriggerEn && ContextEn		Generation Scenario	Taken branch with target in TraceStop IP region, MOV CR3 in TraceStop IP region, or WRMSR that sets TraceEn in TraceStop IP region.																															
Description	Indicates when software has entered a user-configured TraceStop region. When the IP matches a TraceStop range while ContextEn and TriggerEn are set, a TraceStop action occurs. This disables tracing by setting IA32_RTIT_STATUS.Stopped, thereby clearing TriggerEn, and causes a TraceStop packet to be generated. The TraceStop action also forces FilterEn to 0. Note that TraceStop may not force a flush of internally buffered packets, and thus trace packet generation should still be manually disabled by clearing IA32_RTIT_CTL.TraceEn before examining output. See Section 35.2.5.3 for more details.																																		
Application	If TraceStop follows a TIP.PGD (before the next TIP.PGE), then it was triggered either by the instruction that cleared PacketEn, or it was triggered by some later instruction that executed while FilterEn=0. In either case, the TraceStop can be applied at the IP of the TIP.PGD (if any). If TraceStop follows a TIP.PGE (before the next TIP.PGD), it should be applied at the last known IP.																																		

35.4.2.10 Core:Bus Ratio (CBR) Packet

Table 35-29. CBR Packet Definition

Name	Core:Bus Ratio (CBR) Packet

Table 35-29. CBR Packet Definition

Packet Format		7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	1	0
	1	0	0	0	0	0	0	1	1
	2	Core:Bus Ratio							
	3	Reserved							
Dependencies	TriggerEn			Generation Scenario	After any frequency change, on C-state wake up, PSB+, and after enabling trace packet generation.				
Description	Indicates the core:bus ratio of the processor core. Useful for correlating wall-clock time and cycle time.								
Application	The CBR packet indicates the point in the trace when a frequency transition has occurred. On some implementations, software execution will continue during transitions to a new frequency, while on others software execution ceases during frequency transitions. There is not a precise IP provided, to which to bind the CBR packet.								

35.4.2.11 Timestamp Counter (TSC) Packet

Table 35-30. TSC Packet Definition

Name	Timestamp Counter (TSC) Packet																																																																																								
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr><tr><td>1</td><td colspan="8">SW TSC[7:0]</td></tr><tr><td>2</td><td colspan="8">SW TSC[15:8]</td></tr><tr><td>3</td><td colspan="8">SW TSC[23:16]</td></tr><tr><td>4</td><td colspan="8">SW TSC[31:24]</td></tr><tr><td>5</td><td colspan="8">SW TSC[39:32]</td></tr><tr><td>6</td><td colspan="8">SW TSC[47:40]</td></tr><tr><td>7</td><td colspan="8">SW TSC[55:48]</td></tr></table>									7	6	5	4	3	2	1	0	0	0	0	0	1	1	0	0	1	1	SW TSC[7:0]								2	SW TSC[15:8]								3	SW TSC[23:16]								4	SW TSC[31:24]								5	SW TSC[39:32]								6	SW TSC[47:40]								7	SW TSC[55:48]							
		7	6	5	4	3	2	1	0																																																																																
	0	0	0	0	1	1	0	0	1																																																																																
	1	SW TSC[7:0]																																																																																							
	2	SW TSC[15:8]																																																																																							
	3	SW TSC[23:16]																																																																																							
	4	SW TSC[31:24]																																																																																							
	5	SW TSC[39:32]																																																																																							
	6	SW TSC[47:40]																																																																																							
7	SW TSC[55:48]																																																																																								
Dependencies	IA32_RTIT_CTL.TSCEn && TriggerEn		Generation Scenario	Sent after any event that causes the processor clocks or Intel PT timing packets (such as MTC or CYC) to stop, This may include P-state changes, wake from C-state, or clock modulation. Also on transition of TraceEn from 0 to 1.																																																																																					
Description	When enabled by software, a TSC packet provides the lower 7 bytes of the current TSC value, as returned by the RDTSC instruction. This may be useful for tracking wall-clock time, and synchronizing the packets in the log with other timestamped logs.																																																																																								
Application	TSC packet provides a wall-clock proxy of the event which generated it (packet generation enable, sleep state wake, etc). In all cases, TSC does not precisely indicate the time of any control flow packets; however, all preceding packets represent instructions that executed before the indicated TSC time, and all subsequent packets represent instructions that executed after it. There is not a precise IP to which to bind the TSC packet.																																																																																								

35.4.2.12 Mini Time Counter (MTC) Packet

Table 35-31. MTC Packet Definition

Name	Mini time Counter (MTC) Packet

Table 35-31. MTC Packet Definition

Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td></tr><tr><td>1</td><td colspan="8">CTC[N+7:N]</td></tr></table>									7	6	5	4	3	2	1	0	0	0	1	0	1	1	0	0	1	1	CTC[N+7:N]							
	7	6	5	4	3	2	1	0																											
0	0	1	0	1	1	0	0	1																											
1	CTC[N+7:N]																																		
Dependencies	IA32_RTIT_CTL.MTCEn && TriggerEn	Generation Scenario	Periodic, based on the core crystal clock, or Always Running Timer (ART).																																
Description	When enabled by software, an MTC packet provides a periodic indication of wall-clock time. The 8-bit CTC (Common Timestamp Copy) payload value is set to (ART >> N) & FFH. The frequency of the ART is related to the Maximum Non-Turbo frequency, and the ratio can be determined from CPUID.15H, as described in Section 35.8.3. Software can select the threshold N, which determines the MTC frequency by setting the IA32_RTIT_CTL.MTCFreq field (see Section 35.2.8.2) to a supported value using the lookup enumerated by CPUID (see Section 35.3.1). See Section 35.8.3 for details on how to use the MTC payload to track TSC time. MTC provides 8 bits from the ART, starting with the bit selected by MTCFreq to dictate the frequency of the packet. Whenever that 8-bit range being watched changes, an MTC packet will be sent out with the new value of that 8-bit range. This allows the decoder to keep track of how much wall-clock time has elapsed since the last TSC packet was sent, by keeping track of how many MTC packets were sent and what their value was. The decoder can infer the truncated bits, CTC[N-1:0], are 0 at the time of the MTC packet. There are cases in which MTC packet can be dropped, due to overflow or other micro-architectural conditions. The decoder should be able to recover from such cases by checking the 8-bit payload of the next MTC packet, to determine how many MTC packets were dropped. It is not expected that >256 consecutive MTC packets should ever be dropped.																																		
Application	MTC does not precisely indicate the time of any other packet, nor does it bind to any IP. However, all preceding packets represent instructions or events that executed before the indicated ART time, and all subsequent packets represent instructions that executed after, or at the same time as, the ART time.																																		

35.4.2.13 TSC/MTC Alignment (TMA) Packet**Table 35-32. TMA Packet Definition**

Name	TSC/MTC Alignment (TMA) Packet																																																																															
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>0</td><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td></tr><tr><td>2</td><td colspan="8">CTC[7:0]</td></tr><tr><td>3</td><td colspan="8">CTC[15:8]</td></tr><tr><td>4</td><td colspan="7">Reserved</td><td>0</td></tr><tr><td>5</td><td colspan="8">FastCounter[7:0]</td></tr><tr><td>6</td><td colspan="7">Reserved</td><td>FC[8]</td></tr></table>									7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	0	1	1	1	0	0	1	1	2	CTC[7:0]								3	CTC[15:8]								4	Reserved							0	5	FastCounter[7:0]								6	Reserved							FC[8]
	7	6	5	4	3	2	1	0																																																																								
0	0	0	0	0	0	0	1	0																																																																								
1	0	1	1	1	0	0	1	1																																																																								
2	CTC[7:0]																																																																															
3	CTC[15:8]																																																																															
4	Reserved							0																																																																								
5	FastCounter[7:0]																																																																															
6	Reserved							FC[8]																																																																								
Dependencies	IA32_RTIT_CTL.MTCEn && IA32_RTIT_CTL.TSCEn && TriggerEn			Generation Scenario		Sent with any TSC packet.																																																																										
Description	The TMA packet serves to provide the information needed to allow the decoder to correlate MTC packets with TSC packets. With this packet, when a MTC packet is encountered, the decoder can determine how many timestamp counter ticks have passed since the last TSC or MTC packet. See Section 35.8.3.2 for details on how to make this calculation.																																																																															
Application	TMA is always sent immediately following a TSC packet, and the payload values are consistent with the TSC payload value. Thus the application of TMA matches that of TSC.																																																																															

35.4.2.14 Cycle Count (CYC) Packet

Table 35-33. Cycle Count Packet Definition

Name	Cycle Count (CYC) Packet																																															
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td colspan="5">Cycle Counter[4:0]</td><td>Exp</td><td>1</td><td>1</td></tr><tr><td>1</td><td colspan="7">Cycle Counter[11:5]</td><td>Exp</td></tr><tr><td>2</td><td colspan="7">Cycle Counter[18:12]</td><td>Exp</td></tr><tr><td>...</td><td colspan="8">... 1	Cycle Counter[11:5]							Exp																																								
2	Cycle Counter[18:12]							Exp																																								
...	... (if Exp = 1 in the previous byte)																																															
Dependencies	IA32_RTIT_CTL.CYCEn&&TriggerEn	Generation Scenario	Can be sent at any time, though a maximum of one CYC packet is sent per core clock cycle. See Section 35.3.6 for CYC-eligible packets.																																													
Description	The Cycle Counter field increments at the same rate as the processor core clock ticks, but with a variable length format (using a trailing EXP bit field) and a range-capped byte length. If the CYC value is less than 32, a 1-byte CYC will be generated, with Exp=0. If the CYC value is between 32 and 4095 inclusive, a 2-byte CYC will be generated, with byte 0 Exp=1 and byte 1 Exp=0. And so on. CYC provides the number of core clocks that have passed since the last CYC packet. CYC can be configured to be sent in every cycle in which an eligible packet is generated, or software can opt to use a threshold to limit the number of CYC packets, at the expense of some precision. These settings are configured using the IA32_RTIT_CTL.CycThresh field (see Section 35.2.8.2). For details on Cycle-Accurate Mode, IPC calculation, etc, see Section 35.3.6. When CycThresh=0, and hence no threshold is in use, then a CYC packet will be generated in any cycle in which any CYC-eligible packet is generated. The CYC packet will precede the other packets generated in the cycle, and provides the precise cycle time of the packets that follow. In addition to these CYC packets generated with other packets, CYC packets can be sent stand-alone. These packets serve simply to update the decoder with the number of cycles passed, and are used to ensure that a wrap of the processor's internal cycle counter doesn't cause cycle information to be lost. These stand-alone CYC packets do not indicate the cycle time of any other packet or operation, and will be followed by another CYC packet before any other CYC-eligible packet is seen. When CycThresh>0, CYC packets are generated only after a minimum number of cycles have passed since the last CYC packet. Once this threshold has passed, the behavior above resumes, where CYC will either be sent in the next cycle that produces other CYC-eligible packets, or could be sent stand-alone. When using CYC thresholds, only the cycle time of the operation (instruction or event) that generates the CYC packet is truly known. Other operations simply have their execution time bounded: they completed at or after the last CYC time, and before the next CYC time.																																															
Application	CYC provides the offset cycle time (since the last CYC packet) for the CYC-eligible packet that follows. If another CYC is encountered before the next CYC-eligible packet, the cycle values should be accumulated and applied to the next CYC-eligible packet. If a CYC packet is generated by a TNT, note that the cycle time provided by the CYC packet applies to the first branch in the TNT packet.																																															

35.4.2.15 VMCS Packet

Table 35-34. VMCS Packet Definition

Name	VMCS Packet

	7	6	5	4	3	2	1	0																																																																								
0	0	0	0	0	0	0	1	0																																																																								
1	1	1	0	0	1	0	0	0																																																																								
2	VMCS pointer [19:12]																																																																															
3	VMCS pointer [27:20]																																																																															
4	VMCS pointer [35:28]																																																																															
5	VMCS pointer [43:36]																																																																															
6	VMCS pointer [51:44]																																																																															
Dependencies	TriggerEn && ContextEn; Also in VMX operation.		Generation Scenario		Generated on successful VMPTRLD, and optionally on PSB+, SMM VM exits, and VM entries that return from SMM (see Section 35-53).																																																																											
Description	The VMCS packet provides a VMCS pointer for a decoder to determine the transition of code contexts: - On a successful VMPTRLD (i.e., a VMPTRLD that doesn't fault, fail, or VM exit), the VMCS packet contains the logical processor's VMCS pointer established by VMPTRLD (for subsequent execution of a VM guest context). - An SMM VM exit loads the logical processor's VMCS pointer with the SMM-transfer VMCS pointer. If the "conceal VMX from PT" VM-exit control is 0 (see Section 35.5.1), a VMCS packet provides this pointer. See Section 35.6 on tracing inside and outside STM. - A VM entry that returns from SMM loads the logical processor's VMCS pointer from a field in the SMM-transfer VMCS. If the "conceal VMX from PT" VM-entry control is 0, a VMCS packet provides this pointer. Whether the VM entry is to VMX root operation or VMX non-root operation is indicated by the PIP.NR bit. A VMCS packet generated before a VMCS pointer has been loaded, or after the VMCS pointer has been cleared will set all 64 bits in the VMCS pointer field. VMCS packets will not be seen on processors with IA32_VMX_MISC[bit 14]=0, as these processors do not allow TraceEn to be set in VMX operation.																																																																															
Application	The purpose of the VMCS packet is to help the decoder uniquely identify changes in the executing software context in situations that CR3 may not be unique. When a VMCS packet is encountered, a decoder should do the following: - If there was a prior unbound FUP (that is, a FUP not preceded by a packet such as MODE.TSX that consumes it, and it hence pairs with a TIP that has not yet been seen), then this VMCS is part of a compound packet event (Section 35.4.1). Find the ending TIP and apply the new VMCS base pointer value to the TIP payload IP. - Otherwise, look for the next VMPTRLD, VMRESUME, or VMLAUNCH in the disassembly, and apply the new VMCS base pointer on the next VM entry. For examples of the packets generated by these flows, see Section 35.7.																																																																															

35.4.2.16 Overflow (OVF) Packet

Table 35-35. OVF Packet Definition

Name	Overflow (OVF) Packet								
Packet Format									
		7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	1	0
	1	1	1	1	1	0	0	1	1
Dependencies	TriggerEn		Generation Scenario		On resolution of internal buffer overflow				

Table 35-35. OVF Packet Definition

Description	OVF simply indicates to the decoder that an internal buffer overflow occurred, and packets were likely lost. If BranchEN= 1, OVF is followed by a FUP or TIP.PGE which will provide the IP at which packet generation resumes. See Section 35.3.8.
Application	When an OVF packet is encountered, the decoder should skip to the IP given in the subsequent FUP or TIP.PGE. The cycle counter for the CYC packet will be reset at the time the OVF packet is sent. Software should reset its call stack depth on overflow, since no RET compression is allowed across an overflow. Similarly, any IP compression that follows the OVF is guaranteed to use as a reference LastIP the IP payload of an IP packet that preceded the overflow.

35.4.2.17 Packet Stream Boundary (PSB) Packet

Table 35-36. PSB Packet Definition

8	0	0	0	0	0	0	1	0																																																																																																																																																									
9	1	0	0	0	0	0	1	0																																																																																																																																																									
10	0	0	0	0	0	0	1	0																																																																																																																																																									
11	1	0	0	0	0	0	1	0																																																																																																																																																									
12	0	0	0	0	0	0	1	0																																																																																																																																																									
13	1	0	0	0	0	0	1	0																																																																																																																																																									
14	0	0	0	0	0	0	1	0																																																																																																																																																									
15	1	0	0	0	0	0	1	0																																																																																																																																																									
Dependencies	TriggerEn	Generation Scenario	Periodic, based on the number of output bytes generated while tracing. PSB is sent when IA32_RTIT_STATUS.PacketByteCnt=0, and each time it crosses the software selected threshold after that. May be sent for other micro-architectural conditions as well.																																																																																																																																																														
Description	PSB is a unique pattern in the packet output log, and hence serves as a sync point for the decoder. It is a pattern that the decoder can search for in order to get aligned on packet boundaries. This packet is periodic, based on the number of output bytes, as indicated by IA32_RTIT_STATUS.PacketByteCnt. The period is chosen by software, via IA32_RTIT_CTL.PSBFreq (see Section 35.2.8.2). Note, however, that the PSB period is not precise, it simply reflects the average number of output bytes that should pass between PSBs. The processor will make a best effort to insert PSB as quickly after the selected threshold is reached as possible. The processor also may send extra PSB packets for some micro-architectural conditions. PSB also serves as the leading packet for a set of “status-only” packets collectively known as PSB+ (Section 35.3.7).																																																																																																																																																																

Table 35-36. PSB Packet Definition (Contd.)

Application	When a PSB is seen, the decoder should interpret all following packets as “status only”, until either a PSBEND or OVF packet is encountered. “Status only” implies that the binding and ordering rules to which these packets normally adhere are ignored, and the state they carry can instead be applied to the IP payload in the FUP packet that is included.

35.4.2.18 PSBEND Packet**Table 35-37. PSBEND Packet Definition**

Name	PSBEND Packet								
Packet Format									
		7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	1	0
	1	0	0	1	0	0	0	1	1
Dependencies	TriggerEn			Generation Scenario		Always follows PSB packet, separated by PSB+ packets			
Description	PSBEND is simply a terminator for the series of “status only” (PSB+) packets that follow PSB (Section 35.3.7).								
Application	When a PSBEND packet is seen, the decoder should cease to treat packets as “status only”.								

35.4.2.19 Maintenance (MNT) Packet**Table 35-38. MNT Packet Definition**

Name	Maintenance (MNT) Packet								
Packet Format		7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	1	0
	1	1	1	0	0	0	0	1	1
	2	1	0	0	0	1	0	0	0
	3	Payload[7:0]							
	4	Payload[15:8]							
	5	Payload[23:16]							
	6	Payload[31:24]							
	7	Payload[39:32]							
	8	Payload[47:40]							
	9	Payload[55:48]							
	10	Payload[63:56]							
Dependencies	TriggerEn		Generation Scenario		Implementation specific.				
Description	This packet is generated by hardware, the payload meaning is model-specific.								
Application	Unless a decoder has been extended for a particular family/model/stepping to interpret MNT packet payloads, this packet should simply be ignored. It does not bind to any IP.								

35.4.2.20 PAD Packet

Table 35-39. PAD Packet Definition

Name	PAD Packet																										
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr></table>										7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	0	0
	7	6	5	4	3	2	1	0																			
0	0	0	0	0	0	0	0	0																			
Dependencies	TriggerEn			Generation Scenario		Implementation specific																					
Description	PAD is simply a NOP packet. Processor implementations may choose to add pad packets to improve packet alignment or for implementation-specific reasons.																										
Application	Ignore PAD packets.																										

35.4.2.21 PTWRITE (PTW) Packet

Table 35-40. PTW Packet Definition

Name	PTW Packet																																																																																																										
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>IP</td><td colspan="2">PayloadBytes</td><td>1</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>2</td><td colspan="8">Payload[7:0]</td></tr><tr><td>3</td><td colspan="8">Payload[15:8]</td></tr><tr><td>4</td><td colspan="8">Payload[23:16]</td></tr><tr><td>5</td><td colspan="8">Payload[31:24]</td></tr><tr><td>6</td><td colspan="8">Payload[39:32]</td></tr><tr><td>7</td><td colspan="8">Payload[47:40]</td></tr><tr><td>8</td><td colspan="8">Payload[55:48]</td></tr><tr><td>9</td><td colspan="8">Payload[63:56]</td></tr></table>									7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	IP	PayloadBytes		1	0	0	1	0	2	Payload[7:0]								3	Payload[15:8]								4	Payload[23:16]								5	Payload[31:24]								6	Payload[39:32]								7	Payload[47:40]								8	Payload[55:48]								9	Payload[63:56]							
	7	6	5	4	3	2	1	0

4	Payload[23:16]																																																																																																										
5	Payload[31:24]																																																																																																										
6	Payload[39:32]																																																																																																										
7	Payload[47:40]																																																																																																										
8	Payload[55:48]																																																																																																										
9	Payload[63:56]																																																																																																										
	The PayloadBytes field indicates the number of bytes of payload that follow the header bytes. Encodings are as follows: <table><tr><th>PayloadBytes</th><th>Bytes of Payload</th></tr><tr><td>'00</td><td>4</td></tr><tr><td>'01</td><td>8</td></tr><tr><td>'10</td><td>Reserved</td></tr><tr><td>'11</td><td>Reserved</td></tr></table> IP bit indicates if a FUP, whose payload will be the IP of the PTWRITE instruction, will follow.								PayloadBytes	Bytes of Payload	'00	4	'01	8	'10	Reserved	'11	Reserved																																																																																									
PayloadBytes	Bytes of Payload																																																																																																										
'00	4																																																																																																										
'01	8																																																																																																										
'10	Reserved																																																																																																										
'11	Reserved																																																																																																										
Dependencies	TriggerEn && ContextEn && FilterEn && PTWEn		Generation Scenario		PTWRITE Instruction																																																																																																						

Table 35-40. PTW Packet Definition (Contd.)

Description	Contains the value held in the PTWRITE operand. This packet is CYC-eligible, and hence will generate a CYC packet if IA32_RTIT_CTL.CYCEn=1 and any CYC Threshold has been reached.
Application	Binds to the associated PTWRITE instruction. The IP of the PTWRITE will be provided by a following FUP, when PTW.IP=1.

35.4.2.22 Execution Stop (EXSTOP) Packet

Table 35-41. EXSTOP Packet Definition

Name	EXSTOP Packet																													
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>IP</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr></table> IP bit indicates if a FUP will follow.				7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	IP	1	1	0	0	0	1	0
	7	6	5	4	3	2	1	0																						
0	0	0	0	0	0	0	1	0																						
1	IP	1	1	0	0	0	1	0																						
Dependencies	TriggerEn && PwrEvtEn	Generation Scenario	C-state entry, P-state change, or other processor clock power-down. Includes : ▪ Entry to C-state deeper than C0.0 ▪ TM1/2 ▪ STPCLK# ▪ Frequency change due to IA32_CLOCK_MODULATION, Turbo																											
Description	This packet indicates that software execution has stopped due to processor clock powerdown. Later packets will indicate when execution resumes. If EXSTOP is generated while ContextEn is set, the IP bit will be set, and EXSTOP will be followed by a FUP packet containing the IP at which execution stopped. More precisely, this will be the IP of the oldest instruction that has not yet completed. This packet is CYC-eligible, and hence will generate a CYC packet if IA32_RTIT_CTL.CYCEn=1 and any CYC Threshold has been reached.																													
Application	If a FUP follows EXSTOP (hence IP bit set), the EXSTOP can be bound to the FUP IP. Otherwise the IP is not known. Time of powerdown can be inferred from the preceding CYC, if CYCEn=1. Combined with the TSC at the time of wake (if TSCEn=1), this can be used to determine the duration of the powerdown.																													

35.4.2.23 MWAIT Packet

Table 35-42. MWAIT Packet Definition

Name	MWAIT Packet

Table 35-42. MWAIT Packet Definition (Contd.)

Packet Format		7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	1	0
	1	1	1	0	0	0	0	1	0
	2	MWAIT Hints[7:0]							
	3	Reserved							
	4	Reserved							
	5	Reserved							
	6	Reserved						EXT[1:0]	
	7	Reserved							
	8	Reserved							
	9	Reserved							
Dependencies	TriggerEn && PwrEvtEn && ContextEn			Generation Scenario	MWAIT, UMWAIT, or TPAUSE instructions, or I/O redirection to MWAIT, that complete without fault or VMexit.				
Description	Indicates that an MWAIT operation to C-state deeper than C0.0 completed. The MWAIT hints and extensions passed in by software are exposed in the payload. For UMWAIT and TPAUSE, the EXT field holds the input register value that determines the optimized state requested. For entry to some highly optimized C0 sub-C-states, such as C0.1, no MWAIT packet is generated. This packet is CYC-eligible, and hence will generate a CYC packet if IA32_RTIT_CTL.CYCEn=1 and any CYC Threshold has been reached.								
Application	The binding for the upcoming EXSTOP packet also applies to the MWAIT packet. See Section 35.4.2.22.								

35.4.2.24 Power Entry (PWRE) Packet

Table 35-43. PWRE Packet Definition

Name	PWRE Packet								
Packet Format									
		7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	1	0
	1	0	0	1	0	0	0	1	0
	2	HW	Reserved						
	3	Resolved Thread C-State				Resolved Thread Sub C-State			
Dependencies	TriggerEn && PwrEvtEn			Generation Scenario	Transition to a C-state deeper than C0.0.				

Table 35-43. PWRE Packet Definition (Contd.)

Description	Indicates processor entry to the resolved thread C-state and sub C-state indicated. The processor will remain in this C-state until either another PWRE indicates the processor has moved to a C-state deeper than C0.0, or a PWRX packet indicates a return to C0.0. For entry to some highly optimized C0 sub-C-states, such as C0.1, no PWRE packet is generated. Note that some CPUs may allow MWAIT to request a deeper C-state than is supported by the core. These deeper C-states may have platform-level implications that differentiate them. However, the PWRE packet will provide only the resolved thread C-state, which will not exceed that supported by the core. If the C-state entry was initiated by hardware, rather than a direct software request (such as MWAIT, UMWAIT, TPAUSE, HLT, or shutdown), the HW bit will be set to indicate this. Hardware Duty Cycling (see Section 16.5, “Hardware Duty Cycling (HDC),” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3B) is an example of such a case.
Application	When transitioning from C0.0 to a deeper C-state, the PWRE packet will be followed by an EXSTOP. If that EXSTOP packet has the IP bit set, then the following FUP will provide the IP at which the C-state entry occurred. Subsequent PWRE packets generated before the next PWRX should bind to the same IP.

35.4.2.25 Power Exit (PWRX) Packet

Table 35-44. PWRX Packet Definition

Name	PWRX Packet																																																																															
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>1</td><td>0</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>2</td><td colspan="4">Last Core C-State</td><td colspan="4">Deepest Core C-State</td></tr><tr><td>3</td><td colspan="4">Reserved</td><td colspan="4">Wake Reason</td></tr><tr><td>4</td><td colspan="8">Reserved</td></tr><tr><td>5</td><td colspan="8">Reserved</td></tr><tr><td>6</td><td colspan="8">Reserved</td></tr></table>									7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	1	0	1	0	0	0	1	0	2	Last Core C-State				Deepest Core C-State				3	Reserved				Wake Reason				4	Reserved								5	Reserved								6	Reserved							
	7	6	5	4	3	2	1	0																																																																								
0	0	0	0	0	0	0	1	0																																																																								
1	1	0	1	0	0	0	1	0																																																																								
2	Last Core C-State				Deepest Core C-State																																																																											
3	Reserved				Wake Reason																																																																											
4	Reserved																																																																															
5	Reserved																																																																															
6	Reserved																																																																															
Dependencies	TriggerEn && PwrEvtEn		Generation Scenario		Transition from a C-state deeper than C0.0 to C0.																																																																											
Description	Indicates processor return to thread C0 from a C-state deeper than C0.0. For return from some highly optimized C0 sub-C-states, such as C0.1, no PWRX packet is generated. The Last Core C-State field provides the MWAIT encoding for the core C-state at the time of the wake. The Deepest Core C-State provides the MWAIT encoding for the deepest core C-state achieved during the sleep session, or since leaving thread C0. MWAIT encodings for C-states can be found in Table 4-11 in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B. Note that these values reflect only the core C-state, and hence will not exceed the maximum supported core C-state, even if deeper C-states can be requested. The Wake Reason field is one-hot, encoded as follows: <table><tr><td>Bit</td><td>Field</td><td>Meaning</td></tr><tr><td>0</td><td>Interrupt</td><td>Wake due to external interrupt received.</td></tr><tr><td>1</td><td>Timer Deadline</td><td>Wake due to timer expiration, such as UMWAIT/TPAUSE TSC-quanta.</td></tr><tr><td>2</td><td>Store to Monitored Address</td><td>Wake due to store to monitored address.</td></tr><tr><td>3</td><td>HW Wake</td><td>Wake due to hardware autonomous condition, such as HDC.</td></tr></table>								Bit	Field	Meaning	0	Interrupt	Wake due to external interrupt received.	1	Timer Deadline	Wake due to timer expiration, such as UMWAIT/TPAUSE TSC-quanta.	2	Store to Monitored Address	Wake due to store to monitored address.	3	HW Wake	Wake due to hardware autonomous condition, such as HDC.																																																									
Bit	Field	Meaning																																																																														
0	Interrupt	Wake due to external interrupt received.																																																																														
1	Timer Deadline	Wake due to timer expiration, such as UMWAIT/TPAUSE TSC-quanta.																																																																														
2	Store to Monitored Address	Wake due to store to monitored address.																																																																														
3	HW Wake	Wake due to hardware autonomous condition, such as HDC.																																																																														

Table 35-44. PWRX Packet Definition (Contd.)

Application	PWRX will always apply to the same IP as the PWRE. The time of wake can be discerned from (optional) timing packets that precede PWRX.

35.4.2.26 Block Begin Packet (BBP)**Table 35-45. Block Begin Packet Definition**

Name	BBP																																											
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr><tr><td>2</td><td>SZ</td><td colspan="2">Reserved</td><td colspan="5">Type[4:0]</td></tr></table>									7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	0	1	1	0	0	0	1	1	2	SZ	Reserved		Type[4:0]

2	SZ	Reserved		Type[4:0]																																								
Dependencies	TriggerEn		Generation Scenario	PEBS event, if IA32_PEBS_ENABLE.OUTPUT=1.																																								
Description	This packet indicates the beginning of a block of packets which are collectively tied to a single event or instruction. The size of the block item payloads within this block is provided by the Size (SZ) bit: SZ=0: 8-byte block items SZ=1: 4-byte block items The meaning of the BIP payloads is provided by the Type field: <table><tr><th>BBP.Type</th><th>Block name</th></tr><tr><td>0x00</td><td>Reserved</td></tr><tr><td>0x01</td><td>General-Purpose Registers</td></tr><tr><td>0x02..0x03</td><td>Reserved</td></tr><tr><td>0x04</td><td>PEBS Basic</td></tr><tr><td>0x05</td><td>PEBS Memory</td></tr><tr><td>0x06..0x07</td><td>Reserved</td></tr><tr><td>0x08</td><td>LBR Block 0</td></tr><tr><td>0x09</td><td>LBR Block 1</td></tr><tr><td>0x0A</td><td>LBR Block 2</td></tr><tr><td>0x0B..0x0F</td><td>Reserved</td></tr><tr><td>0x10</td><td>XMM Registers</td></tr><tr><td>0x11..0x1F</td><td>Reserved</td></tr></table>								BBP.Type	Block name	0x00	Reserved	0x01	General-Purpose Registers	0x02..0x03	Reserved	0x04	PEBS Basic	0x05	PEBS Memory	0x06..0x07	Reserved	0x08	LBR Block 0	0x09	LBR Block 1	0x0A	LBR Block 2	0x0B..0x0F	Reserved	0x10	XMM Registers	0x11..0x1F	Reserved										
BBP.Type	Block name																																											
0x00	Reserved																																											
0x01	General-Purpose Registers																																											
0x02..0x03	Reserved																																											
0x04	PEBS Basic																																											
0x05	PEBS Memory																																											
0x06..0x07	Reserved																																											
0x08	LBR Block 0																																											
0x09	LBR Block 1																																											
0x0A	LBR Block 2																																											
0x0B..0x0F	Reserved																																											
0x10	XMM Registers																																											
0x11..0x1F	Reserved																																											
Application	A BBP will always be followed by a Block End Packet (BEP), and when the block is generated while ContextEn=1 that BEP will have IP=1 and be followed by a FUP that provides the IP to which the block should be bound. Note that, in addition to BEP, a block can be terminated by a BBP (indicating the start of a new block) or an OVF packet.																																											

35.4.2.27 Block Item Packet (BIP)**Table 35-46. Block Item Packet Definition**

Name	BIP

Table 35-46. Block Item Packet Definition (Contd.)

Packet Format	If the preceding BBP.SZ=0:								
		7	6	5	4	3	2	1	0
	0	ID[5:0]					1	0	0
	1	Payload[7:0]							
	2	Payload[15:8]							
	3	Payload[23:16]							
	4	Payload[31:24]							
	5	Payload[39:32]							
	6	Payload[47:40]							
	7	Payload[55:48]							
	8	Payload[63:56]							
	If the preceding BBP.SZ=1:								
		7	6	5	4	3	2	1	0
	0	ID[5:0]					1	0	0
	1	Payload[7:0]							
	2	Payload[15:8]							
	3	Payload[23:16]							
	4	Payload[31:24]							
Dependencies	TriggerEn			Generation Scenario		See BBP.			
Description	The size of the BIP payload is determined by the Size field in the preceding BBP packet. The BIP header provides the ID value that, when combined with the Type field from the preceding BBP, uniquely identifies the state value held in the BIP payload. See Table 35-47 below for the complete list.								
Application	See BBP.								

BIP State Value Encodings

The table below provides the encoding values for all defined block items. State items that are larger than 8 bytes, such as XMM register values, are broken into multiple 8-byte components. BIP packets with Size=1 (4 byte payload) will provide only the lower 4 bytes of the associated state value.

35.4.2.28 Block End Packet (BEP)

Table 35-48. Block End Packet Definition

Name	BEP																																		
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>IP</td><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td></tr></table>									7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	IP	0	1	1	0	0	1	1
	7	6	5	4	3	2	1	0																											
0	0	0	0	0	0	0	1	0																											
1	IP	0	1	1	0	0	1	1																											
Dependencies	TriggerEn		Generation Scenario		See BBP.																														
Description	Indicates the end of a packet block. The IP bit indicates if a FUP will follow, and will be set if ContextEn=1.																																		
Application	The block, from initial BBP to the BEP, binds to the FUP IP, if IP=1, and consumes the FUP.																																		

35.4.2.29 Control Flow Event (CFE) Packet

Table 35-49. Control Flow Event Packet Definition

Name	CFE																																																				
Packet Format	<table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td><td>1</td></tr><tr><td>2</td><td>IP</td><td colspan="2">Reserved</td><td colspan="5">Type[4:0]</td></tr><tr><td>3</td><td colspan="8">Vector[7:0]</td></tr></table> IP bit indicates if a stand-alone FUP will follow.									7	6	5	4	3	2	1	0	0	0	0	0	0	0	0	1	0	1	0	0	0	1	0	0	1	1	2	IP	Reserved		Type[4:0]					3	Vector[7:0]							
	7	6	5	4	3	2	1	0																																													
0	0	0	0	0	0	0	1	0																																													
1	0	0	0	1	0	0	1	1																																													
2	IP	Reserved		Type[4:0]																																																	
3	Vector[7:0]																																																				
Dependencies	IA32_RTIT_CTL.EventEn && TriggerEn && ContextEn On ContextEn transitions, the CFE will be generated regardless of direction (1→0 or 0→1). VM exit is an exception, where CFE.VMEXIT depends only on the prior value of ContextEn.			Generation Scenario	Software interrupt, external interrupt, user interrupt, or exception, including those injected on VM entry. INIT, SIPI, SMI, RSM, IRET, Shutdown. VM exit, if “Conceal VMX in PT” VMCS exit control is 0. VM entry, if “Conceal VMX in PT” VMCS entry control is 0. TSX Abort.																																																
Description	This packet indicates that an asynchronous event or related event (see list above) has occurred. The type of event is provided in the packet (see Table 35-50 below), and, if the IP bit is set, the IP at which the event occurred is provided in a stand-alone FUP packet that follows. Further, in the case of an interrupt or exception, the vector field provides the vector of the event. The IP bit will be set only when ContextEn=1 before the event is taken, and either BranchEn=0 or else no FUP is generated for this event by BranchEn=1. There are some cases, such as SIPI and RSM, where no FUP is generated. Note that events that are not delivered to software, such as nested events or events which cause a VM exit, do not generate CFE packets.																																																				
Application	If the IP bit is set, a FUP will follow that is stand-alone (not part of a compound packet event), and the CFE consumes the FUP. If the IP bit is not set, the CFE binds to the next FUP if PacketEn=1 (hence the CFE comes after a TIP.PGE but before the next TIP.PGD), and is stand-alone if PacketEn=0.																																																				

CFE Packet Type and Vector Fields

Every CFE has a Type field, which provides the type of event which generated the packet. For a subset of CFE Types, the CFE.Vector field may be valid. Details on these fields, as well as the IP to be expected in any following FUP packet, are provided in the table below.

Table 35-50. CFE Packet Type and Vector Fields Details

CFE Subtype	Type	Vector	FUP IP	Details
INTR	0x1	Event Vector	Varies	Used for interrupts (external and software), Exceptions, Faults, and NMI. FUP contains that address of the instruction that has not completed (NLIP for trap events, CLIP for fault events).
IRET	0x2	Invalid	CLIP	
SMI	0x3	Invalid	NLIP	
RSM	0x4	Invalid	None	
SIPI	0x5	SIPI Vector	None	
INIT	0x6	Invalid	NLIP	
VMENTRY	0x7	Invalid	CLIP	FUP contains IP of VMLAUNCH/VMRESUME.
VMEXIT	0x8	Invalid	Varies	FUP IP varies depending on type of VM exit, but will be the address of the instruction that has not completed. Will be consistent with Guest IP saved in VMCS.
VMEXIT_INTR	0x9	Event Vector	Varies	Sent in cases where VM exit was caused by an INTR event (interrupt, exception, fault, or NMI). Vector provided is for the event which caused the VM exit. FUP IP behavior matches that of INTR type above.
SHUTDOWN	0xa	Invalid	Varies	FUP IP varies depending on the type of event that caused shutdown, but will be the address of the instruction that has not completed.
Reserved	0xb	N/A	N/A	
UINTR	0xc	User Interrupt Vector	NLIP	User interrupt delivered.
UIRET	0xd	Invalid	CLIP	Exiting from user interrupt routine.
Reserved	0xe...0xf	N/A	N/A	Reserved

35.5 TRACING IN VMX OPERATION

On processors that IA32_VMX_MISC[bit 14] reports 1, TraceEn can be set in VMX operation. The VMM can configure specific VMX controls to control what virtualization-specific data is included within the trace packets (see Section 35.5.1 for details). The VMM can also configure the VMCS to limit tracing to non-root operation, or to trace across both root and non-root operation. The VMCS controls exist to simplify virtualization of Intel PT for guest use, including the “Clear IA32_RTIT_CTL” exit control (See Section 26.7.1), “Load IA32_RTIT_CTL” entry control (See Section 26.8.1), and “Intel PT uses guest physical addresses” execution control (See Section 27.5.3).

For older processors that do not support these VMCS controls, the MSR-load areas used by VMX transitions can be employed by the VMM to restrict tracing to the desired context. See Section 35.5.2 for details. Tracing with SMM Transfer Monitor is described in Section 35.6.

35.5.1 VMX-Specific Packets and VMCS Controls

In all of the usages of VMX and Intel PT, a decoder in the host or VMM context can identify the occurrences of VMX transitions with the aid of VMX-specific packets. There are four kinds of packets relevant to VMX:

- **VMCS packet.** The VMX transitions of individual VMs can be distinguished by a decoder using the VMCS-pointer field in a VMCS packet. A VMCS packet is sent on a successful execution of VMPTRLD, and its VMCS-pointer field stores the VMCS pointer loaded by that execution. See Section 35.4.2.15 for details.

- **The NR (non-root) bit in a PIP packet.** Normally, the NR bit is set in any PIP packet generated in VMX non-root operation. In addition, PIP packets are generated with each VM entry and VM exit. Thus a transition of the NR bit from 0 to 1 indicates the occurrence of a VM entry, and a transition of 1 to 0 indicates the occurrence of a VM exit.
- **CFE packet.** Identifies VM exit and VM entry operations.
- **EVD packet.** Provides the exit reason and exit qualification for VM exits.

There are VMX controls that a VMM can set to conceal some of this VMX-specific information (by suppressing its recording) and thereby prevent it from leaking across virtualization boundaries. There is one of these controls (each of which is called “conceal VMX from PT”) of each type of VMX control.

Table 35-52. VMX Controls For Intel Processor Trace

Type of VMX Control	Bit Position ¹	Value	Behavior
Secondary processor-based VM-execution control	19	0	Each PIP generated in VM non-root operation will set the NR bit. PSB+ in VMX non-root operation will include the VMCS packet, to ensure that the decoder knows which guest is currently in use.
		1	Each PIP generated in VMX non-root operation will clear the NR bit. PSB+ in VMX non-root operation will not include the VMCS packet.
VM-exit control	24	0	Each VM exit generates a PIP in which the NR bit is clear, and a CFE/EVD if Event Trace is enabled. In addition, SMM VM exits generate VMCS packets.
		1	VM exits do not generate PIPs, CFEs, or EVDs, and no VMCS packets are generated on SMM VM exits.
VM-entry control	17	0	Each VM entry generates a PIP in which the NR bit is set (except VM entries that return from SMM to VMX root operation), and a CFE if Event Trace is enabled. In addition, VM entries that return from SMM generate VMCS packets.
		1	VM entries do not generate PIPs or CFEs, and no VMCS packets are generated on VM entries that return from SMM.

NOTES:

1. These are the positions of the control bits in the relevant VMX control fields.

The 0-settings of these VMX controls enable all VMX-specific packet information. The scenarios that would use these default settings also do not require the VMM to use VMX MSR-load areas to enable and disable trace-packet generation across VMX transitions.

If IA32_VMX_MISC[bit 14] reports 0, the 1-settings of the VMX controls in Table 35-52 are not supported, and VM entry will fail on any attempt to set them.

35.5.2 Managing Trace Packet Generation Across VMX Transitions

In tracing scenarios that collect packets for both VMX root operation and VMX non-root operation, a host executive can manage the MSRs associated with trace packet generation directly. The states of these MSRs need not be modified across VMX transitions.

For tracing scenarios that collect packets only within VMX root operation or only within VMX non-root operation, the VMM can toggle IA32_RTIT_CTL.TraceEn on VMX transitions.

35.5.2.1 System-Wide Tracing

When a host or VMM configures Intel PT to collect trace packets of the entire system, it can leave the relevant VMX controls clear to allow VMX-specific packets to provide information across VMX transitions.

The decoder will desire to identify the occurrence of VMX transitions. The packets of interests to a decoder are shown in Table 35-53.

Table 35-53. Packets on VMX Transitions (System-Wide Tracing)

Event	Packets	Enable	Description
VM exit	EVD.VMXR, EVD.VMXQ, CFE.VMEXIT*	EventEn	The CFE identifies the transfer as a VM exit, while the associated EVDs provide the exit reason and exit qualification.
	FUP(GuestIP)	BranchEn or EventEn	The FUP indicates at which point in the guest flow the VM exit occurred. This is important, since VM exit can be an asynchronous event. The IP will match that written into the VMCS.
	PIP(HostCR3, NR=0)		The PIP packet provides the new host CR3 value, as well as indication that the logical processor is entering VMX root operation. This allows the decoder to identify the change of executing context from guest to host and load the appropriate set of binaries to continue decode.
	TIP(HostIP)	BranchEn	The TIP indicates the destination IP, the IP of the first instruction to be executed in VMX root operation. Note, this packet could be preceded by a MODE.Exec packet (Section 35.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition.
VM entry	CFEVMENTRY, FUP(CLIP)	EventEn	The CFE identifies the transfer as a VM entry, while the FUP identifies the VMLAUNCH/VMRESUME IP.
	PIP(GuestCR3, NR=1)	BranchEn	The PIP packet provides the new guest CR3 value, as well as indication that the logical processor is entering VMX non-root operation. This allows the decoder to identify the change of executing context from host to guest and load the appropriate set of binaries to continue decode.
	TIP(GuestIP)	BranchEn	The TIP indicates the destination IP, the IP of the first instruction to be executed in VMX non-root operation. This should match the RIP loaded from the VMCS. Note, this packet could be preceded by a MODE.Exec packet (Section 35.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition.

Since the VMX controls that suppress packet generation are cleared, a VMCS packet will be included in all PSB+ for this usage scenario. Additionally, VMPTRLD will generate such a packet. Thus the decoder can distinguish the execution context of different VMs.

When the host VMM configures a system to collect trace packets in this scenario, it should emulate CPUID to report CPUID.07H.00H:EBX[26] as 0 to guests, indicating to guests that Intel PT is not available.

VMX TSC Manipulation

The TSC packets generated while in VMX non-root operation will include any changes resulting from the use of a VMM's use of the TSC offsetting or TSC scaling VMX controls (see Chapter 27, "VMX Non-Root Operation"). In this system-wide usage model, the decoder may need to account for the effect of per-VM adjustments in the TSC packets generated in VMX non-root operation and the absence of TSC adjustments in TSC packets generated in VMX root operation. The VMM can supply this information to the decoder.

35.5.2.2 Guest-Only Tracing

A VMM can configure trace-packet generation while in VMX non-root operation for guests executing normally. This is accomplished by utilizing VMCS controls to manipulate the guest IA32_RTIT_CTL value on VMX transitions. For older processors that do not support these VMCS controls, a VMM can use the VMX MSR-load areas on VM exits (see Section 26.7.2, "VM-Exit Controls for MSRs") and VM entries (see Section 26.8.2, "VM-Entry Controls for MSRs") to limit trace-packet generation to the guest environment.

For this usage, VM entry is programmed to enable trace packet generation, while VM exit is programmed to clear IA32_RTIT_CTL.TraceEn so as to disable trace-packet generation in the host. Further, if it is preferred that the

guest packet stream contain no indication that execution was in VMX non-root operation, the VMM should set to 1 all the VMX controls enumerated in Table 35-52.

35.5.2.3 Emulation of Intel PT Traced State

If a VMM emulates an element of processor state by taking a VM exit on reads and/or writes to that piece of state, and the state element impacts Intel PT packet generation or values, it may be incumbent upon the VMM to insert or modify the output trace data.

If a VM exit is taken on a guest write to CR3 (including “MOV CR3” as well as task switches), the PIP packet normally generated on the CR3 write will be missing.

To avoid decoder confusion when the guest trace is decoded, the VMM should emulate the missing PIP by writing it into the guest output buffer. If the guest CR3 value is manipulated, the VMM may also need to manipulate the IA32_RTIT_CR3_MATCH value, in order to ensure the trace behavior matches the guest's expectation.

Similarly, if a VMM emulates the TSC value by taking a VM exit on RDTSC, the TSC packets generated in the trace may mismatch the TSC values returned by the VMM on RDTSC. To ensure that the trace can be properly aligned with software logs based on RDTSC, the VMM should either make corresponding modifications to the TSC packet values in the guest trace, or use mechanisms such as TSC offsetting or TSC scaling in place of exiting.

35.5.2.4 TSC Scaling

When TSC scaling is enabled for a guest using Intel PT, the VMM should ensure that the value of Maximum Non-Turbo Ratio[15:8] in MSR_PLATFORM_INFO (MSR 0CEH) and the TSC/“core crystal clock” ratio (EBX/EAX) in CPUID.15H are set in a manner consistent with the resulting TSC rate that will be visible to the VM. This will allow the decoder to properly apply TSC packets, MTC packets (based on the core crystal clock or ART, whose frequency is indicated by CPUID.15H), and CBR packets (which indicate the ratio of the processor frequency to the Max Non-Turbo frequency). Absent this, or separate indication of the scaling factor, the decoder will be unable to properly track time in the trace. See Section 35.8.3 for details on tracking time within an Intel PT trace.

35.5.2.5 Failed VM Entry

The packets generated by a failed VM entry depend both on the VMCS configuration, as well as on the type of failure. The results to expect are summarized in the table below. Note that packets in *italics* may or may not be generated, depending on implementation choice, and the point of failure.

Table 35-54. Packets on a Failed VM Entry

Usage Model	Entry Configuration	Early Failure (fall through to next IP)	Late Failure (VM exit like)
System-Wide	No use of “Load IA32_RTIT_CTL” entry control or VM-entry MSR-load area	TIP (NextIP)	<i>CFE.VMENTRY, FUP(CLIP) if EventEn=1</i> <i>PIP(Guest CR3, NR=1), TraceEn 0→1 Packets (See Section 35.2.8.3), PIP(HostCR3, NR=0), TIP(HostIP)</i>
VMM Only	“Load IA32_RTIT_CTL” entry control or VM-entry MSR-load area used to clear TraceEn	TIP (NextIP)	<i>TraceEn 0→1 Packets (See Section 35.2.8.3), TIP(HostIP)</i>
VM Only	“Load IA32_RTIT_CTL” entry control or VM-entry MSR-load area used to set TraceEn	None	None

35.5.2.6 VMX Abort

VMX abort conditions take the processor into a shutdown state. On a VM exit that leads to VMX abort, some packets (FUP, PIP) may be generated, but any expected TIP, TIP.PGE, or TIP.PGD may be dropped.

35.6 TRACING AND SMM TRANSFER MONITOR (STM)

The SMM-transfer monitor (STM) is a VMM that operates inside SMM while in VMX root operation. An STM operates in conjunction with an executive monitor. The latter operates outside SMM and in VMX root operation. Transitions from the executive monitor or its VMs to the STM are called SMM VM exits. The STM returns from SMM via a VM entry to the VM in VMX non-root operation or the executive monitor in VMX root operation.

Intel PT supports tracing in an STM similar to tracing support for VMX operation as described above in Section 35.5. As a result, on a SMM VM exit resulting from #SMI, TraceEn is neither saved nor cleared by default. Software can save the state of the trace configuration MSRs and clear TraceEn using the MSR load/save lists.

Within Event Trace, SMM VM exits generate packets indicating both an #SMI and a VM exit. Similarly, VM entries that return from SMM generate packets that indicate both an RSM and a VM entry. SMM VM exits initiated by the VMCALL instruction do not generate any CFE packet, though the subsequent VM entry returning from SMM will generate a CFE.RSM.

35.7 PACKET GENERATION SCENARIOS

The following tables provides examples of packet generation for various operations. The following acronyms are used in the packet examples below:

- CLIP - Current LIP
- NLIP - Next Sequential LIP
- BLIP - Branch Target LIP

Table 35-55 illustrates the packets generated by a series of example operations, assuming that PacketEn (TriggerEn && ContextEn && FilterEn && BranchEn) is set before and after the operation.

Table 35-55. Packet Generation under Different Example Operations

Case	Operation	Details	Packets
1	Normal non-jump operation		None
2	Conditional branch	6th branch in internal TNT buffer	TNT
3	Conditional branch	1 st ..5 th branch in internal TNT buffer	None
4	Near indirect JMP or CALL		TIP(BLIP)
5	Direct near JMP or CALL		None
6	Near RET	Uncompressed	TIP(BLIP)
7	Near RET	Compressed, 6th branch in internal TNT buffer	TNT
8	Far Branch	Assumes no update to CR3, CS.L, or CS.D	TIP(BLIP)
9	Far Branch	Assumes update to CR3	PIP(NewCR3), TIP(BLIP)
10	Far Branch	Assumes update to CR3 and CS.D/CS.L	PIP(NewCR3), MODE.Exec, TIP(BLIP)
11	External Interrupt or NMI	Assumes no update to CR3, CS.D, or CS.L	FUP(NLIP), TIP(BLIP)
12	External Interrupt or NMI	Assumes update to CR3 and CS.D/CS.L	FUP(NLIP), PIP(NewCR3), MODE.Exec, TIP(BLIP)
13	Exception/Fault or Software Interrupt	Assumes no update to CR3, CS.D, or CS.L	FUP(CLIP), TIP(BLIP)
14	MOV to CR3		PIP(NewCR3, NR)
15	VM exit	Assumes system-wide tracing, see Section 35.5.2.1	See Table 35-53
16	VM entry	Assumes system-wide tracing, see Section 35.5.2.1	See Table 35-53

Table 35-55. Packet Generation under Different Example Operations

Case	Operation	Details	Packets
17	ENCLU[EENTER] / ENCLU[ERESUME] / ENCLU[EEXIT] / AEX/EEE	Only debug enclaves allow PacketEn to be set during enclave execution. Assumes no change to CS.L or CS.D.	FUP(CLIP), TIP(BLIP)
18	XBEGIN/XACQUIRE/XEND/XRELEASE	Does not begin/end transactional execution	None
19	XBEGIN/XACQUIRE	Assumes beginning of transactional execution	MODE.TSX(InTX=1, TXAbort=0), FUP(CLIP)
20	XEND/XRELEASE	Completes transaction	MODE.TSX(InTX=0, TXAbort=0), FUP(CLIP)
21	XABORT or Asynchronous Abort	Aborts transactional execution	MODE.TSX(InTX=0, TXAbort=1), FUP(CLIP), TIP(BLIP)
22	INIT	On BSP. Assumes no CR3, CS.D, or CS.L update.	FUP(NLIP), TIP(ResetLIP)
23	INIT	On AP, goes to wait-for-SIPI. Assumes no CR3 update.	FUP(NLIP)
24	SIPI	Assumes no CS.D or CS.L update	TIP.PGE(SIPI.LIP)
25	Wake from state deeper than C0.1, P-state change, or other scenario where timing packets (MTC, CYC) may have ceased.	TSC if TSCEn=1 TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR
26	UINTR	User interrupt handler entry.	FUP(NLIP)
27	UIRET	Exiting from user interrupt handler.	FUP(NLIP)

Table 35-56 illustrates the packets generated in example scenarios where the operation alters the value of PacketEn. Note that insertion of PSB+ is not included here, though it can be coincident with initial enabling of Intel PT. See Section 35.3.7 for details.

Table 35-56. Packet Generation with Operations That Alter the Value of PacketEn

Case	Operation	PktEn Before	PktEn After	CntxEn After	Details	Packets
1	WRMSR/XRSTORS that changes TraceEn 0 → 1	0	1	0	TSC if TSCEn=1; TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR, MODE.Exec
2	WRMSR/XRSTORS that changes TraceEn 0 → 1	0	1	1	TSC if TSCEn=1; TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR, MODE.Exec, TIP.PGE(NLIP)
3	WRMSR that changes TraceEn 1 → 0	1	0	D.C.		FUP(CLIP), TIP.PGD()
4	Taken Branch	1	0	1	Source is in IP filter region. Target is outside IP filter region.	TIP.PGD(BLIP)
5	Taken Branch, Interrupt, EEXIT, etc.	0	1	1	Source is outside IP filter region. Target is in IP filter region.	TIP.PGE(BLIP)
6	Far Branch, Interrupt, EENTER, etc.	1	0	0	Requires change to CPL or CR3, or entry to opt-out enclave.	TIP.PGD()
7	Trap-like event (external interrupt, NMI, VM exit/entry, etc.)	1	0	0	Requires change to CPL or CR3.	FUP(NLIP), TIP.PGD()
8	Fault-like event (exception/fault, software interrupt, VM exit/entry, etc.)	1	0	0	Requires change to CPL or CR3.	FUP(CLIP), TIP.PGD()

Table 35-56. Packet Generation with Operations That Alter the Value of PacketEn (Contd.)

Case	Operation	PktEn Before	PktEn After	CntxEn After	Details	Packets
9	SMI, VM exit/entry	1	0	0	TraceEn is cleared.	FUP(NLIP), TIP.PGD()
10	RSM, VM exit/entry	0	1	1	TraceEn is set.	See Case 2 for packets on enable. FUP/TIP.PGE IP is the BLIP.
11	VM Exit	1	0	0	Assumes guest-only tracing, see Section 35.5.2.2. TraceEn is cleared.	FUP(VMCSg.RIP), TIP.PGD()
12	VM entry	0	1	1	Assumes guest-only tracing, see Section 35.5.2.2. TraceEn is set.	TIP.PGE(VMCSg.RIP)

Table 35-57 illustrates examples of PTWRITE, assuming TriggerEn & PTWEn is true.

Table 35-57. Examples of PTWRITE when TriggerEn & PTWEn is True

Case	Operation	ContextEn	Details	Packets
1	MWAIT/UMWAIT gets fault or VM exit.	D.C.		None. Other trace sources may generate packets on fault or VM exit.
2	MWAIT/UMWAIT requests C0, or monitor not armed, or VMX virtual-interrupt delivery.	D.C.		None.
3	MWAIT/UMWAIT enters C-state deeper than C0.1.	0		PWRE(Cx), EXSTOP
4	MWAIT/UMWAIT enters C-state deeper than C0.1.	1		MWAIT(Cy), PWRE(Cx), EXSTOP(IP), FUP(CLIP)
5	HLT, Triple-fault shutdown, other operation that enters C1.	1		PWRE(C1), EXSTOP(IP), FUP(CLIP)
6	Hardware Duty Cycling (HDC).	1	TSC if TSCEn=1 TMA if TSCEn=MTCEn=1	PWRE(HW, C6), EXSTOP(IP), FUP(NLIP), TSC?, TMA?, CBR, PWRX(CC6, CC6, 0x8)
7	Wake event during Cx (x > 0).	D.C.	TSC if TSCEn=1 TMA if TSCEn=MTCEn=1	TSC?, TMA?, CBR, PWRX(LCC, DCC, 0x1) Other trace sources may generate packets for the wake operation (e.g., interrupt).

Table 35-58 illustrates examples of Power Event Trace, assuming TriggerEn & PwrEvtEn is true.

Table 35-58. Examples of Power Event Trace when TriggerEn & PwrEvtEn is True

Case	Operation	ContextEn & FilterEn	Details	Packets
1	PTWRITE rm32/64	0		None
2	PTWRITE rm32	1	FUP, PTW.IP=1 if FUPonPTW=1	PTW(IP=1?, 4B, rm32_value), FUP(CLIP)?
3	PTWRITE rm64	1	FUP, PTW.IP=1 if FUPonPTW=1	PTW(IP=1?, 8B, rm64_value), FUP(CLIP)?

Table 35-59 illustrates examples of Event Trace, assuming TriggerEn && ContextEn && EventEn is true. In all cases, other trace sources (e.g., BranchEn), if enabled, may generate additional packets. For details, see the other tables in this section.

Table 35-59. Event Trace Examples when TriggerEn && ContextEn && EventEn is True

Case	Operation	ContextEn Before	ContextEn After	Details	Packets
1	IRET	1	D.C.		CFE.IRET(IP=1), FUP(CLIP)
2	IRET	0	1		CFE.IRET
3	External interrupt, including NMI	1	D.C.		CFE.INTR(IP=1, Vector), FUP(NLIP)
4	External interrupt, including NMI	1	1	Assumes BranchEn=1, illustrates the shared FUP.	CFE.INTR(IP=0, Vector), FUP(NLIP), TIP(BLIP)
5	SW Interrupt, Exception/Fault other than #PF	1	D.C.		CFE.INTR(IP=1, Vector), FUP(CLIP)
6	Page Fault (#PF)	1	D.C.		EVD.PFA, CFE.INTR(IP=1,14), FUP(CLIP)
7	Page Fault (#PF)	0	D.C.		None
10	SMI	1	D.C.		CFE.SMI(IP=1), FUP(NLIP)
11	RSM, TraceEn restored to 1	D.C.	1		CFE.RSM(IP=0)
12	Entry to Shutdown	1	D.C.		CFE.SHUTDOWN(IP=1), FUP(CLIP)
13	VM exit caused by interrupt, fault, or SMI	1	D.C.	Assumes "Conceal VMX in PT" exit control is 0.	EVD.VMXQ, EVD.VMXR, CFE.VMEXIT_INTR(IP=1, Vector), FUP(VMCSSg.LIP)
14	VM exit caused by other than interrupt, fault, or SMI	1	D.C.	Assumes "Conceal VMX in PT" exit control is 0.	EVD.VMXQ, EVD.VMXR, CFE.VMEXIT(IP=1), FUP(VMCSSg.LIP)
15	VM exit caused by other than interrupt, fault, or SMI	0	1	Assumes "Conceal VMX in PT" exit control is 0.	CFE.VMEXIT(IP=0)
16	VM entry	1	D.C.	Assumes "Conceal VMX in PT" entry control is 0.	CFE.VMENTRY(IP=1), FUP(VMCSSh.LIP)
17	AEX/EEE, from opt-out (non-debug) enclave	0	0		None
18	AEX/EEE, from opt-out (non-debug) enclave	0	1		CFE.INTR(IP=0)
19	AEX, from opt-in (debug) enclave	1	D.C.		CFE.INTR(IP=1, Vec), FUP(AEP LIP)
20	INIT	1	D.C.		CFE.INIT(IP=1), FUP(NLIP)
21	SIPI	1	D.C.		CFE.SIPI(IP=0)
22	STI/CLI/POPF	1	1	Assumes a change to RFLAGS.IF.	MODE.Exec, FUP(NLIP)

35.8 SOFTWARE CONSIDERATIONS

35.8.1 Tracing SMM Code

Nothing prevents an SMM handler from configuring and enabling packet generation for its own use. As described in Section 35.2.9.3, SMI will always clear TraceEn, so the SMM handler would have to set TraceEn in order to enable tracing. There are some unique aspects and guidelines involved with tracing SMM code, which follow:

1. SMM should save away the existing values of any configuration MSRs that SMM intends to modify for tracing. This will allow the non-SMM tracing context to be restored before RSM.
2. It is recommended that SMM wait until it sets CSbase to 0 before enabling packet generation, to avoid possible LIP vs RIP confusion.
3. Packet output cannot be directed to SMRR memory, even while tracing in SMM.
4. Before performing RSM, SMM should take care to restore modified configuration MSRs to the values they had immediately after #SMI. This involves first disabling packet generation by clearing TraceEn, then restoring any other configuration MSRs that were modified.
5. RSM
 - Software must ensure that TraceEn=0 at the time of RSM. Tracing RSM is not a supported usage model, and the packets generated by RSM are undefined.
 - For processors on which Intel PT and LBR use are mutually exclusive (see Section 35.3.1.2), any RSM during which TraceEn is restored to 1 will suspend any LBR or BTS logging.

35.8.2 Cooperative Transition of Multiple Trace Collection Agents

A third-party trace-collection tool should take into consideration the fact that it may be deployed on a processor that supports Intel PT but may run under any operating system.

In such a deployment scenario, Intel recommends that tool agents follow similar principles of cooperative transition of single-use hardware resources, similar to how performance monitoring tools handle performance monitoring hardware:

- Respect the “in-use” ownership of an agent who already configured the trace configuration MSRs, see architectural MSRs with the prefix “IA32_RTIT_” in Chapter 2, “Model-Specific Registers (MSRs),” in the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4, where “in-use” can be determined by reading the “enable bits” in the configuration MSRs.
- Relinquish ownership of the trace configuration MSRs by clearing the “enabled bits” of those configuration MSRs.

35.8.3 Tracking Time

This section describes the relationships of several clock counters whose update frequencies reside in different domains that feed into the timing packets. To track time, the decoder also needs to know the regularity or irregularity of the occurrences of various timing packets that store those clock counters.

Intel PT provides time information for three different but related domains:

- Processor timestamp counter

This counter increments at the max non-turbo or P1 frequency, and its value is returned on a RDTSC. Its frequency is fixed. The TSC packet holds the lower 7 bytes of the timestamp counter value. The TSC packet occurs occasionally and are much less frequent than the frequency of the time stamp counter. The timestamp counter will continue to increment when the processor is in deep C-States, with the exception of processors reporting CPUID.80000007H:EDX.TSC_INVARIANT[8] = 0.
- Core crystal clock

The ratio of the core crystal clock to timestamp counter frequency is known as P, and can be calculated as CPUID.15H:EBX[31:0] / CPUID.15H:EAX[31:0]. The frequency of the core crystal clock is fixed and lower than that of the timestamp counter. The periodic MTC packet is generated based on software-selected

multiples of the crystal clock frequency. The MTC packet is expected to occur more frequently than the TSC packet.

- Processor core clock

The processor core clock frequency can vary due to P-state and thermal conditions. The CYC packet provides elapsed time as measured in processor core clock cycles relative to the last CYC packet.

A decoder can use all or some combination of these packets to track time at different resolutions throughout the trace packets.

35.8.3.1 Time Domain Relationships

The three domains are related by the following formula:

$$\text{TimeStampValue} = (\text{CoreCrystalClockValue} * P) + \text{AdjustedProcessorCycles} + \text{Software\_Offset};$$

The CoreCrystalClockValue, also known as the Always Running Timer (ART) value, can provide the coarse-grained component of the TSC value. P, or the TSC/ART ratio, can be derived from CPUID.15H, as described in Section 35.8.3.

The AdjustedProcessorCycles component provides the fine-grained distance from the rising edge of the last core crystal clock. Specifically, it is a cycle count in the same frequency as the timestamp counter from the last crystal clock rising edge. The value is adjusted based on the ratio of the processor core clock frequency to the Maximum Non-Turbo (or P1) frequency.

The Software_Offsets component includes software offsets that are factored into the timestamp value, such as IA32_TSC_ADJUST.

35.8.3.2 Estimating TSC within Intel PT

For many usages, it may be useful to have an estimated timestamp value for all points in the trace. The formula provided in Section 35.8.3.1 above provides the framework for how such an estimate can be calculated from the various timing packets present in the trace.

The TSC packet provides the precise timestamp value at the time it is generated; however, TSC packets are infrequent, and estimates of the current timestamp value based purely on TSC packets are likely to be very inaccurate for this reason. In order to get more precise timing information between TSC packets, CYC packets and/or MTC packets should be enabled.

MTC packets provide incremental updates of the CoreCrystalClockValue. On processors that support CPUID.15H, the frequency of the timestamp counter and the core crystal clock is fixed, thus MTC packets provide a means to update the running timestamp estimate. Between two MTC packets A and B, the number of crystal clock cycles passed is calculated from the 8-bit payloads of respective MTC packets:

$$(\text{CTC}_B - \text{CTC}_A), \text{ where } \text{CTC}_i = \text{MTC}_i[15:8] \ll \text{IA32\_RTIT\_CTL.MTCFreq} \text{ and } i = A, B.$$

The time from a TSC packet to the subsequent MTC packet can be calculated using the TMA packet that follows the TSC packet. The TMA packet provides both the crystal clock value (lower 16 bits, in the CTC field) and the AdjustedProcessorCycles value (in the FastCounter field) that can be used in the calculation of the corresponding core crystal clock value of the TSC packet.

When the next MTC after a pair of TSC/TMA is seen, the number of crystal clocks passed since the TSC packet can be calculated by subtracting the TMA.CTC value from the time indicated by the MTC_{Next} packet by

$$\text{CTC}_{\text{Delta}}[15:0] = (\text{CTC}_{\text{Next}}[15:0] - \text{TMA.CTC}[15:0]), \text{ where } \text{CTC}_{\text{Next}} = \text{MTC}_{\text{Payload}} \ll \text{IA32\_RTIT\_CTL.MTCFreq}.$$

The TMA.FastCounter field provides the number of AdjustedProcessorCycles since the last crystal clock rising edge, from which it can be determined the percentage of the next crystal clock cycle that had passed at the time of the TSC packet.

CYC packets can provide further precision of an estimated timestamp value to many non-timing packets, by providing an indication of the time passed between other timing packets (MTCs or TSCs).

When enabled, CYC packets are sent preceding each CYC-eligible packet, and provide the number of processor core clock cycles that have passed since the last CYC packet. Thus between MTCs and TSCs, the accumulated CYC values can be used to estimate the AdjustedProcessorCycles component of the timestamp value. The accumulated CPU cycles will have to be adjusted to account for the difference in frequency between the processor core clock and

the P1 frequency. The necessary adjustment can be estimated using the core:bus ratio value given in the CBR packet, by multiplying the accumulated cycle count value by $P1/CBR_{\text{payload}}$.

Note that stand-alone TSC packets (that is, TSC packets that are not a part of a PSB+) are typically generated only when generation of other timing packets (MTCs and CYCs) has ceased for a period of time. Example scenarios include when Intel PT is re-enabled, or on wake after a sleep state. Thus any calculated estimate of the timestamp value leading up to a TSC packet will likely result in a discrepancy, which the TSC packet serves to correct.

A greater level of precision may be achieved by calculating the CPU clock frequency, see Section 35.8.3.4 below for a method to do so using Intel PT packets.

CYCs can be used to estimate time between TSCs even without MTCs, though this will likely result in a reduction in estimated TSC precision.

35.8.3.3 VMX TSC Manipulation

When software executes in non-Root operation, additional offset and scaling factors may be applied to the TSC value. These are optional, but may be enabled via VMCS controls on a per-VM basis. See Chapter 27, “VMX Non-Root Operation,” for details on VMX TSC offsetting and TSC scaling.

Like the value returned by RDTSC, TSC packets will include these adjustments, but other timing packets (such as MTC, CYC, and CBR) are not impacted. In order to use the algorithm above to estimate the TSC value when TSC scaling is in use, it will be necessary for software to account for the scaling factor. See Section 35.5.2.4 for details.

35.8.3.4 Calculating Frequency with Intel PT

Because Intel PT can provide both wall-clock time and processor clock cycle time, it can be used to measure the processor core clock frequency. Either TSC or MTC packets can be used to track the wall-clock time. By using CYC packets to count the number of processor core cycles that pass in between a pair of wall-clock time packets, the ratio between processor core clock frequency and TSC frequency can be derived. If the P1 frequency is known, it can be applied to determine the CPU frequency. See Section 35.8.3.1 above for details on the relationship between TSC, MTC, and CYC.

29. Updates to Chapter 37, Volume 3D

Change bars and violet text show changes to Chapter 37 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

Changes to this chapter:

- Chapter 37, "Enclave Access Control and Data Structures" was previously numbered as 36. With the insertion of the new SEAM chapter (chapter 34), this was subsequently re-numbered.
- In Section 37.9, "State Save Area (SSA) Frame", updated offset and size values for the GPRSGX in Table 37-8.

CHAPTER 37

ENCLAVE ACCESS CONTROL AND DATA STRUCTURES

37.1 OVERVIEW OF ENCLAVE EXECUTION ENVIRONMENT

When an enclave is created, it has a range of linear addresses to which the processor applies enhanced access control. This range is called the ELRANGE (see Section 36.3). When an enclave generates a memory access, the existing IA32 segmentation and paging architecture are applied. Additionally, linear addresses inside the ELRANGE must map to an EPC page otherwise when an enclave attempts to access that linear address a fault is generated.

The EPC pages need not be physically contiguous. System software allocates EPC pages to various enclaves. Enclaves must abide by OS/VMM imposed segmentation and paging policies. OS/VMM-managed page tables and extended page tables provide address translation for the enclave pages. Hardware requires that these pages are properly mapped to EPC (any failure generates an exception).

Enclave entry must happen through specific enclave instructions:

- ENCLU[EENTER], ENCLU[ERESUME].

Enclave exit must happen through specific enclave instructions or events:

- ENCLU[EEXIT], Asynchronous Enclave Exit (AEX).

Attempts to execute, read, or write to linear addresses mapped to EPC pages when not inside an enclave will result in the processor altering the access to preserve the confidentiality and integrity of the enclave. The exact behavior may be different between implementations. As an example a read of an enclave page may result in the return of all one's or return of cyphertext of the cache line. Writing to an enclave page may result in a dropped write or a machine check at a later time. The processor will provide the protections as described in Section 37.4 and Section 37.5 on such accesses.

37.2 TERMINOLOGY

A memory access to the ELRANGE and initiated by an instruction executed by an enclave is called a Direct Enclave Access (Direct EA).

Memory accesses initiated by certain Intel® SGX instruction leaf functions such as ECREATE, EADD, EDBGRD, EDBGWR, ELDU/ELDB, EWB, EREMOVE, EENTER, and ERESUME to EPC pages are called Indirect Enclave Accesses (Indirect EA). Table 37-1 lists additional details of the indirect EA of SGX1 and SGX2 extensions.

Direct EAs and Indirect EAs together are called Enclave Accesses (EAs).

Any memory access that is not an Enclave Access is called a non-enclave access.

37.3 ACCESS-CONTROL REQUIREMENTS

Enclave accesses have the following access-control attributes:

- All memory accesses must conform to segmentation and paging protection mechanisms.
- Code fetches from inside an enclave to a linear address outside that enclave result in a #GP(0) exception.
- Shadow-stack-load or shadow-stack-store from inside an enclave to a linear address outside that enclave results in a #GP(0) exception.
- Non-enclave accesses to EPC memory result in undefined behavior. EPC memory is protected as described in Section 37.4 and Section 37.5 on such accesses.
- EPC pages of page types PT_REG, PT_TCS, and PT_TRIM must be mapped to ELRANGE at the linear address specified when the EPC page was allocated to the enclave using ENCLS[EADD] or ENCLS[EAUG] leaf functions. Enclave accesses through other linear address result in a #PF with the PFEC.SGX bit set.

- Direct EAs to any EPC pages must conform to the currently defined security attributes for that EPC page in the EPCM. These attributes may be defined at enclave creation time (EADD) or when the enclave sets them using SGX2 instructions. The failure of these checks results in a #PF with the PFEC.SGX bit set.
 - Target page must belong to the currently executing enclave.
 - Data may be written to an EPC page if the EPCM allow write access.
 - Data may be read from an EPC page if the EPCM allow read access.
 - Instruction fetches from an EPC page are allowed if the EPCM allows execute access.
 - Shadow-stack-load from an EPC page and shadow-stack-store to an EPC page are allowed only if the page type is PT_SS_FIRST or PT_SS_REST.
 - Data writes that are not shadow-stack-store are not allowed if the EPCM page type is PT_SS_FIRST or PT_SS_REST.
 - Target page must not have a restricted page type¹ (PT_SECS, PT_TCS, PT_VA, or PT_TRIM).
 - The EPC page must not be BLOCKED.
 - The EPC page must not be PENDING.
 - The EPC page must not be MODIFIED.

37.4 SEGMENT-BASED ACCESS CONTROL

Intel SGX architecture does not modify the segment checks performed by a logical processor. All memory accesses arising from a logical processor in protected mode (including enclave access) are subject to segmentation checks with the applicable segment register.

To ensure that outside entities do not modify the enclave's logical-to-linear address translation in an unexpected fashion, ENCLU[EENTER] and ENCLU[ERESUME] check that CS, DS, ES, and SS, if usable (i.e., not null), have segment base value of zero. A non-zero segment base value for these registers results in a #GP(0).

On enclave entry either via EENTER or ERESUME, the processor saves the contents of the external FS and GS registers, and loads these registers with values stored in the TCS at build time to enable the enclave's use of these registers for accessing the thread-local storage inside the enclave. On EEXIT and AEX, the contents at time of entry are restored. On AEX, the values of FS and GS are saved in the SSA frame. On ERESUME, FS and GS are restored from the SSA frame. The details of these operations can be found in the descriptions of EENTER, ERESUME, EEXIT, and AEX flows.

37.5 PAGE-BASED ACCESS CONTROL

37.5.1 Access-control for Accesses that Originate from Non-SGX Instructions

Intel SGX builds on the processor's paging mechanism to provide page-granular access-control for enclave pages. Enclave pages are designed to be accessible only from inside the currently executing enclave if they belong to that enclave. In addition, enclave accesses must conform to the access control requirements described in Section 37.3. or through certain Intel SGX instructions. Attempts to execute, read, or write to linear addresses mapped to EPC pages when not inside an enclave will result in the processor altering the access to preserve the confidentiality and integrity of the enclave. The exact behavior may be different between implementations.

37.5.2 Memory Accesses that Split Across ELRANGE

Memory data accesses are allowed to split across ELRANGE (i.e., a part of the access is inside ELRANGE and a part of the access is outside ELRANGE) while the processor is inside an enclave. If an access splits across ELRANGE, the

1. EPCM may allow write, read or execute access only for pages with page type PT_REG.

processor splits the access into two sub-accesses (one inside ELRANGE and the other outside ELRANGE), and each access is evaluated. A code-fetch access that splits across ELRANGE results in a #GP due to the portion that lies outside of the ELRANGE.

37.5.3 Implicit vs. Explicit Accesses

Memory accesses originating from Intel SGX instruction leaf functions are categorized as either explicit accesses or implicit accesses. Table 37-1 lists the implicit and explicit memory accesses made by Intel SGX leaf functions.

37.5.3.1 Explicit Accesses

Accesses to memory locations provided as explicit operands to Intel SGX instruction leaf functions, or their linked data structures are called explicit accesses.

Explicit accesses are always made using logical addresses. These accesses are subject to segmentation, paging, extended paging, and APIC-virtualization checks, and trigger any faults/exit associated with these checks when the access is made.

The interaction of explicit memory accesses with data breakpoints is leaf-function-specific, and is documented in Section 42.3.4.

37.5.3.2 Implicit Accesses

Accesses to data structures whose physical addresses are cached by the processor are called implicit accesses. These addresses are not passed as operands of the instruction but are implied by use of the instruction.

These accesses do not trigger any access-control faults/exits or data breakpoints. Table 37-1 lists memory objects that Intel SGX instruction leaf functions access either by explicit access or implicit access. The addresses of explicit access objects are passed via register operands with the second through fourth column of Table 37-1 matching implicitly encoded registers RBX, RCX, RDX.

Physical addresses used in different implicit accesses are cached via different instructions and for different durations. The physical address of SECS associated with each EPC page is cached at the time the page is added to the enclave via ENCLS[EADD] or ENCLS[EAUG], or when the page is loaded to EPC via ENCLS[ELDB] or ENCLS[ELDU]. This binding is severed when the corresponding page is removed from the EPC via ENCLS[EREMOVE] or ENCLS[EWB]. Physical addresses of TCS and SSA pages are cached at the time of most-recent enclave entry. Exit from an enclave (ENCLU[EEXIT] or AEX) flushes this caching. Details of Asynchronous Enclave Exit is described in Chapter 39.

The physical addresses that are cached for use by implicit accesses are derived from logical (or linear) addresses after checks such as segmentation, paging, EPT, and APIC virtualization checks. These checks may trigger exceptions or VM exits. Note, however, that such exception or VM exits may not occur after a physical address is cached and used for an implicit access.

Table 37-1. List of Implicit and Explicit Memory Access by Intel® SGX Enclave Instructions

Instr. Leaf	Enum.	Explicit 1	Explicit 2	Explicit 3	Implicit
EACCEPT	SGX2	SECINFO	EPCPAGE		SECS

37.6 INTEL® SGX DATA STRUCTURES OVERVIEW

Enclave operation is managed via a collection of data structures. Many of the top-level data structures contain sub-structures. The top-level data structures relate to parameters that may be used in enclave setup/maintenance, by Intel SGX instructions, or AEX event. The top-level data structures are:

- SGX Enclave Control Structure (SECS)
- Thread Control Structure (TCS)
- State Save Area (SSA)
- Page Information (PAGEINFO)
- Security Information (SECINFO)
- Paging Crypto MetaData (PCMD)
- Enclave Signature Structure (SIGSTRUCT)
- EINIT Token Structure (EINITTOKEN)
- Report Structure (REPORT)
- Report Target Info (TARGETINFO)
- Key Request (KEYREQUEST)
- Version Array (VA)
- Enclave Page Cache Map (EPCM)

Details of the top-level data structures and associated sub-structures are listed in Section 37.7 through Section 37.20.

37.7 SGX ENCLAVE CONTROL STRUCTURE (SECS)

The SECS data structure requires 4K-Bytes alignment.

Table 37-2. Layout of SGX Enclave Control Structure (SECS)

Field	OFFSET (Bytes)	Size (Bytes)	Description
SIZE	0	8	Size of enclave in bytes; must be power of 2.
BASEADDR	8	8	Enclave Base Linear Address must be naturally aligned to size.
SSAFRAMESIZE	16	4	Size of one SSA frame in pages, including XSAVE, pad, GPR, and MISC (if CPUID.12H.00H:EBX != 0).
MISCSELECT	20	4	Bit vector specifying which extended features are saved to the MISC region (see Section 37.7.2) of the SSA frame when an AEX occurs.
CET_LEG_BITMAP_OFFSET	24	8	Page aligned offset of legacy code page bitmap from enclave base. Software is expected to program this offset such that the entire bitmap resides in the ELRANGE when legacy compatibility mode for indirect branch tracking is enabled. However this is not enforced by the hardware. This field exists when CPUID.07H.00H:EDX.CET_IBT[20] is enumerated as 1, else it is reserved.
CET_ATTRIBUTES	32	1	CET feature attributes of the enclave; see Table 37-5. This field exists when CPUID.12H.01H:EAX[6] is enumerated as 1, else it is reserved.
RESERVED	33	15	
ATTRIBUTES	48	16	Attributes of the Enclave, see Table 37-3.
MRENCLAVE	64	32	Measurement Register of enclave build process. See SIGSTRUCT for format.
RESERVED	96	32	
MRSIGNER	128	32	Measurement Register extended with the public key that verified the enclave. See SIGSTRUCT for format.
RESERVED	160	32	
CONFIGID	192	64	Post EINIT configuration identity.
ISVPRODID	256	2	Product ID of enclave.
ISVSVN	258	2	Security version number (SVN) of the enclave.
CONFIGSVN	260	2	Post EINIT configuration security version number (SVN).
RESERVED	262	3834	The RESERVED field consists of the following: ▪ EID: An 8 byte Enclave Identifier. Its location is implementation specific. ▪ PAD: A 352 bytes padding pattern from the Signature (used for key derivation strings). It's location is implementation specific. ▪ ISVFAMILYID: A 16 byte value assigned to identify the family of products the enclave belongs to. ▪ ISVEXTPRODID: A 16 byte value assigned to identify the product identity of the enclave. ▪ The remaining 3226 bytes are reserved area. The entire 3834 byte field must be cleared prior to executing ECREATE.

37.7.1 ATTRIBUTES

The ATTRIBUTES data structure is comprised of bit-granular fields that are used in the SECS, the REPORT and the KEYREQUEST structures. CPUID.12H.01H enumerates a bitmap of permitted 1-setting of bits in ATTRIBUTES.

Table 37-3. Layout of ATTRIBUTES Structure

Field	Bit Position	Description
INIT	0	This bit indicates if the enclave has been initialized by EINIT. It must be cleared when loaded as part of ECREATE. For EREPORT instruction, TARGET_INFO.ATTRIBUTES[ENIT] must always be 1 to match the state after EINIT has initialized the enclave.
DEBUG	1	If 1, the enclave permit debugger to read and write enclave data using EDBGD and EDBGWR.

Table 37-3. Layout of ATTRIBUTES Structure

Field	Bit Position	Description
MODE64BIT	2	Enclave runs in 64-bit mode.
RESERVED	3	Must be Zero.
PROVISIONKEY	4	Provisioning Key is available from EGETKEY.
EINITTOKEN_KEY	5	EINIT token key is available from EGETKEY.
CET	6	Enable CET attributes. When CPUID.12H.01H:EAX[6] is 0 this bit is reserved and must be 0.
KSS	7	Key Separation and Sharing Enabled.
RESERVED	9:8	Must be zero.
AEXNOTIFY	10	The bit indicates that threads within the enclave may receive AEX notifications.
RESERVED	63:11	Must be zero.
XFRM	127:64	XSAVE Feature Request Mask. See Section 41.7.

37.7.2 SECS.MISCSELECT Field

CPUID.12H.00H:EBX[31:0] enumerates which extended information that the processor can save into the MISC region of SSA when an AEX occurs. An enclave writer can specify via SIGSTRUCT how to set the SECS.MISCSELECT field. The bit vector of MISCSELECT selects which extended information is to be saved in the MISC region of the SSA frame when an AEX is generated. The bit vector definition of extended information is listed in Table 37-4.

If CPUID.12H.00H:EBX[31:0] = 0, SECS.MISCSELECT field must be all zeros.

The SECS.MISCSELECT field determines the size of MISC region of the SSA frame, see Section 37.9.2.

Table 37-4. Bit Vector Layout of MISCSELECT Field of Extended Information

Field	Bit Position	Description
EXINFO	0	Report information about page fault and general protection exception that occurred inside an enclave.
CPINFO	1	Report information about control protection exception that occurred inside an enclave. When CPUID.12H.00H:EBX[1] is 0, this bit is reserved.
Reserved	31:2	Reserved (0).

37.7.3 SECS.CET_ATTRIBUTES Field

The SECS.CET_ATTRIBUTES field can be used by the enclave writer to enable various CET attributes in an enclave. This field exists when CPUID.12H.01H:EAX[6] is enumerated as 1. Bits 1:0 are defined when CPUID.07H.00H:ECX.CET_SS is 1, and bits 5:2 are defined when CPUID.07H.00H:EDX.CET_IBT is 1.

Table 37-5. Bit Vector Layout of CET_ATTRIBUTES Field of Extended Information

Field	Bit Position	Description
SH_STK_EN	0	When set to 1, enable shadow stacks.
WR_SHSTK_EN	1	When set to 1, enables the WRSS{D,Q}W instructions.
ENDBR_EN	2	When set to 1, enables indirect branch tracking.
LEG_IW_EN	3	Enable legacy compatibility treatment for indirect branch tracking.
NO_TRACK_EN	4	When set to 1, enables use of no-track prefix for indirect branch tracking.
SUPPRESS_DIS	5	When set to 1, disables suppression of CET indirect branch tracking on legacy compatibility.
Reserved	7:6	Reserved (0).

37.8 THREAD CONTROL STRUCTURE (TCS)

Each executing thread in the enclave is associated with a Thread Control Structure. It requires 4K-Bytes alignment.

Table 37-6. Layout of Thread Control Structure (TCS)

Field	OFFSET (Bytes)	Size (Bytes)	Description
STAGE	0	8	Enclave execution state of the thread controlled by this TCS. A value of 0 indicates that this TCS is available for enclave entry. A value of 1 indicates that a logical processor is currently executing an enclave in the context of this TCS.
FLAGS	8	8	The thread's execution flags (see Section 37.8.1).
OSSA	16	8	Offset of the base of the State Save Area stack, relative to the enclave base. Must be page aligned.
CSSA	24	4	Current slot index of an SSA frame, cleared by EADD and EACCEPT.
NSSA	28	4	Number of available slots for SSA frames.
OENTRY	32	8	Offset in enclave to which control is transferred on EENTER relative to the base of the enclave.
AEP	40	8	The value of the Asynchronous Exit Pointer that was saved at EENTER time.
OFSBASE	48	8	Offset to add to the base address of the enclave for producing the base address of FS segment inside the enclave. Must be page aligned.
OGSBASE	56	8	Offset to add to the base address of the enclave for producing the base address of GS segment inside the enclave. Must be page aligned.
FSLIMIT	64	4	Size to become the new FS limit in 32-bit mode.
GSLIMIT	68	4	Size to become the new GS limit in 32-bit mode.
OCETSSA	72	8	When CPUID.12H.01H:EAX[6] is 1, this field provides the offset of the CET state save area from enclave base. When CPUID.12H.01H:EAX[6] is 0, this field is reserved and must be 0.
PREVSSP	80	8	When CPUID.07H.00H:ECX.CET_SS is 1, this field records the SSP at the time of AEX or EEXIT; used to setup SSP on entry. When CPUID.07H.00H:ECX.CET_SS is 0, this field is reserved and must be 0.
RESERVED	88	4008	Must be zero.

37.8.1 TCS.FLAGS

Table 37-7. Layout of TCS.FLAGS Field

Field	Bit Position	Description
DBGOPTIN	0	If set, allows debugging features (single-stepping, breakpoints, etc.) to be enabled and active while executing in the enclave on this TCS. Hardware clears this bit on EADD. A debugger may later modify it if the enclave's ATTRIBUTES.DEBUG is set.
AEXNOTIFY	1	A thread that enters the enclave cannot receive AEX notifications unless this flag is set to 1.
RESERVED	63:2	Must be zero.

37.8.2 State Save Area Offset (OSSA)

The OSSA points to a stack of State Save Area (SSA) frames (see Section 37.9) used to save the processor state when an interrupt or exception occurs while executing in the enclave.

37.8.3 Current State Save Area Frame (CSSA)

CSSA is the index of the current SSA frame that will be used by the processor to determine where to save the processor state on an interrupt or exception that occurs while executing in the enclave. It is an index into the array of frames addressed by OSSA. CSSA is incremented on an AEX and decremented on an ERESUME.

37.8.4 Number of State Save Area Frames (NSSA)

NSSA specifies the number of SSA frames available for this TCS. There must be at least one available SSA frame when EENTER-ing the enclave or the EENTER will fail.

37.9 STATE SAVE AREA (SSA) FRAME

When an AEX occurs while running in an enclave, the architectural state is saved in the thread's current SSA frame, which is pointed to by TCS.CSSA. An SSA frame must be page aligned, and contains the following regions:

- The XSAVE region starts at the base of the SSA frame, this region contains extended feature register state in an XSAVE/FXSAVE-compatible non-compacted format.
- A Pad region: software may choose to maintain a pad region separating the XSAVE region and the MISC region. Software choose the size of the pad region according to the sizes of the MISC and GPRSGX regions.
- The GPRSGX region. The GPRSGX region is the last region of an SSA frame (see Table 37-8). This is used to hold the processor general purpose registers (RAX ... R15), the RIP, the outside RSP and RBP, RFLAGS, and the AEX information.
- The MISC region (If CPUID.12H.00H:EBX[31:0] != 0). The MISC region is adjacent to the GRPSGX region, and may contain zero or more components of extended information that would be saved when an AEX occurs. If the MISC region is absent, the region between the GPRSGX and XSAVE regions is the pad region that software can use. If the MISC region is present, the region between the MISC and XSAVE regions is the pad region that software can use. See additional details in Section 37.9.2.

Table 37-8. Top-to-Bottom Layout of an SSA Frame

Region	Offset (Byte)	Size (Bytes)	Description
XSAVE	0	Calculate using CPUID leaf 0DH information	The size of XSAVE region in SSA is derived from the enclave's support of the collection of processor extended states that would be managed by XSAVE. The enablement of those processor extended state components in conjunction with CPUID.0DH information determines the XSAVE region size in SSA.
Pad	End of XSAVE region	Chosen by enclave writer	Ensure the end of GPRSGX region is aligned to the end of a 4KB page.
MISC	base of GPRSGX - sizeof(MISC)	Calculate from highest set bit of SECS.MISCSELECT	See Section 37.9.2.
GPRSGX	SSAFRAMESIZE - 184	184	See Table 37-9 for layout of the GPRSGX region.

37.9.1 GPRSGX Region

The layout of the GPRSGX region is shown in Table 37-9.

Table 37-9. Layout of GPRSGX Portion of the State Save Area

Field	OFFSET (Bytes)	Size (Bytes)	Description
RAX	0	8	
RCX	8	8	

Table 37-9. Layout of GPRSGX Portion of the State Save Area (Contd.)

Field	OFFSET (Bytes)	Size (Bytes)	Description
RDX	16	8	
RBX	24	8	
RSP	32	8	
RBP	40	8	
RSI	48	8	
RDI	56	8	
R8	64	8	
R9	72	8	
R10	80	8	
R11	88	8	
R12	96	8	
R13	104	8	
R14	112	8	
R15	120	8	
RFLAGS	128	8	Flag register.
RIP	136	8	Instruction pointer.
URSP	144	8	Non-Enclave (outside) stack pointer. Saved by EENTER, restored on AEX.
URBP	152	8	Non-Enclave (outside) RBP pointer. Saved by EENTER, restored on AEX.
EXITINFO	160	4	Contains information about exceptions that cause AEXs, which might be needed by enclave software (see Section 37.9.1.1).
RESERVED	164	3	
AEXNOTIFY	167	1	Bit 0: This bit allows enclave software to dynamically enable/disable AEX notifications. An enclave thread cannot receive AEX notifications unless this bit is set to 1 in the thread's current SSA frame. All other bits are reserved.
FSBASE	168	8	FS BASE.
GSBASE	176	8	GS BASE.

37.9.1.1 EXITINFO

EXITINFO contains the information used to report exit reasons to software inside the enclave. It is a 4 byte field laid out as in Table 37-10. The VALID bit is set only for the exceptions conditions which are reported inside an enclave. See Table 37-11 for which exceptions are reported inside the enclave. If the exception condition is not one reported inside the enclave then VECTOR and EXIT_TYPE are cleared.

When a higher priority event, such as SMI, and a pending debug exception occur at the same time when executing inside an enclave, the higher priority event has precedence. As an example for an SMI, the SSA exit info is zero. The debug exception will be delivered upon return from the SMI. In such cases, the EXITINFO field will not contain the information of a debug exception.

Table 37-10. Layout of EXITINFO Field

Field	Bit Position	Description
VECTOR	7:0	Exception number of exceptions reported inside enclave.
EXIT_TYPE	10:8	011b: Hardware exceptions. 110b: Software exceptions. Other values: Reserved.

Table 37-10. Layout of EXITINFO Field

Field	Bit Position	Description
RESERVED	30:11	Reserved as zero.
VALID	31	0: unsupported exceptions. 1: Supported exceptions. Includes two categories: - Unconditionally supported exceptions: #DE, #DB, #BP, #BR, #UD, #MF, #AC, #XM. - Conditionally supported exception: #PF, #GP if SECS.MISCSELECT.EXINFO = 1. #CP if SECS.MISCSELECT.CPINFO = 1.

37.9.1.2 VECTOR Field Definition

Table 37-11 contains the VECTOR field. This field contains information about some exceptions which occur inside the enclave. These vector values are the same as the values that would be used when vectoring into regular exception handlers. All values not shown are not reported inside an enclave.

Table 37-11. Exception Vectors

Name	Vector #	Description
#DE	0	Divider exception.
#DB	1	Debug exception.
#BP	3	Breakpoint exception.
#BR	5	Bound range exceeded exception.
#UD	6	Invalid opcode exception.
#GP	13	General protection exception. Only reported if SECS.MISCSELECT.EXINFO = 1.
#PF	14	Page fault exception. Only reported if SECS.MISCSELECT.EXINFO = 1.
#MF	16	x87 FPU floating-point error.
#AC	17	Alignment check exceptions.
#XM	19	SIMD floating-point exceptions.
#CP	21	Control protection exception. Only reported if SECS.MISCSELECT.CPINFO = 1.

37.9.2 MISC Region

The layout of the MISC region is shown in Table 37-12. The number of components that the processor supports in the MISC region corresponds to the bits of CPUID.12H.00H:EBX[31:0] set to 1. Each set bit in CPUID.12H.00H:EBX[31:0] has a defined size for the corresponding component, as shown in Table 37-12. Enclave writers needs to do the following:

- Decide which MISC region components will be supported for the enclave.
- Allocate an SSA frame large enough to hold the components chosen above.
- Instruct each enclave builder software to set the appropriate bits in SECS.MISCSELECT.

The first component, EXINFO, starts next to the GPRSGX region. Additional components in the MISC region grow in ascending order within the MISC region towards the XSAVE region.

The size of the MISC region is calculated as follows:

- If CPUID.12H.00H:EBX[31:0] = 0, MISC region is not supported.
- If CPUID.12H.00H:EBX[31:0] != 0, the size of MISC region is derived from sum of the highest bit set in SECS.MISCSELECT and the size of the MISC component corresponding to that bit. Offset and size information of currently defined MISC components are listed in Table 37-12. For example, if the highest bit set in SECS.MISCSELECT is bit 0, the MISC region offset is OFFSET(GPRSGX)-16 and size is 16 bytes.

- The processor saves a MISC component *i* in the MISC region if and only if SECS.MISCSELECT[*i*] is 1.

Table 37-12. Layout of MISC region of the State Save Area

MISC Components	OFFSET (Bytes)	Size (Bytes)	Description
EXINFO	Offset(GPRSGX) -16	16	If CPUID.12H.00H:EBX[0] = 1, exception information on #GP or #PF that occurred inside an enclave can be written to the EXINFO structure if specified by SECS.MISCSELECT[0] = 1. If CPUID.12H.00H:EBX[1] = 1, exception information on #CP that occurred inside an enclave can be written to the EXINFO structure if specified by SECS.MISCSELECT[1] = 1.
Future Extension	Below EXINFO	TBD	Reserved. (Zero size if CPUID.12H.00H:EBX[31:1] = 0).

37.9.2.1 EXINFO Structure

Table 37-13 contains the layout of the EXINFO structure that provides additional information.

Table 37-13. Layout of EXINFO Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
MADDR	0	8	If #PF: contains the page fault linear address that caused a page fault. If #GP: the field is cleared. If #CP: the field is cleared.
ERRCD	8	4	Exception error code for either #GP or #PF.
RESERVED	12	4	

37.9.2.2 Page Fault Error Code

A page-fault error code may be reported in EXINFO.ERRCD. The format of the error code is given in Figure 5-12, "Page-Fault Error Code."

Page faults that would report an error code clearing the U/S bit (indicating a supervisor-mode access) are not reported in EXINFO.

37.10 CET STATE SAVE AREA FRAME

The CET state save area consists of an array of CET state save frames. The number of CET state save frames is equal to the TCS.NSSA. The current CET SSA frame is indicated by TCS.CSSA. The offset of the CET state save area is specified by TCS.OCETSSA.

Table 37-14. Layout of CET State Save Area Frame

Field	Offset (Bytes)	Size (Bytes)	Description
SSP	0	8	Shadow Stack Pointer. This field is reserved when CPUID.07H.00H:ECX.CET_SS is 0.
IB_TRACK_STATE	8	8	Indirect branch tracker state: Bit 0: SUPPRESS - suppressed(1), tracking(0) Bit 1: TRACKER - IDLE (0), WAIT_FOR_ENDBRANCH (1) Bits 63:2 - Reserved This field is reserved when CPUID.07H.00H:EDX.CET_IBT is 0.

37.11 PAGE INFORMATION (PAGEINFO)

PAGEINFO is an architectural data structure that is used as a parameter to the EPC-management instructions. It requires 32-Byte alignment.

Table 37-15. Layout of PAGEINFO Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
LINADDR	0	8	Enclave linear address.
SRCPGE	8	8	Effective address of the page where contents are located.
SECINFO/PCMD	16	8	Effective address of the SECINFO or PCMD (for ELDU, ELDB, EWB) structure for the page.
SECS	24	8	Effective address of EPC slot that currently contains the SECS.

37.12 SECURITY INFORMATION (SECINFO)

The SECINFO data structure holds meta-data about an enclave page.

Table 37-16. Layout of SECINFO Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
FLAGS	0	8	Flags describing the state of the enclave page.
RESERVED	8	56	Must be zero.

37.12.1 SECINFO.FLAGS

The SECINFO.FLAGS are a set of fields describing the properties of an enclave page.

Table 37-17. Layout of SECINFO.FLAGS Field

Field	Bit Position	Description
R	0	If 1 indicates that the page can be read from inside the enclave; otherwise the page cannot be read from inside the enclave.
W	1	If 1 indicates that the page can be written from inside the enclave; otherwise the page cannot be written from inside the enclave.
X	2	If 1 indicates that the page can be executed from inside the enclave; otherwise the page cannot be executed from inside the enclave.
PENDING	3	If 1 indicates that the page is in the PENDING state; otherwise the page is not in the PENDING state.
MODIFIED	4	If 1 indicates that the page is in the MODIFIED state; otherwise the page is not in the MODIFIED state.
PR	5	If 1 indicates that a permission restriction operation on the page is in progress, otherwise a permission restriction operation is not in progress.
RESERVED	7:6	Must be zero.
PAGE_TYPE	15:8	The type of page that the SECINFO is associated with.
RESERVED	63:16	Must be zero.

37.12.2 PAGE_TYPE Field Definition

The SECINFO flags and EPC flags contain bits indicating the type of page.

Table 37-18. Supported PAGE_TYPE

TYPE	Value	Description
PT_SECS	0	Page is an SECS.
PT_TCS	1	Page is a TCS.
PT_REG	2	Page is a regular page.
PT_VA	3	Page is a Version Array.
PT_TRIM	4	Page is in trimmed state.
PT_SS_FIRST	5	When CPUID.12H.01H:EAX[6] is 1, Page is first page of a shadow stack. When CPUID.12H.01H:EAX[6] is 0, this value is reserved.
PT_SS_REST	6	When CPUID.12H.01H:EAX[6] is 1, Page is not first page of a shadow stack. When CPUID.12H.01H:EAX[6] is 0, this value is reserved.
	All others	Reserved.

37.13 PAGING CRYPTO METADATA (PCMD)

The PCMD structure is used to keep track of crypto meta-data associated with a paged-out page. Combined with PAGEINFO, it provides enough information for the processor to verify, decrypt, and reload a paged-out EPC page. The size of the PCMD structure (128 bytes) is architectural.

EWB calculates the Message Authentication Code (MAC) value and writes out the PCMD. ELDB/U reads the fields and checks the MAC.

The format of PCMD is as follows:

Table 37-19. Layout of PCMD Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
SECINFO	0	64	Flags describing the state of the enclave page; R/W by software.
ENCLAVEID	64	8	Enclave Identifier used to establish a cryptographic binding between paged-out page and the enclave.
RESERVED	72	40	Must be zero.
MAC	112	16	Message Authentication Code for the page, page meta-data and reserved field.

37.14 ENCLAVE SIGNATURE STRUCTURE (SIGSTRUCT)

SIGSTRUCT is a structure created and signed by the enclave developer that contains information about the enclave. SIGSTRUCT is processed by the EINIT leaf function to verify that the enclave was properly built.

SIGSTRUCT includes ENCLAVEHASH as SHA256 digest, as defined in FIPS PUB 180-4. The digests are byte strings of length 32. Each of the 8 HASH dwords is stored in little-endian order.

SIGSTRUCT includes four 3072-bit integers (MODULUS, SIGNATURE, Q1, Q2). Each such integer is represented as a byte strings of length 384, with the most significant byte at the position "offset + 383", and the least significant byte at position "offset".

The (3072-bit integer) SIGNATURE should be an RSA signature, where: a) the RSA modulus (MODULUS) is a 3072-bit integer; b) the public exponent is set to 3; c) the signing procedure uses the EMSA-PKCS1-v1.5 format with DER encoding of the "DigestInfo" value as specified in of PKCS#1 v2.1/RFC 3447.

The 3072-bit integers Q1 and Q2 are defined by:

$q1 = \text{floor}(\text{Signature}^2 / \text{Modulus});$

$q2 = \text{floor}((\text{Signature}^3 - q1 * \text{Signature} * \text{Modulus}) / \text{Modulus});$

SIGSTRUCT must be page aligned

In column 5 of Table 37-20, 'Y' indicates that this field should be included in the signature generated by the developer.

Table 37-20. Layout of Enclave Signature Structure (SIGSTRUCT)

Field	OFFSET (Bytes)	Size (Bytes)	Description	Signed
HEADER	0	16	Must be byte stream 06000000E10000000000010000000000H	Y
VENDOR	16	4	Intel Enclave: 00008086H Non-Intel Enclave: 00000000H	Y
DATE	20	4	Build date is yyyyymmdd in hex: yyyy=4 digit year, mm=1-12, dd=1-31	Y
HEADER2	24	16	Must be byte stream 01010000600000006000000001000000H	Y
SWDEFINED	40	4	Available for software use.	Y
RESERVED	44	84	Must be zero.	Y
MODULUS	128	384	Module Public Key (keylength = 3072 bits).	N
EXPONENT	512	4	RSA Exponent = 3.	N
SIGNATURE	516	384	Signature over Header and Body.	N
MISCSELECT ¹	900	4	Bit vector specifying Extended SSA frame feature set to be used.	Y
MISCMASK	904	4	Bit vector mask of MISCSELECT to enforce.	Y
CET_ATTRIBUTES	908	1	When CPUID.12H.01H:EAX[6] is 1, this field provides the Enclave CET attributes that must be set. When CPUID.12H.01H:EAX[6] is 0, this field is reserved and must be 0.	Y
CET_ATTRIBUTES_MASK	909	1	When CPUID.12H.01H:EAX[6] is 1, this field provides the Mask of CET attributes to enforce. When CPUID.12H.01H:EAX[6] is 0, this field is reserved and must be 0.	Y
RESERVED	910	2	Must be zero.	Y
ISVFAMILYID	912	16	ISV assigned Product Family ID.	Y
ATTRIBUTES	928	16	Enclave Attributes that must be set.	Y
ATTRIBUTEMASK	944	16	Mask of Attributes to enforce.	Y
ENCLAVEHASH	960	32	MRENCLAVE of enclave this structure applies to.	Y
RESERVED	992	16	Must be zero.	Y
ISVEXTPRODID	1008	16	ISV assigned extended Product ID.	Y
ISVPRODID	1024	2	ISV assigned Product ID.	Y
ISVSVN	1026	2	ISV assigned SVN (security version number).	Y
RESERVED	1028	12	Must be zero.	N
Q1	1040	384	Q1 value for RSA Signature Verification.	N
Q2	1424	384	Q2 value for RSA Signature Verification.	N

NOTES:

1. If CPUID.12H.00H:EBX[31:0] = 0, MISCSELECT must be 0.

37.15 EINIT TOKEN STRUCTURE (EINITTOKEN)

The EINIT token is used by EINIT to verify that the enclave is permitted to launch. EINIT token is generated by an enclave in possession of the EINITTOKEN key (the Launch Enclave).

EINIT token must be 512-Byte aligned.

Table 37-21. Layout of EINIT Token (EINITTOKEN)

Field	OFFSET (Bytes)	Size (Bytes)	MACed	Description
Valid	0	4	Y	Bit 0: 1: Valid; 0: Invalid. All other bits reserved.
RESERVED	4	44	Y	Must be zero.
ATTRIBUTES	48	16	Y	ATTRIBUTES of the Enclave.
MRENCLAVE	64	32	Y	MRENCLAVE of the Enclave.
RESERVED	96	32	Y	Reserved.
MRSIGNER	128	32	Y	MRSIGNER of the Enclave.
RESERVED	160	32	Y	Reserved.
CPUSVNLE	192	16	N	Launch Enclave's CPUSVN.
ISVPRODIDLE	208	02	N	Launch Enclave's ISVPRODID.
ISVSVNLE	210	02	N	Launch Enclave's ISVSVN.
CET_MASKED_ATTRIBUTES_LE	212	1	N	When CPUID.12H.01H:EAX[6] is 1, this field provides the Launch enclaves masked CET attributes. This should be set to LE's CET_ATTRIBUTES masked with CET_ATTRIBUTES_MASK of the LE's KEYREQUEST. When CPUID.12H.01H:EAX[6] is 0, this field is reserved.
RESERVED	213	23	N	Reserved.
MASKEDMISCSELECTLE	236	4		Launch Enclave's MASKEDMISCSELECT: set by the LE to the resolved MISCSELECT value, used by EGETKEY (after applying KEYREQUEST's masking).
MASKEDATTRIBUTESLE	240	16	N	Launch Enclave's MASKEDATTRIBUTES: This should be set to the LE's ATTRIBUTES masked with ATTRIBUTEMASK of the LE's KEYREQUEST.
KEYID	256	32	N	Value for key wear-out protection.
MAC	288	16	N	Message Authentication Code on EINITTOKEN using EINITTOKEN_KEY.

37.16 REPORT (REPORT)

The REPORT structure is the output of the EREPORT instruction, and must be 512-Byte aligned.

Table 37-22. Layout of REPORT

Field	OFFSET (Bytes)	Size (Bytes)	Description
CPUSVN	0	16	The security version number of the processor.
MISCSELECT	16	4	Bit vector specifying which extended features are saved to the MISC region of the SSA frame when an AEX occurs.
CET_ATTRIBUTES	20	1	When CPUID.12H.01H:EAX[6] is 1, this field reports the CET_ATTRIBUTES of the Enclave. When CPUID.12H.01H:EAX[6] is 0, this field is reserved and must be 0.
RESERVED	21	11	Zero.
ISVEXTNPRODID	32	16	The value of SECS.ISVEXTPRODID.
ATTRIBUTES	48	16	ATTRIBUTES of the Enclave. See Section 37.7.1.
MRENCLAVE	64	32	The value of SECS.MRENCLAVE.
RESERVED	96	32	Zero.
MRSIGNER	128	32	The value of SECS.MRSIGNER.
RESERVED	160	32	Zero.
CONFIGID	192	64	Value provided by SW to identify enclave's post EINIT configuration.

Table 37-22. Layout of REPORT (Contd.)

Field	OFFSET (Bytes)	Size (Bytes)	Description
ISVPRODID	256	2	Product ID of enclave.
ISVSVN	258	2	Security version number (SVN) of the enclave.
CONFIGSVN	260	2	Value provided by SW to indicate expected SVN of enclave's post EINIT configuration.
RESERVED	262	42	Zero.
ISVFAMILYID	304	16	The value of SECS.ISVFAMILYID.
REPORTDATA	320	64	Data provided by the user and protected by the REPORT's MAC, see Section 37.16.1.
KEYID	384	32	Value for key wear-out protection.
MAC	416	16	Message Authentication Code on the report using report key.

37.16.1 REPORTDATA

REPORTDATA is a 64-Byte data structure that is provided by the enclave and included in the REPORT. It can be used to securely pass information from the enclave to the target enclave.

37.17 REPORT TARGET INFO (TARGETINFO)

This structure is an input parameter to the EREPORT leaf function. The address of TARGETINFO is specified as an effective address in RBX. It is used to identify the target enclave which will be able to cryptographically verify the REPORT structure returned by EREPORT. TARGETINFO must be 512-Byte aligned.

Table 37-23. Layout of TARGETINFO Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
MEASUREMENT	0	32	The MRENCLAVE of the target enclave.
ATTRIBUTES	32	16	The ATTRIBUTES field of the target enclave.
CET_ATTRIBUTES	48	1	When CPUID.12H.01H:EAX[6] is 1, this field provides the CET_ATTRIBUTES field of the target enclave. When CPUID.12H.01H:EAX[6] is 0, this field is reserved.
RESERVED	49	1	Must be zero.
CONFIGSVN	50	2	CONFIGSVN of the target enclave.
MISCSELECT	52	4	The MISCSELECT of the target enclave.
RESERVED	56	8	Must be zero.
CONFIGID	64	64	CONFIGID of target enclave.
RESERVED	128	384	Must be zero.

37.18 KEY REQUEST (KEYREQUEST)

This structure is an input parameter to the EGETKEY leaf function. It is passed in as an effective address in RBX and must be 512-Byte aligned. It is used for selecting the appropriate key and any additional parameters required in the derivation of that key.

Table 37-24. Layout of KEYREQUEST Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
KEYNAME	0	2	Identifies the Key Required.
KEYPOLICY	2	2	Identifies which inputs are required to be used in the key derivation.
ISVSVN	4	2	The ISV security version number that will be used in the key derivation.
CET_ATTRIBUTES_MASK	6	1	When CPUID.12H.01H:EAX[6] is 1, this field provides a mask that defines which CET_ATTRIBUTES bits will be included in key derivation. When CPUID.12H.01H:EAX[6] is 0, then this field is reserved and must be 0.
RESERVED	7	1	Must be zero.
CPUSVN	8	16	The security version number of the processor used in the key derivation.
ATTRIBUTEMASK	24	16	A mask defining which ATTRIBUTES bits will be included in key derivation.
KEYID	40	32	Value for key wear-out protection.
MISCMASK	72	4	A mask defining which MISCSELECT bits will be included in key derivation.
CONFIGSVN	76	2	Identifies which enclave Configuration's Security Version should be used in key derivation.
RESERVED	78	434	

37.18.1 KEY REQUEST KeyNames

Table 37-25. Supported KEYName Values

Key Name	Value	Description
EINIT_TOKEN_KEY	0	EINIT_TOKEN key
PROVISION_KEY	1	Provisioning Key
PROVISION_SEAL_KEY	2	Provisioning Seal Key
REPORT_KEY	3	Report Key
SEAL_KEY	4	Seal Key
	All others	Reserved

37.18.2 Key Request Policy Structure

Table 37-26. Layout of KEYPOLICY Field

Field	Bit Position	Description
MRENCLAVE	0	If 1, derive key using the enclave's MRENCLAVE measurement register.
MRSIGNER	1	If 1, derive key using the enclave's MRSIGNER measurement register.
NOISVPRODID	2	If 1, derive key WITHOUT using the enclave's ISVPRODID value.
CONFIGID	3	If 1, derive key using the enclave's CONFIGID value.
ISVFAMILYID	4	If 1, derive key using the enclave ISVFAMILYID value.
ISVEXTPRODID	5	If 1, derive key using enclave's ISVEXTPRODID value.
RESERVED	15:6	Must be zero.

37.19 VERSION ARRAY (VA)

In order to securely store the versions of evicted EPC pages, Intel SGX defines a special EPC page type called a Version Array (VA). Each VA page contains 512 slots, each of which can contain an 8-byte version number for a page evicted from the EPC. When an EPC page is evicted, software chooses an empty slot in a VA page; this slot receives the unique version number of the page being evicted. When the EPC page is reloaded, there must be a VA slot that must hold the version of the page. If the page is successfully reloaded, the version in the VA slot is cleared.

VA pages can be evicted, just like any other EPC page. When evicting a VA page, a version slot in some other VA page must be used to hold the version for the VA being evicted. A Version Array Page must be 4K-Bytes aligned.

Table 37-27. Layout of Version Array Data Structure

Field	OFFSET (Bytes)	Size (Bytes)	Description
Slot 0	0	8	Version Slot 0
Slot 1	8	8	Version Slot 1
...			
Slot 511	4088	8	Version Slot 511

37.20 ENCLAVE PAGE CACHE MAP (EPCM)

EPCM is a secure structure used by the processor to track the contents of the EPC. The EPCM holds exactly one entry for each page that is currently loaded into the EPC. EPCM is not accessible by software, and the layout of EPCM fields is implementation specific.

Table 37-28. Content of an Enclave Page Cache Map Entry

Field	Description
VALID	Indicates whether the EPCM entry is valid.
R	Read access; indicates whether enclave accesses for reads are allowed from the EPC page referenced by this entry.
W	Write access; indicates whether enclave accesses for writes are allowed to the EPC page referenced by this entry.
X	Execute access; indicates whether enclave accesses for instruction fetches are allowed from the EPC page referenced by this entry.
PT	EPCM page type (PT_SECS, PT_TCS, PT_REG, PT_VA, PT_TRIM, PT_SS_FIRST, PT_SS_REST).
ENCLAVESECS	SECS identifier of the enclave to which the EPC page belongs.
ENCLAVEADDRESS	Linear enclave address of the EPC page.
BLOCKED	Indicates whether the EPC page is in the blocked state.
PENDING	Indicates whether the EPC page is in the pending state.
MODIFIED	Indicates whether the EPC page is in the modified state.
PR	Indicates whether the EPC page is in a permission restriction state.

30. Updates Appendix A, Volume 3D

Change bars and violet text show changes to Appendix A of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

Changes to this chapter:

- In Section A.1, "Basic VMX Information", updated footnote 2 in bit 48 description regarding processor's physical-address width.

APPENDIX A

VMX CAPABILITY REPORTING FACILITY

The ability of a processor to support VMX operation and related instructions is indicated by `CPUID.01H:ECX.VMX[5] = 1`. A value 1 in this bit indicates support for VMX features.

Support for specific features detailed in Chapter 28 and other VMX chapters is determined by reading values from a set of capability MSR. These MSR are indexed starting at MSR address 480H. VMX capability MSR are read-only; an attempt to write them (with `WRMSR`) produces a general-protection exception (`#GP(0)`). They do not exist on processors that do not support VMX operation; an attempt to read them (with `RDMR`) on such processors produces a general-protection exception (`#GP(0)`).

A.1 BASIC VMX INFORMATION

The `IA32_VMX_BASIC` MSR (index 480H) consists of the following fields:

- Bits 30:0 contain the 31-bit VMCS revision identifier used by the processor. Processors that use the same VMCS revision identifier use the same size for VMCS regions (see subsequent item on bits 44:32).¹
- Bit 31 is always 0.
- Bits 44:32 report the number of bytes that software should allocate for the VMXON region and any VMCS region. It is a value greater than 0 and at most 4096 (bit 44 is set if and only if bits 43:32 are clear).
- Bit 48 indicates the width of the physical addresses that may be used for the VMXON region, each VMCS, and data structures referenced by pointers in a VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions). If the bit is 0, these addresses are limited to the processor's physical-address width.² If the bit is 1, these addresses are limited to 32 bits. This bit is always 0 for processors that support Intel 64 architecture.
- If bit 49 is read as 1, the logical processor supports the dual-monitor treatment of system-management interrupts and system-management mode. See Section 33.15 for details of this treatment.
- Bits 53:50 report the memory type that should be used for the VMCS, for data structures referenced by pointers in the VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions), and for the MSEG header. If software needs to access these data structures (e.g., to modify the contents of the MSR bitmaps), it can configure the paging structures to map them into the linear-address space. If it does so, it should establish mappings that use the memory type reported bits 53:50 in this MSR.³

As of this writing, all processors that support VMX operation indicate the write-back type. The values used are given in Table A-1.

Table A-1. Memory Types Recommended for VMCS and Related Data Structures

Value(s)	Field
0	Uncacheable (UC)
1-5	Not used
6	Write Back (WB)

1. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field in bits 31:0 of this MSR. For all processors produced prior to this change, bit 31 of this MSR was read as 0.
2. On processors that support Intel 64 architecture, the pointer must not set bits beyond the processor's physical address width. This width is denoted `MAXPHYADDR` and is derived from the value enumerated in `CPUID.80000008H:EAX[7:0]`. If `IA32_TME_ACTIVATE[0] = 1` (indicating that TME has been configured), `MAXPHYADDR` is reduced by the value of `IA32_TME_ACTIVAT[39:36]` when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34); the value is not reduced in SEAM.
3. Alternatively, software may map any of these regions or structures with the UC memory type. (This may be necessary for the MSEG header.) Doing so is discouraged unless necessary as it will cause the performance of software accesses to those structures to suffer.

Table A-1. Memory Types Recommended for VMCS and Related Data Structures (Contd.)

Value(s)	Field
7-15	Not used

- If bit 54 is read as 1, the processor reports information in the VM-exit instruction-information field on VM exits due to execution of the INS and OUTS instructions (see Section 29.2.5). This reporting is done only if this bit is read as 1.
- Bit 55 is read as 1 if any VMX controls that default to 1 may be cleared to 0. See Appendix A.2 for details. It also reports support for the VMX capability MSRs IA32_VMX_TRUE_PINBASED_CTLS, IA32_VMX_TRUE_PROCBASED_CTLS, IA32_VMX_TRUE_EXIT_CTLS, and IA32_VMX_TRUE_ENTRY_CTLS. See Appendix A.3.1, Appendix A.3.2, Appendix A.4, and Appendix A.5 for details.
- If bit 56 is read as 1, software can use VM entry to deliver a hardware exception with or without an error code, regardless of vector (see Section 28.2.1.3).
- The values of bits 47:45 and bits 63:57 are reserved and are read as 0.

A.2 RESERVED CONTROLS AND DEFAULT SETTINGS

As noted in Chapter 28, “VM Entries,” certain VMX controls are reserved and must be set to a specific value (0 or 1) determined by the processor. The specific value to which a reserved control must be set is its **default setting**. Software can discover the default setting of a reserved control by consulting the appropriate VMX capability MSR (see Appendix A.3 through Appendix A.5).

Future processors may define new functionality for one or more reserved controls. Such processors would allow each newly defined control to be set either to 0 or to 1. Software that does not desire a control’s new functionality should set the control to its default setting. For that reason, it is useful for software to know the default settings of the reserved controls.

Default settings partition the various controls into the following classes:

- **Always-flexible.** These have never been reserved.
- **Default0.** These are (or have been) reserved with a default setting of 0.
- **Default1.** They are (or have been) reserved with a default setting of 1.

As noted in Appendix A.1, a logical processor uses bit 55 of the IA32_VMX_BASIC MSR to indicate whether any of the default1 controls may be 0:

- If bit 55 of the IA32_VMX_BASIC MSR is read as 0, all the default1 controls are reserved and must be 1. VM entry will fail if any of these controls are 0 (see Section 28.2.1).
- If bit 55 of the IA32_VMX_BASIC MSR is read as 1, not all the default1 controls are reserved, and some (but not necessarily all) may be 0. The CPU supports four (4) new VMX capability MSRs: IA32_VMX_TRUE_PINBASED_CTLS, IA32_VMX_TRUE_PROCBASED_CTLS, IA32_VMX_TRUE_EXIT_CTLS, and IA32_VMX_TRUE_ENTRY_CTLS. See Appendix A.3 through Appendix A.5 for details. (These MSRs are not supported if bit 55 of the IA32_VMX_BASIC MSR is read as 0.)

A.3 VM-EXECUTION CONTROLS

There are separate capability MSRs for the pin-based VM-execution controls, the primary processor-based VM-execution controls, the secondary processor-based VM-execution controls, and the tertiary processor-based VM-execution controls. These are described in Appendix A.3.1, Appendix A.3.2, Appendix A.3.3, and Appendix A.3.4, respectively.

A.3.1 Pin-Based VM-Execution Controls

The IA32_VMX_PINBASED_CTLS MSR (index 481H) reports on the allowed settings of **most** of the pin-based VM-execution controls (see Section 26.6.1):

- Bits 31:0 indicate the **allowed 0-settings** of these controls. VM entry allows control X (bit X of the pin-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the pin-based VM-execution controls in the default1 class (see Appendix A.2). These are bits 1, 2, and 4; the corresponding bits of the IA32_VMX_PINBASED_CTLMSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any pin-based VM-execution control in the default1 class is 0.
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PINBASED_CTLMSR (see below) reports which of the pin-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the **allowed 1-settings** of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PINBASED_CTLMSR (index 48DH) reports on the allowed settings of **all** of the pin-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the pin-based VM-execution controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32_VMX_PINBASED_CTLMSR. (The IA32_VMX_TRUE_PINBASED_CTLMSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32_VMX_TRUE_PINBASED_CTLMSR. Assuming that software knows that the default1 class of pin-based VM-execution controls contains bits 1, 2, and 4, there is no need for software to consult the IA32_VMX_PINBASED_CTLMSR.

A.3.2 Primary Processor-Based VM-Execution Controls

The IA32_VMX_PROCBASED_CTLMSR (index 482H) reports on the allowed settings of **most** of the primary processor-based VM-execution controls (see Section 26.6.2):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the primary processor-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the primary processor-based VM-execution controls in the default1 class (see Appendix A.2). These are bits 1, 4–6, 8, 13–16, and 26; the corresponding bits of the IA32_VMX_PROCBASED_CTLMSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any of the primary processor-based VM-execution controls in the default1 class is 0.
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PROCBASED_CTLMSR (see below) reports which of the primary processor-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_PROCBASED_CTLMSR (index 48EH) reports on the allowed settings of **all** of the primary processor-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.

- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the primary processor-based VM-execution controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the primary processor-based VM-execution controls is contained in the IA32_VMX_PROCBASED_CTLMSR. (The IA32_VMX_TRUE_PROCBASED_CTLMSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the primary processor-based VM-execution controls is contained in the IA32_VMX_TRUE_PROCBASED_CTLMSR. Assuming that software knows that the default1 class of primary processor-based VM-execution controls contains bits 1, 4–6, 8, 13–16, and 26, there is no need for software to consult the IA32_VMX_PROCBASED_CTLMSR.

A.3.3 Secondary Processor-Based VM-Execution Controls

The IA32_VMX_PROCBASED_CTLMSR2 (index 48BH) reports on the allowed settings of the secondary processor-based VM-execution controls (see Section 26.6.2). The following items provide details, including enforcement by VM entry:

- Bits 31:0 indicate the allowed 0-settings of these controls. These bits are always 0. This fact indicates that VM entry allows each bit of the secondary processor-based VM-execution controls to be 0 (reserved bits must be 0)
- Bits 63:32 indicate the allowed 1-settings of these controls; the 1-setting is not allowed for any reserved bit. VM entry allows control X (bit X of the secondary processor-based VM-execution controls) to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X and the “activate secondary controls” primary processor-based VM-execution control are both 1.

The IA32_VMX_PROCBASED_CTLMSR2 MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32_VMX_PROCBASED_CTLMSR is 1).

A.3.4 Tertiary Processor-Based VM-Execution Controls

The IA32_VMX_PROCBASED_CTLMSR3 (index 492H) reports on the allowed 1-settings of the tertiary processor-based VM-execution controls (see Section 26.6.2); the 1-setting is not allowed for any reserved bit.

VM entry allows control X (bit X of the tertiary processor-based VM-execution controls) to be 1 if bit X in the MSR is set to 1; if bit X in the MSR is cleared to 0, VM entry fails if control X and the “activate tertiary controls” primary processor-based VM-execution control are both 1.

The IA32_VMX_PROCBASED_CTLMSR3 MSR exists only on processors that support the 1-setting of the “activate tertiary controls” VM-execution control (only if bit 49 of the IA32_VMX_PROCBASED_CTLMSR is 1).

Notice that the organization of this MSR differs from that of IA32_VMX_PROCBASED_CTLMSR2 (Appendix A.3.3). This is because there are 64 tertiary processor-based VM-execution controls, while there were only 32 secondary processor-based VM-execution controls.

A.4 VM-EXIT CONTROLS

There are separate capability MSRs for the primary VM-exit controls and the secondary VM-exit controls. These are described in Appendix A.4.1 and Appendix A.4.2, respectively.

A.4.1 Primary VM-Exit Controls

The IA32_VMX_EXIT_CTLMSR (index 483H) reports on the allowed settings of **most** of the primary VM-exit controls (see Section 26.7.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the primary VM-exit controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the primary VM-exit controls in the default1 class (see Appendix A.2). These are bits 0–8, 10, 11, 13, 14, 16, and 17; the corresponding bits of the IA32_VMX_EXIT_CTLS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any primary VM-exit control in the default1 class is 0.
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_EXIT_CTLS MSR (see below) reports which of the primary VM-exit controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_EXIT_CTLS MSR (index 48FH) reports on the allowed settings of **all** of the primary VM-exit controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the primary VM-exit controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the primary VM-exit controls is contained in the IA32_VMX_EXIT_CTLS MSR. (The IA32_VMX_TRUE_EXIT_CTLS MSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the primary VM-exit controls is contained in the IA32_VMX_TRUE_EXIT_CTLS MSR. Assuming that software knows that the default1 class of primary VM-exit controls contains bits 0–8, 10, 11, 13, 14, 16, and 17, there is no need for software to consult the IA32_VMX_EXIT_CTLS MSR.

A.4.2 Secondary VM-Exit Controls

The IA32_VMX_EXIT_CTLS2 MSR (index 493H) reports on the allowed 1-settings of the secondary VM-exit controls (see Section 26.7.1); the 1-setting is not allowed for any reserved bit.

VM entry allows control X (bit X of the secondary VM-exit controls) to be 1 if bit X in the MSR is set to 1; if bit X in the MSR is cleared to 0, VM entry fails if control X and the “activate secondary controls” primary VM-exit control are both 1.

The IA32_VMX_EXIT_CTLS2 MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-exit control (only if bit 63 of the IA32_VMX_EXIT_CTLS MSR is 1).

Notice that the organization of this MSR differs from that of IA32_VMX_EXIT_CTLS (Appendix A.4.1). This is because there are 64 secondary VM-exit controls, while there were only 32 primary VM-exit controls.

A.5 VM-ENTRY CONTROLS

The IA32_VMX_ENTRY_CTLS MSR (index 484H) reports on the allowed settings of **most** of the VM-entry controls (see Section 26.8.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-entry controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. Exceptions are made for the VM-entry controls in the default1 class (see Appendix A.2). These are bits 0–8 and 12; the corresponding bits of the IA32_VMX_ENTRY_CTLS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32_VMX_BASIC MSR:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, VM entry fails if any VM-entry control in the default1 class is 0.
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_ENTRY_CTLMS MSR (see below) reports which of the VM-entry controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry fails if bit X is 1 in the VM-entry controls and bit 32+X is 0 in this MSR.

If bit 55 in the IA32_VMX_BASIC MSR is read as 1, the IA32_VMX_TRUE_ENTRY_CTLMS MSR (index 490H) reports on the allowed settings of **all** of the VM-entry controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-entry controls:

- If bit 55 in the IA32_VMX_BASIC MSR is read as 0, all information about the allowed settings of the VM-entry controls is contained in the IA32_VMX_ENTRY_CTLMS MSR. (The IA32_VMX_TRUE_ENTRY_CTLMS MSR is not supported.)
- If bit 55 in the IA32_VMX_BASIC MSR is read as 1, all information about the allowed settings of the VM-entry controls is contained in the IA32_VMX_TRUE_ENTRY_CTLMS MSR. Assuming that software knows that the default1 class of VM-entry controls contains bits 0–8 and 12, there is no need for software to consult the IA32_VMX_ENTRY_CTLMS MSR.

A.6 MISCELLANEOUS DATA

The IA32_VMX_MISC MSR (index 485H) consists of the following fields:

- Bits 4:0 report a value X that specifies the relationship between the rate of the VMX-preemption timer and that of the timestamp counter (TSC). Specifically, the VMX-preemption timer (if it is active) counts down by 1 every time bit X in the TSC changes due to a TSC increment.
- If bit 5 is read as 1, VM exits store the value of IA32_EFER.LMA into the “IA-32e mode guest” VM-entry control; see Section 29.2 for more details. This bit is read as 1 on any logical processor that supports the 1-setting of the “unrestricted guest” VM-execution control.
- Bits 8:6 report, as a bitmap, the activity states supported by the implementation:
 - Bit 6 reports (if set) the support for activity state 1 (HLT).
 - Bit 7 reports (if set) the support for activity state 2 (shutdown).
 - Bit 8 reports (if set) the support for activity state 3 (wait-for-SIPI).

If an activity state is not supported, the implementation causes a VM entry to fail if it attempts to establish that activity state. All implementations support VM entry to activity state 0 (active).

- If bit 14 is read as 1, Intel® Processor Trace (Intel PT) can be used in VMX operation. If the processor supports Intel PT but does not allow it to be used in VMX operation, execution of VMXON clears IA32_RTIT_CTL.TraceEn (see “VMXON—Enter VMX Operation” in Chapter 32); any attempt to write IA32_RTIT_CTL while in VMX operation (including VMX root operation) causes a general-protection exception.
- If bit 15 is read as 1, the RDMSR instruction can be used in system-management mode (SMM) to read the IA32_SMBASE MSR (MSR address 9EH). See Section 33.15.6.3.
- Bits 24:16 indicate the number of CR3-target values supported by the processor. This number is a value between 0 and 256, inclusive (bit 24 is set if and only if bits 23:16 are clear).
- Bits 27:25 is used to compute the recommended maximum number of MSRs that should appear in the VM-exit MSR-store list, the VM-exit MSR-load list, or the VM-entry MSR-load list. Specifically, if the value bits 27:25 of IA32_VMX_MISC is N, then $512 * (N + 1)$ is the recommended maximum number of MSRs to be included in each list. If the limit is exceeded, undefined processor behavior may result (including a machine check during the VMX transition).

- If bit 28 is read as 1, bit 2 of the `IA32_SMM_MONITOR_CTL` can be set to 1. `VMXOFF` unblocks SMIs unless `IA32_SMM_MONITOR_CTL[bit 2]` is 1 (see Section 33.14.4).
- If bit 29 is read as 1, software can use `VMWRITE` to write to any supported field in the VMCS; otherwise, `VMWRITE` cannot be used to modify VM-exit information fields.
- If bit 30 is read as 1, VM entry allows injection of a software interrupt, software exception, or privileged software exception with an instruction length of 0.
- Bits 63:32 report the 32-bit MSEG revision identifier used by the processor.
- Bits 13:9 and bit 31 are reserved and are read as 0.

A.7 VMX-FIXED BITS IN CR0

The `IA32_VMX_CR0_FIXED0` MSR (index 486H) and `IA32_VMX_CR0_FIXED1` MSR (index 487H) indicate how bits in CR0 may be set in VMX operation. They report on bits in CR0 that are allowed to be 0 and to be 1, respectively, in VMX operation. If bit X is 1 in `IA32_VMX_CR0_FIXED0`, then that bit of CR0 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in `IA32_VMX_CR0_FIXED1`, then that bit of CR0 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in `IA32_VMX_CR0_FIXED0`, then that bit is also 1 in `IA32_VMX_CR0_FIXED1`; if bit X is 0 in `IA32_VMX_CR0_FIXED1`, then that bit is also 0 in `IA32_VMX_CR0_FIXED0`. Thus, each bit in CR0 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in `IA32_VMX_CR0_FIXED0` and 1 in `IA32_VMX_CR0_FIXED1`).

A.8 VMX-FIXED BITS IN CR4

The `IA32_VMX_CR4_FIXED0` MSR (index 488H) and `IA32_VMX_CR4_FIXED1` MSR (index 489H) indicate how bits in CR4 may be set in VMX operation. They report on bits in CR4 that are allowed to be 0 and 1, respectively, in VMX operation. If bit X is 1 in `IA32_VMX_CR4_FIXED0`, then that bit of CR4 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in `IA32_VMX_CR4_FIXED1`, then that bit of CR4 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in `IA32_VMX_CR4_FIXED0`, then that bit is also 1 in `IA32_VMX_CR4_FIXED1`; if bit X is 0 in `IA32_VMX_CR4_FIXED1`, then that bit is also 0 in `IA32_VMX_CR4_FIXED0`. Thus, each bit in CR4 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in `IA32_VMX_CR4_FIXED0` and 1 in `IA32_VMX_CR4_FIXED1`).

A.9 VMCS ENUMERATION

The `IA32_VMX_VMCS_ENUM` MSR (index 48AH) provides information to assist software in enumerating fields in the VMCS.

As noted in Section 26.11.2, each field in the VMCS is associated with a 32-bit encoding which is structured as follows:

- Bits 31:15 are reserved (must be 0).
- Bits 14:13 indicate the field's width.
- Bit 12 is reserved (must be 0).
- Bits 11:10 indicate the field's type.
- Bits 9:1 is an index field that distinguishes different fields with the same width and type.
- Bit 0 indicates access type.

`IA32_VMX_VMCS_ENUM` indicates to software the highest index value used in the encoding of any field supported by the processor:

- Bits 9:1 contain the highest index value used for any VMCS encoding.
- Bit 0 and bits 63:10 are reserved and are read as 0.

A.10 VPID AND EPT CAPABILITIES

The IA32_VMX_EPT_VPID_CAP MSR (index 48CH) reports information about the capabilities of the logical processor with regard to virtual-processor identifiers (VPIDs, Section 30.1) and extended page tables (EPT, Section 30.3):

- If bit 0 is read as 1, the processor supports execute-only translations by EPT. This support allows software to configure EPT paging-structure entries in which bits 1:0 are clear (indicating that data accesses are not allowed) and bit 2 is set (indicating that instruction fetches are allowed).¹
- Bit 6 indicates support for a page-walk length of 4.
- Bit 7 indicates support for a page-walk length of 5.
- If bit 8 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be uncacheable (UC); see Section 26.6.11.
- If bit 14 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be write-back (WB).
- If bit 16 is read as 1, the logical processor allows software to configure a EPT PDE to map a 2-Mbyte page (by setting bit 7 in the EPT PDE).
- If bit 17 is read as 1, the logical processor allows software to configure a EPT PDPTE to map a 1-Gbyte page (by setting bit 7 in the EPT PDPTE).
- Support for the INVEPT instruction (see Chapter 32 and Section 30.4.3.1):
 - If bit 20 is read as 1, the INVEPT instruction is supported.
 - If bit 25 is read as 1, the single-context INVEPT type is supported.
 - If bit 26 is read as 1, the all-context INVEPT type is supported.
- If bit 21 is read as 1, accessed and dirty flags for EPT are supported (see Section 30.3.5).
- If bit 22 is read as 1, the processor reports advanced VM-exit information for EPT violations (see Section 29.2.1). This reporting is done only if this bit is read as 1.
- If bit 23 is read as 1, supervisor shadow-stack control is supported (see Section 30.3.3.2).
- Support for the INVVPID instruction (see Chapter 32 and Section 30.4.3.1):
 - If bit 32 is read as 1, the INVVPID instruction is supported.
 - If bit 40 is read as 1, the individual-address INVVPID type is supported.
 - If bit 41 is read as 1, the single-context INVVPID type is supported.
 - If bit 42 is read as 1, the all-context INVVPID type is supported.
 - If bit 43 is read as 1, the single-context-retaining-globals INVVPID type is supported.
- Bits 53:48 enumerate the maximum HLAT prefix size. It is expected that any processor that supports the 1-setting of the “enable HLAT” VM-execution control will enumerate this value as 1. See Section 5.5.1.
- Bits 5:1, bits 13:9, bit 15, bits 19:18, bit 24, bits 31:27, bits 39:33, bits 47:44, and bits 63:54 are reserved and are read as 0.

The IA32_VMX_EPT_VPID_CAP MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32_VMX_PROCBASED_CTLMSR is 1) and that support either the 1-setting of the “enable EPT” VM-execution control (only if bit 33 of the IA32_VMX_PROCBASED_CTLMSR2 is 1) or the 1-setting of the “enable VPID” VM-execution control (only if bit 37 of the IA32_VMX_PROCBASED_CTLMSR2 is 1).

1. If the “mode-based execute control for EPT” VM-execution control is 1, setting bit 0 indicates also that software may also configure EPT paging-structure entries in which bits 1:0 are both clear and in which bit 10 is set (indicating a translation that can be used to fetch instructions from a supervisor-mode linear address or a user-mode linear address).

A.11 VM FUNCTIONS

The IA32_VMX_VMFUNC MSR (index 491H) reports on the allowed settings of the VM-function controls (see Section 26.6.14). VM entry allows bit X of the VM-function controls to be 1 if bit X in the MSR is set to 1; if bit X in the MSR is cleared to 0, VM entry fails if bit X of the VM-function controls, the “activate secondary controls” primary processor-based VM-execution control, and the “enable VM functions” secondary processor-based VM-execution control are all 1.

The IA32_VMX_VMFUNC MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32_VMX_PROCBASED_CTL1 MSR is 1) and the 1-setting of the “enable VM functions” secondary processor-based VM-execution control (only if bit 45 of the IA32_VMX_PROCBASED_CTL2 MSR is 1).

31. Updates Appendix B, Volume 3D

Change bars and violet text show changes to Appendix B of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

Changes to this chapter:

- Added SEAM shared EPT pointer to Table B-4 in Section B.2.1, "64-Bit Control Fields".
- Added SEAM-guest KeyID to Table B-8 in Section B.3.1, "32-Bit Control Fields".

APPENDIX B FIELD ENCODING IN VMCS

Every component of the VMCS is encoded by a 32-bit field that can be used by VMREAD and VMWRITE. Section 26.11.2 describes the structure of the encoding space (the meanings of the bits in each 32-bit encoding).

This appendix enumerates all fields in the VMCS and their encodings. Fields are grouped by width (16-bit, 32-bit, etc.) and type (guest-state, host-state, etc.).

B.1 16-BIT FIELDS

A value of 0 in bits 14:13 of an encoding indicates a 16-bit field. Only guest-state areas and the host-state area contain 16-bit fields. As noted in Section 26.11.2, each 16-bit field allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

B.1.1 16-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table B-1 enumerates the 16-bit control fields.

Table B-1. Encoding for 16-Bit Control Fields (0000_00xx_xxxx_0xx0B)

Field Name	Index	Encoding
Virtual-processor identifier (VPID) ¹	000000000B	00000000H
Posted-interrupt notification vector ²	000000001B	00000002H
EPTP index ³	000000010B	00000004H
HLAT prefix size ⁴	000000011B	00000006H
Last PID-pointer index ⁵	000000100B	00000008H

NOTES:

1. This field exists only on processors that support the 1-setting of the “enable VPID” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “process posted interrupts” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “EPT-violation #VE” VM-execution control.
4. This field exists only on processors that support the 1-setting of the “enable HLAT” VM-execution control.
5. This field exists only on processors that support the 1-setting of the “IPI virtualization” VM-execution control.

B.1.2 16-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table B-2 enumerates 16-bit guest-state fields.

Table B-2. Encodings for 16-Bit Guest-State Fields (0000_10xx_xxxx_0xx0B)

Field Name	Index	Encoding
Guest ES selector	000000000B	00000800H
Guest CS selector	000000001B	00000802H
Guest SS selector	000000010B	00000804H
Guest DS selector	000000011B	00000806H
Guest FS selector	000000100B	00000808H

Table B-2. Encodings for 16-Bit Guest-State Fields (0000_10xx_xxxx_xxx0B) (Contd.)

Field Name	Index	Encoding
Guest GS selector	000000101B	0000080AH
Guest LDTR selector	000000110B	0000080CH
Guest TR selector	000000111B	0000080EH
Guest interrupt status ¹	000001000B	00000810H
PML index ²	000001001B	00000812H
Guest UINV ³	000001010B	00000814H

NOTES:

1. This field exists only on processors that support the 1-setting of the “virtual-interrupt delivery” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “enable PML” VM-execution control.
3. This field exists only on processors that support the 1-setting of either the “clear UINV” VM-exit control or the “load UINV” VM-entry control.

B.1.3 16-Bit Host-State Fields

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table B-3 enumerates the 16-bit host-state fields.

Table B-3. Encodings for 16-Bit Host-State Fields (0000_11xx_xxxx_xxx0B)

Field Name	Index	Encoding
Host ES selector	000000000B	00000C00H
Host CS selector	000000001B	00000C02H
Host SS selector	000000010B	00000C04H
Host DS selector	000000011B	00000C06H
Host FS selector	000000100B	00000C08H
Host GS selector	000000101B	00000C0AH
Host TR selector	000000110B	00000C0CH

B.2 64-BIT FIELDS

A value of 1 in bits 14:13 of an encoding indicates a 64-bit field. There are 64-bit fields only for controls and for guest state. As noted in Section 26.11.2, every 64-bit field has two encodings, which differ on bit 0, the access type. Thus, each such field has an even encoding for full access and an odd encoding for high access.

B.2.1 64-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table B-4 enumerates the 64-bit control fields.

Table B-4. Encodings for 64-Bit Control Fields (0010_00xx_xxxx_xxxAb)

Field Name	Index	Encoding

NOTES:

1. This field exists only on processors that support the 1-setting of the “use MSR bitmaps” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “enable PML” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “use TPR shadow” VM-execution control.
4. This field exists only on processors that support the 1-setting of the “virtualize APIC accesses” VM-execution control.
5. This field exists only on processors that support the 1-setting of the “process posted interrupts” VM-execution control.
6. This field exists only on processors that support the 1-setting of the “enable VM functions” VM-execution control.
7. This field exists only on processors that support the 1-setting of the “enable EPT” VM-execution control.
8. This field exists only on processors that support the 1-setting of the “virtual-interrupt delivery” VM-execution control.
9. This field exists only on processors that support the 1-setting of the “EPTP switching” VM-function control.

10. This field exists only on processors that support the 1-setting of the “VMCS shadowing” VM-execution control.
11. This field exists only on processors that support the 1-setting of the “EPT-violation #VE” VM-execution control.
12. This field exists only on processors that support the 1-setting of the “enable XSAVES/XRSTORS” VM-execution control.
13. This field exists only on processors that support the 1-setting of the “enable ENCLS exiting” VM-execution control.
14. This field exists only on processors that support the 1-setting of the “sub-page write permissions for EPT” VM-execution control.
15. This field exists only on processors that support the 1-setting of the “use TSC scaling” VM-execution control.
16. This field exists only on processors that support the 1-setting of the “activate tertiary controls” VM-execution control.
17. This field exists only on processors that support the 1-setting of the “PASID translation” VM-execution control.
18. This field exists only on processors that support the 1-setting of the “SEAM guest-physical address width” VM-execution control.
19. This field exists only on processors that support the 1-setting of the “enable PCONFIG” VM-execution control.
20. This field exists only on processors that support the 1-setting of the “enable HLAT” VM-execution control.
21. This field exists only on processors that support the 1-setting of the “IPI virtualization” VM-execution control.
22. This field exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control.
23. This field exists only on processors that support the 1-setting of the “virtualize IA32_SPEC_CTRL” VM-execution control.

B.2.2 64-Bit Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table B-5 enumerates the 64-bit read-only data fields.

Table B-5. Encodings for 64-Bit Read-Only Data Fields (0010_01xx_xxxx_xxxAb)

Field Name	Index	Encoding
Guest-physical address (full) ¹	000000000B	00002400H
Guest-physical address (high) ¹		00002401H
MSR data (full) ²	000000001B	00002402H
MSR data (high) ²		00002403H

NOTES:

1. This field exists only on processors that support the 1-setting of the “enable EPT” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “enable MSR-list instructions” VM-execution control.

B.2.3 64-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table B-6 enumerates the 64-bit guest-state fields.

Table B-6. Encodings for 64-Bit Guest-State Fields (0010_10xx_xxxx_xxxAb)

Host IA32_PKRS (high) ⁴		00002C07H

NOTES:

1. This field exists only on processors that support the 1-setting of the "load IA32_PAT" VM-exit control.
2. This field exists only on processors that support the 1-setting of the "load IA32_EFER" VM-exit control.
3. This field exists only on processors that support the 1-setting of the "load IA32_PERF_GLOBAL_CTRL" VM-exit control.
4. This field exists only on processors that support the 1-setting of the "load PKRS" VM-exit control.

B.3 32-BIT FIELDS

A value of 2 in bits 14:13 of an encoding indicates a 32-bit field. As noted in Section 26.11.2, each 32-bit field allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

B.3.1 32-Bit Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table B-8 enumerates the 32-bit control fields.

Table B-8. Encodings for 32-Bit Control Fields (0100_00xx_xxxx_xxx0B)

Field Name	Index	Encoding
Pin-based VM-execution controls	000000000B	00004000H
Primary processor-based VM-execution controls	000000001B	00004002H
Exception bitmap	000000010B	00004004H

Instruction-timeout control ⁴	000010010B	00004024H
SEAM-guest KeyID ⁵	000010011B	00004026H

NOTES:

1. This field exists only on processors that support the 1-setting of the “use TPR shadow” VM-execution control.
2. This field exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control.
3. This field exists only on processors that support the 1-setting of the “PAUSE-loop exiting” VM-execution control.
4. This field exists only on processors that support the 1-setting of the “instruction timeout” VM-execution control.
5. This field exists only on processors that support the 1-setting of the “SEAM guest-physical address width” VM-execution control.

B.3.2 32-Bit Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table B-9 enumerates the 32-bit read-only data fields.

Table B-9. Encodings for 32-Bit Read-Only Data Fields (0100_01xx_xxxx_xxx0B)

Field Name	Index	Encoding
VM-instruction error	000000000B	00004400H
Exit reason	000000001B	00004402H
VM-exit interruption information	000000010B	00004404H
VM-exit interruption error code	000000011B	00004406H
IDT-vectoring information field	000000100B	00004408H
IDT-vectoring error code	000000101B	0000440AH
VM-exit instruction length	000000110B	0000440CH
VM-exit instruction information	000000111B	0000440EH

B.3.3 32-Bit Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table B-10 enumerates the 32-bit guest-state fields.

Table B-10. Encodings for 32-Bit Guest-State Fields (0100_10xx_xxxx_xxx0B)

Field Name	Index	Encoding
Guest ES limit	000000000B	00004800H
Guest CS limit	000000001B	00004802H
Guest SS limit	000000010B	00004804H
Guest DS limit	000000011B	00004806H
Guest FS limit	000000100B	00004808H
Guest GS limit	000000101B	0000480AH
Guest LDTR limit	000000110B	0000480CH
Guest TR limit	000000111B	0000480EH
Guest GDTR limit	000001000B	00004810H

Table B-10. Encodings for 32-Bit Guest-State Fields (0100_10xx_xxxx_xxx0B) (Contd.)

Field Name	Index	Encoding
Guest IDTR limit	000001001B	00004812H
Guest ES access rights	000001010B	00004814H
Guest CS access rights	000001011B	00004816H
Guest SS access rights	000001100B	00004818H
Guest DS access rights	000001101B	0000481AH
Guest FS access rights	000001110B	0000481CH
Guest GS access rights	000001111B	0000481EH
Guest LDTR access rights	000010000B	00004820H
Guest TR access rights	000010001B	00004822H
Guest interruptibility state	000010010B	00004824H
Guest activity state	000010011B	00004826H
Guest SMBASE	000010100B	00004828H
Guest IA32_SYSENTER_CS	000010101B	0000482AH
VMX-preemption timer value ¹	000010111B	0000482EH

NOTES:

1. This field exists only on processors that support the 1-setting of the “activate VMX-preemption timer” VM-execution control.

The limit fields for GDTR and IDTR are defined to be 32 bits in width even though these fields are only 16-bits wide in the Intel 64 and IA-32 architectures. VM entry ensures that the high 16 bits of both these fields are cleared to 0.

B.3.4 32-Bit Host-State Field

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. There is only one such 32-bit field as given in Table B-11.

Table B-11. Encoding for 32-Bit Host-State Field (0100_11xx_xxxx_xxx0B)

Field Name	Index	Encoding
Host IA32_SYSENTER_CS	000000000B	00004C00H

B.4 NATURAL-WIDTH FIELDS

A value of 3 in bits 14:13 of an encoding indicates a natural-width field. As noted in Section 26.11.2, each of these fields allows only full access, meaning that bit 0 of its encoding is 0. Each such encoding is thus an even number.

B.4.1 Natural-Width Control Fields

A value of 0 in bits 11:10 of an encoding indicates a control field. These fields are distinguished by their index value in bits 9:1. Table B-12 enumerates the natural-width control fields.

Table B-12. Encodings for Natural-Width Control Fields (0110_00xx_xxxx_xxx0B)

Field Name	Index	Encoding
CR0 guest/host mask	000000000B	00006000H
CR4 guest/host mask	000000001B	00006002H

Table B-12. Encodings for Natural-Width Control Fields (0110_00xx_xxxx_xxx0B) (Contd.)

Field Name	Index	Encoding
CR0 read shadow	000000010B	00006004H
CR4 read shadow	000000011B	00006006H
CR3-target value 0	000000100B	00006008H
CR3-target value 1	000000101B	0000600AH
CR3-target value 2	000000110B	0000600CH
CR3-target value 3 ¹	000000111B	0000600EH

NOTES:

1. If a future implementation supports more than 4 CR3-target values, they will be encoded consecutively following the 4 encodings given here.

B.4.2 Natural-Width Read-Only Data Fields

A value of 1 in bits 11:10 of an encoding indicates a read-only data field. These fields are distinguished by their index value in bits 9:1. Table B-13 enumerates the natural-width read-only data fields.

Table B-13. Encodings for Natural-Width Read-Only Data Fields (0110_01xx_xxxx_xxx0B)

Field Name	Index	Encoding
Exit qualification	000000000B	00006400H
I/O RCX	000000001B	00006402H
I/O RSI	000000010B	00006404H
I/O RDI	000000011B	00006406H
I/O RIP	000000100B	00006408H
Guest-linear address	000000101B	0000640AH

B.4.3 Natural-Width Guest-State Fields

A value of 2 in bits 11:10 of an encoding indicates a field in the guest-state area. These fields are distinguished by their index value in bits 9:1. Table B-14 enumerates the natural-width guest-state fields.

Table B-14. Encodings for Natural-Width Guest-State Fields (0110_10xx_xxxx_xxx0B)

Field Name	Index	Encoding
Guest CR0	000000000B	00006800H
Guest CR3	000000001B	00006802H
Guest CR4	000000010B	00006804H
Guest ES base	000000011B	00006806H

Guest DS base	000000110B	0000680CH
Guest FS base	000000111B	0000680EH
Guest GS base	000001000B	00006810H
Guest LDTR base	000001001B	00006812H

Table B-14. Encodings for Natural-Width Guest-State Fields (0110_10xx_xxxx_xxx0B) (Contd.)

Field Name	Index	Encoding
Guest TR base	000001010B	00006814H
Guest GDTR base	000001011B	00006816H
Guest IDTR base	000001100B	00006818H
Guest DR7	000001101B	0000681AH
Guest RSP	000001110B	0000681CH
Guest RIP	000001111B	0000681EH
Guest RFLAGS	000010000B	00006820H
Guest pending debug exceptions	000010001B	00006822H
Guest IA32_SYSENTER_ESP	000010010B	00006824H
Guest IA32_SYSENTER_EIP	000010011B	00006826H
Guest IA32_S_CET ¹	000010100B	00006828H
Guest SSP ¹	000010101B	0000682AH
Guest IA32_INTERRUPT_SSP_TABLE_ADDR ¹	000010110B	0000682CH

NOTES:

1. This field is supported only on processors that support the 1-setting of the “load CET state” VM-entry control.

The base-address fields for ES, CS, SS, and DS in the guest-state area are defined to be natural-width (with 64 bits on processors supporting Intel 64 architecture) even though these fields are only 32-bits wide in the Intel 64 architecture. VM entry ensures that the high 32 bits of these fields are cleared to 0.

B.4.4 Natural-Width Host-State Fields

A value of 3 in bits 11:10 of an encoding indicates a field in the host-state area. These fields are distinguished by their index value in bits 9:1. Table B-15 enumerates the natural-width host-state fields.

Table B-15. Encodings for Natural-Width Host-State Fields (0110_11xx_xxxx_xxx0B)

Field Name	Index	Encoding
Host CR0	000000000B	00006C00H
Host CR3	000000001B	00006C02H
Host CR4	000000010B	00006C04H
Host FS base	000000011B	00006C06H
Host GS base	000000100B	00006C08H

Table B-15. Encodings for Natural-Width Host-State Fields (0110_11xx_xxxx_xxx0B) (Contd.)

Field Name	Index	Encoding
Host IA32_INTERRUPT_SSP_TABLE_ADDR ¹	000001110B	00006C1CH

NOTES:

1. This field is supported only on processors that support the 1-setting of the “load CET state” VM-exit control.

32. Updates Appendix C, Volume 3D

Change bars and violet text show changes to Appendix C of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

Changes to this chapter:

- Added UDB to Basic Exit Reason 0 in Table C-1.

APPENDIX C

VMX BASIC EXIT REASONS

Every VM exit writes a 32-bit exit reason to the VMCS (see Section 26.9.1). Certain VM-entry failures also do this (see Section 28.8). The low 16 bits of the exit-reason field form the basic exit reason which provides basic information about the cause of the VM exit or VM-entry failure.

Table C-1 lists values for basic exit reasons and explains their meaning. Entries apply to VM exits, unless otherwise noted.

Table C-1. Basic Exit Reasons

Basic Exit Reason	Description
0	Exception or non-maskable interrupt (NMI). Either: 1: Guest software caused an exception and the bit in the exception bitmap associated with exception's vector was 1. This case includes executions of BOUND that cause #BR, executions of INT1 (they cause #DB), executions of INT3 (they cause #BP), executions of INTO that cause #OF, and executions of UD0, UD1, UD2, and UDB (they cause #UD). 2: An NMI was delivered to the logical processor and the "NMI exiting" VM-execution control was 1.
1	External interrupt. An external interrupt arrived and the "external-interrupt exiting" VM-execution control was 1.
2	Triple fault. The logical processor encountered an exception while attempting to call the double-fault handler and that exception did not itself cause a VM exit due to the exception bitmap.
3	INIT signal. An INIT signal arrived
4	Start-up IPI (SIPI). A SIPI arrived while the logical processor was in the "wait-for-SIPI" state.
5	I/O system-management interrupt (SMI). An SMI arrived immediately after retirement of an I/O instruction and caused an SMM VM exit (see Section 33.15.2).
6	Other SMI. An SMI arrived and caused an SMM VM exit (see Section 33.15.2) but not immediately after retirement of an I/O instruction.
7	Interrupt window. At the beginning of an instruction, RFLAGS.IF was 1; events were not blocked by STI or by MOV SS; and the "interrupt-window exiting" VM-execution control was 1.
8	NMI window. At the beginning of an instruction, there was no virtual-NMI blocking; events were not blocked by MOV SS; and the "NMI-window exiting" VM-execution control was 1.
9	Task switch. Guest software attempted a task switch.
10	CPUID. Guest software attempted to execute CPUID.
11	GETSEC. Guest software attempted to execute GETSEC.
12	HLT. Guest software attempted to execute HLT and the "HLT exiting" VM-execution control was 1.
13	INVD. Guest software attempted to execute INVD.
14	INVLPG. Guest software attempted to execute INVLPG and the "INVLPG exiting" VM-execution control was 1.
15	RDPMC. Guest software attempted to execute RDPMC and the "RDPMC exiting" VM-execution control was 1.
16	RDTSC. Guest software attempted to execute RDTSC and the "RDTSC exiting" VM-execution control was 1.
17	RSM. Guest software attempted to execute RSM in SMM.
18	VMCALL. VMCALL was executed either by guest software (causing an ordinary VM exit) or by the executive monitor (causing an SMM VM exit; see Section 33.15.2).
19	VMCLEAR. Guest software attempted to execute VMCLEAR.
20	VMLAUNCH. Guest software attempted to execute VMLAUNCH.
21	VMPTRLD. Guest software attempted to execute VMPTRLD.
22	VMPTRST. Guest software attempted to execute VMPTRST.

Table C-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
23	VMREAD. Guest software attempted to execute VMREAD.
24	VMRESUME. Guest software attempted to execute VMRESUME.
25	VMWRITE. Guest software attempted to execute VMWRITE.
26	VMXOFF. Guest software attempted to execute VMXOFF.
27	VMXON. Guest software attempted to execute VMXON.
28	Control-register accesses. Guest software attempted to access CR0, CR3, CR4, or CR8 using CLTS, LMSW, or MOV CR and the VM-execution control fields indicate that a VM exit should occur (see Section 27.1 for details). This basic exit reason is not used for trap-like VM exits following executions of the MOV to CR8 instruction when the “use TPR shadow” VM-execution control is 1. Such VM exits instead use basic exit reason 43.
29	MOV DR. Guest software attempted a MOV to or from a debug register and the “MOV-DR exiting” VM-execution control was 1.
30	I/O instruction. Guest software attempted to execute an I/O instruction and either: 1: The “use I/O bitmaps” VM-execution control was 0 and the “unconditional I/O exiting” VM-execution control was 1. 2: The “use I/O bitmaps” VM-execution control was 1 and a bit in the I/O bitmap associated with one of the ports accessed by the I/O instruction was 1.
31	RDMSR. Guest software attempted to execute RDMSR and one of the following holds: ▪ The “use MSR bitmaps” VM-execution control was 0. ▪ The value of RCX is neither in the range 00000000H – 00001FFFH nor in the range C0000000H – C0001FFFH. ▪ The value of RCX is in the range 00000000H – 00001FFFH and the n^{th} bit in read bitmap for low MSRs is 1, where n is the value of RCX. ▪ The value of RCX is in the range C0000000H – C0001FFFH and the n^{th} bit in read bitmap for high MSRs is 1, where n is the value of RCX & 00001FFFH.
32	WRMSR or WRMSRNS. Guest software attempted to execute either WRMSR or WRMSRNS and either: 1: The “use MSR bitmaps” VM-execution control was 0. 2: The value of RCX is neither in the range 00000000H – 00001FFFH nor in the range C0000000H – C0001FFFH. 3: The value of RCX is in the range 00000000H – 00001FFFH and the n^{th} bit in write bitmap for low MSRs is 1, where n is the value of RCX. 4: The value of RCX is in the range C0000000H – C0001FFFH and the n^{th} bit in write bitmap for high MSRs is 1, where n is the value of RCX & 00001FFFH.
33	VM-entry failure due to invalid guest state. A VM entry failed one of the checks identified in Section 28.3.1.
34	VM-entry failure due to MSR loading. A VM entry failed in an attempt to load MSRs. See Section 28.4.
36	MWAIT. Guest software attempted to execute MWAIT and the “MWAIT exiting” VM-execution control was 1.
37	Monitor trap flag. A VM exit occurred due to the 1-setting of the “monitor trap flag” VM-execution control (see Section 27.5.2) or VM entry injected a pending MTF VM exit as part of VM entry (see Section 28.6.2).
39	MONITOR. Guest software attempted to execute MONITOR and the “MONITOR exiting” VM-execution control was 1.
40	PAUSE. Either guest software attempted to execute PAUSE and the “PAUSE exiting” VM-execution control was 1 or the “PAUSE-loop exiting” VM-execution control was 1 and guest software executed a PAUSE loop with execution time exceeding PLE_Window (see Section 27.1.3).
41	VM-entry failure due to machine-check event. A machine-check event occurred during VM entry (see Section 28.9).
43	TPR below threshold. The logical processor determined that the value of bits 7:4 of the byte at offset 080H on the virtual-APIC page was below that of the TPR threshold VM-execution control field while the “use TPR shadow” VM-execution control was 1 either as part of TPR virtualization (Section 31.1.2) or VM entry (Section 28.7.7).
44	APIC access. Guest software attempted to access memory at a physical address on the APIC-access page and the “virtualize APIC accesses” VM-execution control was 1 (see Section 31.4).
45	Virtualized EOI. EOI virtualization was performed for a virtual interrupt whose vector indexed a bit set in the EOI-exit bitmap.

Table C-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
46	Access to GDTR or IDTR. Guest software attempted to execute LGDT, LIDT, SGDT, or SIDT and the “descriptor-table exiting” VM-execution control was 1.
47	Access to LDTR or TR. Guest software attempted to execute LLDT, LTR, SLDT, or STR and the “descriptor-table exiting” VM-execution control was 1.
48	EPT violation. An attempt to access memory with a guest-physical address was disallowed by the configuration of the EPT paging structures.
49	EPT misconfiguration. An attempt to access memory with a guest-physical address encountered a misconfigured EPT paging-structure entry.
50	INVEPT. Guest software attempted to execute INVEPT.
51	RDTSMP. Guest software attempted to execute RDTSMP and the “enable RDTSMP” and “RDTSMP exiting” VM-execution controls were both 1.
52	VMX-preemption timer expired. The preemption timer counted down to zero.
53	INVVPID. Guest software attempted to execute INVVPID.
54	WBINVD or WBNOINVD. Guest software attempted to execute WBINVD or WBNOINVD and the “WBINVD exiting” VM-execution control was 1.
55	XSETBV. Guest software attempted to execute XSETBV.
56	APIC write. Guest software completed a write to the virtual-APIC page that must be virtualized by VMM software (see Section 31.4.3.3).
57	RDRAND. Guest software attempted to execute RDRAND and the “RDRAND exiting” VM-execution control was 1.
58	INVPCID. Guest software attempted to execute INVPCID and the “enable INVPCID” and “INVLPG exiting” VM-execution controls were both 1.
59	VMFUNC. Guest software invoked a VM function with the VMFUNC instruction and the VM function either was not enabled or generated a function-specific condition causing a VM exit.
60	ENCLS. Guest software attempted to execute ENCLS, “enable ENCLS exiting” VM-execution control was 1, and either (1) EAX < 63 and the corresponding bit in the ENCLS-exiting bitmap is 1; or (2) EAX ≥ 63 and bit 63 in the ENCLS-exiting bitmap is 1.
61	RDSEED. Guest software attempted to execute RDSEED and the “RDSEED exiting” VM-execution control was 1.
62	Page-modification log full. The processor attempted to create a page-modification log entry and the value of the PML index was not in the range 0–511.
63	XSAVES. Guest software attempted to execute XSAVES, the “enable XSAVES/XRSTORS” was 1, and a bit was set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap.
64	XRSTORS. Guest software attempted to execute XRSTORS, the “enable XSAVES/XRSTORS” was 1, and a bit was set in the logical-AND of the following three values: EDX:EAX, the IA32_XSS MSR, and the XSS-exiting bitmap.
65	PCONFIG. Guest software attempted to execute PCONFIG, “enable PCONFIG” VM-execution control was 1, and either (1) EAX < 63 and the corresponding bit in the PCONFIG-exiting bitmap is 1; or (2) EAX ≥ 63 and bit 63 in the PCONFIG-exiting bitmap is 1.
66	SPP-related event. The processor attempted to determine an access’s sub-page write permission and encountered an SPP miss or an SPP misconfiguration. See Section 30.3.4.2.
67	UMWAIT. Guest software attempted to execute UMWAIT and the “enable user wait and pause” and “RDTSMP exiting” VM-execution controls were both 1.
68	TPAUSE. Guest software attempted to execute TPAUSE and the “enable user wait and pause” and “RDTSMP exiting” VM-execution controls were both 1.
69	LOADIWKEY. Guest software attempted to execute LOADIWKEY and the “LOADIWKEY exiting” VM-execution control was 1.
72	ENQCMD PASID translation failure. A VM exit occurred during PASID translation because the present bit was clear in a PASID-directory entry, the valid bit was clear in a PASID-table entry, or one of the entries set a reserved bit.

Table C-1. Basic Exit Reasons (Contd.)

Basic Exit Reason	Description
73	ENQCMDS PASID translation failure. A VM exit occurred during PASID translation because the present bit was clear in a PASID-directory entry, the valid bit was clear in a PASID-table entry, or one of the entries set a reserved bit.
74	Bus lock. The processor asserted a bus lock while the “bus-lock detection” VM-execution control was 1. (Such VM exits will also set bit 26 of the exit-reason field.)
75	Instruction timeout. The “instruction timeout” VM-execution control was 1 and certain operations prevented the processor from reaching an instruction boundary within the amount of time specified by the instruction-timeout control.
76	SEAMCALL. Guest software attempted to execute SEAMCALL.
77	TDCALL. Guest software attempted to execute TDCALL.
78	RDMSRLIST. Guest software attempted to execute RDMSRLIST and either the “use MSR bitmaps” VM-execution control was 0 or any of the following holds for the index an MSR being accessed: ▪ The index is neither in the range 00000000H – 00001FFFFH nor in the range C0000000H – C0001FFFFH. ▪ The index is in the range 00000000H – 00001FFFFH and the n^{th} bit in read bitmap for low MSRs is 1, where n is the index. ▪ The index is in the range C0000000H – C0001FFFFH and the n^{th} bit in read bitmap for high MSRs is 1, where n is the logical AND of the index and the value 00001FFFFH.
79	WRMSRLIST. Guest software attempted to execute WRMSRLIST and either the “use MSR bitmaps” VM-execution control was 0 or any of the following holds for the index an MSR being accessed: ▪ The index is neither in the range 00000000H – 00001FFFFH nor in the range C0000000H – C0001FFFFH. ▪ The index is in the range 00000000H – 00001FFFFH and the n^{th} bit in write bitmap for low MSRs is 1, where n is the index. ▪ The index is in the range C0000000H – C0001FFFFH and the n^{th} bit in write bitmap for high MSRs is 1, where n is the logical AND of the index and the value 00001FFFFH.

33. Updates to Chapter 2, Volume 4

Change bars and violet text show changes to Chapter 2 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4: Model-Specific Registers*.

Changes to this chapter:

- Removed CPUID Signature DisplayFamily_DisplayModel value of 06_7DH from 10th generation Intel® Core™ processors based on Ice Lake microarchitecture.
- In Section 2.1, added detail for MAXPHYADDR.
- In Table 2-2, the following MSRs were updated:
 - IA32_APIC_BASE (address 1BH)
 - IA32_MKTME_KEYID_PARTITIONING (address 87H)
 - IA32_MTRRCAP (address FEH), bit 15
 - IA32_ARCH_CAPABILITIES (address 10AH), bit 17
 - IA32_MCG_CAP (address 179H), bit 12
 - IA32_MCG_STATUS (address 17AH), bits 3 and 12
 - IA32_RTIT_OUTPUT_BASE (address 560H)
 - IA32_TME_CAPABILITY (address 981H), bits 3 and 28
 - IA32_TME_ACTIVATE (address 982H), bits 7:4, 31, 39:36, and 51
 - IA32_TME_EXCLUDE_MASK (address 983H)
 - IA32_TME_EXCLUDE_BASE (address 984H)
 - IA32_SEAMRR_BASE (address 1400H)
 - IA32_SEAMRR_MASK (address 1401H)
- In Table 2-34, updated MSR IA32_RTIT_OUTPUT_BASE (address 560H).
- In Section 2.17.8, added paragraph for MAXPHYADDR.
- In Table 2-53, Table 2-56, and Table 2-57, updated MSR_CORE_MKTME_ACTIVATE (address 9FFH), bits 39:36.

CHAPTER 2 MODEL-SPECIFIC REGISTERS (MSRS)

This chapter lists MSRs across Intel processor families. All MSRs listed can be read with the RDMSR and written with the WRMSR instructions. The scope of an MSR defines the set of processors that access the same MSR with RDMSR and WRMSR. Thread-scope MSRs are unique to every logical processor. Core-scope MSRs are shared by the threads in the same core; similarly for module-scope, die-scope, and package-scope.

When a processor package contains a single die, die-scope and package-scope are synonymous. When a package contains multiple die, they are distinct.

NOTE

For information on hierarchical level types supported, refer to the CPUID.1FH definition for the actual level type numbers: "V2 Extended Topology Enumeration Leaf" in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A. Also see Section 10.9.1, "Hierarchical Mapping of Shared Resources," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A.

Register addresses are given in both hexadecimal and decimal. The register name is the mnemonic register name and the bit description describes individual bits in registers.

Model specific registers and its bit-fields may be supported for a finite range of processor families/models. To distinguish between different processor family and/or models, software must use CPUID.01H to query the combination of DisplayFamily and DisplayModel to determine model-specific availability of MSRs (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-L," in the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A). Table 2-1 lists the signature values of DisplayFamily and DisplayModel for various processor families or processor number series.

Table 2-1. CPUID Signature Values of DisplayFamily_DisplayModel

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_BDH	Intel® Series 2 Core™ Ultra processors supporting Lunar Lake performance hybrid architecture
06_ADH, 06_AEH	Intel® Xeon® 6 P-core processors based on Granite Rapids microarchitecture
06_AFH	Intel® Xeon® 6 E-core processors based on Sierra Forest microarchitecture
06_AAH	Intel® Core™ Ultra 7 processors supporting Meteor Lake performance hybrid architecture
06_CFH	5th generation Intel® Xeon® Scalable Processor Family based on Emerald Rapids microarchitecture
06_8FH	4th generation Intel® Xeon® Scalable Processor Family based on Sapphire Rapids microarchitecture
06_BAH, 06_B7H, 06_BFH	13th generation Intel® Core™ processors supporting Raptor Lake performance hybrid architecture
06_97H, 06_9AH	12th generation Intel® Core™ processors supporting Alder Lake performance hybrid architecture
06_8CH, 06_8DH	11th generation Intel® Core™ processors based on Tiger Lake microarchitecture
06_A7H	11th generation Intel® Core™ processors based on Rocket Lake microarchitecture
06_7EH	10th generation Intel® Core™ processors based on Ice Lake microarchitecture
06_A5H, 06_A6H	10th generation Intel® Core™ processors based on Comet Lake microarchitecture
06_66H	Intel® Core™ processors based on Cannon Lake microarchitecture
06_8EH, 06_9EH	7th generation Intel® Core™ processors based on Kaby Lake microarchitecture, 8th and 9th generation Intel® Core™ processors based on Coffee Lake microarchitecture, Intel® Xeon® E processors based on Coffee Lake microarchitecture
06_6AH, 06_6CH	3rd generation Intel® Xeon® Scalable Processor Family based on Ice Lake microarchitecture

Table 2-1. CPUID Signature Values of DisplayFamily_DisplayModel (Contd.)

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_55H	Intel® Xeon® Scalable Processor Family based on Skylake microarchitecture, 2nd generation Intel® Xeon® Scalable Processor Family based on Cascade Lake product, and 3rd generation Intel® Xeon® Scalable Processor Family based on Cooper Lake product
06_4EH, 06_5EH	6th generation Intel Core processors and Intel Xeon processor E3-1500m v5 product family and E3-1200 v5 product family based on Skylake microarchitecture
06_85H	Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series based on Knights Mill microarchitecture
06_57H	Intel® Xeon Phi™ Processor 3200, 5200, 7200 Series based on Knights Landing microarchitecture
06_56H	Intel Xeon processor D-1500 product family based on Broadwell microarchitecture
06_4FH	Intel Xeon processor E5 v4 Family based on Broadwell microarchitecture, Intel Xeon processor E7 v4 Family, Intel Core i7-69xx Processor Extreme Edition
06_47H	5th generation Intel Core processors, Intel Xeon processor E3-1200 v4 product family based on Broadwell microarchitecture
06_3DH	Intel Core M-5xxx Processor, 5th generation Intel Core processors based on Broadwell microarchitecture
06_3FH	Intel Xeon processor E5-4600/2600/1600 v3 product families, Intel Xeon processor E7 v3 product families based on Haswell-E microarchitecture, Intel Core i7-59xx Processor Extreme Edition
06_3CH, 06_45H, 06_46H	4th Generation Intel Core processor and Intel Xeon processor E3-1200 v3 product family based on Haswell microarchitecture
06_3EH	Intel Xeon processor E7-8800/4800/2800 v2 product families based on Ivy Bridge-E microarchitecture
06_3EH	Intel Xeon processor E5-2600/1600 v2 product families and Intel Xeon processor E5-2400 v2 product family based on Ivy Bridge-E microarchitecture, Intel Core i7-49xx Processor Extreme Edition
06_3AH	3rd Generation Intel Core Processor and Intel Xeon processor E3-1200 v2 product family based on Ivy Bridge microarchitecture
06_2DH	Intel Xeon processor E5 Family based on Sandy Bridge microarchitecture, Intel Core i7-39xx Processor Extreme Edition
06_2FH	Intel Xeon Processor E7 Family
06_2AH	Intel Xeon processor E3-1200 product family; 2nd Generation Intel Core i7, i5, i3 Processors 2xxx Series
06_2EH	Intel Xeon processor 7500, 6500 series
06_25H, 06_2CH	Intel Xeon processors 3600, 5600 series, Intel Core i7, i5, and i3 Processors
06_1EH, 06_1FH	Intel Core i7 and i5 Processors
06_1AH	Intel Core i7 Processor, Intel Xeon processor 3400, 3500, 5500 series
06_1DH	Intel Xeon processor MP 7400 series
06_17H	Intel Xeon processor 3100, 3300, 5200, 5400 series, Intel Core 2 Quad processors 8000, 9000 series
06_0FH	Intel Xeon processor 3000, 3200, 5100, 5300, 7300 series, Intel Core 2 Quad processor 6000 series, Intel Core 2 Extreme 6000 series, Intel Core 2 Duo 4000, 5000, 6000, 7000 series processors, Intel Pentium dual-core processors
06_0EH	Intel Core Duo, Intel Core Solo processors
06_0DH	Intel Pentium M processor
06_86H, 06_96H, 06_9CH	Intel Atom® processors, Intel® Celeron® processors, Intel® Pentium® processors, and Intel® Pentium® Silver processors based on Tremont Microarchitecture
06_7AH	Intel Atom processors based on Goldmont Plus microarchitecture
06_5FH	Intel Atom processors based on Goldmont microarchitecture (Denverton)
06_5CH	Intel Atom processors based on Goldmont microarchitecture

Table 2-1. CPUID Signature Values of DisplayFamily_DisplayModel (Contd.)

DisplayFamily_DisplayModel	Processor Families/Processor Number Series
06_4CH	Intel Atom processor X7-Z8000 and X5-Z8000 series based on Airmont microarchitecture
06_5DH	Intel Atom processor X3-C3000 based on Silvermont microarchitecture
06_5AH	Intel Atom processor Z3500 series
06_4AH	Intel Atom processor Z3400 series
06_37H	Intel Atom processor E3000 series, Z3600 series, Z3700 series
06_4DH	Intel Atom processor C2000 series
06_36H	Intel Atom processor S1000 Series
06_1CH, 06_26H, 06_27H, 06_35H, 06_36H	Intel Atom processor family, Intel Atom processor D2000, N2000, E2000, Z2000, C1000 series
0F_06H	Intel Xeon processor 7100, 5000 Series, Intel Xeon Processor MP, Intel Pentium 4, Pentium D processors
0F_03H, 0F_04H	Intel Xeon processor, Intel Xeon processor MP, Intel Pentium 4, Pentium D processors
06_09H	Intel Pentium M processor
0F_02H	Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors
0F_0H, 0F_01H	Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors
06_7H, 06_08H, 06_0AH, 06_0BH	Intel Pentium III Xeon processor, Intel Pentium III processor
06_03H, 06_05H	Intel Pentium II Xeon processor, Intel Pentium II processor
06_01H	Intel Pentium Pro processor
05_01H, 05_02H, 05_04H	Intel Pentium processor, Intel Pentium processor with MMX Technology
06_BEH	Intel® Processor and Intel® Core™ i3 and Intel® Core™ 3 N-Series Processors and Intel Atom® x7000 Processor Series based on Gracemont microarchitecture

The Intel® Quark™ SoC X1000 processor can be identified by the signature of DisplayFamily_DisplayModel = 05_09H and SteppingID = 0

2.1 ARCHITECTURAL MSRS

Many MSRs have carried over from one generation of IA-32 processors to the next and to Intel 64 processors. A subset of MSRs and associated bit fields, which do not change on future processor generations, are now considered architectural MSRs. For historical reasons (beginning with the Pentium 4 processor), these “architectural MSRs” were given the prefix “IA32_”. Table 2-2 lists the architectural MSRs, their addresses, their current names, their names in previous IA-32 processors, and bit fields that are considered architectural. MSR addresses outside Table 2-2 and certain bit fields in an MSR address that may overlap with architectural MSR addresses are model-specific. Code that accesses a model-specific MSR and that is executed on a processor that does not support that MSR will generate an exception.

Architectural MSR or individual bit fields in an architectural MSR may be introduced or transitioned at the granularity of certain processor family/model or the presence of certain CPUID feature flags. The right-most column of Table 2-2 provides information on the introduction of each architectural MSR or its individual fields. This information is expressed either as signature values of “DF_DM” (see Table 2-1) or via CPUID flags.

Certain bit field position may be related to the maximum physical address width, the value of which is expressed as “MAXPHYADDR” in Table 2-2. MAXPHYADDR is derived from the value enumerated in CPUID.80000008H:EAX[7:0] (this width is at most 52). However, if IA32_TME_ACTIVATE[0] = 1 (indicating that TME has been configured), MAXPHYADDR is reduced by the value of IA32_TME_ACTIVATE[39:36] when a logical processor is outside secure arbitration mode (SEAM; see Chapter 34 of the Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3); the value is not reduced in SEAM.¹

MSR address range between 40000000H - 4000FFFFH is marked as a specially reserved range. All existing and future processors will not implement any features using any MSR in this range.

Table 2-2. IA-32 Architectural MSRs

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)	
Bit Fields	MSR/Bit Description		Comment
Register Address: 0H, 0		IA32_P5_MC_ADDR (P5_MC_ADDR)	
See Section 2.23, "MSRs in Pentium Processors."			Pentium Processor (05_01H)
Register Address: 1H, 1		IA32_P5_MC_TYPE (P5_MC_TYPE)	
See Section 2.23, "MSRs in Pentium Processors."			DF_DM = 05_01H
Register Address: 6H, 6		IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination."			0F_03H
Register Address: 10H, 16		IA32_TIME_STAMP_COUNTER (TSC)	
See Section 19.17, "Time-Stamp Counter."			05_01H
Register Address: 17H, 23		IA32_PLATFORM_ID (MSR_PLATFORM_ID)	
Platform ID (R/O) The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.			06_01H
49:0	Reserved.		
52:50	Platform ID (R/O) Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7		
63:53	Reserved.		
Register Address: 1BH, 27		IA32_APIC_BASE (APIC_BASE)	
This register holds the APIC base address, permitting the relocation of the APIC memory map. See Section 12.4.4, "Local APIC Status and Location," and Section 12.4.5, "Relocating the Local APIC Registers."			06_01H
7:0	Reserved.		
8	BSP Flag (R/W)		
9	Reserved.		
10	Enable x2APIC mode.		06_1AH
11	APIC Global Enable (R/W)		

1. IA32_TME_ACTIVATE[39:36] is the number of physical-address bits reserved to encode TDX-private key identifiers. This number is never greater than IA32_TME_ACTIVATE[35:32], which is the number physical-address bits used for key identifiers generally.

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
MAXAPICADDR -1:12	APIC Base (R/W)	MAXAPICADDR is normally CPUID.80000008H:EAX[7:0] for processors that support CPUID.80000008H and 36 otherwise. If IA32_TME_ACTIVATE[39:36] > 0, MAXAPICADDR is reduced by IA32_TME_ACTIVATE[35:32].
63: MAXAPICADDR	Reserved.	
Register Address: 2FH, 47		IA32_BARRIER
IA32_BARRIER (R/O) The IA32_BARRIER MSR ensures ordered execution by acting like LFENCE, controlling the sequencing of subsequent MSR reads after prior MSR reads and instructions.		CPUID.07H.01H:EAX[27] = 1
31:0	DATA Reserved. Always 0.	
63:32	Reserved.	
Register Address: 3AH, 58		IA32_FEATURE_CONTROL
Control Features in Intel 64 Processor (R/W)		If any one enumeration condition for defined bit field holds.
0	Lock bit (R/WO): (1 = locked). When set, locks this MSR from being written; writes to this bit will result in GP(0). Note: Once the Lock bit is set, the contents of this register cannot be modified. Therefore the lock bit must be set after configuring support for Intel Virtualization Technology and prior to transferring control to an option ROM or the OS. Hence, once the Lock bit is set, the entire IA32_FEATURE_CONTROL contents are preserved across RESET when PWRGOOD is not deasserted.	If any one enumeration condition for defined bit field position greater than bit 0 holds.
1	Enable VMX inside SMX operation (R/WL) This bit enables a system executive to use VMX in conjunction with SMX to support Intel® Trusted Execution Technology. BIOS must set this bit only when CPUID.01H:ECX[6:5] returns 11b (SMX and VMX respectively).	If CPUID.01H:ECX[5] = 1 && CPUID.01H:ECX[6] = 1
2	Enable VMX outside SMX operation (R/WL) This bit enables VMX for a system executive that does not require SMX. BIOS must set this bit only when CPUID.01H:ECX.VMX[5] is set.	If CPUID.01H:ECX[5] = 1
7:3	Reserved.	
14:8	SENTER Local Function Enables (R/WL) When set, each bit in the field represents an enable control for a corresponding SENTER function. This field is supported only if CPUID.01H:ECX[6] is set.	If CPUID.01H:ECX[6] = 1
15	SENTER Global Enable (R/WL) This bit must be set to enable SENTER leaf functions. This bit is supported only if CPUID.01H:ECX[6] is set.	If CPUID.01H:ECX[6] = 1
16	Reserved.	
17	SGX Launch Control Enable (R/WL) This bit must be set to enable runtime re-configuration of SGX Launch Control via the IA32_SGXLEPUBKEYHASHn MSR.	If CPUID.07H.00H:ECX[30] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
18	SGX Global Enable (R/WL) This bit must be set to enable SGX leaf functions.	If CPUID.07H.00H:EBX[2] = 1
19	Reserved.	
20	LMCE On (R/WL) When set, system software can program the MSRs associated with LMCE to configure delivery of some machine check exceptions to a single logical processor.	If IA32_MCG_CAP[27] = 1
63:21	Reserved.	
Register Address: 3BH, 59		IA32_TSC_ADJUST
Per Logical Processor TSC Adjust (R/Write to clear)		If CPUID.07H.00H:EBX[1] = 1
63:0	THREAD_ADJUST Local offset value of the IA32_TSC for a logical processor. Reset value is zero. A write to IA32_TSC will modify the local offset in IA32_TSC_ADJUST and the content of IA32_TSC, but does not affect the internal invariant TSC hardware.	
Register Address: 48H, 72		IA32_SPEC_CTRL
Speculation Control (R/W) The MSR bits are defined as logical processor scope. On some core implementations, the bits may impact sibling logical processors on the same core. This MSR has a value of 0 after reset and is unaffected by INIT# or SIPI#.		If any one of the enumeration conditions for defined bit field positions holds.
0	Indirect Branch Restricted Speculation (IBRS). Restricts speculation of indirect branch.	If CPUID.07H.00H:EDX[26] = 1
1	Single Thread Indirect Branch Predictors (STIBP). Prevents indirect branch predictions on all logical processors on the core from being controlled by any sibling logical processor in the same core.	If CPUID.07H.00H:EDX[27] = 1
2	Speculative Store Bypass Disable (SSBD) delays speculative execution of a load until the addresses for all older stores are known.	If CPUID.07H.00H:EDX[31] = 1
3	IPRED_DIS_U If 1, enables IPRED_DIS control for CPL3.	If CPUID.07H.02H:EDX[1] = 1
4	IPRED_DIS_S If 1, enables IPRED_DIS control for CPL0/1/2.	If CPUID.07H.02H:EDX[1] = 1
5	RRSBA_DIS_U If 1, disables RRSBA behavior for CPL3.	If CPUID.07H.02H:EDX[2] = 1
6	RRSBA_DIS_S If 1, disables RRSBA behavior for CPL0/1/2.	If CPUID.07H.02H:EDX[2] = 1
7	PSFD If 1, disables Fast Store Forwarding Predictor. Note that setting bit 2 (SSBD) also disables this.	If CPUID.07H.02H:EDX[0] = 1
8	DDPD_U If 1, disables the Data Dependent Prefetcher that examines data values in memory while CPL = 3. Note that setting bit 2 (SSBD) also disables this.	If CPUID.07H.02H:EDX[3] = 1
9	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
10	BHI_DIS_S When '1, enables BHI_DIS_S behavior.	If CPUID.07H.02H:EDX[4] = 1
63:11	Reserved.	
Register Address: 49H, 73		IA32_PRED_CMD
Prediction Command (W0) Gives software a way to issue commands that affect the state of predictors.		If any one of the enumeration conditions for defined bit field positions holds.
0	Indirect Branch Prediction Barrier (IBPB)	If CPUID.07H.00H:EDX[26] = 1
63:1	Reserved.	
Register Address: 4EH, 78		IA32_PPIN_CTL
Protected Processor Inventory Number Enable Control (R/W)		If CPUID.07H.01H:EBX[0] = 1 ¹
0	LockOut (R/W0) If 0, indicates that further writes to IA32_PPIN_CTL is allowed. If 1, indicates that further writes to IA32_PPIN_CTL is disallowed. Writing 1 to this bit is only permitted if the Enable_PPIN bit is clear. The Privileged System Software Inventory Agent should read IA32_PPIN_CTL[bit 1] to determine if IA32_PPIN is accessible. The Privileged System Software Inventory Agent is not expected to write to this MSR.	
1	Enable_PPIN (R/W) If 1, indicates that IA32_PPIN is accessible using RDMSR. If 0, indicates that IA32_PPIN is inaccessible using RDMSR. Any attempt to read IA32_PPIN will cause #GP.	
63:2	Reserved.	
Register Address: 4FH, 79		IA32_PPIN
Protected Processor Inventory Number (R/O)		If CPUID.07H.01H:EBX[0] = 1 ¹
63:0	Protected Processor Inventory Number (R/O) A unique value within a given CPUID family/model/stepping signature that a privileged inventory initialization agent can access to identify each physical processor, when access to IA32_PPIN is enabled. Access to IA32_PPIN is permitted only if IA32_PPIN_CTL[bits 1:0] = '10b'.	
Register Address: 79H, 121		IA32_BIOS_UPDT_TRIG (BIOS_UPDT_TRIG)
BIOS Update Trigger (W) Executing a WRMSR instruction to this MSR causes a microcode update to be loaded into the processor. See Section 11.11.6, "Microcode Update Loader." A processor may prevent writing to this MSR when loading guest states on VM entries or saving guest states on VM exits.		06_01H
Register Address: 7AH, 122		IA32_FEATURE_ACTIVATION
Feature Activation (R/W) Implements Feature Activation command. WRMSR to this address activates all 'activatable' features on this thread.		
0	SE Secure Enclaves feature activation.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
1	KL Keylocker feature activation.	
63:2	Reserved.	
Register Address: 7BH, 123		IA32_MCU_ENUMERATION
IA32_MCU_ENUMERATION (R/O) Enumeration of architectural features.		
0	UNIFORM_MCU_AVAIL When set to 1, uniform microcode update is available, and UNIFORM_MCU_SCOPE (bits [10:8]) indicates the scope of writes to IA32_BIOS_UPDT_TRIG. When set to 0, uniform microcode update is not available, and writes to IA32_BIOS_UPDT_TRIG are core scoped.	
1	UNIFORM_MCU_CONFIG_REQD When set to 1, indicates that configuration is required to ensure that all MCU components are updated on WRMSR 79H, and UNIFORM_MCU_CONFIG_COMPLETE (bit 2) should be checked to determine whether the necessary configuration has been completed. When set to 0, indicates that no configuration is required, and UNIFORM_MCU_CONFIG_COMPLETE should be ignored.	
2	UNIFORM_MCU_CONFIG_COMPLETE If UNIFORM_MCU_CONFIG_REQD (bit 1) is 0, then this bit should be ignored. If UNIFORM_MCU_CONFIG_REQD is 1, then this bit indicates whether all necessary configurations have been completed to ensure that all MCU components will be updated on WRMSR 79H.	
3	ARCH_ROLLBACK_SVN_COMMIT When set to 1, indicates support for the MCU deferred SVN architecture, SVN reporting architecture, and MCU rollback architecture.	
4	MCU_STAGING When set to 1, indicates that the microcode update staging capability is supported by the processor. When supported, the use of the MCU staging capability is recommended to reduce the latency of the IA32_BIOS_UPDT_TRIG operation.	
7:5	Reserved for future use.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
15:8	UNIFORM_MCU_SCOPE Indicates the current* uniform microcode update scope: ▪ 0x02: Core Scoped ▪ 0x03: Module Scoped** ▪ 0x04: Tile Scoped** ▪ 0x05: Die Scoped** ▪ 0x80: Package Scoped ▪ 0xC0: Platform Scoped All others: Reserved for future use * The value of this field reflects the state of platform configuration and may change as the configuration changes during the boot process. Once configuration is complete, it is not expected to change during runtime. ** If these domains are enumerated by CPUID.1FH, then this field may also report them as appropriate.	
63:16	Reserved for future use.	
Register Address: 7CH, 124		IA32_MCU_STATUS
MCU Status (R/O) Communicates results from the previous patch loads.		
0	MCU_PARTIAL_UPDATE When set to 1, indicates that the most recent write to IA32_BIOS_UPDT_TRIG resulted in a partial update. This means that microcode update components were only partially updated after some portion of the MCU had already been committed and the Revision ID had been updated.	
1	AUTH_FAIL_ON_MCU_COMPONENT When set to 1, indicates that an authentication failure occurred on some portion of the MCU after another portion of the MCU had already been committed and the Revision ID had already been updated on the most recent write to IA32_BIOS_UPDT_TRIG.	
2	Reserved for future use.	
3	POST_BIOS_MCU When set to 1, indicates that an update was successfully loaded via IA32_BIOS_UPDT_TRIG after bit 0 of MSR_BIOS_DONE (address 151H) was set to 1.	
63:4	Reserved for future use.	
Register Address: 82H, 130		IA32_FZM_RANGE_INDEX
IA32_FZM_RANGE_INDEX (R/W) Index and Domain handle for a valid FZM region. Programmed by software and used by other FRM MSRs FZM Range Index register to R/W Domain Index.		
3:0	REGION_INDEX Holds the Index of domain.	
7:4	Reserved.	
12:8	DOMAIN_HANDLE Holds the Domain Handle.	
63:13	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
Register Address: 83H, 131		IA32_FZM_DOMAIN_CONFIG
IA32_FZM_DOMAIN_CONFIG (R/O) Bit mask of valid regions within the domain identified by FZM_RANGE_INDEX.		
63:0	REGION_BITMAP Bitmap of valid regions for a given domain.	
Register Address: 84H, 132		IA32_FZM_RANGE_STARTADDR
IA32_FZM_RANGE_STARTADDR (R/O) Start address of the FZM range pointed to by FZM_RANGE_INDEX.		
51:0	START_ADDR Start address of the specified domain in FZM_RANGE_INDEX.	
63:52	Reserved.	
Register Address: 85H, 133		IA32_FZM_RANGE_ENDADDR
IA32_FZM_RANGE_ENDADDR (R/O) End address of the specified domain in FZM_RANGE_INDEX.		
51:0	END_ADDR End address of the specified domain in FZM_RANGE_INDEX.	
63:52	Reserved.	
Register Address: 86H, 134		IA32_FZM_RANGE_WRITESTATUS
IA32_FZM_RANGE_WRITESTATUS (R/O) Write status of the FZM range pointed to by FZM_RANGE_INDEX.		
0	WRITE_STATUS Write status of the specified domain in FZM_RANGE_INDEX.	
1	READ_STATUS Read status of the specified domain in FZM_RANGE_INDEX.	
63:2	Reserved.	
Register Address: 87H, 135		IA32_MKTME_KEYID_PARTITIONING
MKTME KEY ID Partitioning (R/O) Enumerates the number of activated KeyIDs for Intel TME-MK and Intel TDX.		
31:0	NUM_MKTME_KEYIDS Number of activated Intel TME-MK KeyIDs. This field is supported on all parts that enumerate support for Intel Total Memory Encryption - Multi-Key (Intel TME-MK). If IA32_TME_ACTIVATE.LOCK is 1, this field reports the number of shared KeyIDs supported by the processor (all KeyIDs other than SEAM-private KeyIDs and KeyID 0); otherwise, it reports 0. Intel TME-MK KeyIDs will always span the KeyID range [1 ... NUM_MKTME_KEYIDS]. <i>Note: KeyID 0 is reserved for TME and will not be included.</i>	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
63:32	NUM_TDX_PRIV_KEYIDS Number of activated SEAM-private KeyIDs. This field is supported on all parts that enumerate support for SEAM mode. If IA32_TME_ACTIVATE.LOCK is 1, this field reports the number of SEAM-private KeyIDs supported by the processor (all KeyIDs, except shared KeyIDs and KeyID 0); otherwise, it reports 0. SEAM-private KeyIDs will always span the range [NUM_MKTME_KEYIDS+1... (NUM_MKTME_KEYIDS + NUM_TDX_PRIV_KEYIDS)]. Note: KeyID 0 is reserved for TME and will not be included.	
Register Address: 8BH, 139		IA32_BIOS_SIGN_ID (BIOS_SIGN/BBL_CR_D3)
BIOS Update Signature (R/W) Returns the microcode update signature following the execution of CPUID.01H. A processor may prevent writing to this MSR when loading guest states on VM entries or saving guest states on VM exits.		06_01H
31:0	Reserved.	
63:32	PATCH_SIGN_ID It is recommended that this field be preloaded with zero prior to executing CPUID. If the field remains zero following the execution of CPUID, this indicates that no microcode update is loaded. Any non-zero value is the microcode update signature patch signature ID.	
Register Address: 8CH, 140		IA32_SGXLEPUBKEYHASH0
IA32_SGXLEPUBKEYHASH[63:0] (R/W) Bits 63:0 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Read permitted if CPUID.12H.00H:EAX[0] = 1 && CPUID.07H.00H:ECX[30] = 1. Write permitted if CPUID.12H.00H:EAX[0] = 1 && IA32_FEATURE_CONTROL[17] = 1 && IA32_FEATURE_CONTROL[0] = 1.
Register Address: 8DH, 141		IA32_SGXLEPUBKEYHASH1
IA32_SGXLEPUBKEYHASH[127:64] (R/W) Bits 127:64 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 8EH, 142		IA32_SGXLEPUBKEYHASH2
IA32_SGXLEPUBKEYHASH[191:128] (R/W) Bits 191:128 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 8FH, 143		IA32_SGXLEPUBKEYHASH3
IA32_SGXLEPUBKEYHASH[255:192] (R/W) Bits 255:192 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 90H, 144		IA32_SGXLEPUBKEYHASH4
IA32_SGXLEPUBKEYHASH[319:256] (R/W) Bits 319:256 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
Register Address: 91H, 145		IA32_SGXLEPUBKEYHASH5
IA32_SGXLEPUBKEYHASH[383:320] (R/W) Bits 383:320 of the SHA256 digest of the SIGSTRUCT.MODULUS for SGX Launch Enclave. On reset, the default value is the digest of Intel's signing key.		Same comment in MSR listing for IA32_SGXLEPUBKEYHASH0 (MSR address 8CH, 140) applies here.
Register Address: 9BH, 155		IA32_SMM_MONITOR_CTL
SMM Monitor Configuration (R/W)		If CPUID.01H:ECX[5] = 1 CPUID.01H:ECX[6] = 1
0	Valid (R/W)	
1	Reserved.	
2	Controls SMI unblocking by VMXOFF (see Section 33.14.4).	If IA32_VMX_MISC[28]
11:3	Reserved.	
31:12	MSEG Base (R/W)	
63:32	Reserved.	
Register Address: 9EH, 158		IA32_SMBASE
Base address of the logical processor's SMRAM image (R/O, SMM only).		If IA32_VMX_MISC[15]
Register Address: BCH, 188		IA32_MISC_PACKAGE_CTL5
Power Filtering Control (R/W) This MSR has a value of 0 after reset and is unaffected by INIT# or SIPI#.		If IA32_ARCH_CAPABILITIES [10] = 1
0	ENERGY_FILTERING_ENABLE (R/W) If set, RAPL MSRs report filtered processor power consumption data. This bit can be changed from 0 to 1, but cannot be changed from 1 to 0. After setting, all attempts to clear it are ignored until the next processor reset.	If IA32_ARCH_CAPABILITIES [11] = 1
63:1	Reserved.	
Register Address: BDH, 189		IA32_XAPIC_DISABLE_STATUS
xAPIC Disable Status (R/O)		If CPUID.07H:00H:EDX[29] = 1 and IA32_ARCH_CAPABILITIES [21] = 1
0	LEGACY_XAPIC_DISABLED When set, indicates that the local APIC is in x2APIC mode (IA32_APIC_BASE.EXTD = 1) and that attempts to clear IA32_APIC_BASE.EXTD will fail (e.g., WRMSR will #GP).	
63:1	Reserved.	
Register Address: C1H, 193		IA32_PMC0 (PERFCTR0)
General Performance Counter 0 (R/W)		If CPUID.0AH:EAX[15:8] > 0
Register Address: C2H, 194		IA32_PMC1 (PERFCTR1)
General Performance Counter 1 (R/W)		If CPUID.0AH:EAX[15:8] > 1
Register Address: C3H, 195		IA32_PMC2
General Performance Counter 2 (R/W)		If CPUID.0AH:EAX[15:8] > 2
Register Address: C4H, 196		IA32_PMC3
General Performance Counter 3 (R/W)		If CPUID.0AH:EAX[15:8] > 3

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
Register Address: C5H, 197		IA32_PMC4
General Performance Counter 4 (R/W)		If CPUID.0AH:EAX[15:8] > 4
Register Address: C6H, 198		IA32_PMC5
General Performance Counter 5 (R/W)		If CPUID.0AH:EAX[15:8] > 5
Register Address: C7H, 199		IA32_PMC6
General Performance Counter 6 (R/W)		If CPUID.0AH:EAX[15:8] > 6
Register Address: C8H, 200		IA32_PMC7
General Performance Counter 7 (R/W)		If CPUID.0AH:EAX[15:8] > 7
Register Address: C9H, 201		IA32_PMC8
General Performance Counter 8 (R/W)		If CPUID.0AH:EAX[15:8] > 8
Register Address: CAH, 202		IA32_PMC9
General Performance Counter 9 (R/W)		If CPUID.0AH:EAX[15:8] > 9
Register Address: CFH, 207		IA32_CORE_CAPABILITIES
IA32 Core Capabilities Register		If CPUID.07H.00H:EDX[30] = 1
63:0	Reserved.	No architecturally defined bits.
Register Address: E1H, 225		IA32_UMWAIT_CONTROL
UMWAIT Control (R/W)		
0	C0.2 is not allowed by the OS. Value of "1" means all C0.2 requests revert to C0.1.	
1	Reserved.	
31:2	Determines the maximum time in TSC-quanta that the processor can reside in either C0.1 or C0.2. A zero value indicates no maximum time. The maximum time value is a 32-bit value where the upper 30 bits come from this field and the lower two bits are zero.	
Register Address: E7H, 231		IA32_MPERF
TSC Frequency Clock Counter (R/Write to clear)		If CPUID.06H:ECX[0] = 1
63:0	CO_MCNT: C0 TSC Frequency Clock Count Increments at fixed interval (relative to TSC freq.) when the logical processor is in C0. Cleared upon overflow / wrap-around of IA32_APERF.	
Register Address: E8H, 232		IA32_APERF
Actual Performance Clock Counter (R/Write to clear)		If CPUID.06H:ECX[0] = 1
63:0	CO_ACNT: C0 Actual Frequency Clock Count Accumulates core clock counts at the coordinated clock frequency, when the logical processor is in C0. Cleared upon overflow / wrap-around of IA32_MPERF.	
Register Address: FEH, 254		IA32_MTRRCAP (MTRRcap)
MTRR Capability (R/O) See Section 13.11.2.1, "IA32_MTRR_DEF_TYPE MSR."		06_01H
7:0	VCNT: The number of variable memory type ranges in the processor.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
8	Fixed range MTRRs are supported when set.	
9	Reserved.	
10	WC Supported when set.	
11	SMRR Supported when set.	
12	PRMRR supported when set.	
14:13	Reserved.	
15	SEAMRR supported when set.	
63:16	Reserved.	
Register Address: 10AH, 266		IA32_ARCH_CAPABILITIES
Enumeration of Architectural Features (R/O)		If CPUID.07H.00H:EDX[29] = 1
0	RDCL_NO: The processor is not susceptible to Rogue Data Cache Load (RDCL).	
1	IBRS_ALL: The processor supports enhanced IBRS.	
2	RSBA: The processor supports RSB Alternate. Alternative branch predictors may be used by RET instructions when the RSB is empty. SW using retpoline may be affected by this behavior.	
3	SKIP_L1DFL_VMENTRY: A value of 1 indicates the hypervisor need not flush the L1D on VM entry.	
4	SSB_NO: Processor is not susceptible to Speculative Store Bypass.	
5	MDS_NO: Processor is not susceptible to Microarchitectural Data Sampling (MDS).	
6	IF_PSCCHANGE_MC_NO: The processor is not susceptible to a machine check error due to modifying the size of a code page without TLB invalidation.	
7	TSX_CTRL: If 1, indicates presence of IA32_TSX_CTRL MSR.	
8	TAA_NO: If 1, processor is not affected by TAA.	
9	MCU_CONTROL: If 1, the processor supports the IA32_MCU_CONTROL MSR.	
10	MISC_PACKAGE_CTL: The processor supports IA32_MISC_PACKAGE_CTL MSR.	
11	ENERGY_FILTERING_CTL: The processor supports setting and reading the IA32_MISC_PACKAGE_CTL[0] (ENERGY_FILTERING_ENABLE) bit.	
12	DOITM: If 1, the processor supports Data Operand Independent Timing Mode.	
13	SBDR_SSDP_NO: The processor is not affected by either the Shared Buffers Data Read (SBDR) vulnerability or the Sideband Stale Data Propagator (SSDP).	
14	FBSDP_NO: The processor is not affected by the Fill Buffer Stale Data Propagator (FBSDP).	
15	PSDP_NO: The processor is not affected by vulnerabilities involving the Primary Stale Data Propagator (PSDP).	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
16	MCU_ENUMERATION: If 1, the processor supports the IA32_MCU_ENUMERATION and IA32_MCU_STATUS MSRs.	
17	FB_CLEAR: If 1, the processor supports overwrite of fill buffer values as part of MD_CLEAR operations with the VERW instruction. On these processors, L1D_FLUSH does not overwrite fill buffer values.	
18	FB_CLEAR_CTRL: If 1, the processor supports the IA32_MCU_OPT_CTRL MSR and allows software to set bit 3 of that MSR (FB_CLEAR_DIS).	
19	RRSBA: A value of 1 indicates the processor may have the RRSBA alternate prediction behavior, if not disabled by RRSBA_DIS_U or RRSBA_DIS_S.	
20	BHI_NO: A value of 1 indicates BHI_NO branch prediction behavior, regardless of the value of IA32_SPEC_CTRL[BHI_DIS_S] MSR bit.	
21	XAPIC_DISABLE_STATUS: Enumerates that the IA32_XAPIC_DISABLE_STATUS MSR exists, and that bit 0 specifies whether the legacy xAPIC is disabled and APIC state is locked to x2APIC.	
22	MCU_EXTENDED_SERVICE: If 1, the processor supports MCU Extended servicing - IA32_MCU_EXT_SERVICE MSR.	
23	OVERCLOCKING_STATUS: If set, the IA32_OVERCLOCKING_STATUS MSR exists.	
24	PBSRB_NO: If 1, the processor is not affected by issues related to Post-Barrier Return Stack Buffer Predictions.	
25	GDS_CTRL: If 1, the processor supports the GDS_MITG_DIS and GDS_MITG_LOCK bits of the IA32_MCU_OPT_CTRL MSR.	
26	GDS_NO: If 1, the processor is not affected by Gather Data Sampling.	
27	RFDS_NO: If 1, the processor is not affected by Register File Data Sampling.	
28	RFDS_CLEAR: If 1, when VERW is executed the processor will clear stale data from register files affected by Register File Data Sampling.	
29	IGN_UMONITOR_SUPPORT If 0, IA32_MCU_OPT_CTRL bit 6 (IGN_UMONITOR) is not supported. If 1, it indicates support of IA32_MCU_OPT_CTRL bit 6 (IGN_UMONITOR).	
30	MON_UMON_MITG_SUPPORT If 0, IA32_MCU_OPT_CTRL bit 7 (MON_UMON_MITG) is not supported. If 1, it indicates support of IA32_MCU_OPT_CTRL bit 7 (MON_UMON_MITG).	
31	Reserved.	
32	PBOPT_SUPPORT If 0, IA32_PBOPT_CTRL bit 0 (Prediction Barrier Option [PBOPT]) is not supported. If 1, IA32_PBOPT_CTRL bit 0 (Prediction Barrier Option [PBOPT]) is supported.	
61:33	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)	
Bit Fields	MSR/Bit Description		Comment
62	ITS_NO If 0, the hypervisor indicates that the system is not affected by Indirect Target Selection. If 1, the hypervisor indicates that the system may be affected by Indirect Target Selection.		
63	Reserved.		
Register Address: 10BH, 267		IA32_FLUSH_CMD	
Flush Command (W0) Gives software a way to invalidate structures with finer granularity than other architectural methods.			If any one of the enumeration conditions for defined bit field positions holds.
0	L1D_FLUSH Writeback and invalidate the L1 data cache.		If CPUID.07H.00H:EDX[28] = 1
63:1	Reserved.		
Register Address: 10FH, 271		IA32_TSX_FORCE_ABORT	
TSX Force Abort			If CPUID.07H.00H:EDX[13] = 1
0	RTM_FORCE_ABORT If 1, all RTM transactions abort with EAX code 0.		R/W, Default: 0 If CPUID.07H.00H:EDX[11] = 1, bit 0 is always 1 and writes to change it are ignored. If SDV_ENABLE_RTM is 1, bit 0 is always 0 and writes to change it are ignored.
1	TSX_CPUID_CLEAR When set, CPUID.07H.00H:EBX[11] = 0 and CPUID.07H.00H:EBX[4] = 0.		R/W, Default: 0 Can be set only if CPUID.07H.00H:EDX[11] = 1 or if SDV_ENABLE_RTM is 1.
2	SDV_ENABLE_RTM When set, CPUID.07H.00H:EDX[11] = 0 and the processor may not force abort RTM. This unsupported mode should only be used for software development and not for production usage.		R/W, Default: 0 If 0, can be set only if CPUID.07H.00H:EDX[11] = 1.
63:3	Reserved.		
Register Address: 122H, 290		IA32_TSX_CTRL	
IA32_TSX_CTRL (R/W)			Thread scope. Not architecturally serializing. Available when CPUID.07H.00H:EDX.ARCH_CAPABILITIES[29] = 1 and IA32_ARCH_CAPABILITIES.bit 7 = 1.
0	RTM_DISABLE When set to 1, XBEGIN will always abort with EAX code 0.		

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
1	TSX_CPUID_CLEAR When set to 1, CPUID.07H.00H:EBX.RTM[11] and CPUID.07H.00H:EBX.HLE[4] report 0. When set to 0 and the SKU supports TSX, these bits will return 1.	
63:2	Reserved.	
Register Address: 123H, 291		IA32_MCU_OPT_CTRL
Microcode Update Option Control (R/W)		If CPUID.07H.00H:EDX[9] = 1 or CPUID.07H.00H:EDX[11] = 1 IA32_ARCH_CAPABILITIES [18] = 1 or IA32_ARCH_CAPABILITIES [25] = 1 or IA32_ARCH_CAPABILITIES [29] = 1 or IA32_ARCH_CAPABILITIES [30] = 1
0	RNGDS_MITG_DIS (R/W) If 0 (default), SRBDS mitigation is enabled for RDRAND and RDSEED. If 1, SRBDS mitigation is disabled for RDRAND and RDSEED executed outside of Intel SGX enclaves.	If CPUID.07H.00H:EDX[9] = 1
1	RTM_ALLOW If 0, XBEGIN will always abort with EAX code 0. If 1, XBEGIN behavior depends on the value of IA32_TSX_CTRL[RTM_DISABLE].	If CPUID.07H.00H:EDX[11] = 1 Read/Write Setting RTM_LOCKED prevents writes to this bit.
2	RTM_LOCKED When 1, RTM_ALLOW is locked at zero, writes to RTM_ALLOW will be ignored.	If CPUID.07H.00H:EDX[11] = 1 Read-Only status bit.
3	FB_CLEAR_DIS If 1, prevents the VERW instruction from performing an FB_CLEAR action.	If IA32_ARCH_CAPABILITIES [18] = 1
4	GDS_MITG_DIS If 0, the Gather Data Sampling mitigation is enabled (patch load time default). If 1 on all threads for a given core, the Gather Data Sampling mitigation is disabled.	If IA32_ARCH_CAPABILITIES [25] = 1
5	GDS_MITG_LOCK If 0, not locked, and GDS_MITG_DIS is under OS control. If 1, locked and GDS_MITG_DIS is forced to 0 (writes are ignored).	If IA32_ARCH_CAPABILITIES [25] = 1
6	IGN_UMONITOR If 0, enable CPL0-3 software to use the UMONITOR/UMWAIT instructions. If 1 (default), disable UMONITOR functionality. CPL0-3 software will be able to call the UMONITOR instruction without causing a fault, however the address monitoring hardware will not be armed. When UMWAIT is called, it will not enter an implementation-dependent optimized state.	If IA32_ARCH_CAPABILITIES [29] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
7	MON_UMON_MITG If 0 (default), disabled. If 1, enable: Flush the thread's previously monitored address from the CPU caches as part of the (U)MONITOR instruction. Additionally, for every 4th (U)MONITOR instruction within a core, flush the peer hyperthread's monitored address from the CPU caches as well. This will increase the latency of the instruction. This may have a minor impact on workloads using the (U)MONITOR instruction.	If IA32_ARCH_CAPABILITIES [30] = 1
63:8	Reserved.	
Register Address: 174H, 372		IA32_SYSENTER_CS
SYSENTER_CS_MSR (R/W)		06_01H
15:0	CS Selector.	
31:16	Not used.	Can be read and written.
63:32	Not used.	Writes ignored; reads return zero.
Register Address: 175H, 373		IA32_SYSENTER_ESP
SYSENTER_ESP_MSR (R/W)		06_01H
Register Address: 176H, 374		IA32_SYSENTER_EIP
SYSENTER_EIP_MSR (R/W)		06_01H
Register Address: 179H, 377		IA32_MCG_CAP (MCG_CAP)
Global Machine Check Capability (R/O)		06_01H
7:0	Count: Number of reporting banks.	
8	MCG_CTL_P: IA32_MCG_CTL is present if this bit is set.	
9	MCG_EXT_P: Extended machine check state registers are present if this bit is set.	
10	MCP_CMCI_P: Support for corrected MC error event is present.	06_01H
11	MCG_TES_P: Threshold-based error status register are present if this bit is set.	
12	MCG_SEAM_NR_P: Indicates that the processor supports SEAM non-root operation indication in IA32_MCG_STATUS.	
15:13	Reserved.	
23:16	MCG_EXT_CNT: Number of extended machine check state registers present.	
24	MCG_SER_P: The processor supports software error recovery if this bit is set.	
25	Reserved.	
26	MCG_ELOG_P: Indicates that the processor allows platform firmware to be invoked when an error is detected so that it may provide additional platform specific information in an ACPI format "Generic Error Data Entry" that augments the data included in machine check bank registers.	06_3EH
27	MCG_LMCE_P: Indicates that the processor supports extended state in IA32_MCG_STATUS and associated MSR necessary to configure Local Machine Check Exception (LMCE).	06_3EH

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
63:28	Reserved.	
Register Address: 17AH, 378		IA32_MCG_STATUS (MCG_STATUS)
Global Machine Check Status (R/W)		06_01H
0	RIPV. Restart IP valid.	06_01H
1	EIPV. Error IP valid.	06_01H
2	MCIP. Machine check in progress.	06_01H
3	LMCE_S. Local machine check.	If IA32_MCG_CAP.LMCE_P[27] = 1
11:4	Reserved.	
12	SEAM_NR. SEAM non-root operation.	If IA32_MCG_CAP.SEAM_NR_P[12] = 1
63:13	Reserved.	
Register Address: 17BH, 379		IA32_MCG_CTL (MCG_CTL)
Global Machine Check Control (R/W)		If IA32_MCG_CAP.CTL_P[8] = 1
Register Address: 180H–185H, 384–389		N/A
Reserved		06_0EH ²
Register Address: 186H, 390		IA32_PERFVTSEL0 (PERFVTSEL0)
Performance Event Select Register 0 (R/W)		If CPUID.0AH:EAX[15:8] > 0
7:0	Event Select: Selects a performance event logic unit.	
15:8	UMask: Qualifies the microarchitectural condition to detect on the selected event logic.	
16	USR: Counts while in privilege level is not ring 0.	
17	OS: Counts while in privilege level is ring 0.	
18	Edge: Enables edge detection if set.	
19	PC: Enables pin control.	
20	INT: Enables interrupt on counter overflow.	
21	AnyThread: When set to 1, it enables counting the associated event conditions occurring across all logical processors sharing a processor core. When set to 0, the counter only increments the associated event conditions occurring in the logical processor which programmed the MSR.	
22	EN: Enables the corresponding performance counter to commence counting when this bit is set.	
23	INV: Invert the CMASK.	
31:24	CMASK: When CMASK is not zero, the corresponding performance counter increments each cycle if the event count is greater than or equal to the CMASK.	
63:32	Reserved.

23	Threshold #2 Interrupt Enable	If CPUID.01H:EDX[22] = 1
24	Power Limit Notification Enable	If CPUID.06H:EAX[4] = 1
63:25	Reserved.	
Register Address: 19CH, 412		IA32_THERM_STATUS
Thermal Status Information (R/O) Contains status information about the processor's thermal sensor and automatic thermal monitoring facilities. See Section 16.8.2, "Thermal Monitor."		If CPUID.01H:EDX[22] = 1
0	Thermal Status (R/O)	If CPUID.01H:EDX[22] = 1
1	Thermal Status Log (R/W)	If CPUID.01H:EDX[22] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
2	PROCHOT # or FORCEPR# event (R/O)	If CPUID.01H:EDX[22] = 1
3	PROCHOT # or FORCEPR# log (R/WCO)	If CPUID.01H:EDX[22] = 1
4	Critical Temperature Status (R/O)	If CPUID.01H:EDX[22] = 1
5	Critical Temperature Status log (R/WCO)	If CPUID.01H:EDX[22] = 1
6	Thermal Threshold #1 Status (R/O)	If CPUID.01H:ECX[8] = 1
7	Thermal Threshold #1 log (R/WCO)	If CPUID.01H:ECX[8] = 1
8	Thermal Threshold #2 Status (R/O)	If CPUID.01H:ECX[8] = 1
9	Thermal Threshold #2 log (R/WCO)	If CPUID.01H:ECX[8] = 1
10	Power Limitation Status (R/O)	If CPUID.06H:EAX[4] = 1
11	Power Limitation log (R/WCO)	If CPUID.06H:EAX[4] = 1
12	Current Limit Status (R/O)	If CPUID.06H:EAX[7] = 1
13	Current Limit log (R/WCO)	If CPUID.06H:EAX[7] = 1
14	Cross Domain Limit Status (R/O)	If CPUID.06H:EAX[7] = 1
15	Cross Domain Limit log (R/WCO)	If CPUID.06H:EAX[7] = 1
22:16	Digital Readout (R/O)	If CPUID.06H:EAX[0] = 1
26:23	Reserved.	
30:27	Resolution in Degrees Celsius (R/O)	If CPUID.06H:EAX[0] = 1
31	Reading Valid (R/O)	If CPUID.06H:EAX[0] = 1
63:32	Reserved.	
Register Address: 1A0H, 416		IA32_MISC_ENABLE
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
0	Fast-Strings Enable When set, the fast-strings feature (for REP MOVSB and REP STOSB) is enabled (default). When clear, fast-strings are disabled.	OF_OH
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) 1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows the processor to automatically reduce power consumption in response to TCC activation. 0 = Disabled. Note: In some products clearing this bit might be ignored in critical thermal conditions, and TM1, TM2, and adaptive thermal throttling will still be activated. The default value of this field varies with product. See respective tables where default value is listed.	OF_OH
6:4	Reserved.	
7	Performance Monitoring Available (R) 1 = Performance monitoring enabled. 0 = Performance monitoring disabled.	OF_OH

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
10:8	Reserved.	
11	Branch Trace Storage Unavailable (R/O) 1 = Processor doesn't support branch trace storage (BTS). 0 = BTS is supported.	0F_0H
12	Processor Event Based Sampling (PEBS) Unavailable (R/O) 1 = PEBS is not supported. 0 = PEBS is supported.	06_0FH
15:13	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) 0 = Enhanced Intel SpeedStep Technology disabled. 1 = Enhanced Intel SpeedStep Technology enabled.	If CPUID.01H:ECX[7] = 1
17	Reserved.	
18	ENABLE MONITOR FSM (R/W) When this bit is set to 0, the MONITOR feature flag is not set (CPUID.01H:ECX[3] = 0). This indicates that MONITOR/MWAIT are not supported. Software attempts to execute MONITOR/MWAIT will cause #UD when this bit is 0. When this bit is set to 1 (default), MONITOR/MWAIT are supported (CPUID.01H:ECX[3] = 1). If the SSE3 feature flag ECX[0] is not set (CPUID.01H:ECX[0] = 0), the OS must not attempt to alter this bit. BIOS must leave it in the default state. Writing this bit when the SSE3 feature flag is set to 0 may generate a #GP exception.	0F_03H
21:19	Reserved.	
22	Limit CPUID Maxval (R/W) When this bit is set to 1, CPUID.00H returns a maximum value in EAX[7:0] of 2.	CPUID.00H:EAX > 2 and CPUID.07H:01H:EBX. CPUIDMAXVAL_LIM_RMV[3] = 0
23	xTPR Message Disable (R/W) When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority.	If CPUID.01H:ECX[14] = 1
63:24	Reserved. Note: Some older processors defined one of these bits as a disable for the execute-disable feature of paging. If a processor supports this bit, this information is provided in the model-specific tables. See Table 2-3 for the definition of this bit.	
Register Address: 1B0H, 432		IA32_ENERGY_PERF_BIAS
Performance Energy Bias Hint (R/W)		If CPUID.06H:ECX[3] = 1
3:0	Power Policy Preference: 0 indicates preference to highest performance. 15 indicates preference to maximize energy saving.	
63:4	Reserved.	
Register Address: 1B1H, 433		IA32_PACKAGE_THERM_STATUS

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
Package Thermal Status Information (R/O) Contains status information about the package's thermal sensor. See Section 16.9, "Package Level Thermal Management."		If CPUID.06H:EAX[6] = 1
0	Pkg Thermal Status (R/O)

22:16	Pkg Threshold #2 Value.	
23	Pkg Threshold #2 Interrupt Enable.	
24	Pkg Power Limit Notification Enable.	
25	Hardware Feedback Interrupt Enable.	If CPUID.06H:EAX[19] = 1
63:26	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
Register Address: 1C4H, 452		IA32_XFD
Extended Feature Disable Control (R/W) Controls which XSAVE-enabled features are temporarily disabled. See Section 13.14 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1.		If CPUID.0DH.01H:EAX[4] = 1
Register Address: 1C5H, 453		IA32_XFD_ERR
Extended Feature Disable Error Code (R/W) Reports which XSAVE-enabled features caused a fault due to being disabled. See Section 13.14 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1.		If CPUID.0DH.01H:EAX[4] = 1
Register Address: 1D9H, 473		IA32_DEBUGCTL (MSR_DEBUGCTLA, MSR_DEBUGCTLB)
Trace/Profile Resource Control (R/W)		06_0EH
0	LBR: Setting this bit to 1 enables the processor to record a running trace of the most recent branches taken by the processor in the LBR stack.	06_01H
1	BTF: Setting this bit to 1 enables the processor to treat EFLAGS.TF as single-step on branches instead of single-step on instructions.	06_01H
2	BLD: Enable OS bus-lock detection. See Section 19.3.1.6 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B.	If (CPUID.07H.00H:ECX[24] = 1)
5:3	Reserved.	
6	TR: Setting this bit to 1 enables branch trace messages to be sent.	06_0EH
7	BTS: Setting this bit enables branch trace messages (BTMs) to be logged in a BTS buffer.	06_0EH
8	BTINT: When clear, BTMs are logged in a BTS buffer in circular fashion. When this bit is set, an interrupt is generated by the BTS facility when the BTS buffer is full.	06_0EH
9	1: BTS_OFF_OS: When set, BTS or BTM is skipped if CPL = 0.	06_0FH
10	BTS_OFF_USR: When set, BTS or BTM is skipped if CPL > 0.	06_0FH
11	FREEZE_LBRS_ON_PMI: When set, the LBR stack is frozen on a PMI request.	If CPUID.01H:ECX[15] = 1 && CPUID.0AH:EAX[7:0] > 1
12	FREEZE_PERFMON_ON_PMI: When set, each ENABLE bit of the global counter control MSR are frozen (address 38FH) on a PMI request.	If CPUID.01H:ECX[15] = 1 && CPUID.0AH:EAX[7:0] > 1
13	ENABLE_UNCORE_PMI: When set, enables the logical processor to receive and generate PMI on behalf of the uncore.	06_1AH
14	FREEZE_WHILE_SMM: When set, freezes PerfMon and trace messages while in SMM.	If IA32_PERF_CAPABILITIES[12] = 1
15	RTM_DEBUG: When set, enables DR7 debug bit on XBEGIN.	If (CPUID.07H.00H:EBX[11] = 1)
63:16	Reserved.	
Register Address: 1DDH, 477		IA32_LER_FROM_IP
Last Event Record Source IP Register (R/W)		
63:0	FROM_IP The source IP of the recorded branch or event, in canonical form.	Reset Value: 0
Register Address: 1DEH, 478		IA32_LER_TO_IP

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)

47:0	FIXED_COUNTER Top-down Retiring counter.	
63:46	Reserved.	
Register Address: 345H, 837		IA32_PERF_CAPABILITIES
Read Only MSR that enumerates the existence of performance monitoring features. (R/O)		If CPUID.01H:ECX[15] = 1
5:0	LBR format	
6	PEBS Trap	
7	PEBSSaveArchRegs	
11:8	PEBS Record Format	
12	1: Freeze while SMM is supported.	
13	1: Full width of counter writable via IA32_A_PMCx.	
14	PEBS_BASELINE	
15	1: Performance metrics available.	
16	1: PEBS output will be written into the Intel PT trace stream.	If CPUID.07H.00H:EBX[25] = 1
17	1: Indicates support for PEBS Retire Latency output.	
18	TSX_ADDRESS	
19	RDPMC_METRICS_CLEAR	
63:20	Reserved.	
Register Address: 38DH, 909		IA32_FIXED_CTR_CTRL
Fixed-Function Performance Counter Control (R/W) Counter increments while the results of ANDing respective enable bit in IA32_PERF_GLOBAL_CTRL with the corresponding OS or USR bits in this MSR is true.		If CPUID.0AH:EAX[7:0] > 1
0	EN0_OS: Enable Fixed Counter 0 to count while CPL = 0.	
1	EN0_Usr: Enable Fixed Counter 0 to count while CPL > 0.	
2	AnyThr0: When set to 1, it enables counting the associated event conditions occurring across all logical processors sharing a processor core. When set to 0, the counter only increments the associated event conditions occurring in the logical processor which programmed the MSR.	If CPUID.0AH:EAX[7:0] > 2 && CPUID.0AH:EDX[15] = 0
3	EN0_PMI: Enable PMI when fixed counter 0 overflows.	
4	EN1_OS: Enable Fixed Counter 1 to count while CPL = 0.	
5	EN1_Usr: Enable Fixed Counter 1 to count while CPL > 0.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
6	AnyThr1: When set to 1, it enables counting the associated event conditions occurring across all logical processors sharing a processor core. When set to 0, the counter only increments the associated event conditions occurring in the logical processor which programmed the MSR.	If CPUID.0AH:EAX[7:0] > 2 && CPUID.0AH:EDX[15] = 0
7	EN1_PMI: Enable PMI when fixed counter 1 overflows.	
8	EN2_OS: Enable Fixed Counter 2 to count while CPL = 0.	
9	EN2_Usr: Enable Fixed Counter 2 to count while CPL > 0.	
10	AnyThr2: When set to 1, it enables counting the associated event conditions occurring across all logical processors sharing a processor core. When set to 0, the counter only increments the associated event conditions occurring in the logical processor which programmed the MSR.	If CPUID.0AH:EAX[7:0] > 2 && CPUID.0AH:EDX[15] = 0
11	EN2_PMI: Enable PMI when fixed counter 2 overflows.	
12	EN3_OS: Enable Fixed Counter 3 to count while CPL = 0.	
13	EN3_Usr: Enable Fixed Counter 3 to count while CPL > 0.	
14	Reserved.	
15	EN3_PMI: Enable PMI when fixed counter 3 overflows.	
63:16	Reserved.	
Register Address: 38EH, 910		IA32_PERF_GLOBAL_STATUS
Global Performance Counter Status (R/O)		If CPUID.0AH:EAX[7:0] > 0 (CPUID.07H.00H:EBX[25] = 1 && CPUID.14H.00H:ECX[0] = 1)
0	Ovf_PMC0: Overflow status of IA32_PMC0.	If CPUID.0AH:EAX[15:8] > 0
1	Ovf_PMC1: Overflow status of IA32_PMC1.	If CPUID.0AH:EAX[15:8] > 1
2	Ovf_PMC2: Overflow status of IA32_PMC2.	If CPUID.0AH:EAX[15:8] > 2
3	Ovf_PMC3: Overflow status of IA32_PMC3.	If CPUID.0AH:EAX[15:8] > 3
n	Ovf_PMCn: Overflow status of IA32_PMCn.	If CPUID.0AH:EAX[15:8] > n
31:n+1	Reserved.	
32	Ovf_FixedCtr0: Overflow status of IA32_FIXED_CTR0.	If CPUID.0AH:EAX[7:0] > 1

Register Address: 600H, 1536		IA32_DS_AREA
DS Save Area (R/W) Points to the linear address of the first byte of the DS buffer management area, which is used to manage the BTS and PEBS buffers. See Section 21.6.3.4, "Debug Store (DS) Mechanism."		If (CPUID.01H:EDX.DS[21] = 1)
63:0	The linear address of the first byte of the DS buffer management area, if IA-32e mode is active.	
31:0	The linear address of the first byte of the DS buffer management area, if not in IA-32e mode.	
63:32	Reserved if not in IA-32e mode.	
Register Address: 6A0H, 1696		IA32_U_CET
Configure User Mode CET (R/W)		Bits 1:0 are defined if CPUID.07H.00H:ECX.CET_SS[7] = 1. Bits 5:2 and bits 63:10 are defined if CPUID.07H.00H:EDX.CET_IBT[20] = 1.
0	SH_STK_EN: When set to 1, enable shadow stacks at CPL3.	
1	WR_SHSTK_EN: When set to 1, enables the WRSSD/WRSSQ instructions.	
2	ENDBR_EN: When set to 1, enables indirect branch tracking.	
3	LEG_IW_EN: Enable legacy compatibility treatment for indirect branch tracking.	
4	NO_TRACK_EN: When set to 1, enables use of no-track prefix for indirect branch tracking.	
5	SUPPRESS_DIS: When set to 1, disables suppression of CET indirect branch tracking on legacy compatibility.	
9:6	Reserved; must be zero.	
10	SUPPRESS: When set to 1, indirect branch tracking is suppressed. This bit can be written to 1 only if TRACKER is written as IDLE.	
11	TRACKER: Value of the indirect branch tracking state machine. Values: IDLE (0), WAIT_FOR_ENDBRANCH(1).	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)	
Bit Fields	MSR/Bit Description		Comment
63:12	EB_LEG_BITMAP_BASE: Linear address bits 63:12 of a legacy code page bitmap used for legacy compatibility when indirect branch tracking is enabled. If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are used.		
Register Address: 6A2H, 1698		IA32_S_CET	
Configure Supervisor Mode CET (R/W)		See IA32_U_CET (6A0H) for reference; similar format.	
Register Address: 6A4H, 1700		IA32_PL0_SSP	
Linear address to be loaded into SSP on transition to privilege level 0. (R/W) If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are loaded. Bits 1:0 of the MSR must be 0. Transitions to privilege level 0 will check that bit 2 is also 0.		If CPUID.07H.00H:ECX.CET_SS[7] = 1	
Register Address: 6A5H, 1701		IA32_PL1_SSP	
Linear address to be loaded into SSP on transition to privilege level 1. (R/W) If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are loaded. Bits 1:0 of the MSR must be 0. Transitions to privilege level 1 from a higher privilege level will check that bit 2 is also 0.		If CPUID.07H.00H:ECX.CET_SS[7] = 1	
Register Address: 6A6H, 1702		IA32_PL2_SSP	
Linear address to be loaded into SSP on transition to privilege level 2. (R/W) If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are loaded. Bits 1:0 of the MSR must be 0. Transitions to privilege level 2 from a higher privilege level will check that bit 2 is also 0.		If CPUID.07H.00H:ECX.CET_SS[7] = 1	
Register Address: 6A7H, 1703		IA32_PL3_SSP	
Linear address to be loaded into SSP on transition to privilege level 3. (R/W) If the processor does not support Intel 64 architecture, these fields have only 32 bits; bits 63:32 of the MSRs are reserved. On processors that support Intel 64 architecture this value cannot represent a non-canonical address. In protected mode, only 31:0 are loaded. Bits 1:0 of the MSR must be 0.		If CPUID.07H.00H:ECX.CET_SS[7] = 1	
Register Address: 6A8H, 1704		IA32_INTERRUPT_SSP_TABLE_ADDR	
Linear address of a table of seven shadow stack pointers that are selected in IA-32e mode using the IST index (when not 0) from the interrupt gate descriptor. (R/W) This MSR is not present on processors that do not support Intel 64 architecture. This field cannot represent a non-canonical address.		If CPUID.07H.00H:ECX.CET_SS[7] = 1	
Register Address: 6E0H, 1760		IA32_TSC_DEADLINE	
TSC Target of Local APIC's TSC Deadline Mode (R/W)		If CPUID.01H:ECX[24] = 1	
63:0	REGISTER_VALUE TSC-deadline value.

Register Address: 981H, 2433		IA32_TME_CAPABILITY
Memory Encryption Capability MSR		If CPUID.07H.00H:ECX[13] = 1
0	Support for AES-XTS 128-bit encryption algorithm. (NIST standard)	
1	Support for AES-XTS 128-bit encryption with integrity algorithm.	
2	Support for AES-XTS 256-bit encryption algorithm.	
3	Support for AES-XTS 256-bit encryption with integrity algorithm.	
27:4	Reserved.	
28	Non-zero KeyIDs must be SEAM-private.	If set, any write to IA32_TME_ACTIVATE must write identical values to MK_TME_KEYID_BITS and TDX_RESERVED_KEYID_BITS.
29	Reserved.	
30	SUPPORT_IA32_TME_CLEAR_SAVED_KEY Support for the IA32_TME_CLEAR_SAVED_KEY MSR.	
31	TME encryption bypass supported.	
35:32	MK_TME_MAX_KEYID_BITS Number of bits which can be allocated for usage as key identifiers for multi-key memory encryption. 4 bits allow for a maximum value of 15, which could address 32K keys. Zero if TME-MK is not supported.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
50:36	MK_TME_MAX_KEYS Indicates the maximum number of keys which are available for usage. This value may not be a power of 2. KeyID 0 is specially reserved and is not accounted for in this field.	
63:51	Reserved.	
Register Address: 982H, 2434		IA32_TME_ACTIVATE
Memory Encryption Activation MSR This MSR is used to lock the MSRs listed below. Any write to the following MSRs will be ignored after they are locked. The lock is reset when CPU is reset. ▪ IA32_TME_ACTIVATE ▪ IA32_TME_EXCLUDE_MASK ▪ IA32_TME_EXCLUDE_BASE Note that IA32_TME_EXCLUDE_MASK and IA32_TME_EXCLUDE_BASE must be configured before IA32_TME_ACTIVATE.		If CPUID.07H.00H:ECX[13] = 1
0	Lock R/O – Will be set upon successful WRMSR (or first SMI); written value ignored.	
1	Hardware Encryption Enable This bit also enables TME-MK; TME-MK cannot be enabled without enabling encryption hardware. TME is enabled depending on the TME Encryption Bypass Enable bit (bit 31).	
2	Key Select 0: Create a new TME key (expected cold/warm boot). 1: Restore the TME key from storage (expected when resume from standby).	
3	Save TME Key for Standby Save key into storage to be used when resume from standby. Note: This may not be supported in all processors.	
7:4	TME Policy/Encryption Algorithm Only algorithms enumerated in IA32_TME_CAPABILITY MSR are allowed. Any other values are invalid and will result in #GP. Additionally, any algorithm that supports integrity checking is not allowed to be used for TME even if it is listed as allowed in the IA32_TME_CAPABILITY MSR and will result in #GP.	
30:8	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
31	TME Encryption Bypass Enable When encryption hardware is enabled: - Total Memory Encryption is enabled using a CPU generated ephemeral key based on a hardware random number generator when this bit is set to 0. - Total Memory Encryption is bypassed (no encryption/decryption for KeyID0) when this bit is set to 1. <i>On some processors, bypassing TME encryption can provide performance benefits to accesses made with KeyID 0 by avoiding the latency of decryption or encryption and decryption.</i> Software must inspect Hardware Encryption Enable (bit 1) and TME Encryption Bypass Enable (bit 31) to determine if TME encryption is enabled.	
35:32	MK_TME_KEYID_BITS Reserved if TME-MK is not enumerated, otherwise: The number of key identifier bits to allocate to TME-MK usage. Similar to enumeration, this is an encoded value. Writing a value greater than MK_TME_MAX_KEYID_BITS will result in #GP. Writing a non-zero value to this field will #GP if bit 1 of EAX (Hardware Encryption Enable) is not also set to 1, as encryption hardware must be enabled to use TME-MK. Example: To support 255 keys, this field would be set to a value of 8.	
39:36	TDX_RESERVED_KEYID_BITS The number of key identifier bits to allocate to TDX usage, which are allocated from the most significant bit downward. Writing a value greater than MK_TME_KEYID_BITS will result in a #GP. Note: These bits are a subset of the overall KeyID bits which are declared by MK_TME_MAX_KEYID_BITS.	If IA32_TME_CAPABILITY[28] = 1, this value must be the same as that of MK_TME_KEYID_BITS.
47:40	Reserved.	
63:48	MK_TME_CRYPT0_ALGS Reserved if TME-MK is not enumerated, otherwise: Bit 48: AES-XTS 128. Bit 49: AES-XTS 128 with integrity. Bit 50: AES-XTS 256. Bit 51: AES-XTS-256 with integrity. Bit 63:52: Reserved (#GP) Bitmask for BIOS to set which encryption algorithms are allowed for TME-MK, would be later enforced by the key loading ISA ('1' = allowed).	
Register Address: 983H, 2435		IA32_TME_EXCLUDE_MASK
Memory Encryption Exclude Mask The IA32_TME_EXCLUDE_MASK MSR must define a contiguous region. WRMSR will #GP if the TMEEMASK field does not specify a contiguous region. This MSR is locked by the IA32_TME_ACTIVATE MSR. If lock=1, then WRMSR to IA32_TME_EXCLUDE_MASK/IA32_TME_EXCLUDE_BASE MSRs will result in #GP.		If CPUID.07H.00H:ECX[13] = 1
10:0	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
11	Enable: When set to '1', then TME_EXCLUDE_BASE and TME_EXCLUDE_MASK are used to define an exclusion region for TME/TME-MK (for KeyID=0).	
MAXPHYADDR-1:12	TMEEMASK: This field indicates the bits that must match TMEEBASE in order to qualify as a TME/TME-MK (for KeyID=0) exclusion memory range access.	
63:MAXPHYADDR	Reserved; must be zero.	
Register Address: 984H, 2436		IA32_TME_EXCLUDE_BASE
Memory Encryption Exclude Base Note: Writing '1' into bits greater than the max supported physical size will result in #GP. This MSRs is locked by the IA32_TME_ACTIVATE MSR. If lock=1, then WRMSR to IA32_TME_EXCLUDE_MASK/IA32_TME_EXCLUDE_BASE MSRs will result in #GP.		If CPUID.07H.00H:ECX[13] = 1
11:0	Reserved.	
MAXPHYADDR-1:12	TMEEBASE: Base physical address to be excluded for TME/TME-MK (for KeyID=0) encryption.	
63:MAXPHYADDR	Reserved; must be zero.	
Register Address: 985H, 2437		IA32_UINTR_RR
User Interrupt Request Register (R/W)		If CPUID.07H.01H:EDX[13] = 1
63:0	UIRR Bitmap of requested user interrupt vectors.	
Register Address: 986H, 2438		IA32_UINTR_HANDLER
User Interrupt Handler Address (R/W)		If CPUID.07H.01H:EDX[13] = 1
63:0	UIHANDLER User interrupt handler linear address.	
Register Address: 987H, 2439		IA32_UINTR_STACKADJUST
User Interrupt Stack Adjustment (R/W)		If CPUID.07H.01H:EDX[13] = 1
0	LOAD_RSP User interrupt stack mode.	
2:1	Reserved.	
63:3	STACK_ADJUST Stack adjust value.	
Register Address: 988H, 2440		IA32_UINTR_MISC
User-Interrupt Target-Table Size and Notification Vector (R/W)		If CPUID.07H.01H:EDX[13] = 1
31:0	UITTSZ The highest index of a valid entry in the user-interrupt target table. Valid entries are indices 0..UITTSZ (inclusive).	
39:32	UINV User-interrupt notification vector.	
63:40	Reserved.	
Register Address: 989H, 2441		IA32_UINTR_PD
User Interrupt PID Address (R/W)		If CPUID.07H.01H:EDX[13] = 1

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
5:0	Reserved.	
63:6	UPIDADDR User-interrupt notification processing accesses a UPID at this linear address.	
Register Address: 98AH, 2442		IA32_UINTR_TT
User-Interrupt Target Table (R/W)		If CPUID.07H.01H:EDX[13] = 1
0	SENDUIPI_ENABLE User-interrupt target table is valid.	
3:1	Reserved.	
63:4	UITTADDR User-interrupt target table base linear address.	
Register Address: 990H, 2448		IA32_COPY_STATUS ⁴
Status of Most Recent Platform to Local or Local to Platform Copies (R/O)		If ((CPUID.19H:EBX[4] = 1) && (CPUID.07H.00H:ECX[23] = 1))
0	IWKEY_COPY_SUCCESSFUL Status of most recent copy to or from IwKeyBackup.	If ((CPUID.19H:EBX[4] = 1) && (CPUID.07H.00H:ECX[23] = 1))
63:1	Reserved.	
Register Address: 991H, 2449		IA32_IWKEYBACKUP_STATUS ⁵
Information about IwKeyBackup Register (R/O)		If ((CPUID.19H:EBX[4] = 1) && (CPUID.07H.00H:ECX[23] = 1))
0	Backup/Restore Valid Cleared when a write to IwKeyBackup is initiated, and then set when the latest write of IwKeyBackup has been written to storage that persists across S3/S4 sleep state. If S3/S4 is entered between when an IwKeyBackup write occurs and when this bit is set, then IwKeyBackup may not be recovered after S3/S4 exit. During S3/S4 sleep state exit (system wake up), this bit is cleared. It is set again when IwKeyBackup is restored from persistent storage and thus available to be copied to IwKey using IA32_COPY_PLATFORM_TO_LOCAL MSR. Another write to IwKeyBackup (via IA32_COPY_LOCAL_TO_PLATFORM MSR) may fail if a previous write has not yet set this bit.	If ((CPUID.19H:EBX[4] = 1) && (CPUID.07H.00H:ECX[23] = 1))
1	Reserved.	
2	Backup Key Storage Read/Write Error Updated prior to backup/restore valid being set. Set when an error is encountered while backing up or restoring a key to persistent storage.	If ((CPUID.19H:EBX[4] = 1) && (CPUID.07H.00H:ECX[23] = 1))
3	IwKeyBackup Consumed Set after the previous backup operation has been consumed by the platform. This does not indicate that the system is ready for a second IwKeyBackup write as the previous IwKeyBackup write may still need to set Backup/restore valid.	If ((CPUID.19H:EBX[4] = 1) && (CPUID.07H.00H:ECX[23] = 1))
63:4	Reserved.	
Register Address: 9FBH, 2555		IA32_TME_CLEAR_SAVED_KEY
IA32_TME_CLEAR_SAVED_KEY (W/O)		

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
0	TME_CLEAR_SAVED_KEY Clear saved TME keys.	
63:1	Reserved.	
Register Address: C80H, 3200		IA32_DEBUG_INTERFACE
Silicon Debug Feature Control (R/W)		If CPUID.01H:ECX[11] = 1
0	Enable (R/W) BIOS set 1 to enable Silicon debug features. Default is 0.	If CPUID.01H:ECX[11] = 1
29:1	Reserved.	
30	Lock (R/W): If 1, locks any further change to the MSR. The lock bit is set automatically on the first SMI assertion even if not explicitly set by BIOS. Default is 0.	If CPUID.01H:ECX[11] = 1
31	Debug Occurred (R/O): This “sticky bit” is set by hardware to indicate the status of bit 0. Default is 0.	If CPUID.01H:ECX[11] = 1
63:32	Reserved.	
Register Address: C81H, 3201		IA32_L3_QOS_CFG
L3 QOS Configuration (R/W)		If (CPUID.10H.01H:ECX[2] = 1)

63:60	Reserved	
Register Address: 1200H–121FH, 4608–4639		IA32_LBR_x_INFO
Last Branch Record Entry X Info Register (R/W) An attempt to read or write IA32_LBR_x_INFO such that $x \geq \text{IA32\_LBR\_DEPTH.DEPTH}$ will #GP.		

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
15:0	CYC_CNT The elapsed CPU cycles (saturating) since the last LBR was recorded. See Section 18.1.3.3.	Reset Value: 0
55:16	Undefined, may be zero or non-zero. Writes of non-zero values do not fault, but reads may return a different value.	Reset Value: 0
59:56	BR_TYPE The branch type recorded by this LBR. Encodings: 0000B: COND 0001B: JMP Indirect 0010B: JMP Direct 0011B: CALL Indirect 0100B: CALL Direct 0101B: RET 011xB: Reserved 1xxxB: Other Branch	Reset Value: 0
60	CYC_CNT_VALID CYC_CNT value is valid. See Section 20.1.3.3.	Reset Value: 0
61	TSX_ABORT This LBR record is a TSX abort. On processors that do not support Intel TSX (CPUID.07H.00H:EBX.HLE[4] = 0 and CPUID.07H.00H:EBX.RTM[11] = 0), this bit is undefined.	Reset Value: 0
62	IN_TSX This LBR record records a branch that retired during a TSX transaction. On processors that do not support Intel TSX (CPUID.07H.00H:EBX.HLE[4] = 0 and CPUID.07H.00H:EBX.RTM[11] = 0), this bit is undefined.	Reset Value: 0
63	MISPRED The recorded branch direction (conditional branch) or target (indirect branch) was mispredicted.	Reset Value: 0
Register Address: 1400H, 5120		IA32_SEAMRR_BASE
SEAM Memory Range Register for TDX - Base Address (R/W)		IA32_MTRRCAP.SEAMRR[15] = 1
2:0	Reserved.	
3	CONFIGURED When set to 1, the SEAM range is configured.	
24:4	Reserved.	
M-1:25	BASE SEAM Range Register BASE address.	M is the value enumerated by CPUID.80000008H:EAX[7:0] Bits M-1:M-k must be 0, where k = IA32_TME_ACTIVATE.MK_TME_KEYID_BITS
63:M	Reserved.	
Register Address: 1401H, 5121		IA32_SEAMRR_MASK

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
SEAM Memory Range Register - Address Mask (R/W)		IA32_MTRRCAP.SEAMRR[15] = 1
9:0	Reserved.	
10	LOCK	When the LOCK bit is set, the IA32_SEAMRR_BASE/MASK registers are non-writable.
11	VALID Returns 1 when SEAM range protections are active	Read-only. Must be written with 0.
24:12	Reserved.	
M-1:25	MASK Mask value for SEAMRR matching. Lowest granularity is 32MB.	M is the value enumerated by CPUID.80000008H:EAX[7:0]
63:M	Reserved.	
Register Address: 1406H, 5126		IA32_MCU_CONTROL
MCU Control (R/W) Controls the behavior of the Microcode Update Trigger MSR, IA32_BIOS_UPDT_TRIG.		If CPUID.07H.00H:EDX[29] = 1 && IA32_ARCH_CAPABILITIES.MCU_CONTROL = 1
0	LOCK Once set, further writes to this MSR will cause a #GP(0) fault. Bypassed during SMM if EN_SMM_BYPASS (bit 2) is set.	
1	DIS_MCU_LOAD If this bit is set on a given logical processor, then any subsequent attempts to load a microcode update by that logical processor will be silently dropped (WRMSR 0x79 has no effect).	
2	EN_SMM_BYPASS If set, then writes to IA32_MCU_CONTROL are allowed during SMM regardless of the LOCK bit. This enables BIOS to Opt-In to the SMM Bypass functionality.	
63:3	Reserved.	
Register Address: 14CEH, 5326		IA32_LBR_CTL
Last Branch Record Enabling and Configuration Register (R/W)		
0	LBREn When set, enables LBR recording.	Reset Value: 0
1	OS When set, allows LBR recording when CPL == 0.	Reset Value: 0
2	USR When set, allows LBR recording when CPL != 0.	Reset Value: 0
3	CALL_STACK When set, records branches in call-stack mode. See Section 20.1.2.4.	Reset Value: 0
15:4	Reserved.	Reset Value: 0
16	COND When set, records taken conditional branches. See Section 20.1.2.3.	
17	NEAR_REL_JMP When set, records near relative JMPs. See Section 20.1.2.3.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
18	NEAR_IND_JMP When set, records near indirect JMPs. See Section 20.1.2.3.	
19	NEAR_REL_CALL When set, records near relative CALLs. See Section 20.1.2.3.	
20	NEAR_IND_CALL When set, records near indirect CALLs. See Section 20.1.2.3.	
21	NEAR_RET When set, records near RETs. See Section 20.1.2.3.	
22	OTHER_BRANCH When set, records other branches. See Section 20.1.2.3.	
63:23	Reserved.	
Register Address: 14CFH, 5327		IA32_LBR_DEPTH
Last Branch Record Maximum Stack Depth Register (R/W)		
N:0	DEPTH The number of LBRs to be used for recording. Supported values are indicated by the bitmap in CPUID.1CH.00H:EAX[7:0]. The reset value will match the maximum supported by the CPU. Writes of unsupported values will #GP fault.	Reset Value: Varies
63:N+1	Reserved.	Reset Value: 0
Register Address: 1500H–151FH, 5376–5407		IA32_LBR_x_FROM_IP
Last Branch Record entry X source IP register (R/W). An attempt to read or write IA32_LBR_x_FROM_IP such that $x \geq \text{IA32\_LBR\_DEPTH.DEPTH}$ will #GP.		
63:0	FROM_IP The source IP of the recorded branch or event, in canonical form. Writes to bits above MAXLINADDR-1 are ignored.	Reset Value: 0
Register Address: 1600H–161FH, 5632–5663		IA32_LBR_x_TO_IP
Last Branch Record Entry X Destination IP Register (R/W). An attempt to read or write IA32_LBR_x_TO_IP such that $x \geq \text{IA32\_LBR\_DEPTH.DEPTH}$ will #GP.		
63:0	TO_IP The destination IP of the recorded branch or event, in canonical form. Writes to bits above MAXLINADDR-1 are ignored.	Reset Value: 0
Register Address: 17D0H, 6096		IA32_HW_FEEDBACK_PTR
Hardware Feedback Interface Pointer		If CPUID.06H:EAX[19] = 1
0	Valid (R/W) When set to 1, indicates a valid pointer is programmed into the ADDR field of the MSR.	
11:1	Reserved.	
MAXPHYADDR-1:12	ADDR (R/W) Physical address of the page frame of the first page of the hardware feedback interface structure.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
63:MAXPHYADDR	Reserved.	
Register Address: 17D1H, 6097		IA32_HW_FEEDBACK_CONFIG
Hardware Feedback Interface Configuration		If CPUID.06H:EAX[19] = 1
0	Enable (R/W) When set to 1, enables the hardware feedback interface.	
63:1	Reserved.	
Register Address: 17D2H, 6098		IA32_THREAD_FEEDBACK_CHAR
Thread Feedback Characteristics (R/O)		If CPUID.06H:EAX[23] = 1
7:0	Application Class ID, pointing into the Intel Thread Director structure.	
62:8	Reserved.	
63	Valid bit. When set to 1 the OS Scheduler can use the Class ID (in bits 7:0) for its scheduling decisions. If this bit is 0, the Class ID field should be ignored. It is recommended that the OS uses the last known Class ID of the software thread for its scheduling decisions.	
Register Address: 17D4H, 6100		IA32_HW_FEEDBACK_THREAD_CONFIG
Hardware Feedback Thread Configuration (R/W)		
0	Enables Intel Thread Director. When set to 1, logical processor scope Intel Thread Director is enabled. Default is 0 (disabled).	
63:1	Reserved.	
Register Address: 17DAH, 6106		IA32_HRESET_ENABLE
History Reset Enable (R/W)		
0	Enable reset of the Intel Thread Director history.	
31:1	Reserved for other capabilities that can be reset by the HRESET instruction.	
63:32	Reserved.	
Register Address: 1900H, 6400		IA32_PMC_GPO_CTR
Full Width Writable General Performance Counter 0 (R/W)		If CPUID.0AH:EAX[15:8] > 0 and IA32_PERF_CAPABILITIES[13] = 1
47:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:48	Reserved.	
Register Address: 1901H, 6401		IA32_PMC_GPO_CFG_A
IA32_PMC_GPO_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 0.		If CPUID.0AH:EAX[15:8] > 0
7:0	EVENT_SELECT Selects a performance event logic unit.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
15:8	UMASK Qualifies the microarchitectural condition to detect on the selected event logic.	
16	USR When set, events are counted only when the processor is operating at privilege levels 1, 2 or 3. This flag can be used in conjunction with the OS flag.	
17	OS When set, events are counted only when the processor is operating at privilege level 0. This flag can be used in conjunction with the USER flag.	
18	EDGE When set, enables edge detection of events.	
19	Reserved.	
20	INT When set, the processor generates an exception through its local APIC on counter overflow for this counter's thread.	
21	ANYTHREAD If CPUID.0AH:EDX[15] is 1, then this bit is deprecated. When set to 1, it enables counting the associated event conditions occurring across all logical processors sharing a processor core. When set to 0, the counter only increments the associated event conditions occurring in the logical processor which programmed the MSR.	
22	ENABLE When set, performance counting is enabled in the performance-monitoring counter; when clear, the counter is disabled.	
23	INVERT Inverts the result of the counter-mask (CMASK) comparison when set, so that both greater than equal to and less than comparisons can be made. 0: The comparison is: threshold is greater than or equal to the event 1: The comparison is inverted: threshold is less than event.	
31:24	CMASK When CMASK is not zero, the corresponding performance counter increments by 1 each cycle if the event count is $\geq$ CMASK. This mask enables counting cycles in which multiple occurrences happen (for example, two or more instructions retired per clock).	
34:32	Reserved.	
35	EN_LBR_LOG When set enables updating LBRs with that counters event occurrences, if selected event is precise.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
36	EQUAL When EQ flag is set and the INV flag is clear, the comparison evaluates to true if the selected performance monitoring event (the event) is equal to the specified Counter Mask value (CMask). When EQ flag is set and INV flag is set, the comparison evaluates to true if the event is less-than the CMask value and the event is not zero. Note if CMask is zero, the EQ flag is ignored.	
39:37	Reserved.	
47:40	UMASK2 Unit mask 2 (UMASK2) field (bits 40 through 47) - These bits qualify the condition that the selected event logic unit detects. Valid UMASK2 values for each event logic unit are specific to the unit. The new UMASK2 field may also be used in conjunction with UMASK.	
63:48	Reserved.	
Register Address: 1903H, 6403		IA32_PMC_GPO_CFG_C
IA32_PMC_GPO_CFG_C (R/W) Extended Perf event selector for GP counter 0.		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 1904H, 6404		IA32_PMC_GP1_CTR
Full Width Writable General Performance Counter 1 (R/W) See IA32_PMC_GPO_CTR (1900H) for reference; similar format.		If CPUID.0AH:EAX[15:8] > 1 and IA32_PERF_CAPABILITIES[13] = 1
Register Address: 1905H, 6405		IA32_PMC_GP1_CFG_A
IA32_PMC_GP1_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 1. See IA32_PMC_GPO_CFG_A (1901H) for reference; similar format.		If CPUID.0AH:EAX[15:8] > 1
Register Address: 1907H, 6407		IA32_PMC_GP1_CFG_C
IA32_PMC_GP1_CFG_C (R/W) Extended Perf event selector for GP counter 1. See IA32_PMC_GPO_CFG_C (1903H) for reference; similar format.		
Register Address: 1908H, 6408		IA32_PMC_GP2_CTR
Full Width Writable General Performance Counter 2 (R/W) See IA32_PMC_GPO_CTR (1900H) for reference; similar format.		If CPUID.0AH:EAX[15:8] > 2 and IA32_PERF_CAPABILITIES[13] = 1
Register Address: 1909H, 6409		IA32_PMC_GP2_CFG_A
IA32_PMC_GP2_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 2. See IA32_PMC_GPO_CFG_A (1901H) for reference; similar format.		If CPUID.0AH:EAX[15:8] > 2
Register Address: 190AH, 6410		IA32_PMC_GP2_CFG_B

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
IA32_PMC_GP2_CFG_B (R/W)		
GP counter reload configuration register.		
1:0	Reserved.	
2	RELOAD_PMC2 Reload GP2 when GP2 overflows.	
3	RELOAD_PMC3 Reload GP2 when GP3 overflows.	
4	RELOAD_PMC4 Reload GP2 when GP4 overflows.	
5	RELOAD_PMC5 Reload GP2 when GP5 overflows.	
6	RELOAD_PMC6 Reload GP2 when GP6 overflows.	
7	RELOAD_PMC7 Reload GP2 when GP7 overflows.	
31:8	Reserved.	
32	RELOAD_FC0 Reload GP2 when FC0 overflows.	
33	RELOAD_FC1 Reload GP2 when FC1 overflows.	
47:34	Reserved.	
48	METRICS_CLEAR Clear PERF_METRICS on overflow of GP2.	
63:49	Reserved.	
Register Address: 190BH, 6411		IA32_PMC_GP2_CFG_C
IA32_PMC_GP2_CFG_C (R/W)		
Extended Perf event selector for GP counter 2.		
See IA32_PMC_GPO_CFG_C (1903H) for reference; similar format.		
Register Address: 190CH, 6412		IA32_PMC_GP3_CTR
Full Width Writable General Performance Counter 3 (R/W)		If CPUID.0AH:EAX[15:8] > 3 and IA32_PERF_CAPABILITIES[13] = 1
See IA32_PMC_GPO_CTR (1900H) for reference; similar format.		
Register Address: 190DH, 6413		IA32_PMC_GP3_CFG_A
IA32_PMC_GP3_CFG_A (R/W)		If CPUID.0AH:EAX[15:8] > 3
Performance Event Select Register used to control the operation of the General Performance Counter 3. See IA32_PMC_GPO_CFG_A (1901H) for reference; similar format.		
Register Address: 190EH, 6414		IA32_PMC_GP3_CFG_B
IA32_PMC_GP3_CFG_B (R/W)		
GP counter reload configuration register.		
See IA32_PMC_GP2_CFG_B (190AH) for reference; similar format.		

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)

Bit Fields	MSR/Bit Description	Comment
Register Address: 1984H, 6532		IA32_PMC_FX1_CTR
Fixed-Function Performance Counter 1 (R/W) Unhalted core clock cycles.		If CPUID.0AH:EDX[4:0] > 1
47:0	FIXED_COUNTER Unhalted core clock cycles counter.	
63:46	Reserved.	
Register Address: 1986H, 6534		IA32_PMC_FX1_CFG_B
Fixed-Function Counter Reload Configuration Register (R/W)		
1:0	Reserved.	
2	RELOAD_PMC2 Reload Fixed-Function Counter1 when GP2 overflows.	
3	RELOAD_PMC3 Reload Fixed-Function Counter1 when GP3 overflows.	
4	RELOAD_PMC4 Reload Fixed-Function Counter1 when GP4 overflows.	
5	RELOAD_PMC5 Reload Fixed-Function Counter1 when GP5 overflows.	
6	RELOAD_PMC6 Reload Fixed-Function Counter1 when GP6 overflows.	
7	RELOAD_PMC7 Reload Fixed-Function Counter1 when GP7 overflows.	
31:8	Reserved.	
32	RELOAD_FC0 Reload Fixed-Function Counter1 when FC0 overflows.	
33	RELOAD_FC1 Reload Fixed-Function Counter1 when FC1 overflows.	
47:34	Reserved.	
48	METRICS_CLEAR Clear PERF_METRICS on overflow of Fixed-Function Counter 1.	
63:49	Reserved.	
Register Address: 1987H, 6532		IA32_PMC_FX1_CFG_C
Extended Perf Event Selector for Fixed-Function Counter 1 (R/W)		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 1988H, 6536		IA32_PMC_FX2_CTR
Fixed-Function Performance Counter 2 (R/W) Unhalted core reference cycles.		If CPUID.0AH:EDX[4:0] > 2

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
47:0	FIXED_COUNTER Unhalted core reference cycles counter.	
63:48	Reserved.	
Register Address: 198BH, 6539		IA32_PMC_FX2_CFG_C
Extended Perf Event Selector for Fixed-Function Counter 2 (R/W)		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 198CH, 6540		IA32_PMC_FX3_CTR
Fixed-Function Performance Counter 3 (R/W) Top-down Microarchitecture Analysis unhalted number of available slots.		If CPUID.0AH:EDX[4:0] > 3
47:0	FIXED_COUNTER Top-down microarchitecture analysis unhalted number of available slots counter.	
63:48	Reserved.	
Register Address: 1990H, 6544		IA32_PMC_FX4_CTR
Fixed-Function Performance Counter 4 (R/W) Top-down bad speculation.		If CPUID.0AH:EDX[4:0] > 4
47:0	FIXED_COUNTER Top-down bad speculation counter.	
63:48	Reserved.	
Register Address: 1993H, 6547		IA32_PMC_FX4_CFG_C
Extended Perf Event Selector for Fixed-Function Counter 4 (R/W)		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 1994H, 6548		IA32_PMC_FX5_CTR
Fixed-Function Performance Counter 5 (R/W) Top-down frontend bound.		If CPUID.0AH:EDX[4:0] > 5
47:0	FIXED_COUNTER Top-down frontend-bound counter.	
63:48	Reserved.	
Register Address: 1997H, 6551		IA32_PMC_FX5_CFG_C
Extended Perf Event Selector for Fixed-Function Counter 5 (R/W)		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
Register Address: 1998H, 6552		IA32_PMC_FX6_CTR
Fixed-Function Performance Counter 6 (R/W) Top-down retiring.		If CPUID.0AH:EDX[4:0] > 6
47:0	FIXED_COUNTER Top-down retiring counter.	
63:48	Reserved.	
Register Address: 199BH, 6555		IA32_PMC_FX6_CFG_C
Extended Perf Event Selector for Fixed-Function Counter 6 (R/W)		
31:0	RELOAD_VALUE Contains the reload value to be loaded into the associated counter by Auto Counter Reload. Will be 1-extended to 48 bits.	
63:32	Reserved.	
Register Address: 1B01H, 6913		IA32_UARCH_MISC_CTL
IA32_UARCH_MISC_CTL (R/W)		If IA32_ARCH_CAPABILITIES[12] = 1
0	Data Operand Independent Timing Mode (DOITM).	If IA32_ARCH_CAPABILITIES[12] = 1
63:1	Reserved.	
Register Address: 4000_0000H–4000_00FFH		Reserved MSR Address Space
All existing and future processors will not implement MSRs in this range.		
Register Address: C000_0080H		IA32_EFER
Extended Feature Enables		If (CPUID.80000001H:EDX[20] CPUID.80000001H:EDX[29])
0	SYSCALL Enable: IA32_EFER.SCE (R/W) Enables SYSCALL/SYSRET instructions in 64-bit mode.	
7:1	Reserved.	
8	IA-32e Mode Enable: IA32_EFER.LME (R/W) Enables IA-32e mode operation.	
9	Reserved.	
10	IA-32e Mode Active: IA32_EFER.LMA (R) Indicates IA-32e mode is active when set.	
11	Execute Disable Bit Enable: IA32_EFER.NXE (R/W)	
63:12	Reserved.	
Register Address: C000_0081H		IA32_STAR
System Call Target Address (R/W)		If CPUID.80000001H:EDX[29] = 1
Register Address: C000_0082H		IA32_LSTAR
IA-32e Mode System Call Target Address (R/W) Target RIP for the called procedure when SYSCALL is executed in 64-bit mode.		If CPUID.80000001H:EDX[29] = 1
Register Address: C000_0083H		IA32_CSTAR

Table 2-2. IA-32 Architectural MSRs (Contd.)

Register Address: Hex, Decimal		Architectural MSR Name (Former MSR Name)
Bit Fields	MSR/Bit Description	Comment
IA-32e Mode System Call Target Address (R/W) Not used, as the SYSCALL instruction is not recognized in compatibility mode.		If CPUID.80000001H:EDX[29] = 1
Register Address: C000_0084H		IA32_FMASK
System Call Flag Mask (R/W)		If CPUID.80000001H:EDX[29] = 1
Register Address: C000_0100H		IA32_FS_BASE
Map of BASE Address of FS (R/W)		If CPUID.80000001H:EDX[29] = 1
Register Address: C000_0101H		IA32_GS_BASE
Map of BASE Address of GS (R/W)		If CPUID.80000001H:EDX[29] = 1
Register Address: C000_0102H		IA32_KERNEL_GS_BASE
Swap Target of BASE Address of GS (R/W)		If CPUID.80000001H:EDX[29] = 1
Register Address: C000_0103H		IA32_TSC_AUX
Auxiliary TSC (R/W)		If CPUID.80000001H:EDX[27] = 1 or CPUID.07H.00H:ECX[22] = 1
31:0	AUX: Auxiliary signature of TSC.	
63:32	Reserved.	

NOTES:

1. Some older processors may have supported this MSR as model-specific and do not enumerate it with CPUID.
2. In processors based on Intel NetBurst® microarchitecture, MSR addresses 180H-197H are supported, software must treat them as model-specific. Starting with Intel Core Duo processors, MSR addresses 180H-185H, 188H-197H are reserved.
3. The *_ADDR MSRs may or may not be present; this depends on flag settings in IA32_MCI_STATUS. See Section 17.3.2.3 and Section 17.3.2.4 for more information.
4. Further details on Key Locker and usage of this MSR can be found here:
<https://software.intel.com/content/www/us/en/develop/download/intel-key-locker-specification.html>.

2.2 MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY

Table 2-3 lists model-specific registers (MSRs) for the Intel Core 2 processor family and for Intel Xeon processors based on Intel Core microarchitecture, architectural MSR addresses are also included in Table 2-3. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_0FH, see Table 2-1.

MSRs listed in Table 2-2 and Table 2-3 are also supported by processors based on the Enhanced Intel Core microarchitecture. Processors based on the Enhanced Intel Core microarchitecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_17H.

The column “Shared/Unique” applies to multi-core processors based on Intel Core microarchitecture. “Unique” means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. “Shared” means the MSR or the bit field in an MSR address governs the operation of both processor cores.

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Register Address: 0H, 0	IA32_P5_MC_ADDR	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
See Section 2.23, "MSRs in Pentium Processors."		Unique

15	Reserved.	
17:16	APIC Cluster ID (R/O)	
18	N/2 Non-Integer Bus Ratio (R/O) 0 = Integer ratio; 1 = Non-integer ratio.	
19	Reserved.	
21: 20	Symmetric Arbitration ID (R/O)	
26:22	Integer Bus Frequency Ratio (R/O)	
Register Address: 3AH, 58	MSR_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Unique
3	SMRR Enable (R/WL) When this bit is set and the lock bit is set, this makes the SMRR_PHYS_BASE and SMRR_PHYS_MASK registers read visible and writeable while in SMM.	Unique
Register Address: 40H, 64	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of four pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: - Last Branch Record Stack TOS at 1C9H. - Section 19.5.		Unique
Register Address: 41H, 65	MSR_LASTBRANCH_1_FROM_IP	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 42H, 66	MSR_LASTBRANCH_2_FROM_IP	
Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 43H, 67	MSR_LASTBRANCH_3_FROM_IP	
Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 60H, 96	MSR_LASTBRANCH_0_TO_IP	
Last Branch Record 0 To IP (R/W) One of four pairs of last branch record registers on the last branch record stack. This To_IP part of the stack contains pointers to the destination instruction.		Unique
Register Address: 61H, 97	MSR_LASTBRANCH_1_TO_IP	
Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 62H, 98	MSR_LASTBRANCH_2_TO_IP	
Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 63H, 99	MSR_LASTBRANCH_3_TO_IP	
Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Unique
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Unique
Register Address: A0H, 160	MSR_SMRR_PHYSBASE	
System Management Mode Base Address register (WO in SMM) Model-specific implementation of SMRR-like interface, read visible and write only in SMM.		Unique
11:0	Reserved.	
31:12	PhysBase: SMRR physical Base Address.	
63:32	Reserved.	
Register Address: A1H, 161	MSR_SMRR_PHYSMASK	
System Management Mode Physical Address Mask register (WO in SMM) Model-specific implementation of SMRR-like interface, read visible and write only in SMM.		Unique
10:0	Reserved.	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
11	Valid: Physical address base and range mask are valid.	
31:12	PhysMask: SMRR physical address range mask.	
63:32	Reserved.	
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Unique
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Unique
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Intel Core microarchitecture.		Shared
2:0	▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) ▪ 010B: 200 MHz (FSB 800) ▪ 000B: 267 MHz (FSB 1067) ▪ 100B: 333 MHz (FSB 1333)	
	133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B. 266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 000B. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 100B.	
63:3	Reserved.	
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Enhanced Intel Core microarchitecture.		Shared

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

2:0	▪ 101B: 100 MHz (FSB 400) ▪ 001B: 133 MHz (FSB 533) ▪ 011B: 167 MHz (FSB 667) ▪ 010B: 200 MHz (FSB 800) ▪ 000B: 267 MHz (FSB 1067) ▪ 100B: 333 MHz (FSB 1333) ▪ 110B: 400 MHz (FSB 1600) 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B. 266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 110B. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 111B.	
63:3	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: FEH, 254	IA32_MTRRCAP	
See Table 2-2.		Unique
11	SMRR Capability Using MSR 0A0H and 0A1H (R)	Unique
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Unique
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Unique
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Unique
Register Address: 179H, 377	IA32_MCG_CAP	
See Table 2-2.		Unique
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Unique
0	RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
1	EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved.	
Register Address: 186H, 390	IA32_PERFEVTSELO	
See Table 2-2.		Unique
Register Address: 187H, 391	IA32_PERFEVTSEL1	
See Table 2-2.		Unique
Register Address: 198H, 408	IA32_PERF_STATUS	
See Table 2-2.		Shared
Register Address: 198H, 408	MSR_PERF_STATUS	
Current performance status. See Section 16.1.1, "Software Interface For Initiating Performance State Transitions."		Shared
15:0	Current Performance State Value	
30:16	Reserved.	
31	XE Operation (R/O). If set, XE operation is enabled. Default is cleared.	
39:32	Reserved.	
44:40	Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.	
45	Reserved.	
46	Non-Integer Bus Ratio (R/O) Indicates non-integer bus ratio is enabled. Applies processors based on Enhanced Intel Core microarchitecture.	
63:47	Reserved.	
Register Address: 199H, 409	IA32_PERF_CTL	
See Table 2-2.		Unique
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.		Unique
Register Address: 19BH, 411	IA32_THERM_INTERRUPT	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Thermal Interrupt Control (R/W) See Table 2-2.		Unique
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Unique
Register Address: 19DH, 413	MSR_THERM2_CTL	
Thermal Monitor 2 Control		Unique
15:0	Reserved.	
16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle). 1 = Thermal Monitor 2 (thermally-initiated frequency transitions). If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 are enabled.	
63:16	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
0	Fast-Strings Enable See Table 2-2.	
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2.	Unique
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Shared
8	Reserved.	
9	Hardware Prefetcher Disable (R/W) When set, disables the hardware prefetcher operation on streams of data. When clear (default), enables the prefetch queue. Disabling of the hardware prefetcher may impact processor performance.	
10	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor. 0 = Indicates compatible FERR# signaling behavior. This bit must be set to 1 to support XAPIC interrupt model usage.	Shared
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Shared

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
12	Processor Event Based Sampling Unavailable (R/O) See Table 2-2.	Shared
13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.01H:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.	Shared
15:14	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.	Shared
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Shared
19	Adjacent Cache Line Prefetch Disable (R/W) When set to 1, the processor fetches the cache line that contains data currently required by the processor. When set to 0, the processor fetches cache lines that comprise a cache line pair (128 bytes). Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit.	Shared
20	Enhanced Intel SpeedStep Technology Select Lock (R/WO) When set, this bit causes the following bits to become read-only: - Enhanced Intel SpeedStep Technology Select Lock (this bit). - Enhanced Intel SpeedStep Technology Enable bit. The bit must be set before an Enhanced Intel SpeedStep Technology transition is requested. This bit is cleared on reset.	Shared
21	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2.	Shared
23	xTPR Message Disable (R/W) See Table 2-2.	Shared
33:24	Reserved.	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
34	XD Bit Disable (R/W) When set to 1, the Execute Disable Bit feature (XD Bit) is disabled and the XD Bit extended feature flag will be clear (CPUID.80000001H:EDX[20] = 0). When set to a 0 (default), the Execute Disable Bit feature (if available) allows the OS to enable PAE paging and take advantage of data only pages. BIOS must not alter the contents of this bit location if XD bit is not supported. Writing this bit to 1 when the XD Bit extended feature flag is set to 0 may generate a #GP exception.	Unique
36:35	Reserved.	
37	DCU Prefetcher Disable (R/W) When set to 1, the DCU L1 data cache prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature. The DCU prefetcher is an L1 data cache prefetcher. When the DCU prefetcher detects multiple loads from the same line done within a time limit, the DCU prefetcher assumes the next line will be required. The next line is prefetched in to the L1 data cache from memory or L2.	Unique
38	IDA Disable (R/W) When set to 1 on processors that support IDA, the Intel Dynamic Acceleration feature (IDA) is disabled and the IDA_Enable feature flag will be cleared (CPUID.06H:EAX[1] = 0). When set to a 0 on processors that support IDA, CPUID.06H:EAX[1] reports the processor's support of IDA is enabled. Note: The power-on default value is used by BIOS to detect hardware support of IDA. If the power-on default value is 1, IDA is available in the processor. If the power-on default value is 0, IDA is not available.	Shared
39	IP Prefetcher Disable (R/W) When set to 1, the IP prefetcher is disabled. The default value after reset is 0. BIOS may write '1' to disable this feature. The IP prefetcher is an L1 data cache prefetcher. The IP prefetcher looks for sequential load history to determine whether to prefetch the next expected data into the L1 cache from memory or L2.	Unique
63:40	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).		Unique
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W) See Table 2-2.		Unique
Register Address: 1DDH, 477	MSR_LER_FROM_LIP	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Last Exception Record From Linear IP (R/W) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 1DEH, 478	MSR_LER_TO_LIP	
Last Exception Record To Linear IP (R/W) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 200H, 512	IA32_MTRR_PHYSBASE0	
See Table 2-2.		Unique
Register Address: 201H, 513	IA32_MTRR_PHYSMASK0	
See Table 2-2.		Unique
Register Address: 202H, 514	IA32_MTRR_PHYSBASE1	
See Table 2-2.		Unique
Register Address: 203H, 515	IA32_MTRR_PHYSMASK1	
See Table 2-2.		Unique
Register Address: 204H, 516	IA32_MTRR_PHYSBASE2	
See Table 2-2.		Unique
Register Address: 205H, 517	IA32_MTRR_PHYSMASK2	
See Table 2-2.		Unique
Register Address: 206H, 518	IA32_MTRR_PHYSBASE3	
See Table 2-2.		Unique
Register Address: 207H, 519	IA32_MTRR_PHYSMASK3	
See Table 2-2.		Unique
Register Address: 208H, 520	IA32_MTRR_PHYSBASE4	
See Table 2-2.		Unique
Register Address: 209H, 521	IA32_MTRR_PHYSMASK4	
See Table 2-2.		Unique
Register Address: 20AH, 522	IA32_MTRR_PHYSBASE5	
See Table 2-2.		Unique
Register Address: 20BH, 523	IA32_MTRR_PHYSMASK5	
See Table 2-2.		Unique
Register Address: 20CH, 524	IA32_MTRR_PHYSBASE6	
See Table 2-2.		Unique
Register Address: 20DH, 525	IA32_MTRR_PHYSMASK6	
See Table 2-2.		Unique
Register Address: 20EH, 526	IA32_MTRR_PHYSBASE7	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
See Table 2-2.		Unique
Register Address: 20FH, 527	IA32_MTRR_PHYSMASK7	
See Table 2-2.		Unique
Register Address: 250H, 592	IA32_MTRR_FIX64K_00000	
See Table 2-2.		Unique
Register Address: 258H, 600	IA32_MTRR_FIX16K_80000	
See Table 2-2.		Unique
Register Address: 259H, 601	IA32_MTRR_FIX16K_A0000	
See Table 2-2.		Unique
Register Address: 268H, 616	IA32_MTRR_FIX4K_C0000	
See Table 2-2.		Unique
Register Address: 269H, 617	IA32_MTRR_FIX4K_C8000	
See Table 2-2.		Unique
Register Address: 26AH, 618	IA32_MTRR_FIX4K_D0000	
See Table 2-2.		Unique
Register Address: 26BH, 619	IA32_MTRR_FIX4K_D8000	
See Table 2-2.		Unique
Register Address: 26CH, 620	IA32_MTRR_FIX4K_E0000	
See Table 2-2.		Unique
Register Address: 26DH, 621	IA32_MTRR_FIX4K_E8000	
See Table 2-2.		Unique
Register Address: 26EH, 622	IA32_MTRR_FIX4K_F0000	
See Table 2-2.		Unique
Register Address: 26FH, 623	IA32_MTRR_FIX4K_F8000	
See Table 2-2.		Unique
Register Address: 277H, 631	IA32_PAT	
See Table 2-2.		Unique
Register Address: 2FFH, 767	IA32_MTRR_DEF_TYPE	
Default Memory Types (R/W) See Table 2-2.		Unique
Register Address: 309H, 777	IA32_FIXED_CTR0	
Fixed-Function Performance Counter Register 0 (R/W) See Table 2-2.		Unique
Register Address: 30AH, 778	IA32_FIXED_CTR1	
Fixed-Function Performance Counter Register 1 (R/W) See Table 2-2.		Unique

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Register Address: 30BH, 779	IA32_FIXED_CTR2	
Fixed-Function Performance Counter Register 2 (R/W) See Table 2-2.		Unique
Register Address: 345H, 837	IA32_PERF_CAPABILITIES	
See Table 2-2. See Section 19.4.1, "IA32_DEBUGCTL MSR."		Unique
Register Address: 345H, 837	MSR_PERF_CAPABILITIES	
R/O. This applies to processors that do not support architectural PerfMon version 2.		Unique
5:0	LBR Format. See Table 2-2.	
6	PEBS Record Format.	
7	PEBSSaveArchRegs. See Table 2-2.	
63:8	Reserved.	
Register Address: 38DH, 909	IA32_FIXED_CTR_CTRL	
Fixed-Function-Counter Control Register (R/W) See Table 2-2.		Unique
Register Address: 38EH, 910	IA32_PERF_GLOBAL_STATUS	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 38EH, 910	MSR_PERF_GLOBAL_STATUS	
See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 38FH, 911	IA32_PERF_GLOBAL_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 38FH, 911	MSR_PERF_GLOBAL_CTRL	
See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 390H, 912	IA32_PERF_GLOBAL_OVF_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 390H, 912	MSR_PERF_GLOBAL_OVF_CTRL	
See Section 21.6.2.2, "Global Counter Control Facilities."		Unique
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)	
See Table 2-2. See Section 21.6.2.4, "Processor Event Based Sampling (PEBS)."		Unique
0	Enable PEBS on IA32_PMC0. (R/W)	
Register Address: 400H, 1024	IA32_MCO_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."		Unique
Register Address: 401H, 1025	IA32_MCO_STATUS	
See Section 17.3.2.2, "IA32_MCI_STATUS MSRs."		Unique
Register Address: 402H, 1026	IA32_MCO_ADDR	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 404H, 1028	IA32_MC1_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."		Unique
Register Address: 405H, 1029	IA32_MC1_STATUS	
See Section 17.3.2.2, "IA32_MCI_STATUS MSRs."		Unique
Register Address: 406H, 1030	IA32_MC1_ADDR	
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 408H, 1032	IA32_MC2_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."		Unique
Register Address: 409H, 1033	IA32_MC2_STATUS	
See Section 17.3.2.2, "IA32_MCI_STATUS MSRs."		Unique
Register Address: 40AH, 1034	IA32_MC2_ADDR	
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 40CH, 1036	IA32_MC4_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."		Unique
Register Address: 40DH, 1037	IA32_MC4_STATUS	
See Section 17.3.2.2, "IA32_MCI_STATUS MSRs."		Unique
Register Address: 40EH, 1038	IA32_MC4_ADDR	
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 410H, 1040	IA32_MC3_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."		
Register Address: 411H, 1041	IA32_MC3_STATUS	
See Section 17.3.2.2, "IA32_MCI_STATUS MSRs."		
Register Address: 412H, 1042	IA32_MC3_ADDR	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 413H, 1043	IA32_MC3_MISC	
Machine Check Error Reporting Register: Contains additional information describing the machine-check error if the MISC_V flag in the IA32_MCI_STATUS register is set.		Unique
Register Address: 414H, 1044	IA32_MC5_CTL	
Machine Check Error Reporting Register: Controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).		Unique
Register Address: 415H, 1045	IA32_MC5_STATUS	
Machine Check Error Reporting Register: Contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCI_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.		Unique
Register Address: 416H, 1046	IA32_MC5_ADDR	
Machine Check Error Reporting Register: Contains the address of the code or data memory location that produced the machine-check error if the ADDR_V flag in the IA32_MCI_STATUS register is set.		Unique
Register Address: 417H, 1047	IA32_MC5_MISC	
Machine Check Error Reporting Register: Contains additional information describing the machine-check error if the MISC_V flag in the IA32_MCI_STATUS register is set.		Unique
Register Address: 419H, 1045	IA32_MC6_STATUS	
Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.3.2.2, "IA32_MCI_STATUS MSRs," and Chapter 25.		Unique
Register Address: 480H, 1152	IA32_VMX_BASIC	
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information."		Unique
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTL	
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2. See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTL	
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 483H, 1155	IA32_VMX_EXIT_CTL	
Capability Reporting Register of VM-Exit Controls (R/O) See Table 2-2. See Appendix A.4, "VM-Exit Controls."		Unique
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTL	
Capability Reporting Register of VM-Entry Controls (R/O) See Table 2-2. See Appendix A.5, "VM-Entry Controls."		Unique
Register Address: 485H, 1157	IA32_VMX_MISC	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2. See Appendix A.6, "Miscellaneous Data."		Unique
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Unique
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Unique
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Unique
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Unique
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2. See Appendix A.9, "VMCS Enumeration."		Unique
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTL2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Unique
Register Address: 600H, 1536	IA32_DS_AREA	
DS Save Area (R/W) See Table 2-2. See Section 21.6.3.4, "Debug Store (DS) Mechanism."		Unique
Register Address: 107CCH, 67532	MSR_EMON_L3_CTR_CTL0	
GBUSQ Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107CDH, 67533	MSR_EMON_L3_CTR_CTL1	
GBUSQ Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107CEH, 67534	MSR_EMON_L3_CTR_CTL2	
GSPNQ Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107CFH, 67535	MSR_EMON_L3_CTR_CTL3	
GSPNQ Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D0H, 67536	MSR_EMON_L3_CTR_CTL4	

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
FSB Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D1H, 67537	MSR_EMON_L3_CTR_CTL5	
FSB Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D2H, 67538	MSR_EMON_L3_CTR_CTL6	
FSB Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D3H, 67539	MSR_EMON_L3_CTR_CTL7	
FSB Event Control/Counter Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: 107D8H, 67544	MSR_EMON_L3_GL_CTL	
L3/FSB Common Control Register (R/W) Applies to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 19.2.2.		Unique
Register Address: C000_0080H	IA32_EFER	
Extended Feature Enables See Table 2-2.		Unique
Register Address: C000_0081H	IA32_STAR	
System Call Target Address (R/W) See Table 2-2.		Unique
Register Address: C000_0082H	IA32_LSTAR	
IA-32e Mode System Call Target Address (R/W) See Table 2-2.		Unique
Register Address: C000_0084H	IA32_FMASK	
System Call Flag Mask (R/W) See Table 2-2.		Unique
Register Address: C000_0100H	IA32_FS_BASE	
Map of BASE Address of FS (R/W) See Table 2-2.		Unique
Register Address: C000_0101H	IA32_GS_BASE	
Map of BASE Address of GS (R/W) See Table 2-2.		Unique
Register Address: C000_0102H	IA32_KERNEL_GS_BASE	
Swap Target of BASE Address of GS (R/W) See Table 2-2.		Unique

2.3 MSRS IN THE 45 NM AND 32 NM INTEL ATOM® PROCESSOR FAMILY

Table 2-4 lists model-specific registers (MSRs) for 45 nm and 32 nm Intel Atom processors, architectural MSR addresses are also included in Table 2-4. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_1CH, 06_26H, 06_27H, 06_35H, or 06_36H; see Table 2-1.

The column “Shared/Unique” applies to logical processors sharing the same core in processors based on the Intel Atom microarchitecture. “Unique” means each logical processor has a separate MSR, or a bit field in an MSR governs only a logical processor. “Shared” means the MSR or the bit field in an MSR address governs the operation of both logical processors in the same core.

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, “MSRs in Pentium Processors.”		Shared
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, “MSRs in Pentium Processors.”		Shared
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, “Monitor/Mwait Address Range Determination,” and Table 2-2.		Unique
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, “Time-Stamp Counter,” and see Table 2-2.		Unique
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2.		Shared
Register Address: 17H, 23	MSR_PLATFORM_ID	
Model Specific Platform ID (R)		Shared
7:0	Reserved.	
12:8	Maximum Qualified Ratio (R) The maximum allowed bus ratio.	
63:13	Reserved.	
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, “Local APIC Status and Location,” and Table 2-2.		Unique
Register Address: 2AH, 42	MSR_EBL_CR_POWERON	
Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.		Shared
0	Reserved.	
1	Data Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
2	Response Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Always 0.	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Shared/ Unique
3	AERR# Drive Enable (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
4	BERR# Enable for initiator bus requests (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
5	Reserved.	
6	Reserved.	
7	BINIT# Driver Enable (R/W) 1 = Enabled; 0 = Disabled. Always 0.	
8	Reserved.	
9	Execute BIST (R/O) 1 = Enabled; 0 = Disabled.	
10	AERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled. Always 0.	
11	Reserved.	
12	BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled. Always 0.	
13	Reserved.	
14	1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes.	
15	Reserved.	
17:16	APIC Cluster ID (R/O) Always 00B.	
19: 18	Reserved.	
21: 20	Symmetric Arbitration ID (R/O) Always 00B.	
26:22	Integer Bus Frequency Ratio (R/O)	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64Processor (R/W) See Table 2-2.		Unique
Register Address: 40H, 64	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: - Last Branch Record Stack TOS at 1C9H. - Section 19.5.		Unique

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Register Address: 41H, 65	MSR_LASTBRANCH_1_FROM_IP	
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 42H, 66	MSR_LASTBRANCH_2_FROM_IP	
Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 43H, 67	MSR_LASTBRANCH_3_FROM_IP	
Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 44H, 68	MSR_LASTBRANCH_4_FROM_IP	
Last Branch Record 4 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 45H, 69	MSR_LASTBRANCH_5_FROM_IP	
Last Branch Record 5 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 46H, 70	MSR_LASTBRANCH_6_FROM_IP	
Last Branch Record 6 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 47H, 71	MSR_LASTBRANCH_7_FROM_IP	
Last Branch Record 7 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Unique
Register Address: 60H, 96	MSR_LASTBRANCH_0_TO_IP	
Last Branch Record 0 To IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.		Unique
Register Address: 61H, 97	MSR_LASTBRANCH_1_TO_IP	
Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 62H, 98	MSR_LASTBRANCH_2_TO_IP	
Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 63H, 99	MSR_LASTBRANCH_3_TO_IP	
Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 64H, 100	MSR_LASTBRANCH_4_TO_IP	
Last Branch Record 4 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 65H, 101	MSR_LASTBRANCH_5_TO_IP	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Last Branch Record 5 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 66H, 102	MSR_LASTBRANCH_6_TO_IP	
Last Branch Record 6 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 67H, 103	MSR_LASTBRANCH_7_TO_IP	
Last Branch Record 7 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Unique
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Shared
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Unique
Register Address: C1H, 193	IA32_PMC0	
Performance counter register See Table 2-2.		Unique
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Unique
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Intel Atom microarchitecture.		Shared
2:0	111B: 083 MHz (FSB 333) 101B: 100 MHz (FSB 400) 001B: 133 MHz (FSB 533) 011B: 167 MHz (FSB 667) 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.	
63:3	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Unique
Register Address: FEH, 254	IA32_MTRRCAP	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Memory Type Range Register (R) See Table 2-2.		Shared
Register Address: 11EH, 281	MSR_BBL_CR_CTL3	
Control Register 3 Used to configure the L2 Cache.		Shared
0	L2 Hardware Enabled (R/O) 1 = Indicates the L2 is hardware-enabled. 0 = Indicates the L2 is hardware-disabled.	
7:1	Reserved.	
8	L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set, the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.	
22:9	Reserved.	
23	L2 Not Present (R/O) 0 = L2 Present. 1 = L2 Not Present.	
63:24	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Unique
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Unique
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Unique
Register Address: 179H, 377	IA32_MCG_CAP	
See Table 2-2.		Unique
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Unique
0	RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.	
1	EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Shared/ Unique
2	MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved.	
Register Address: 186H, 390	IA32_PERFEVTSELO	
See Table 2-2.		Unique
Register Address: 187H, 391	IA32_PERFEVTSEL1	
See Table 2-2.		Unique
Register Address: 198H, 408	IA32_PERF_STATUS	
See Table 2-2.		Shared
Register Address: 198H, 408	MSR_PERF_STATUS	
Performance Status		Shared
15:0	Current Performance State Value.	
39:16	Reserved.	
44:40	Maximum Bus Ratio (R/O) Indicates maximum bus ratio configured for the processor.	
63:45	Reserved.	
Register Address: 199H, 409	IA32_PERF_CTL	
See Table 2-2.		Unique
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.		Unique
Register Address: 19BH, 411	IA32_THERM_INTERRUPT	
Thermal Interrupt Control (R/W) See Table 2-2.		Unique
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Unique
Register Address: 19DH, 413	MSR_THERM2_CTL	
Thermal Monitor 2 Control		Shared
15:0	Reserved.	

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Shared/ Unique
16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle). 1 = Thermal Monitor 2 (thermally-initiated frequency transitions). If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 are enabled.	
63:17	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		Unique
0	Fast-Strings Enable See Table 2-2.	
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2. Default value is 0.	Unique
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Shared
8	Reserved.	
9	Reserved.	
10	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor. 0 = Indicates compatible FERR# signaling behavior. This bit must be set to 1 to support XAPIC interrupt model usage.	Shared
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Shared
12	Processor Event Based Sampling Unavailable (R/O) See Table 2-2.	Shared
13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is cleared (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermally managed state. The BIOS must enable this feature if the TM2 feature flag (CPUID.01H:ECX[8]) is set; if the TM2 feature flag is not set, this feature is not supported and BIOS must not alter the contents of the TM2 bit location. The processor is operating out of specification if both this bit and the TM1 bit are set to 0.	Shared

Table 2-4. MSRs in the 45 nm and 32 nm Intel Atom® Processor Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Shared/ Unique
15:14	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.	Shared
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Shared
19	Reserved.	
20	Enhanced Intel SpeedStep Technology Select Lock (R/WO) When set, this bit causes the following bits to become read-only: - Enhanced Intel SpeedStep Technology Select Lock (this bit). - Enhanced Intel SpeedStep Technology Enable bit. The bit must be set before an Enhanced Intel SpeedStep Technology transition is requested. This bit is cleared on reset.	Shared
21	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2.	Unique
23	xTPR Message Disable (R/W) See Table 2-2.	Shared
33:24	Reserved.	
34	XD Bit Disable (R/W) See Table 2-3.	Unique
63:35	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-2) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).		Unique
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W) See Table 2-2.		Unique
Register Address: 1DDH, 477	MSR_LER_FROM_LIP	
Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 1DEH, 478	MSR_LER_TO_LIP	
Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 200H, 512	IA32_MTRR_PHYSBASE0	
See Table 2-2.		Shared

Map of BASE Address of FS (R/W) See Table 2-2.		Unique
Register Address: C000_0101H	IA32_GS_BASE	
Map of BASE Address of GS (R/W) See Table 2-2.		Unique
Register Address: C000_0102H	IA32_KERNEL_GS_BASE	
Swap Target of BASE Address of GS (R/W) See Table 2-2.		Unique

Table 2-5 lists model-specific registers (MSRs) that are specific to Intel Atom® processor with a CPUID Signature DisplayFamily_DisplayModel value of 06_27H.

Table 2-5. MSRs Supported by Intel Atom® Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_27H

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 3F8H, 1016	MSR_PKG_C2_RESIDENCY	
Package C2 Residency Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package

Table 2-5. MSRs Supported by Intel Atom® Processors (Contd.)with a CPUID Signature DisplayFamily_DisplayModel Value of 06_27H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
63:0	Package C2 Residency Counter (R/O) Time that this package is in processor-specific C2 states since last reset. Counts at 1 Mhz frequency.	Package
Register Address: 3F9H, 1017	MSR_PKG_C4_RESIDENCY	
Package C4 Residency Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C4 Residency Counter. (R/O) Time that this package is in processor-specific C4 states since last reset. Counts at 1 Mhz frequency.	Package
Register Address: 3FAH, 1018	MSR_PKG_C6_RESIDENCY	
Package C6 Residency Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C6 Residency Counter. (R/O) Time that this package is in processor-specific C6 states since last reset. Counts at 1 Mhz frequency.	Package

2.4 MSRS IN INTEL PROCESSORS BASED ON SILVERMONT MICROARCHITECTURE

Table 2-6 lists model-specific registers (MSRs) common to Intel processors based on the Silvermont microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_37H, 06_4AH, 06_4DH, 06_5AH, or 06_5DH; see Table 2-1. The MSRs listed in Table 2-6 are also common to processors based on the Airmont microarchitecture and newer microarchitectures for next generation Intel Atom processors.

Table 2-7 lists MSRs common to processors based on the Silvermont and Airmont microarchitectures, but not newer microarchitectures.

Table 2-8, Table 2-9, and Table 2-10 lists MSRs that are model-specific across processors based on the Silvermont microarchitecture.

In the Silvermont microarchitecture, the scope column indicates the following: “Core” means each processor core has a separate MSR, or a bit field not shared with another processor core. “Module” means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Silvermont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID.04H enumeration can be used to figure out which processors are in the same module. “Package” means all processor cores in the physical package share the same MSR or bit interface.

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, “MSRs in Pentium Processors.”		Module
Register Address: 1H, 1	IA32_P5_MC_TYPE	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
See Section 2.23, "MSRs in Pentium Processors."		Module
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Core
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and Table 2-2.		Core
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Core
Register Address: 2AH, 42	MSR_EBL_CR_POWERON	
Processor Hard Power-On Configuration (R/W) Writes ignored.		Module
63:0	Reserved.	
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/O)		Core
31:0	SMI Count (R/O) Running count of SMI events since last RESET.	
63:32	Reserved.	
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Core
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Core
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Core
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Core
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Redirection in C-state (R/W) See http://biosbits.org .		Module
15:0	LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWait Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWait instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
18:16	C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit 10]: 100b - C4 is the max C-State to include 110b - C6 is the max C-State to include 111b - C7 is the max C-State to include	
63:19	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Core
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Core
Register Address: FEH, 254	IA32_MTRRCAP	
Memory Type Range Register (R) See Table 2-2.		Core
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction sets availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note: AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Core
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Core
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Core
Register Address: 179H, 377	IA32_MCG_CAP	
See Table 2-2.		Core
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Core

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
0	RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.	
1	EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved.	
Register Address: 186H, 390	IA32_PERFEVTSEL0	
See Table 2-2.		Core
7:0	Event Select	
15:8	UMask	
16	USR	
17	OS	
18	Edge	
19	PC	
20	INT	
21	Reserved.	
22	EN	
23	INV	
31:24	CMASK	
63:32	Reserved.	
Register Address: 187H, 391	IA32_PERFEVTSEL1	
See Table 2-2.		Core
Register Address: 198H, 408	IA32_PERF_STATUS	
See Table 2-2.		Module
Register Address: 199H, 409	IA32_PERF_CTL	
See Table 2-2.		Core
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2. IA32_CLOCK_MODULATION MSR was originally named IA32_THERM_CONTROL MSR.		Core
Register Address: 19BH, 411	IA32_THERM_INTERRUPT	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Thermal Interrupt Control (R/W) See Table 2-2.		Core
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Core
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target		Package
15:0	Reserved.	
23:16	Temperature Target (R) The default thermal throttling or PROCHOT# activation temperature in degrees C. The effective temperature for thermal throttling or PROCHOT# activation is "Temperature Target" + "Target Offset".	
29:24	Target Offset (R/W) Specifies an offset in degrees C to adjust the throttling and PROCHOT# activation temperature from the default target specified in TEMPERATURE_TARGET (bits 23:16).	
63:30	Reserved.	
Register Address: 1A6H, 422	MSR_OFFCORE_RSP_0	
Offcore Response Event Select Register (R/W)		Module
Register Address: 1A7H, 423	MSR_OFFCORE_RSP_1	
Offcore Response Event Select Register (R/W)		Module
Register Address: 1B0H, 432	IA32_ENERGY_PERF_BIAS	
See Table 2-2.		Core
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W) See Table 2-2.		Core
Register Address: 1DDH, 477	MSR_LER_FROM_LIP	
Last Exception Record From Linear IP (R/W) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Core
Register Address: 1DEH, 478	MSR_LER_TO_LIP	
Last Exception Record To Linear IP (R/W) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Core
Register Address: 1F2H, 498	IA32_SMRR_PHYSBASE	
See Table 2-2.		Core
Register Address: 1F3H, 499	IA32_SMRR_PHYSMASK	
See Table 2-2.		Core
Register Address: 200H, 512	IA32_MTRR_PHYSBASE0	
See Table 2-2.		Core

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 201H, 513	IA32_MTRR_PHYSMASK0	
See Table 2-2.		Core
Register Address: 202H, 514	IA32_MTRR_PHYSBASE1	
See Table 2-2.		Core
Register Address: 203H, 515	IA32_MTRR_PHYSMASK1	
See Table 2-2.		Core
Register Address: 204H, 516	IA32_MTRR_PHYSBASE2	
See Table 2-2.		Core
Register Address: 205H, 517	IA32_MTRR_PHYSMASK2	
See Table 2-2.		Core
Register Address: 206H, 518	IA32_MTRR_PHYSBASE3	
See Table 2-2.		Core
Register Address: 207H, 519	IA32_MTRR_PHYSMASK3	
See Table 2-2.		Core
Register Address: 208H, 520	IA32_MTRR_PHYSBASE4	
See Table 2-2.		Core
Register Address: 209H, 521	IA32_MTRR_PHYSMASK4	
See Table 2-2.		Core
Register Address: 20AH, 522	IA32_MTRR_PHYSBASE5	
See Table 2-2.		Core
Register Address: 20BH, 523	IA32_MTRR_PHYSMASK5	
See Table 2-2.		Core
Register Address: 20CH, 524	IA32_MTRR_PHYSBASE6	
See Table 2-2.		Core
Register Address: 20DH, 525	IA32_MTRR_PHYSMASK6	
See Table 2-2.		Core
Register Address: 20EH, 526	IA32_MTRR_PHYSBASE7	
See Table 2-2.		Core
Register Address: 20FH, 527	IA32_MTRR_PHYSMASK7	
See Table 2-2.		Core
Register Address: 250H, 592	IA32_MTRR_FIX64K_00000	
See Table 2-2.		Core
Register Address: 258H, 600	IA32_MTRR_FIX16K_80000	
See Table 2-2.		Core
Register Address: 259H, 601	IA32_MTRR_FIX16K_A0000	
See Table 2-2.		Core
Register Address: 268H, 616	IA32_MTRR_FIX4K_C0000	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
See Table 2-2.		Core
Register Address: 269H, 617	IA32_MTRR_FIX4K_C8000	
See Table 2-2.		Core
Register Address: 26AH, 618	IA32_MTRR_FIX4K_D0000	
See Table 2-2.		Core
Register Address: 26BH, 619	IA32_MTRR_FIX4K_D8000	
See Table 2-2.		Core
Register Address: 26CH, 620	IA32_MTRR_FIX4K_E0000	
See Table 2-2.		Core
Register Address: 26DH, 621	IA32_MTRR_FIX4K_E8000	
See Table 2-2.		Core
Register Address: 26EH, 622	IA32_MTRR_FIX4K_F0000	
See Table 2-2.		Core
Register Address: 26FH, 623	IA32_MTRR_FIX4K_F8000	
See Table 2-2.		Core
Register Address: 277H, 631	IA32_PAT	
See Table 2-2.		Core
Register Address: 2FFH, 767	IA32_MTRR_DEF_TYPE	
Default Memory Types (R/W) See Table 2-2.		Core
Register Address: 309H, 777	IA32_FIXED_CTR0	
Fixed-Function Performance Counter Register 0 (R/W) See Table 2-2.		Core
Register Address: 30AH, 778	IA32_FIXED_CTR1	
Fixed-Function Performance Counter Register 1 (R/W) See Table 2-2.		Core
Register Address: 30BH, 779	IA32_FIXED_CTR2	
Fixed-Function Performance Counter Register 2 (R/W) See Table 2-2.		Core
Register Address: 345H, 837	IA32_PERF_CAPABILITIES	
See Table 2-2. See Section 19.4.1, "IA32_DEBUGCTL MSR."		Core
Register Address: 38DH, 909	IA32_FIXED_CTR_CTRL	
Fixed-Function-Counter Control Register (R/W) See Table 2-2.		Core
Register Address: 38FH, 911	IA32_PERF_GLOBAL_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Core
Register Address: 3FDH, 1021	MSR_CORE_C6_RESIDENCY	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C6 Residency Counter (R/O) Value since last reset that this core is in processor-specific C6 states. Counts at the TSC Frequency.	
Register Address: 400H, 1024	IA32_MCO_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Module
Register Address: 401H, 1025	IA32_MCO_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Module
Register Address: 402H, 1026	IA32_MCO_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Module
Register Address: 404H, 1028	IA32_MC1_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Module
Register Address: 405H, 1029	IA32_MC1_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Module
Register Address: 408H, 1032	IA32_MC2_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Module
Register Address: 409H, 1033	IA32_MC2_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Module
Register Address: 40AH, 1034	IA32_MC2_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Module
Register Address: 40CH, 1036	IA32_MC3_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Core
Register Address: 40DH, 1037	IA32_MC3_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Core
Register Address: 40EH, 1038	IA32_MC3_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Core
Register Address: 410H, 1040	IA32_MC4_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Core
Register Address: 411H, 1041	IA32_MC4_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Core

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 412H, 1042	IA32_MC4_ADDR	
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Core
Register Address: 414H, 1044	IA32_MC5_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."		Package
Register Address: 415H, 1045	IA32_MC5_STATUS	
See Section 17.3.2.2, "IA32_MCI_STATUS MSRs."		Package
Register Address: 416H, 1046	IA32_MC5_ADDR	
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Package
Register Address: 480H, 1152	IA32_VMX_BASIC	
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2. See Appendix A.1, "Basic VMX Information."		Core
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTL	
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2. See Appendix A.3, "VM-Execution Controls."		Core
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTL	
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Core
Register Address: 483H, 1155	IA32_VMX_EXIT_CTL	
Capability Reporting Register of VM-Exit Controls (R/O) See Table 2-2. See Appendix A.4, "VM-Exit Controls."		Core
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTL	
Capability Reporting Register of VM-Entry Controls (R/O) See Table 2-2. See Appendix A.5, "VM-Entry Controls."		Core
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2. See Appendix A.6, "Miscellaneous Data."		Core
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Core
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.7, "VMX-Fixed Bits in CR0."		Core
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Core
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2. See Appendix A.8, "VMX-Fixed Bits in CR4."		Core
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2. See Appendix A.9, "VMCS Enumeration."		Core
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTL2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Core
Register Address: 48CH, 1164	IA32_VMX_EPT_VPID_ENUM	
Capability Reporting Register of EPT and VPID (R/O) See Table 2-2.		Core
Register Address: 48DH, 1165	IA32_VMX_TRUE_PINBASED_CTL2	
Capability Reporting Register of Pin-Based VM-Execution Flex Controls (R/O) See Table 2-2.		Core
Register Address: 48EH, 1166	IA32_VMX_TRUE_PROCBASED_CTL2	
Capability Reporting Register of Primary Processor-based VM-Execution Flex Controls (R/O) See Table 2-2.		Core
Register Address: 48FH, 1167	IA32_VMX_TRUE_EXIT_CTL2	
Capability Reporting Register of VM-Exit Flex Controls (R/O) See Table 2-2.		Core
Register Address: 490H, 1168	IA32_VMX_TRUE_ENTRY_CTL2	
Capability Reporting Register of VM-Entry Flex Controls (R/O) See Table 2-2.		Core
Register Address: 491H, 1169	IA32_VMX_FMFUNC	
Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2.		Core

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 4C1H, 1217	IA32_A_PMC0	
See Table 2-2.		Core
Register Address: 4C2H, 1218	IA32_A_PMC1	
See Table 2-2.		Core
Register Address: 600H, 1536	IA32_DS_AREA	
DS Save Area (R/W) See Table 2-2 and Section 21.6.3.4, "Debug Store (DS) Mechanism."		Core
Register Address: 660H, 1632	MSR_CORE_C1_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C1 Residency Counter. (R/O) Value since last reset that this core is in processor-specific C1 states. Counts at the TSC frequency.	
Register Address: 6E0H, 1760	IA32_TSC_DEADLINE	
TSC Target of Local APIC's TSC Deadline Mode (R/W) See Table 2-2.		Core
Register Address: C000_0080H	IA32_EFER	
Extended Feature Enables See Table 2-2.		Core
Register Address: C000_0081H	IA32_STAR	
System Call Target Address (R/W) See Table 2-2.		Core
Register Address: C000_0082H	IA32_LSTAR	
IA-32e Mode System Call Target Address (R/W) See Table 2-2.		Core
Register Address: C000_0084H	IA32_FMASK	
System Call Flag Mask (R/W) See Table 2-2.		Core
Register Address: C000_0100H	IA32_FS_BASE	
Map of BASE Address of FS (R/W) See Table 2-2.		Core
Register Address: C000_0101H	IA32_GS_BASE	
Map of BASE Address of GS (R/W) See Table 2-2.		Core
Register Address: C000_0102H	IA32_KERNEL_GS_BASE	
Swap Target of BASE Address of GS (R/W) See Table 2-2.		Core
Register Address: C000_0103H	IA32_TSC_AUX	

Table 2-6. MSRs Common to Intel Atom® Processors (Silvermont and Newer Microarchitectures) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
AUXILIARY TSC Signature (R/W) See Table 2-2.		Core

Table 2-7 lists model-specific registers (MSRs) that are common to Intel Atom® processors based on the Silvermont and Airmont microarchitectures but not newer microarchitectures.

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 17H, 23	MSR_PLATFORM_ID	
Model Specific Platform ID (R)		Module
7:0	Reserved.	
13:8	Maximum Qualified Ratio (R) The maximum allowed bus ratio.	
49:13	Reserved.	
52:50	See Table 2-2.	
63:33	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64Processor (R/W) See Table 2-2.		Core
0	Lock (R/WL)	
1	Reserved.	
2	Enable VMX outside SMX operation (R/WL)	
Register Address: 40H, 64	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: - Last Branch Record Stack TOS at 1C9H. - Section 19.5 and record format in Section 19.4.8.1.		Core
Register Address: 41H, 65	MSR_LASTBRANCH_1_FROM_IP	
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 42H, 66	MSR_LASTBRANCH_2_FROM_IP	
Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 43H, 67	MSR_LASTBRANCH_3_FROM_IP	
Last Branch Record 3 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 44H, 68	MSR_LASTBRANCH_4_FROM_IP	
Last Branch Record 4 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 45H, 69	MSR_LASTBRANCH_5_FROM_IP	
Last Branch Record 5 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 46H, 70	MSR_LASTBRANCH_6_FROM_IP	
Last Branch Record 6 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 47H, 71	MSR_LASTBRANCH_7_FROM_IP	
Last Branch Record 7 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 60H, 96	MSR_LASTBRANCH_0_TO_IP	
Last Branch Record 0 To IP (R/W) One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.		Core
Register Address: 61H, 97	MSR_LASTBRANCH_1_TO_IP	
Last Branch Record 1 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 62H, 98	MSR_LASTBRANCH_2_TO_IP	
Last Branch Record 2 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 63H, 99	MSR_LASTBRANCH_3_TO_IP	
Last Branch Record 3 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 64H, 100	MSR_LASTBRANCH_4_TO_IP	
Last Branch Record 4 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 65H, 101	MSR_LASTBRANCH_5_TO_IP	
Last Branch Record 5 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 66H, 102	MSR_LASTBRANCH_6_TO_IP	
Last Branch Record 6 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: 67H, 103	MSR_LASTBRANCH_7_TO_IP	
Last Branch Record 7 To IP (R/W) See description of MSR_LASTBRANCH_0_TO_IP.		Core
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information: Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the maximum frequency that does not require turbo. Frequency = ratio * Scalable Bus Frequency.	Package
63:16	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org .		Module
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-state support) 001b: C1 (Behavior is the same as 000b) 100b: C4 110b: C6 111b: C7 (Silvermont only)	
9:3	Reserved.	
10	I/O MWait Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWait instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
63:16	Reserved.	
Register Address: 11EH, 281	MSR_BBL_CR_CTL3	
Control Register 3 Used to configure the L2 Cache.		Module
0	L2 Hardware Enabled (R/O) 1 = If the L2 is hardware-enabled. 0 = Indicates if the L2 is hardware-disabled.	
7:1	Reserved.	
8	L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.	
22:9	Reserved.	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
23	L2 Not Present (R/O) 0 = L2 Present. 1 = L2 Not Present.	
63:24	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
0	Fast-Strings Enable See Table 2-2.	Core
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2. Default value is 0.	Module
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Core
10:8	Reserved.	
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Core
12	Processor Event Based Sampling Unavailable (R/O) See Table 2-2.	Core
15:13	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.	Module
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Core
21:19	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2.	Core
23	xTPR Message Disable (R/W) See Table 2-2.	Module
33:24	Reserved.	
34	XD Bit Disable (R/W) See Table 2-3.	Core
37:35	Reserved.	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
38	Turbo Mode Disable (R/W) When set to 1 on processors that support Intel Turbo Boost Technology, the turbo mode feature is disabled and the IDA_Enable feature flag will be cleared (CPUID.06H:EAX[1] = 0). When set to a 0 on processors that support IDA, CPUID.06H:EAX[1] reports the processor's support of turbo mode is enabled. Note: The power-on default value is used by BIOS to detect hardware support of turbo mode. If the power-on default value is 1, turbo mode is available in the processor. If the power-on default value is 0, turbo mode is not available.	Module
63:39	Reserved.	
Register Address: 1C8H, 456	MSR_LBR_SELECT	
Last Branch Record Filtering Select Register (R/W) See Section 19.9.2, "Filtering of Last Branch Records."		Core
0	CPL_EQ_0	
1	CPL_NEQ_0	
2	JCC	
3	NEAR_REL_CALL	
4	NEAR_IND_CALL	
5	NEAR_RET	
6	NEAR_IND_JMP	
7	NEAR_REL_JMP	
8	FAR_BRANCH	
63:9	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-2) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP.		Core
Register Address: 38EH, 910	IA32_PERF_GLOBAL_STATUS	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Core
Register Address: 390H, 912	IA32_PERF_GLOBAL_OVF_CTRL	
See Table 2-2. See Section 21.6.2.2, "Global Counter Control Facilities."		Core
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)	
See Table 2-2. See Section 21.6.2.4, "Processor Event Based Sampling (PEBS)."		Core
0	Enable PEBS for precise event on IA32_PMC0 (R/W)	
Register Address: 3FAH, 1018	MSR_PKG_C6_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C6 Residency Counter (R/O) Value since last reset that this package is in processor-specific C6 states. Counts at the TSC Frequency.	

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 664H, 1636	MSR_MC6_RESIDENCY_COUNTER	
Module C6 Residency Counter (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Module
63:0	Time that this module is in module-specific C6 states since last reset. Counts at 1 Mhz frequency.	

2.4.1 MSRs with Model-Specific Behavior in the Silvermont Microarchitecture

Table 2-8 lists MSRs that are specific to the Intel Atom[®] processor E3000 Series (CPUID Signature DisplayFamily_DisplayModel value of 06_37H) and Intel Atom processors (CPUID Signature DisplayFamily_DisplayModel value of 06_4AH, 06_5AH, or 06_5DH).

Table 2-8. Specific MSRs Supported by Intel Atom[®] Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_37H, 06_4AH, 06_5AH, or 06_5DH

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Silvermont microarchitecture.		Module
2:0	100B: 080.0 MHz 000B: 083.3 MHz 001B: 100.0 MHz 010B: 133.3 MHz 011B: 116.7 MHz	
63:3	Reserved.	
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers used in RAPL Interfaces (R/O) See Section 16.10.1, "RAPL Interfaces."		Package
3:0	Power Units Power related information (in milliWatts) is based on the multiplier, 2^{PU} ; where PU is an unsigned integer represented by bits 3:0. Default value is 0101b, indicating power unit is in 32 milliWatts increment.	
7:4	Reserved.	
12:8	Energy Status Units Energy related information (in microJoules) is based on the multiplier, 2^{ESU} ; where ESU is an unsigned integer represented by bits 12:8. Default value is 00101b, indicating energy unit is in 32 microJoules increment.	
15:13	Reserved.	
19:16	Time Unit The value is 0000b, indicating time unit is in one second.	
63:20	Reserved.	
Register Address: 610H, 1552	MSR_PKG_POWER_LIMIT	
PKG RAPL Power Limit Control (R/W)		Package

Table 2-8. Specific MSRs Supported by Intel Atom® Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_37H, 06_4AH, 06_5AH, or 06_5DH (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
14:0	Package Power Limit #1 (R/W) See Section 16.10.3, "Package RAPL Domain," and MSR_RAPL_POWER_UNIT in Table 2-8.	
15	Enable Power Limit #1 (R/W) See Section 16.10.3, "Package RAPL Domain."	
16	Package Clamping Limitation #1 (R/W) See Section 16.10.3, "Package RAPL Domain."	
23:17	Time Window for Power Limit #1 (R/W) In unit of second. If 0 is specified in bits [23:17], defaults to 1 second window.	
63:24	Reserved.	
Register Address: 611H, 1553	MSR_PKG_ENERGY_STATUS	
PKG Energy Status (R/O) See Section 16.10.3, "Package RAPL Domain," and MSR_RAPL_POWER_UNIT in Table 2-8.		Package
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains," and MSR_RAPL_POWER_UNIT in Table 2-8.		Package

Table 2-9 lists model-specific registers (MSRs) that are specific to the Intel Atom® processor E3000 Series (CPUID Signature DisplayFamily_DisplayModel value of 06_37H).

Table 2-9. Specific MSRs Supported by the Intel Atom® Processor E3000 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_37H

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 668H, 1640	MSR_CC6_DEMOTION_POLICY_CONFIG	
Core C6 Demotion Policy Config MSR		Package
63:0	Controls per-core C6 demotion policy. Writing a value of 0 disables core level HW demotion policy.	
Register Address: 669H, 1641	MSR_MC6_DEMOTION_POLICY_CONFIG	
Module C6 Demotion Policy Config MSR		Package
63:0	Controls module (i.e., two cores sharing the second-level cache) C6 demotion policy. Writing a value of 0 disables module level HW demotion policy.	
Register Address: 664H, 1636	MSR_MC6_RESIDENCY_COUNTER	
Module C6 Residency Counter (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Module
63:0	Time that this module is in module-specific C6 states since last reset. Counts at 1 Mhz frequency.	

Table 2-10 lists model-specific registers (MSRs) that are specific to Intel Atom® processor C2000 Series (CPUID Signature DisplayFamily_DisplayModel value of 06_4DH).

Table 2-10. Specific MSRs Supported by Intel Atom® Processor C2000 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_4DH

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1A4H, 420	MSR_MISC_FEATURE_CONTROL	
Miscellaneous Feature Control (R/W)		
0	L2 Hardware Prefetcher Disable (R/W) If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	Core
1	Reserved.	
2	DCU Hardware Prefetcher Disable (R/W) If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	Core
63:3	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode (R/W)		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.	Package
39:32	Maximum Ratio Limit for 5C Maximum turbo ratio limit of 5 core active.	Package
47:40	Maximum Ratio Limit for 6C Maximum turbo ratio limit of 6 core active.	Package
55:48	Maximum Ratio Limit for 7C Maximum turbo ratio limit of 7 core active.	Package
63:56	Maximum Ratio Limit for 8C Maximum turbo ratio limit of 8 core active.	Package
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers used in RAPL Interfaces (R/O) See Section 16.10.1, "RAPL Interfaces."		Package
3:0	Power Units Power related information (in milliWatts) is based on the multiplier, 2^{PU} ; where PU is an unsigned integer represented by bits 3:0. Default value is 0101b, indicating power unit is in 32 milliWatts increment.	
7:4	Reserved.	

Table 2-10. Specific MSRs Supported by Intel Atom® Processor C2000 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_4DH (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
12:8	Energy Status Units. Energy related information (in microjoules) is based on the multiplier, 2^{ESU} ; where ESU is an unsigned integer represented by bits 12:8. Default value is 00101b, indicating energy unit is in 32 microjoules increment.	
15:13	Reserved.	
19:16	Time Unit The value is 0000b, indicating time unit is in one second.	
63:20	Reserved.	
Register Address: 610H, 1552	MSR_PKG_POWER_LIMIT	
PKG RAPL Power Limit Control (R/W) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 66EH, 1646	MSR_PKG_POWER_INFO	
PKG RAPL Parameter (R/O)		Package
14:0	Thermal Spec Power (R/O) The unsigned integer value is the equivalent of the thermal specification power of the package domain. The unit of this field is specified by the "Power Units" field of MSR_RAPL_POWER_UNIT.	
63:15	Reserved.	

2.4.2 MSRs in Intel Atom® Processors Based on Airmont Microarchitecture

Intel Atom processor X7-Z8000 and X5-Z8000 series are based on the Airmont microarchitecture. These processors support MSRs listed in Table 2-6, Table 2-7, Table 2-8, and Table 2-11. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_4CH; see Table 2-1.

Table 2-11. MSRs in Intel Atom® Processors Based on Airmont Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: CDH, 205	MSR_FSB_FREQ	
Scaleable Bus Speed (R/O) This field indicates the intended scalable bus clock speed for processors based on Airmont microarchitecture.		Module
3:0	▪ 0000B: 083.3 MHz ▪ 0001B: 100.0 MHz ▪ 0010B: 133.3 MHz ▪ 0011B: 116.7 MHz ▪ 0100B: 080.0 MHz ▪ 0101B: 093.3 MHz ▪ 0110B: 090.0 MHz ▪ 0111B: 088.9 MHz ▪ 1000B: 087.5 MHz	
63:5	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	

Table 2-11. MSRs in Intel Atom® Processors Based on Airmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org .		Module
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: No limit 001b: C1 010b: C2 110b: C6 111b: C7	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/W0) When set, locks bits 15:0 of this register until next reset.	
63:16	Reserved.	
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Redirection in C-state (R/W) See http://biosbits.org .		Module
15:0	LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PMG_CST_CONFIG_CONTROL[bit 10]: 000b - C3 is the max C-State to include. 001b - Deep Power Down Technology is the max C-State. 010b - C7 is the max C-State to include.	
63:19	Reserved.	
Register Address: 638H, 1592	MSR_PPO_POWER_LIMIT	
PPO RAPL Power Limit Control (R/W)		Package

Table 2-11. MSRs in Intel Atom® Processors Based on Airmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
14:0	PP0 Power Limit #1 (R/W) See Section 16.10.4, “PP0/PP1 RAPL Domains,” and MSR_RAPL_POWER_UNIT in Table 2-8.	
15	Enable Power Limit #1 (R/W) See Section 16.10.4, “PP0/PP1 RAPL Domains.”	
16	Reserved.	
23:17	Time Window for Power Limit #1 (R/W) Specifies the time duration over which the average power must remain below PP0_POWER_LIMIT #1(14:0). Supported Encodings: 0x0: 1 second time duration. 0x1: 5 second time duration (Default). 0x2: 10 second time duration. 0x3: 15 second time duration. 0x4: 20 second time duration. 0x5: 25 second time duration. 0x6: 30 second time duration. 0x7: 35 second time duration. 0x8: 40 second time duration. 0x9: 45 second time duration. 0xA: 50 second time duration. 0xB-0x7F - reserved.	
63:24	Reserved.	

2.5 MSRS IN INTEL ATOM® PROCESSORS BASED ON GOLDMONT MICROARCHITECTURE

Intel Atom processors based on the Goldmont microarchitecture support MSRs listed in Table 2-6 and Table 2-12. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_5CH; see Table 2-1.

In the Goldmont microarchitecture, the scope column indicates the following: “Core” means each processor core has a separate MSR, or a bit field not shared with another processor core. “Module” means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Goldmont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID.04H enumeration can be used to figure out which processors are in the same module. “Package” means all processor cores in the physical package share the same MSR or bit interface.

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 17H, 23	MSR_PLATFORM_ID	
Model Specific Platform ID (R)		Module
49:0	Reserved.	
52:50	See Table 2-2.

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
63:33	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Core
0	Lock (R/WL)	
1	Enable VMX inside SMX operation (R/WL)	
2	Enable VMX outside SMX operation (R/WL)	
14:8	SENTER local functions enables (R/WL)	
15	SENTER global functions enable (R/WL)	
18	SGX global functions enable (R/WL)	
63:19	Reserved.	
Register Address: 3BH, 59	IA32_TSC_ADJUST	
Per-Core TSC ADJUST (R/W) See Table 2-2.		Core
Register Address: C3H, 195	IA32_PMC2	
Performance Counter Register See Table 2-2.		Core
Register Address: C4H, 196	IA32_PMC3	
Performance Counter Register See Table 2-2.		Core
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the maximum frequency that does not require turbo. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
30	Programmable TJ OFFSET (R/O) When set to 1, indicates that MSR_TEMPERATURE_TARGET.[27:24] is valid and writable to specify a temperature offset.	Package
39:31	Reserved.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org .		Core
3:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 0000b: No limit 0001b: C1 0010b: C3 0011b: C6 0100b: C7 0101b: C7S 0110b: C8 0111b: C9 1000b: C10	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
63:16	Reserved.	
Register Address: 17DH, 381	MSR_SMM_MCA_CAP	
Enhanced SMM Capabilities (SMM-RO) Reports SMM capability enhancement. Accessible only while in SMM.		Core
57:0	Reserved.	
58	SMM_Code_Access_Chk (SMM-RO) If set to 1 indicates that the SMM code access restriction is supported and the MSR_SMM_FEATURE_CONTROL is supported.	
59	Long_Flow_Indication (SMM-RO) If set to 1 indicates that the SMM long flow indicator is supported and the MSR_SMM_DELAYED is supported.	
63:60	Reserved.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

See Table 2-2.		Core
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Misc. Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
0	Fast-Strings Enable See Table 2-2.	Core
2:1	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2. Default value is 1.	Package
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Core
10:8	Reserved.	
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Core
12	Processor Event Based Sampling Unavailable (R/O) See Table 2-2.	Core
15:13	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) See Table 2-2.	Package
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Core
21:19	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2.	Core
23	xTPR Message Disable (R/W) See Table 2-2.	Package
33:24	Reserved.	
34	XD Bit Disable (R/W) See Table 2-3.	Core
37:35	Reserved.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
38	Turbo Mode Disable (R/W) When set to 1 on processors that support Intel Turbo Boost Technology, the turbo mode feature is disabled and the IDA_Enable feature flag will be clear (CPUID.06H:EAX[1] = 0). When set to a 0 on processors that support IDA, CPUID.06H:EAX[1] reports the processor's support of turbo mode is enabled. Note: The power-on default value is used by BIOS to detect hardware support of turbo mode. If the power-on default value is 1, turbo mode is available in the processor. If the power-on default value is 0, turbo mode is not available.	Package
63:39	Reserved.	
Register Address: 1A4H, 420	MSR_MISC_FEATURE_CONTROL	
Miscellaneous Feature Control (R/W)		
0	L2 Hardware Prefetcher Disable (R/W) If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	Core
1	Reserved.	
2	DCU Hardware Prefetcher Disable (R/W) If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	Core
63:3	Reserved.	
Register Address: 1AAH, 426	MSR_MISC_PWR_MGMT	
Miscellaneous Power Management Control Various model specific features enumeration. See http://biosbits.org.		Package
0	EIST Hardware Coordination Disable (R/W) When 0, enables hardware coordination of Enhanced Intel Speedstep Technology request from processor cores. When 1, disables hardware coordination of Enhanced Intel Speedstep Technology requests.	
21:1	Reserved.	
22	Thermal Interrupt Coordination Enable (R/W) If set, then thermal interrupt on one core is routed to all cores.	
63:23	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode by Core Groups (R/W) Specifies Maximum Ratio Limit for each Core Group. Max ratio for groups with more cores must decrease monotonically. For groups with less than 4 cores, the max ratio must be 32 or less. For groups with 4-5 cores, the max ratio must be 22 or less. For groups with more than 5 cores, the max ratio must be 16 or less.		Package
7:0	Maximum Ratio Limit for Active Cores in Group 0 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 0 threshold.	Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
15:8	Maximum Ratio Limit for Active Cores in Group 1 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 1 threshold, and greater than the Group 0 threshold.	Package
23:16	Maximum Ratio Limit for Active Cores in Group 2 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 2 threshold, and greater than the Group 1 threshold.	Package
31:24	Maximum Ratio Limit for Active Cores in Group 3 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 3 threshold, and greater than the Group 2 threshold.	Package
39:32	Maximum Ratio Limit for Active Cores in Group 4 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 4 threshold, and greater than the Group 3 threshold.	Package
47:40	Maximum Ratio Limit for Active Cores in Group 5 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 5 threshold, and greater than the Group 4 threshold.	Package
55:48	Maximum Ratio Limit for Active Cores in Group 6 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 6 threshold, and greater than the Group 5 threshold.	Package
63:56	Maximum Ratio Limit for Active Cores in Group 7 Maximum turbo ratio limit when the number of active cores is less than or equal to the Group 7 threshold, and greater than the Group 6 threshold.	Package
Register Address: 1AEH, 430	MSR_TURBO_GROUP_CORECNT	
Group Size of Active Cores for Turbo Mode Operation (R/W) Writes of 0 threshold is ignored.		Package
7:0	Group 0 Core Count Threshold Maximum number of active cores to operate under the Group 0 Max Turbo Ratio limit.	Package
15:8	Group 1 Core Count Threshold Maximum number of active cores to operate under the Group 1 Max Turbo Ratio limit. Must be greater than the Group 0 Core Count.	Package
23:16	Group 2 Core Count Threshold Maximum number of active cores to operate under the Group 2 Max Turbo Ratio limit. Must be greater than the Group 1 Core Count.	Package
31:24	Group 3 Core Count Threshold Maximum number of active cores to operate under the Group 3 Max Turbo Ratio limit. Must be greater than the Group 2 Core Count.	Package
39:32	Group 4 Core Count Threshold Maximum number of active cores to operate under the Group 4 Max Turbo Ratio limit. Must be greater than the Group 3 Core Count.	Package
47:40	Group 5 Core Count Threshold Maximum number of active cores to operate under the Group 5 Max Turbo Ratio limit. Must be greater than the Group 4 Core Count.	Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
55:48	Group 6 Core Count Threshold Maximum number of active cores to operate under the Group 6 Max Turbo Ratio limit. Must be greater than the Group 5 Core Count.	Package
63:56	Group 7 Core Count Threshold Maximum number of active cores to operate under the Group 7 Max Turbo Ratio limit. Must be greater than the Group 6 Core Count, and not less than the total number of processor cores in the package. E.g., specify 255.	Package
Register Address: 1C8H, 456	MSR_LBR_SELECT	
Last Branch Record Filtering Select Register (R/W) See Section 19.9.2, "Filtering of Last Branch Records."		Core
0	CPL_EQ_0	
1	CPL_NEQ_0	
2	JCC	
3	NEAR_REL_CALL

Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)	
See Table 2-2 and Section 21.6.2.4, "Processor Event Based Sampling (PEBS)."		Core
0	Enable PEBS trigger and recording for the programmed event (precise or otherwise) on IA32_PMC0. (R/W)	
Register Address: 3F8H, 1016	MSR_PKG_C3_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C3 Residency Counter (R/O) Value since last reset that this package is in processor-specific C3 states. Count at the same frequency as the TSC.	
Register Address: 3F9H, 1017	MSR_PKG_C6_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C6 Residency Counter (R/O) Value since last reset that this package is in processor-specific C6 states. Count at the same frequency as the TSC.	
Register Address: 3FCH, 1020	MSR_CORE_C3_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C3 Residency Counter (R/O) Value since last reset that this core is in processor-specific C3 states. Count at the same frequency as the TSC.	
Register Address: 406H, 1030	IA32_MC1_ADDR	
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Module
Register Address: 418H, 1048	IA32_MC6_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."		Package
Register Address: 419H, 1049	IA32_MC6_STATUS	
See Section 17.3.2.2, "IA32_MCI_STATUS MSRs," and Chapter 18.		Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 41AH, 1050	IA32_MC6_ADDR	
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs."		Package
Register Address: 4C3H, 1219	IA32_A_PMC2	
See Table 2-2.		Core
Register Address: 4C4H, 1220	IA32_A_PMC3	
See Table 2-2.		Core
Register Address: 4E0H, 1248	MSR_SMM_FEATURE_CONTROL	
Enhanced SMM Feature Control (SMM-RW) Reports SMM capability Enhancement. Accessible only while in SMM.		Package
0	Lock (SMM-RW0) When set to '1' locks this register from further changes.	
1	Reserved.	
2	SMM_Code_Chk_En (SMM-RW) This control bit is available only if MSR_SMM_MCA_CAP[58] == 1. When set to '0' (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set to '1' any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.	
63:3	Reserved.	
Register Address: 4E2H, 1250	MSR_SMM_DELAYED	
SMM Delayed (SMM-RO) Reports the interruptible state of all logical processors in the package. Available only while in SMM and MSR_SMM_MCA_CAP[LONG_FLOW_INDICATION] == 1.		Package
N-1:0	LOG_PROC_STATE (SMM-RO) Each bit represents a processor core of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: Microcode Update Load, C6, WBINVD, Ratio Change, Throttle. The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.0BH.PKG_LVL:EBX[15:0] can be updated.	
63:N	Reserved.	
Register Address: 4E3H, 1251	MSR_SMM_BLOCKED	
SMM Blocked (SMM-RO) Reports the blocked state of all logical processors in the package. Available only while in SMM.		Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
N-1:0	LOG_PROC_STATE (SMM-RO) Each bit represents a processor core of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: Wait For SIPI or SENTER Sleep. The reset value of this field is OFFFH. Only bit positions below N = CPUID.0BH.PKG_LVL:EBX[15:0] can be updated.	
63:N	Reserved.	
Register Address: 500H, 1280	IA32_SGX_SVN_STATUS	
Status and SVN Threshold of SGX Support for ACM (R/O)		Core
0	Lock See Section 41.11.3, "Interactions with Authenticated Code Modules (ACMs)."	
15:1	Reserved.	
23:16	SGX_SVN_SINIT See Section 41.11.3, "Interactions with Authenticated Code Modules (ACMs)."	
63:24	Reserved.	
Register Address: 560H, 1376	IA32_RTIT_OUTPUT_BASE	
Trace Output Base Register (R/W) See Table 2-2.		Core
Register Address: 561H, 1377	IA32_RTIT_OUTPUT_MASK_PTRS	
Trace Output Mask Pointers Register (R/W) See Table 2-2.		Core

63:0	See Table 2-2.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers used in RAPL Interfaces (R/O) See Section 16.10.1, "RAPL Interfaces."		Package
3:0	Power Units Power related information (in Watts) is in unit of $1W/2^{PU}$; where PU is an unsigned integer represented by bits 3:0. Default value is 1000b, indicating power unit is in 3.9 milliWatts increment.	
7:4	Reserved.	
12:8	Energy Status Units Energy related information (in Joules) is in unit of $1Joule/2^{ESU}$; where ESU is an unsigned integer represented by bits 12:8. Default value is 01110b, indicating energy unit is in 61 microJoules.	
15:13	Reserved.	
19:16	Time Unit Time related information (in seconds) is in unit of $1S/2^{TU}$; where TU is an unsigned integer represented by bits 19:16. Default value is 1010b, indicating power unit is in 0.977 millisecond.	
63:20	Reserved.	
Register Address: 60AH, 1546	MSR_PKG_C3_IRT_L	
Package C3 Interrupt Response Limit (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C3 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.	
63:16	Reserved.	
Register Address: 60BH, 1547	MSR_PKG_C6_C7S_IRT_L1	
Package C6/C7S Interrupt Response Limit 1 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7S state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7S state.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.	
63:16	Reserved.	
Register Address: 60CH, 1548	MSR_PKGC_IRTL2	
Package C7 Interrupt Response Limit 2 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C7 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.	
63:16	Reserved.	
Register Address: 60DH, 1549	MSR_PKG_C2_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
63:0	Package C2 Residency Counter (R/O) Value since last reset that this package is in processor-specific C2 states. Count at the same frequency as the TSC.	
Register Address: 610H, 1552	MSR_PKG_POWER_LIMIT	
PKG RAPL Power Limit Control (R/W) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 611H, 1553	MSR_PKG_ENERGY_STATUS	
PKG Energy Status (R/O) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 613H, 1555	MSR_PKG_PERF_STATUS	
PKG Perf Status (R/O) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 614H, 1556	MSR_PKG_POWER_INFO	
PKG RAPL Parameters (R/W)		Package

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)

14:0	Thermal Spec Power (R/W) See Section 16.10.3, "Package RAPL Domain."	
15	Reserved.	
30:16	Minimum Power (R/W) See Section 16.10.3, "Package RAPL Domain."	
31	Reserved.	
46:32	Maximum Power (R/W) See Section 16.10.3, "Package RAPL Domain."	
47	Reserved.	
54:48	Maximum Time Window (R/W) Specified by $2^Y * (1.0 + Z/4.0) * \text{Time\_Unit}$, where "Y" is the unsigned integer value represented by bits 52:48, "Z" is an unsigned integer represented by bits 54:53. "Time_Unit" is specified by the "Time Units" field of MSR_RAPL_POWER_UNIT.	
63:55	Reserved.	
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
DRAM RAPL Power Limit Control (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 632H, 1586	MSR_PKG_C10_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
63:0	Package C10 Residency Counter (R/O) Value since last reset that the entire SOC is in an S0i3 state. Count at the same frequency as the TSC.	
Register Address: 639H, 1593	MSR_PPO_ENERGY_STATUS	
PPO Energy Status (R/O) See Section 16.10.4, "PPO/PP1 RAPL Domains."		Package
Register Address: 641H, 1601	MSR_PP1_ENERGY_STATUS	
PP1 Energy Status (R/O) See Section 16.10.4, "PPO/PP1 RAPL Domains."		Package
Register Address: 64CH, 1612	MSR_TURBO_ACTIVATION_RATIO	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
ConfigTDP Control (R/W)		Package
7:0	MAX_NON_TURBO_RATIO (RW/L) System BIOS can program this field.	
30:8	Reserved.	
31	TURBO_ACTIVATION_RATIO_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
Register Address: 64FH, 1615	MSR_CORE_PERF_LIMIT_REASONS	
Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)		Package
0	PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.	
2	Package-Level Power Limiting PL1 Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL1.	
3	Package-Level PL2 Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL2.	
8:4	Reserved.	
9	Core Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to domain-level power limiting.	
10	VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.	
11	Max Turbo Limit Status (R0) When set, frequency is reduced below the operating system request due to multi-core turbo limits.	
12	Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).	
13	Turbo Transition Attenuation Status (R0) When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.	
14	Maximum Efficiency Frequency Status (R0) When set, frequency is reduced below the maximum efficiency frequency.	
15	Reserved.	

Table 2-12. MSRs in Intel Atom® Processors Based on Goldmont Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
16	PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
18	Package-Level PL1 Power Limiting Log When set, indicates that the Package Level PL1 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19	Package-Level PL2 Power Limiting Log When set, indicates that the Package Level PL2 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
24:20	Reserved.	
25	Core Power Limiting Log When set, indicates that the Core Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
26	VR Therm Alert Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
27	Max Turbo Limit Log When set, indicates that the Max Turbo Limit Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
28	Electrical Design Point Log When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
29	Turbo Transition Attenuation Log When set, indicates that the Turbo Transition Attenuation Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
30	Maximum Efficiency Frequency Log When set, indicates that the Maximum Efficiency Frequency Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
63:31	Reserved.

2.6 MSRS IN INTEL ATOM® PROCESSORS BASED ON GOLDMONT PLUS MICROARCHITECTURE

Intel Atom processors based on the Goldmont Plus microarchitecture support MSRs listed in Table 2-6, Table 2-12, and Table 2-13. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_7AH; see Table 2-1. For an MSR listed in Table 2-13 that also appears in the model-specific tables of prior generations, Table 2-13 supersedes prior generation tables.

In the Goldmont Plus microarchitecture, the scope column indicates the following: “Core” means each processor core has a separate MSR, or a bit field not shared with another processor core. “Module” means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Goldmont Plus microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID.04H enumeration can be used to figure out which processors are in the same module. “Package” means all processor cores in the physical package share the same MSR or bit interface.

See Table 2-6, Table 2-12, and Table 2-13 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_7AH.		

2.7 MSRS IN INTEL ATOM® PROCESSORS BASED ON TREMONT MICROARCHITECTURE

Processors based on the Tremont microarchitecture support MSRs listed in Table 2-6, Table 2-12, Table 2-13, and Table 2-14. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_86H, 06_96H, or 06_9CH; see Table 2-1. For an MSR listed in Table 2-14 that also appears in the model-specific tables of prior generations, Table 2-14 supersedes prior generation tables.

In the Tremont microarchitecture, the scope column indicates the following: “Core” means each processor core has a separate MSR, or a bit field not shared with another processor core. “Module” means the MSR or the bit field is shared by a subset of the processor cores in the physical package. The number of processor cores in this subset is model specific and may differ between different processors. For all processors based on Tremont microarchitecture, the L2 cache is also shared between cores in a module and thus CPUID.04H enumeration can be used to figure out which processors are in the same module. “Package” means all processor cores in the physical package share the same MSR or bit interface.

Reload value for IA32_PMCx (R/W)		Core
47:0	Value loaded into IA32_PMCx when a PEBS record is generated while PEBS_EN_PMCx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and PMCx is overflowed.	
63:48	Reserved.	
See Table 2-6, Table 2-12, Table 2-13, and Table 2-14 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_86H.		

2.8 MSRS IN PROCESSORS BASED ON NEHALEM MICROARCHITECTURE

Table 2-15 lists model-specific registers (MSRs) that are common for Nehalem microarchitecture. These include the Intel Core i7 and i5 processor family. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_1AH, 06_1EH, 06_1FH, or 06_2EH; see Table 2-1. Additional MSRs specific to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_1AH, 06_1EH, or 06_1FH are listed in Table 2-16. Some MSRs listed in these tables are used by BIOS. More information about these MSR can be found at <http://biosbits.org>.

The column “Scope” represents the package/core/thread scope of individual bit field of an MSR. “Thread” means this bit field must be programmed on each logical processor independently. “Core” means the bit field must be programmed on each processor core independently, logical processors in the same core will be affected by change of this bit on the other logical processor in the same core. “Package” means the bit field must be programmed once for each physical package. Change of a bit filed with a package scope will affect all logical processors in that physical package.

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture

Performance Counter Register See Table 2-2.		Thread
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. The invariant TSC frequency can be computed by multiplying this ratio by 133.33 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
29	Programmable TDC-TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDC and TDP Limits for Turbo mode are programmable. When set to 0, indicates TDC and TDP Limits for Turbo mode are not programmable.	Package
39:30	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 133.33MHz.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org .		Core
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0 (no package C-state support) 001b: C1 (Behavior is the same as 000b) 010b: C3 011b: C6 100b: C7 101b and 110b: Reserved 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
23:16	Reserved.	
24	Interrupt filtering enable (R/W) When set, processor cores in a deep C-State will wake only when the event message is destined for that core. When 0, all processor cores in a deep C-State will wake for an event message.	
25	C3 state auto demotion enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
26	C1 state auto demotion enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	Enable C3 Undemotion (R/W)	
28	Enable C1 Undemotion (R/W)	
29	Package C State Demotion Enable (R/W)	
30	Package C State Undemotion Enable (R/W)	
63:31	Reserved.	
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Redirection in C-state (R/W) See http://biosbits.org .		Core
15:0	LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	C-state Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit 10]: 000b - C3 is the max C-State to include. 001b - C6 is the max C-State to include. 010b - C7 is the max C-State to include.	
63:19	Reserved.

See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Core
Register Address: 40EH, 1038	IA32_MC3_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Core
Register Address: 40FH, 1039	IA32_MC3_MISC	
See Section 17.3.2.4, "IA32_MCi_MISC MSRs."		Core
Register Address: 410H, 1040	IA32_MC4_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Core
Register Address: 411H, 1041	IA32_MC4_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Core
Register Address: 412H, 1042	IA32_MC4_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Core
Register Address: 413H, 1043	IA32_MC4_MISC	
See Section 17.3.2.4, "IA32_MCi_MISC MSRs."		Core
Register Address: 414H, 1044	IA32_MC5_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Core
Register Address: 415H, 1045	IA32_MC5_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Core

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 416H, 1046	IA32_MC5_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Core
Register Address: 417H, 1047	IA32_MC5_MISC	
See Section 17.3.2.4, "IA32_MCi_MISC MSRs."		Core
Register Address: 418H, 1048	IA32_MC6_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Package
Register Address: 419H, 1049	IA32_MC6_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 18.		Package
Register Address: 41AH, 1050	IA32_MC6_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 41BH, 1051	IA32_MC6_MISC	
See Section 17.3.2.4, "IA32_MCi_MISC MSRs."		Package
Register Address: 41CH, 1052	IA32_MC7_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Package
Register Address: 41DH, 1053	IA32_MC7_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 18.		Package
Register Address: 41EH, 1054	IA32_MC7_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 41FH, 1055	IA32_MC7_MISC

Register Address: 421H, 1057	IA32_MC8_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 18.		Package
Register Address: 422H, 1058	IA32_MC8_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 423H, 1059	IA32_MC8_MISC	
See Section 17.3.2.4, "IA32_MCi_MISC MSRs."		Package
Register Address: 480H, 1152	IA32_VMX_BASIC	
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2 and Appendix A.1, "Basic VMX Information."		Thread
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTL	
Capability Reporting Register of Pin-based VM-execution Controls (R/O) See Table 2-2 and Appendix A.3, "VM-Execution Controls."		Thread
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTL	
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Thread
Register Address: 483H, 1155	IA32_VMX_EXIT_CTL	

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Capability Reporting Register of VM-Exit Controls (R/O) See Table 2-2 and Appendix A.4, "VM-Exit Controls."		Thread
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTLS	
Capability Reporting Register of VM-Entry Controls (R/O) See Table 2-2 and Appendix A.5, "VM-Entry Controls."		Thread
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2 and Appendix A.6, "Miscellaneous Data."		Thread
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2 and Appendix A.7, "VMX-Fixed Bits in CR0."		Thread
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2 and Appendix A.7, "VMX-Fixed Bits in CR0."		Thread
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2 and Appendix A.8, "VMX-Fixed Bits in CR4."		Thread
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2 and Appendix A.8, "VMX-Fixed Bits in CR4."		Thread
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2 and Appendix A.9, "VMCS Enumeration."		Thread
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLS2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls."		Thread
Register Address: 600H, 1536	IA32_DS_AREA	
DS Save Area (R/W) See Table 2-2 and Section 21.6.3.4, "Debug Store (DS) Mechanism."		Thread
Register Address: 680H, 1664	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of sixteen pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the source instruction. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ See Section 19.9.1 and record format in Section 19.4.8.1.		Thread
Register Address: 681H, 1665	MSR_LASTBRANCH_1_FROM_IP	
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Thread
Register Address: 682H, 1666	MSR_LASTBRANCH_2_FROM_IP	

Table 2-15. MSRs in Processors Based on Nehalem Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Last Branch Record 2 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Thread

2.8.1 Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series

The Intel Xeon Processor 5500 and 3400 series supports additional model-specific registers listed in Table 2-16. These MSRs also apply to the Intel Core i7 and i5 processor family with a CPUID Signature DisplayFamily_DisplayModel value of 06_1AH, 06_1EH, or 06_1FH; see Table 2-1.

Table 2-16. Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Actual maximum turbo frequency is multiplied by 133.33MHz. (Not available in model 06_2EH.)		Package
7:0	Maximum Turbo Ratio Limit 1C (R/O) Maximum Turbo mode ratio limit with 1 core active.	
15:8	Maximum Turbo Ratio Limit 2C (R/O) Maximum Turbo mode ratio limit with 2 cores active.	
23:16	Maximum Turbo Ratio Limit 3C (R/O) Maximum Turbo mode ratio limit with 3 cores active.	
31:24	Maximum Turbo Ratio Limit 4C (R/O) Maximum Turbo mode ratio limit with 4 cores active.	
63:32	Reserved.	
Register Address: 301H, 769	MSR_GQ_SNOOP_MESF	
MSR_GQ_SNOOP_MESF		Package
0	From M to S (R/W)	
1	From E to S (R/W)	
2	From S to S (R/W)	
3	From F to S (R/W)	
4	From M to I (R/W)	

Table 2-16. Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
5	From E to I (R/W)	
6	From S to I (R/W)	
7	From F to I (R/W)	
63:8	Reserved.	
Register Address: 391H, 913	MSR_UNCORE_PERF_GLOBAL_CTRL	
See Section 21.3.1.2.1, "Uncore Performance Monitoring Management Facility."		Package
Register Address: 392H, 914	MSR_UNCORE_PERF_GLOBAL_STATUS	
See Section 21.3.1.2.1, "Uncore Performance Monitoring Management Facility."		Package
Register Address: 393H, 915	MSR_UNCORE_PERF_GLOBAL_OVF_CTRL	
See Section 21.3.1.2.1, "Uncore Performance Monitoring Management Facility."		Package
Register Address: 394H, 916	MSR_UNCORE_FIXED_CTR0	
See Section 21.3.1.2.1, "Uncore Performance Monitoring Management Facility."		Package
Register Address: 395H, 917	MSR_UNCORE_FIXED_CTR_CTRL	
See Section 21.3.1.2.1, "Uncore Performance Monitoring Management Facility."		Package
Register Address: 396H, 918	MSR_UNCORE_ADDR_OPCODE_MATCH	
See Section 21.3.1.2.3, "Uncore Address/Opcode Match MSR."		Package
Register Address: 3B0H, 960	MSR_UNCORE_PMC0	
See Section 21.3.1.2.2, "Uncore Performance Event Configuration Facility."		Package
Register Address: 3B1H, 961	MSR_UNCORE_PMC1	
See Section 21.3.1.2.2, "Uncore Performance Event Configuration Facility."		Package
Register Address: 3B2H, 962	MSR_UNCORE_PMC2	
See Section 21.3.1.2.2, "Uncore Performance Event Configuration Facility."		Package
Register Address: 3B3H, 963	MSR_UNCORE_PMC3

See Section 21.3.1.2.2, "Uncore Performance Event Configuration Facility."		Package

2.8.2 Additional MSRs in the Intel® Xeon® Processor 7500 Series

The Intel Xeon Processor 7500 series supports MSRs listed in Table 2-15 (except MSR address 1ADH) and additional model-specific registers listed in Table 2-17. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2EH.

Table 2-17. Additional MSRs in the Intel® Xeon® Processor 7500 Series

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Reserved. Attempt to read/write will cause #UD.		Package
Register Address: 289H, 649	IA32_MC9_CTL2	
See Table 2-2.		Package
Register Address: 28AH, 650	IA32_MC10_CTL2	
See Table 2-2.		Package
Register Address: 28BH, 651	IA32_MC11_CTL2	
See Table 2-2.		Package
Register Address: 28CH, 652	IA32_MC12_CTL2	
See Table 2-2.		Package
Register Address: 28DH, 653	IA32_MC13_CTL2	
See Table 2-2.		Package
Register Address: 28EH, 654	IA32_MC14_CTL2	
See Table 2-2.		Package
Register Address: 28FH, 655	IA32_MC15_CTL2	
See Table 2-2.		Package
Register Address: 290H, 656	IA32_MC16_CTL2	
See Table 2-2.		Package

Table 2-17. Additional MSRs in the Intel® Xeon® Processor 7500 Series (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 291H, 657	IA32_MC17_CTL2	
See Table 2-2.		Package
Register Address: 292H, 658	IA32_MC18_CTL2	
See Table 2-2.		Package
Register Address: 293H, 659	IA32_MC19_CTL2	
See Table 2-2.		Package
Register Address: 294H, 660	IA32_MC20_CTL2	
See Table 2-2.		Package
Register Address: 295H, 661	IA32_MC21_CTL2	
See Table 2-2.		Package
Register Address: 394H, 816	MSR_W_PMON_FIXED_CTR	
Uncore W-box PerfMon fixed counter.		Package
Register Address: 395H, 817	MSR_W_PMON_FIXED_CTR_CTL	
Uncore U-box PerfMon fixed counter control MSR.		Package
Register Address: 424H, 1060	IA32_MC9_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Package
Register Address: 425H, 1061	IA32_MC9_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 426H, 1062	IA32_MC9_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 427H, 1063	IA32_MC9_MISC	
See Section 17.3.2.4, "IA32_MCi_MISC MSRs."		Package
Register Address: 428H, 1064	IA32_MC10_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Package
Register Address: 429H, 1065	IA32_MC10_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 42AH, 1066	IA32_MC10_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 42BH, 1067	IA32_MC10_MISC	
See Section 17.3.2.4, "IA32_MCi_MISC MSRs."		Package
Register Address: 42CH, 1068	IA32_MC11_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Package
Register Address: 42DH, 1069	IA32_MC11_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 18.		Package
Register Address: 42EH, 1070	IA32_MC11_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs."		Package
Register Address: 42FH, 1071	IA32_MC11_MISC

2.9 MSRS IN THE INTEL® XEON® PROCESSOR 5600 SERIES BASED ON WESTMERE MICROARCHITECTURE

The Intel® Xeon® Processor 5600 Series is based on Westmere microarchitecture and supports the MSR interfaces listed in Table 2-15, Table 2-16, plus additional MSRs listed in Table 2-18. These MSRs apply to the Intel Core i7, i5, and i3 processor family with a CPUID Signature DisplayFamily_DisplayModel value of 06_25H or 06_2CH; see Table 2-1.

Table 2-18. Additional MSRs Supported by Intel® Processors Based on Westmere Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core

Table 2-18. Additional MSRs Supported by Intel® Processors Based on Westmere Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.	
Register Address: 1A7H, 423	MSR_OFFCORE_RSP_1

2.11 MSRS IN THE INTEL® PROCESSOR FAMILY BASED ON SANDY BRIDGE MICROARCHITECTURE

Table 2-20 lists model-specific registers (MSRs) that are common to the Intel® processor family based on Sandy Bridge microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH or 06_2DH; see Table 2-1. Additional MSRs specific to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH are listed in Table 2-21.

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors."		Thread
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors."		Thread
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Thread
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and see Table 2-2.		Thread
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2.		Package
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Thread
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/O)		Thread
31:0	SMI Count (R/O) Count SMIs.	
63:32	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Thread
0	Lock (R/WL)	
1	Enable VMX Inside SMX Operation (R/WL)	
2	Enable VMX Outside SMX Operation (R/WL)	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
14:8	SENTER Local Functions Enables (R/WL)	
15	SENTER Global Functions Enable (R/WL)	
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Core
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Thread
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Thread
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Thread
Register Address: C3H, 195	IA32_PMC2	
Performance Counter Register See Table 2-2.		Thread
Register Address: C4H, 196	IA32_PMC3	
Performance Counter Register See Table 2-2.		Thread
Register Address: C5H, 197	IA32_PMC4	
Performance Counter Register (if core not shared by threads)		Core
Register Address: C6H, 198	IA32_PMC5	
Performance Counter Register (if core not shared by threads)		Core
Register Address: C7H, 199	IA32_PMC6	
Performance Counter Register (if core not shared by threads)		Core
Register Address: C8H, 200	IA32_PMC7	
Performance Counter Register (if core not shared by threads)		Core
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
39:30	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org .		Core
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-state support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit Note: This field cannot be used to limit package C-state to C3.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
24:16	Reserved.	
25	C3 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	
26	C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	Enable C3 Undemotion (R/W) When set, enables undemotion from demoted C3.	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
28	Enable C1 Undemotion (R/W) When set, enables undemotion from demoted C1.	
63:29	Reserved.	
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Redirection in C-state (R/W) See http://biosbits.org .		Core
15:0	LVL_2 Base Address (R/W) Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	C-State Range (R/W) Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit 10]: 000b - C3 is the max C-State to include. 001b - C6 is the max C-State to include. 010b - C7 is the max C-State to include.	
63:19	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: FEH, 254	IA32_MTRRCAP	
See Table 2-2.		Thread
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.

See Table 2-2.		Thread
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Thread
0	RIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted.	
1	EIPV When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved.

DS Save Area (R/W) See Table 2-2 and Section 21.6.3.4, "Debug Store (DS) Mechanism."		Thread
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers used in RAPL Interfaces (R/O) See Section 16.10.1, "RAPL Interfaces."		Package
Register Address: 60AH, 1546	MSR_PKG_C3_IRT_L	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Package C3 Interrupt Response Limit (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C3 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.	
63:16	Reserved.	
Register Address: 60BH, 1547	MSR_PKGC6_IRTL	
Package C6 Interrupt Response Limit (R/W) This MSR defines the budget allocated for the package to exit from a C6 to a C0 state, where an interrupt request can be delivered to the core and serviced. Additional core-exit latency may be applicable depending on the actual C-state the core is in. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.	

Table 2-20. MSRs Supported by Intel® Processors Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
63:16	Reserved.	
Register Address: 60DH, 1549	MSR_PKG_C2_RESIDENCY	
Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
63:0	Package C2 Residency Counter (R/O) Value since last reset that this package is in processor-specific C2 states. Count at the same frequency as the TSC.	
Register Address: 610H, 1552	MSR_PKG_POWER_LIMIT	
PKG RAPL Power Limit Control (R/W) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 611H, 1553	MSR_PKG_ENERGY_STATUS	
PKG Energy Status (R/O) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 614H, 1556	MSR_PKG_POWER_INFO	
PKG RAPL Parameters (R/W) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 638H, 1592	MSR_PPO_POWER_LIMIT	
PPO RAPL Power Limit Control (R/W) See Section 16.10.4, "PPO/PP1 RAPL Domains."		Package
Register Address: 680H, 1664	MSR_LASTBRANCH_0_FROM_IP	
Last Branch Record 0 From IP (R/W) One of sixteen pairs of last branch record registers on the last branch record stack. This part of the stack contains pointers to the source instruction. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ Section 19.9.1 and record format in Section 19.4.8.1.		Thread
Register Address: 681H, 1665	MSR_LASTBRANCH_1_FROM_IP	
Last Branch Record 1 From IP (R/W) See description of MSR_LASTBRANCH_0_FROM_IP.		Thread

2.11.1 MSRs in the 2nd Generation Intel® Core™ Processor Family Based on Sandy Bridge Microarchitecture

Table 2-21 and Table 2-22 list model-specific registers (MSRs) that are specific to the 2nd generation Intel® Core™ processor family based on the Sandy Bridge microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH; see Table 2-1.

Table 2-21. MSRs Supported by the 2nd Generation Intel® Core™ Processors (Sandy Bridge Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0. R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.	Package
63:32	Reserved.	
Register Address: 60CH, 1548	MSR_PKG_C7_IRTL	
Package C7 Interrupt Response Limit (R/W) This MSR defines the budget allocated for the package to exit from a C7 to a C0 state, where interrupt request can be delivered to the core and serviced. Additional core-exit latency may be applicable depending on the actual C-state the core is in. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C7 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported: 000b: 1 ns 001b: 32 ns 010b: 1024 ns 011b: 32768 ns 100b: 1048576 ns 101b: 33554432 ns	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.	
63:16	Reserved.	
Register Address: 639H, 1593	MSR_PP0_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 63AH, 1594	MSR_PP0_POLICY	

Table 2-21. MSRs Supported by the 2nd Generation Intel® Core™ Processors (Sandy Bridge Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
PP0 Balance Policy (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 640H, 1600	MSR_PP1_POWER_LIMIT	
PP1 RAPL Power Limit Control (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 641H, 1601	MSR_PP1_ENERGY_STATUS	
PP1 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 642H, 1602	MSR_PP1_POLICY	
PP1 Balance Policy (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
See Table 2-20, Table 2-21, and Table 2-22 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH.		

Table 2-22 lists the MSRs of uncore PMU for Intel processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_2AH.

Table 2-22. Uncore PMU MSRs Supported by 2nd Generation Intel® Core™ Processors

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 391H, 913	MSR_UNC_PERF_GLOBAL_CTRL	
Uncore PMU Global Control		Package
0	Slice 0 select.	
1	Slice 1 select.	
2	Slice 2 select.	
3	Slice 3 select.	
4	Slice 4 select.	
18:5	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: 392H, 914	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	

Table 2-22. Uncore PMU MSRs Supported by 2nd Generation Intel® Core™ Processors (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 394H, 916	MSR_UNC_PERF_FIXED_CTRL	
Uncore Fixed Counter Control (R/W)		Package
19:0	Reserved.	
20	Enable overflow propagation.	
21	Reserved.	
22	Enable counting.	
63:23	Reserved.	
Register Address: 395H, 917	MSR_UNC_PERF_FIXED_CTR	
Uncore Fixed Counter		Package
47:0	Current count.	
63:48	Reserved.	
Register Address: 396H, 918	MSR_UNC_CBO_CONFIG	
Uncore C-Box Configuration Information (R/O)		Package
3:0	Report the number of C-Box units with performance counters, including processor cores and processor graphics.	
63:4	Reserved.	
Register Address: 3B0H, 946	MSR_UNC_ARB_PERFCTRO	
Uncore Arb Unit, Performance Counter 0		Package
Register Address: 3B1H, 947	MSR_UNC_ARB_PERFCTR1	
Uncore Arb Unit, Performance Counter 1		Package
Register Address: 3B2H, 944	MSR_UNC_ARB_PERFEVTSELO	
Uncore Arb Unit, Counter 0 Event Select MSR		Package
Register Address: 3B3H, 945	MSR_UNC_ARB_PERFEVTSEL1	
Uncore Arb unit, Counter 1 Event Select MSR		Package
Register Address: 700H, 1792	MSR_UNC_CBO_0_PERFEVTSELO	
Uncore C-Box 0, Counter 0 Event Select MSR		Package
Register Address: 701H, 1793	MSR_UNC_CBO_0_PERFEVTSEL1	
Uncore C-Box 0, Counter 1 Event Select MSR		Package
Register Address: 702H, 1794	MSR_UNC_CBO_0_PERFEVTSEL2	
Uncore C-Box 0, Counter 2 Event Select MSR		Package

2.11.2 MSRs in the Intel® Xeon® Processor E5 Family Based on Sandy Bridge Microarchitecture

Table 2-23 lists additional model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 Family based on Sandy Bridge microarchitecture. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2DH, and also support MSRs listed in Table 2-20 and Table 2-24.

Table 2-23. Additional MSRs Supported by the Intel® Xeon® Processors E5 Family Based on Sandy Bridge Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 17FH, 383	MSR_ERROR_CONTROL	
	MC Bank Error Configuration (R/W)	Package
0	Reserved.	
1	MemError Log Enable (R/W) When set, enables IMC status bank to log additional info in bits 36:32.	
63:2	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0. R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 cores active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 cores active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 cores active.	Package
39:32	Maximum Ratio Limit for 5C Maximum turbo ratio limit of 5 cores active.	Package
47:40	Maximum Ratio Limit for 6C Maximum turbo ratio limit of 6 cores active.	Package
55:48	Maximum Ratio Limit for 7C Maximum turbo ratio limit of 7 cores active.	Package
63:56	Maximum Ratio Limit for 8C Maximum turbo ratio limit of 8 cores active.	Package
Register Address: 285H, 645	IA32_MC5_CTL2	
See Table 2-2.		Package

Table 2-23. Additional MSRs Supported by the Intel® Xeon® Processors E5 Family Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 286H, 646	IA32_MC6_CTL2	
See Table 2-2.		Package
Register Address: 287H, 647	IA32_MC7_CTL2	
See Table 2-2.		Package
Register Address: 288H, 648	IA32_MC8_CTL2	
See Table 2-2.		Package
Register Address: 289H, 649	IA32_MC9_CTL2	
See Table 2-2.		Package
Register Address: 28AH, 650	IA32_MC10_CTL2	
See Table 2-2.		Package
Register Address: 28BH, 651	IA32_MC11_CTL2	
See Table 2-2.		Package
Register Address: 28CH, 652	IA32_MC12_CTL2	
See Table 2-2.		Package
Register Address: 28DH, 653	IA32_MC13_CTL2	
See Table 2-2.		Package
Register Address: 28EH, 654	IA32_MC14_CTL2	
See Table 2-2.		Package
Register Address: 28FH, 655	IA32_MC15_CTL2	
See Table 2-2.		Package
Register Address: 290H, 656	IA32_MC16_CTL2	
See Table 2-2.		Package
Register Address: 291H, 657	IA32_MC17_CTL2	
See Table 2-2.		Package
Register Address: 292H, 658	IA32_MC18_CTL2	
See Table 2-2.		Package
Register Address: 293H, 659	IA32_MC19_CTL2	
See Table 2-2.		Package
Register Address: 39CH, 924	MSR_PEBS_NUM_ALT	
ENABLE_PEBS_NUM_ALT (R/W)		Package
0	ENABLE_PEBS_NUM_ALT (R/W) Write 1 to enable alternate PEBS counting logic for specific events requiring additional configuration, see https://perfmon-events.intel.com/ .	
63:1	Reserved, must be zero.	
Register Address: 414H, 1044	IA32_MCI_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."		Package
Register Address: 415H, 1045	IA32_MCI_STATUS	

Table 2-23. Additional MSRs Supported by the Intel® Xeon® Processors E5 Family Based on Sandy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope

Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 639H, 1593	MSR_PPO_ENERGY_STATUS	
PPO Energy Status (R/O) See Section 16.10.4, "PPO/PP1 RAPL Domains."		Package
See Table 2-20, Table 2-23, and Table 2-24 for MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_2DH.		

2.11.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 Family

Intel Xeon Processor E5 family is based on the Sandy Bridge microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-24. For complete details of the uncore PMU, refer to the Intel Xeon Processor E5 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_2DH.

Table 2-24. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: C08H, 3080	MSR_U_PMON_UCLK_FIXED_CTL	
Uncore U-box UCLK Fixed Counter Control		Package
Register Address: C09H, 3081	MSR_U_PMON_UCLK_FIXED_CTR	

Table 2-24. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Uncore U-box UCLK Fixed Counter		Package
Register Address: C10H, 3088	MSR_U_PMON_EVTNSELO	
Uncore U-box PerfMon Event Select for U-box Counter 0		Package
Register Address: C11H, 3089	MSR_U_PMON_EVTNSEL1	
Uncore U-box PerfMon Event Select for U-box Counter 1		Package
Register Address: C16H, 3094	MSR_U_PMON_CTR0	
Uncore U-box PerfMon Counter 0		Package
Register Address: C17H, 3095	MSR_U_PMON_CTR1	
Uncore U-box PerfMon Counter 1		Package
Register Address: C24H, 3108	MSR_PCU_PMON_BOX_CTL	
Uncore PCU PerfMon for PCU-box-wide Control		Package
Register Address: C30H, 3120	MSR_PCU_PMON_EVTNSELO	
Uncore PCU PerfMon Event Select for PCU Counter 0		Package
Register Address: C31H, 3121	MSR_PCU_PMON_EVTNSEL1	
Uncore PCU PerfMon Event Select for PCU Counter 1		Package
Register Address: C32H, 3122	MSR_PCU_PMON_EVTNSEL2	
Uncore PCU PerfMon Event Select for PCU Counter 2		Package

2.12 MSRS IN THE 3RD GENERATION INTEL® CORE™ PROCESSOR FAMILY BASED ON IVY BRIDGE MICROARCHITECTURE

The 3rd generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200v2 product family based on Ivy Bridge microarchitecture support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, and Table 2-25. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3AH.

Table 2-25. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors Based on Ivy Bridge Microarchitecture

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates that TDP Limit for Turbo mode is not programmable.	Package
31:30	Reserved.	
32	Low Power Mode Support (LPM) (R/O) When set to 1, indicates that LPM is supported. When set to 0, indicates LPM is not supported.	Package
34:33	Number of ConfigTDP Levels (R/O) 00: Only Base TDP level available. 01: One additional TDP level available. 02: Two additional TDP level available. 03: Reserved	Package
39:35	Reserved.	

Table 2-25. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors Based on Ivy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
55:48	Minimum Operating Ratio (R/O) Contains the minimum supported operating ratio in units of 100 MHz.	Package
63:56	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
	C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. See http://biosbits.org .	Core
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-state support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
24:16	Reserved	
25	C3 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	
26	C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	Enable C3 Undemotion (R/W) When set, enables undemotion from demoted C3.	

Table 2-25. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors Based on Ivy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
28	Enable C1 Undemotion (R/W) When set, enables undemotion from demoted C1.	
63:29	Reserved.	
Register Address: 639H, 1593	MSR_PPO_ENERGY_STATUS	
PP0 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 648H, 1608	MSR_CONFIG_TDP_NOMINAL	
Base TDP Ratio (R/O)		Package
7:0	Config_TDP_Base Base TDP level ratio to be used for this specific processor (in units of 100 MHz).	
63:8	Reserved.	
Register Address: 649H, 1609	MSR_CONFIG_TDP_LEVEL1	
	ConfigTDP Level 1 ratio and power level (R/O)	Package
14:0	PKG_TDP_LVL1 Power setting for ConfigTDP Level 1.	
15	Reserved.	
23:16	Config_TDP_LVL1_Ratio ConfigTDP level 1 ratio to be used for this specific processor.	
31:24	Reserved.	
46:32	PKG_MAX_PWR_LVL1 Max Power setting allowed for ConfigTDP Level 1.	
47	Reserved.	
62:48	PKG_MIN_PWR_LVL1 MIN Power setting allowed for ConfigTDP Level 1.	
63	Reserved.	
Register Address: 64AH, 1610	MSR_CONFIG_TDP_LEVEL2	
ConfigTDP Level 2 ratio and power level (R/O)		Package
14:0	PKG_TDP_LVL2 Power setting for ConfigTDP Level 2.	
15	Reserved.	
23:16	Config_TDP_LVL2_Ratio ConfigTDP level 2 ratio to be used for this specific processor.	
31:24	Reserved.	
46:32	PKG_MAX_PWR_LVL2 Max Power setting allowed for ConfigTDP Level 2.	
47	Reserved.	

Table 2-25. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors Based on Ivy Bridge Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
62:48	PKG_MIN_PWR_LVL2 MIN Power setting allowed for ConfigTDP Level 2.	
63	Reserved.	
Register Address: 64BH, 1611	MSR_CONFIG_TDP_CONTROL	
ConfigTDP Control (R/W)		Package
1:0	TDP_LEVEL (RW/L) System BIOS can program this field.	
30:2	Reserved.	
31	Config_TDP_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
Register Address: 64CH, 1612	MSR_TURBO_ACTIVATION_RATIO	
ConfigTDP Control (R/W)		Package
7:0	MAX_NON_TURBO_RATIO (RW/L) System BIOS can program this field.	
30:8	Reserved.	
31	TURBO_ACTIVATION_RATIO_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
See Table 2-20, Table 2-21, and Table 2-22 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3AH.		

2.12.1 MSRs in the Intel® Xeon® Processor E5 v2 Product Family Based on Ivy Bridge-E Microarchitecture

Table 2-26 lists model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 v2 Product Family (based on Ivy Bridge-E microarchitecture). These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3EH; see Table 2-1. These processors supports the MSR interfaces listed in Table 2-20 and Table 2-26.

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 4EH, 78	IA32_PPIN_CTL (MSR_PPIN_CTL)	
Protected Processor Inventory Number	Enable Control (R/W)	Package
0	LockOut (R/WO) See Table 2-2.	
1	Enable_PPIN (R/W) See Table 2-2.	
63:2	Reserved.	

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 4FH, 79	IA32_PPIN (MSR_PPIN)	
Protected Processor Inventory Number (R/O)		Package
63:0	Protected Processor Inventory Number (R/O) See Table 2-2.	
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
22:16	Reserved.	
23	PPIN_CAP (R/O) When set to 1, indicates that Protected Processor Inventory Number (PPIN) capability can be enabled for a privileged system inventory agent to read PPIN from MSR_PPIN. When set to 0, PPIN capability is not supported. An attempt to access MSR_PPIN_CTL or MSR_PPIN will cause #GP.	Package
27:24	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
30	Programmable TJ OFFSET (R/O) When set to 1, indicates that MSR_TEMPERATURE_TARGET.[27:24] is valid and writable to specify a temperature offset.	Package
39:31	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See http://biosbits.org .		Core

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-state support) 001b: C2 010b: C6 no retention 011b: C6 retention 100b: C7 101b: C7s 111: No package C-state limit. Note: This field cannot be used to limit package C-state to C3.	
9:3	Reserved.	
10	I/O MWait Redirection Enable (R/W) When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWait instructions.	
14:11	Reserved.	
15	CFG Lock (R/WO) When set, locks bits 15:0 of this register until next reset.	
63:16	Reserved.	
Register Address: 179H, 377		
IA32_MCG_CAP		
Global Machine Check Capability (R/O)		Thread
7:0	Count	
8	MCG_CTL_P	
9	MCG_EXT_P	
10	MCP_CMCI_P	
11	MCG_TES_P	
15:12	Reserved.	
23:16	MCG_EXT_CNT	
24	MCG_SER_P	
25	Reserved.	
26	MCG_ELOG_P	
63:27	Reserved.	
Register Address: 17FH, 383		
MSR_ERROR_CONTROL		
MC Bank Error Configuration (R/W)		Package
0	Reserved.	
1	MemError Log Enable (R/W) When set, enables IMC status bank to log additional info in bits 36:32.	
63:2	Reserved.	

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target		Package
15:0	Reserved.	
23:16	Temperature Target (R/O) The minimum temperature at which PROCHOT# will be asserted. The value is degrees C.	
27:24	TCC Activation Offset (R/W) Specifies a temperature offset in degrees C from the temperature target (bits 23:16). PROCHOT# will assert at the offset target temperature. Write is permitted only if MSR_PLATFORM_INFO.[30] is set.	
63:28	Reserved.	
Register Address: 1AEH, 430	MSR_TURBO_RATIO_LIMIT1	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0. R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 9C Maximum turbo ratio limit of 9 core active.	Package
15:8	Maximum Ratio Limit for 10C Maximum turbo ratio limit of 10 core active.	Package
23:16	Maximum Ratio Limit for 11C Maximum turbo ratio limit of 11 core active.	Package
31:24	Maximum Ratio Limit for 12C Maximum turbo ratio limit of 12 core active.	Package
63:32	Reserved.	
Register Address: 285H, 645	IA32_MC5_CTL2	
See Table 2-2.		Package
Register Address: 286H, 646	IA32_MC6_CTL2

Register Information / Bit Fields	Bit Description	Scope
Register Address: 416H, 1046	IA32_MC5_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC5 reports MC errors from the Intel QPI module.		Package
Register Address: 417H, 1047	IA32_MC5_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC5 reports MC errors from the Intel QPI module.		Package
Register Address: 418H, 1048	IA32_MC6_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 419H, 1049	IA32_MC6_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41AH, 1050	IA32_MC6_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41BH, 1051	IA32_MC6_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41CH, 1052	IA32_MC7_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package
Register Address: 41DH, 1053	IA32_MC7_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package
Register Address: 41EH, 1054	IA32_MC7_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package
Register Address: 41FH, 1055	IA32_MC7_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package
Register Address: 420H, 1056	IA32_MC8_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package
Register Address: 421H, 1057	IA32_MC8_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package
Register Address: 422H, 1058	IA32_MC8_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package

Table 2-26. MSRs Supported by the Intel® Xeon® Processor E5 v2 Product Family (Ivy Bridge-E Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 423H, 1059	IA32_MC8_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC7 and MC 8 report MC errors from the two home agents.		Package
Register Address: 424H, 1060	IA32_MC9_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 425H, 1061	IA32_MC9_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 426H, 1062	IA32_MC9_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 427H, 1063	IA32_MC9_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 428H, 1064	IA32_MC10_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 429H, 1065	IA32_MC10_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42AH, 1066	IA32_MC10_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42BH, 1067	IA32_MC10_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42CH, 1068	IA32_MC11_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs." Bank MC11 reports MC errors from a specific channel of the integrated memory controller.		Package
Register Address: 42DH, 1069	IA32_MC11_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs." Bank MC11 reports MC errors from a specific channel of the integrated memory controller.		Package
Register Address: 42EH, 1070	IA32_MC11_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs." Bank MC11 reports MC errors from a specific channel of the integrated memory controller.		Package
Register Address: 42FH, 1071	IA32_MC11_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs." Bank MC11 reports MC errors from a specific channel of the integrated memory controller.		Package

Register Address: 477H, 1143	IA32_MC29_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC29 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 478H, 1144	IA32_MC30_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC30 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 479H, 1145	IA32_MC30_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC30 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47AH, 1146	IA32_MC30_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC30 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47BH, 1147	IA32_MC30_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC30 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47CH, 1148	IA32_MC31_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC31 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47DH, 1149	IA32_MC31_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC31 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47EH, 1150	IA32_MC31_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC31 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
Register Address: 47FH, 1147	IA32_MC31_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC31 reports MC errors from a specific CBo (core broadcast) and its corresponding slice of L3.		Package
See Table 2-20, Table 2-26 for other MSR definitions applicable to Intel Xeon processor E7 v2 with a CPUID Signature DisplayFamily_DisplayModel value of 06_3AH.		

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.12.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v2 and E7 v2 Families

Intel Xeon Processor E5 v2 and E7 v2 families are based on the Ivy Bridge-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-24 and Table 2-28. For complete detail of the uncore PMU, refer to Intel

Xeon Processor E5 v2 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3EH.

2.13 MSRS IN THE 4TH GENERATION INTEL® CORE™ PROCESSORS BASED ON HASWELL MICROARCHITECTURE

The 4th generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200v3 product family (based on Haswell microarchitecture), with a CPUID Signature DisplayFamily_DisplayModel value of 06_3CH, 06_45H, or 06_46H, support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, and Table 2-29. For an MSR listed in Table 2-20 that also appears in Table 2-29, Table 2-29 supersedes Table 2-20.

The MSRs listed in Table 2-29 also apply to processors based on Haswell-E microarchitecture (see Section 2.14).

Table 2-29. Additional MSRs Supported by Processors Based on the Haswell and Haswell-E Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 3BH, 59	IA32_TSC_ADJUST	
Per-Logical-Processor TSC ADJUST (R/W) See Table 2-2.		Thread
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
31:30	Reserved.	
32	Low Power Mode Support (LPM) (R/O) When set to 1, indicates that LPM is supported. When set to 0, indicates LPM is not supported.	Package
34:33	Number of ConfigTDP Levels (R/O) 00: Only Base TDP level available. 01: One additional TDP level available. 02: Two additional TDP level available. 03: Reserved.	Package
39:35	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
55:48	Minimum Operating Ratio (R/O) Contains the minimum supported operating ratio in units of 100 MHz.	Package
63:56	Reserved.	

Table 2-29. Additional MSRs Supported by Processors Based on the Haswell and Haswell-E Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 186H, 390	IA32_PERFEVTSELO	
Performance Event Select for Counter 0 (R/W) Supports all fields described in Table 2-2 and the fields below.		Thread
32	IN_TX: See Section 21.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.	
Register Address: 187H, 391	IA32_PERFEVTSEL1	
Performance Event Select for Counter 1 (R/W) Supports all fields described in Table 2-2 and the fields below.		Thread
32	IN_TX: See Section 21.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.	
Register Address: 188H, 392	IA32_PERFEVTSEL2	
Performance Event Select for Counter 2 (R/W) Supports all fields described in Table 2-2 and the fields below.		Thread
32	IN_TX: See Section 21.3.6.5.1. When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.	
33	IN_TXCP: See Section 21.3.6.5.1. When IN_TXCP=1 & IN_TX=1 and in sampling, a spurious PMI may occur and transactions may continuously abort near overflow conditions. Software should favor using IN_TXCP for counting over sampling. If sampling, software should use large “sample-after” value after clearing the counter configured to use IN_TXCP and also always reset the counter even when no overflow condition was reported.	
Register Address: 189H, 393	IA32_PERFEVTSEL3	
Performance Event Select for Counter 3 (R/W) Supports all fields described in Table 2-2 and the fields below.		Thread
32	IN_TX: See Section 21.3.6.5.1 When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results.	
Register Address: 1C8H, 456	MSR_LBR_SELECT	
Last Branch Record Filtering Select Register (R/W)		Thread
0	CPL_EQ_0	
1	CPL_NEQ_0	
2	JCC	
3	NEAR_REL_CALL	
4	NEAR_IND_CALL	
5	NEAR_RET	
6	NEAR_IND_JMP	
7	NEAR_REL_JMP

13	ENABLE_UNCORE_PMI	
14	FREEZE_WHILE_SMM	
15	RTM_DEBUG	
63:15	Reserved.	
Register Address: 491H, 1169	IA32_VMX_VMFUNC	
Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2.		Thread
Register Address: 60BH, 1548	MSR_PKG_C6_C7_INTERRUPT_RESPONSE_LIMIT_1	
Package C6/C7 Interrupt Response Limit 1 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7 state. The latency programmed in this register is for the shorter-latency sub C-states used by an MWAIT hint to a C6 or C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt Response Time Limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.	

Table 2-29. Additional MSRs Supported by Processors Based on the Haswell and Haswell-E Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
63:16	Reserved.	
Register Address: 60CH, 1548	MSR_PKG_C_IRT_L2	
Package C6/C7 Interrupt Response Limit 2 (R/W) This MSR defines the interrupt response time limit used by the processor to manage a transition to a package C6 or C7 state. The latency programmed in this register is for the longer-latency sub C-states used by an MWAIT hint to a C6 or C7 state. Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
9:0	Interrupt response time limit (R/W) Specifies the limit that should be used to decide if the package should be put into a package C6 or C7 state.	
12:10	Time Unit (R/W) Specifies the encoding value of time unit of the interrupt response time limit. See Table 2-20 for supported time unit encodings.	
14:13	Reserved.	
15	Valid (R/W) Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.	
63:16	Reserved.	
Register Address: 613H, 1555	MSR_PKG_PERF_STATUS	
PKG Perf Status (R/O) See Section 16.10.3, "Package RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 648H, 1608	MSR_CONFIG_TDP_NOMINAL	
Base TDP Ratio (R/O)		Package
7:0	Config_TDP_Base Base TDP level ratio to be used for this specific processor (in units of 100 MHz).	
63:8	Reserved.	
Register Address: 649H, 1609	MSR_CONFIG_TDP_LEVEL1	
ConfigTDP Level 1 Ratio and Power Level (R/O)		Package
14:0	PKG_TDP_LVL1 Power setting for ConfigTDP Level 1.	
15	Reserved.	
23:16	Config_TDP_LVL1_Ratio ConfigTDP level 1 ratio to be used for this specific processor.	

Table 2-29. Additional MSRs Supported by Processors Based on the Haswell and Haswell-E Microarchitectures

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
31:24	Reserved.	
46:32	PKG_MAX_PWR_LVL1 Max Power setting allowed for ConfigTDP Level 1.	
62:47	PKG_MIN_PWR_LVL1 MIN Power setting allowed for ConfigTDP Level 1.	
63	Reserved.	
Register Address: 64AH, 1610	MSR_CONFIG_TDP_LEVEL2	
ConfigTDP Level 2 Ratio and Power Level (R/O)		Package
14:0	PKG_TDP_LVL2 Power setting for ConfigTDP Level 2.	
15	Reserved.	
23:16	Config_TDP_LVL2_Ratio ConfigTDP level 2 ratio to be used for this specific processor.	
31:24	Reserved.	
46:32	PKG_MAX_PWR_LVL2 Max Power setting allowed for ConfigTDP Level 2.	
62:47	PKG_MIN_PWR_LVL2 MIN Power setting allowed for ConfigTDP Level 2.	
63	Reserved.	
Register Address: 64BH, 1611	MSR_CONFIG_TDP_CONTROL	
ConfigTDP Control (R/W)		Package
1:0	TDP_LEVEL (RW/L) System BIOS can program this field.	
30:2	Reserved.	
31	Config_TDP_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
Register Address: 64CH, 1612	MSR_TURBO_ACTIVATION_RATIO	
ConfigTDP Control (R/W)		Package
7:0	MAX_NON_TURBO_RATIO (RW/L) System BIOS can program this field.	
30:8	Reserved.	
31	TURBO_ACTIVATION_RATIO_Lock (RW/L) When this bit is set, the content of this register is locked until a reset.	
63:32	Reserved.	
Register Address: C80H, 3200	IA32_DEBUG_INTERFACE	
Silicon Debug Feature Control (R/W) See Table 2-2.		Package

2.13.1 MSRs in the 4th Generation Intel® Core™ Processor Family Based on Haswell Microarchitecture

Table 2-30 lists model-specific registers (MSRs) that are specific to the 4th generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200 v3 product family (based on Haswell microarchitecture). These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3CH, 06_45H, or 06_46H; see Table 2-1.

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See http://biosbits.org .		Core
3:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 0000b: C0/C1 (no package C-state support) 0001b: C2 0010b: C3 0011b: C6 0100b: C7 0101b: C7s Package C states C7 are not available to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3CH.	
9:4	Reserved.	
10	I/O MWAIT Redirection Enable (R/W)	
14:11	Reserved	
15	CFG Lock (R/WO)	
24:16	Reserved.	
25	C3 State Auto Demotion Enable (R/W)	
26	C1 State Auto Demotion Enable (R/W)	
27	Enable C3 Undemotion (R/W)	
28	Enable C1 Undemotion (R/W)	
63:29	Reserved.	
Register Address: 17DH, 381	MSR_SMM_MCA_CAP	
Enhanced SMM Capabilities (SMM-RO) Reports SMM capability Enhancement. Accessible only while in SMM.		Thread
57:0	Reserved.	
58	SMM_Code_Access_Chk (SMM-RO) If set to 1, indicates that the SMM code access restriction is supported and the MSR_SMM_FEATURE_CONTROL is supported.	

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
59	Long_Flow_Indication (SMM-RO) If set to 1, indicates that the SMM long flow indicator is supported and the MSR_SMM_DELAYED is supported.	
63:60	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0, and R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.	Package
63:32	Reserved.	
Register Address: 391H, 913	MSR_UNC_PERF_GLOBAL_CTRL	
Uncore PMU Global Control		Package
0	Core 0 select.	
1	Core 1 select.	
2	Core 2 select.	
3	Core 3 select.	
18:4	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: 392H, 914	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	
Register Address: 394H, 916	MSR_UNC_PERF_FIXED_CTRL	
Uncore Fixed Counter Control (R/W)		Package
19:0	Reserved.	
20	Enable overflow propagation.	
21	Reserved.	

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
22	Enable counting.	
63:23	Reserved.	
Register Address: 395H, 917	MSR_UNC_PERF_FIXED_CTR	
Uncore Fixed Counter		Package
47:0	Current count.	
63:48	Reserved.	
Register Address: 396H, 918	MSR_UNC_CBO_CONFIG	
Uncore C-Box Configuration Information (R/O)		Package
3:0	Encoded number of C-Box, derive value by "-1".	
63:4	Reserved.	
Register Address: 3B0H, 946	MSR_UNC_ARB_PERFCTR0	
Uncore Arb Unit, Performance Counter 0		Package
Register Address: 3B1H, 947	MSR_UNC_ARB_PERFCTR1	
Uncore Arb Unit, Performance Counter 1		Package
Register Address: 3B2H, 944	MSR_UNC_ARB_PERFEVTSELO	
Uncore Arb Unit, Counter 0 Event Select MSR		Package
Register Address: 3B3H, 945	MSR_UNC_ARB_PERFEVTSEL1	
Uncore Arb Unit, Counter 1 Event Select MSR		Package
Register Address: 4E0H, 1248	MSR_SMM_FEATURE_CONTROL	
Enhanced SMM Feature Control (SMM-RW) Reports SMM capability Enhancement. Accessible only while in SMM.		Package
0	Lock (SMM-RW) When set to '1' locks this register from further changes.	
1	Reserved.	
2	SMM_Code_Chk_En (SMM-RW) This control bit is available only if MSR_SMM_MCA_CAP[58] == 1. When set to '0' (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set to '1' any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.	
63:3	Reserved.	
Register Address: 4E2H, 1250	MSR_SMM_DELAYED	
SMM Delayed (SMM-RO) Reports the interruptible state of all logical processors in the package. Available only while in SMM and MSR_SMM_MCA_CAP[LONG_FLOW_INDICATION] == 1.		Package

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
N-1:0	LOG_PROC_STATE (SMM-RO) Each bit represents a logical processor of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: Microcode Update Load, C6, WBINVD, Ratio Change, Throttle. The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.0BH.PKG_LVL:EBX[15:0] can be updated.	
63:N	Reserved.	
Register Address: 4E3H, 1251	MSR_SMM_BLOCKED	
SMM Blocked (SMM-RO) Reports the blocked state of all logical processors in the package. Available only while in SMM.		Package
N-1:0	LOG_PROC_STATE (SMM-RO) Each bit represents a logical processor of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: Wait For SIPI or SENTER Sleep. The reset value of this field is OFFFH. Only bit positions below N = CPUID.0BH.PKG_LVL:EBX[15:0] can be updated.	
63:N	Reserved.	
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers Used in RAPL Interfaces (R/O)		Package
3:0	Power Units See Section 16.10.1, "RAPL Interfaces."	Package
7:4	Reserved.	Package
12:8	Energy Status Units Energy related information (in Joules) is based on the multiplier, $1/2^{\text{ESU}}$; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules).	Package
15:13	Reserved.	Package
19:16	Time Units See Section 16.10.1, "RAPL Interfaces."	Package
63:20	Reserved.	
Register Address: 639H, 1593	MSR_PPO_ENERGY_STATUS	
PPO Energy Status (R/O) See Section 16.10.4, "PPO/PP1 RAPL Domains."		Package
Register Address: 640H, 1600	MSR_PP1_POWER_LIMIT	
PP1 RAPL Power Limit Control (R/W) See Section 16.10.4, "PPO/PP1 RAPL Domains."		Package
Register Address: 641H, 1601	MSR_PP1_ENERGY_STATUS	

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
PP1 Energy Status (R/O) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 642H, 1602	MSR_PP1_POLICY	
PP1 Balance Policy (R/W) See Section 16.10.4, "PP0/PP1 RAPL Domains."		Package
Register Address: 690H, 1680	MSR_CORE_PERF_LIMIT_REASONS	
Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)		Package
0	PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.	
3:2	Reserved.	
4	Graphics Driver Status (R0) When set, frequency is reduced below the operating system request due to Processor Graphics driver override.	
5	Autonomous Utilization-Based Frequency Control Status (R0) When set, frequency is reduced below the operating system request because the processor has detected that utilization is low.	
6	VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.	
7	Reserved.	
8	Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).	
9	Core Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to domain-level power limiting.	
10	Package-Level Power Limiting PL1 Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL1.	
11	Package-Level PL2 Power Limiting Status (R0) When set, frequency is reduced below the operating system request due to package-level power limiting PL2.	
12	Max Turbo Limit Status (R0) When set, frequency is reduced below the operating system request due to multi-core turbo limits.	

Table 2-30. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
13	Turbo Transition Attenuation Status (R0) When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.	
15:14	Reserved.	
16	PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19:18	Reserved.	
20	Graphics Driver Log When set, indicates that the Graphics Driver Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
21	Autonomous Utilization-Based Frequency Control Log When set, indicates that the Autonomous Utilization-Based Frequency Control Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
22	VR Therm Alert Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
23	Reserved.	
24	Electrical Design Point Log When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
25	Core Power Limiting Log When set, indicates that the Core Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
26	Package-Level PL1 Power Limiting Log When set, indicates that the Package Level PL1 Power Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.

23:16	Maximum Ratio Limit for 11C Maximum turbo ratio limit of 11 core active.	Package
31:24	Maximum Ratio Limit for 12C Maximum turbo ratio limit of 12 core active.	Package
39:32	Maximum Ratio Limit for 13C Maximum turbo ratio limit of 13 core active.	Package
47:40	Maximum Ratio Limit for 14C Maximum turbo ratio limit of 14 core active.	Package
55:48	Maximum Ratio Limit for 15C Maximum turbo ratio limit of 15 core active.	Package
63:56	Maximum Ratio Limit for 16C Maximum turbo ratio limit of 16 core active.	Package
Register Address: 1AFH, 431	MSR_TURBO_RATIO_LIMIT2	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0, and R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
7:0	Maximum Ratio Limit for 17C Maximum turbo ratio limit of 17 core active.	Package
15:8	Maximum Ratio Limit for 18C Maximum turbo ratio limit of 18 core active.	Package
62:16	Reserved.	Package
63	Semaphore for Turbo Ratio Limit Configuration If 1, the processor uses override configuration ¹ specified in MSR_TURBO_RATIO_LIMIT, MSR_TURBO_RATIO_LIMIT1, and MSR_TURBO_RATIO_LIMIT2. If 0, the processor uses factory-set configuration (Default).	Package
Register Address: 414H, 1044	IA32_MC5_CTL	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs," through Section 17.3.2.4, "IA32_MCI_MISC MSRs." Bank MC5 reports MC errors from the Intel QPI 0 module.		Package
Register Address: 415H, 1045	IA32_MC5_STATUS	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs," through Section 17.3.2.4, "IA32_MCI_MISC MSRs." Bank MC5 reports MC errors from the Intel QPI 0 module.		Package

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 416H, 1046	IA32_MC5_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC5 reports MC errors from the Intel QPI 0 module.		Package
Register Address: 417H, 1047	IA32_MC5_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC5 reports MC errors from the Intel QPI 0 module.		Package
Register Address: 418H, 1048	IA32_MC6_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 419H, 1049	IA32_MC6_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41AH, 1050	IA32_MC6_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41BH, 1051	IA32_MC6_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41CH, 1052	IA32_MC7_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the home agent HA 0.		Package
Register Address: 41DH, 1053	IA32_MC7_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the home agent HA 0.		Package
Register Address: 41EH, 1054	IA32_MC7_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the home agent HA 0.		Package
Register Address: 41FH, 1055	IA32_MC7_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the home agent HA 0.		Package
Register Address: 420H, 1056	IA32_MC8_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 421H, 1057	IA32_MC8_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 422H, 1058	IA32_MC8_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 423H, 1059	IA32_MC8_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 424H, 1060	IA32_MC9_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 425H, 1061	IA32_MC9_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 426H, 1062	IA32_MC9_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 427H, 1063	IA32_MC9_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 428H, 1064	IA32_MC10_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 429H, 1065	IA32_MC10_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42AH, 1066	IA32_MC10_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42BH, 1067	IA32_MC10_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42CH, 1068	IA32_MC11_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42DH, 1069	IA32_MC11_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42EH, 1070	IA32_MC11_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42FH, 1071	IA32_MC11_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package

Register Address: 44CH, 1100	IA32_MC19_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC19 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo2, CBo5, CBo8, CBo11, CBo14, CBo17.		Package
Register Address: 44DH, 1101	IA32_MC19_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC19 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo2, CBo5, CBo8, CBo11, CBo14, CBo17.		Package
Register Address: 44EH, 1102	IA32_MC19_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC19 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo2, CBo5, CBo8, CBo11, CBo14, CBo17.		Package
Register Address: 44FH, 1103	IA32_MC19_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC19 reports MC errors from the following pair of CBo/L3 Slices (if the pair is present): CBo2, CBo5, CBo8, CBo11, CBo14, CBo17.		Package
Register Address: 450H, 1104	IA32_MC20_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 451H, 1105	IA32_MC20_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 452H, 1106	IA32_MC20_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 453H, 1107	IA32_MC20_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 454H, 1108	IA32_MC21_CTL	

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 455H, 1109	IA32_MC21_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 456H, 1110	IA32_MC21_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 457H, 1111	IA32_MC21_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers Used in RAPL Interfaces (R/O)		Package
3:0	Power Units See Section 16.10.1, "RAPL Interfaces."	Package
7:4	Reserved.	Package
12:8	Energy Status Units Energy related information (in Joules) is based on the multiplier, $1/2^{\text{ESU}}$; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules).	Package
15:13	Reserved.	Package
19:16	Time Units See Section 16.10.1, "RAPL Interfaces."	Package
63:20	Reserved.	
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
DRAM RAPL Power Limit Control (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) Energy Consumed by DRAM devices.		Package
31:0	Energy in 15.3 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61EH, 1566	MSR_PCIE_PLL_RATIO	

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Configuration of PCIE PLL Relative to BCLK(R/W)		Package
1:0	PCIE Ratio (R/W) 00b: Use 5:5 mapping for 100MHz operation (default). 01b: Use 5:4 mapping for 125MHz operation. 10b: Use 5:3 mapping for 166MHz operation. 11b: Use 5:2 mapping for 250MHz operation.	Package
2	LPLL Select (R/W) If 1, use configured setting of PCIE Ratio.	Package
3	LONG RESET (R/W) If 1, wait an additional time-out before re-locking Gen2/Gen3 PLLs.	Package
63:4	Reserved.	
Register Address: 620H, 1568	MSR_UNCORE_RATIO_LIMIT	
Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.		Package
6:0	MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.	
7	Reserved.	
14:8	MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.	
63:15	Reserved.	
Register Address: 639H, 1593	MSR_PPO_ENERGY_STATUS	
Reserved (R/O) Reads return 0.		Package
Register Address: 690H, 1680	MSR_CORE_PERF_LIMIT_REASONS	
Indicator of Frequency Clipping in Processor Cores (R/W) (Frequency refers to processor core frequency.)		Package
0	PROCHOT Status (R0) When set, processor core frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	Thermal Status (R0) When set, frequency is reduced below the operating system request due to a thermal event.	
2	Power Budget Management Status (R0) When set, frequency is reduced below the operating system request due to PBM limit	
3	Platform Configuration Services Status (R0) When set, frequency is reduced below the operating system request due to PCS limit	
4	Reserved.	

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
5	Autonomous Utilization-Based Frequency Control Status (R0) When set, frequency is reduced below the operating system request because the processor has detected that utilization is low.	
6	VR Therm Alert Status (R0) When set, frequency is reduced below the operating system request due to a thermal alert from the Voltage Regulator.	
7	Reserved.	
8	Electrical Design Point Status (R0) When set, frequency is reduced below the operating system request due to electrical design point constraints (e.g., maximum electrical current consumption).	
9	Reserved.	
10	Multi-Core Turbo Status (R0) When set, frequency is reduced below the operating system request due to Multi-Core Turbo limits.	
12:11	Reserved.	
13	Core Frequency P1 Status (R0) When set, frequency is reduced below max non-turbo P1.	
14	Core Max N-Core Turbo Frequency Limiting Status (R0) When set, frequency is reduced below max n-core turbo frequency.	
15	Core Frequency Limiting Status (R0) When set, frequency is reduced below the operating system request.	
16	PROCHOT Log When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
18	Power Budget Management Log When set, indicates that the PBM Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19	Platform Configuration Services Log When set, indicates that the PCS Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
20	Reserved.	
21	Autonomous Utilization-Based Frequency Control Log When set, indicates that the AUBFC Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
22	VR Therm Alert Log When set, indicates that the VR Therm Alert Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
23	Reserved.	
24	Electrical Design Point Log When set, indicates that the EDP Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
25	Reserved.	
26	Multi-Core Turbo Log When set, indicates that the Multi-Core Turbo Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
28:27	Reserved.	
29	Core Frequency P1 Log When set, indicates that the Core Frequency P1 Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
30	Core Max N-Core Turbo Frequency Limiting Log When set, indicates that the Core Max n-core Turbo Frequency Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
31	Core Frequency Limiting Log When set, indicates that the Core Frequency Limiting Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
63:32	Reserved.	
Register Address: C8DH, 3213	IA32_QM_EVTSEL	
Monitoring Event Select Register (R/W) If CPUID.07H.00H:EBX.RDT_M[12] = 1.		Thread
7:0	EventID (R/W) Event encoding: 0x0: No monitoring. 0x1: L3 occupancy monitoring. All other encoding reserved.	
31:8	Reserved.	
41:32	RMID (R/W)	
63:42	Reserved.	
Register Address: C8EH, 3214	IA32_QM_CTR	
Monitoring Counter Register (R/O) If CPUID.07H.00H:EBX.RDT_M[12] = 1.		Thread

Table 2-32. Additional MSRs Supported by the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
61:0	Resource Monitored Data	
62	Unavailable: If 1, indicates data for this RMID is not available or not monitored for this resource or RMID.	
63	Error: If 1, indicates an unsupported RMID or event type was written to IA32_PQR_QM_EVTSEL.	
Register Address: C8FH, 3215	IA32_PQR_ASSOC	
Resource Association Register (R/W)		Thread
9:0	RMID	
63: 10	Reserved.	
See Table 2-20 and Table 2-29 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3FH.		

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.14.1 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v3 Family

The Intel Xeon Processor E5 v3 and E7 v3 families are based on Haswell-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-33. For complete details of the uncore PMU, refer to the Intel Xeon Processor E5 v3 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3FH.

Table 2-33. Uncore PMU MSRs in the Intel® Xeon® Processor E5 v3 Family

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 700H, 1792	MSR_PMON_GLOBAL_CTL	
Uncore PerfMon Per-Socket Global Control		Package
Register Address: 701H, 1793	MSR_PMON_GLOBAL_STATUS	
Uncore PerfMon Per-Socket Global Status		Package
Register Address: 702H, 1794	MSR_PMON_GLOBAL_CONFIG	
Uncore PerfMon Per-Socket Global Configuration		Package
Register Address: 703H, 1795	MSR_U_PMON_UCLK_FIXED_CTL	
Uncore U-Box UCLK Fixed Counter Control		Package
Register Address: 704H, 1796	MSR_U_PMON_UCLK_FIXED_CTR	
Uncore U-Box UCLK Fixed Counter		Package
Register Address: 705H, 1797	MSR_U_PMON_EVNTSELO	
Uncore U-Box PerfMon Event Select for U-Box Counter 0		Package
Register Address: 706H, 1798	MSR_U_PMON_EVNTSEL1	
Uncore U-Box PerfMon Event Select for U-Box Counter 1		Package
Register Address: 708H, 1800	MSR_U_PMON_BOX_STATUS

2.15 MSRS IN THE INTEL® CORE™ M PROCESSORS AND THE 5TH GENERATION INTEL® CORE™ PROCESSORS

The Intel® Core™ M-5xxx processors, 5th generation Intel® Core™ Processors, and the Intel® Xeon® Processor E3-1200 v4 family are based on Broadwell microarchitecture. The Intel® Core™ M-5xxx processors and 5th generation Intel® Core™ Processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_3DH. The Intel® Xeon® Processor E3-1200 v4 family and 5th generation Intel® Core™ Processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_47H. Processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3DH or 06_47H support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-22, Table 2-25, Table 2-29, Table 2-30, Table 2-34, and Table 2-35. For an MSR listed in Table 2-35 that also appears in the model-specific tables of prior generations, Table 2-35 supersedes prior generation tables.

Table 2-34 lists MSRs that are common to processors based on the Broadwell microarchitectures (including CPUID Signature DisplayFamily_DisplayModel values of 06_3DH, 06_47H, 06_4FH, and 06_56H).

PPO Energy Status (R/O) See Section 16.10.4, "PPO/PP1 RAPL Domains."		Package
See Table 2-20, Table 2-21, Table 2-22, Table 2-25, Table 2-29, Table 2-30, and Table 2-34 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_3DH.		

2.16 MSRS IN THE INTEL® XEON® PROCESSOR E5 V4 FAMILY

The MSRs listed in Table 2-36 are available and common to the Intel® Xeon® Processor D Product Family (CPUID Signature DisplayFamily_DisplayModel value of 06_56H) and to the Intel Xeon processors E5 v4 and E7 v4 families (CPUID Signature DisplayFamily_DisplayModel value of 06_4FH). These processors are based on Broadwell microarchitecture.

See Section 2.16.1 for lists of tables of MSRs that are supported by the Intel® Xeon® Processor D Family.

63:20	Reserved.	

2.16.1 Additional MSRs Supported in the Intel® Xeon® Processor D Product Family

The MSRs listed in Table 2-37 are available to Intel® Xeon® Processor D Product Family (CPUID Signature DisplayFamily_DisplayModel value of 06_56H). The Intel® Xeon® processor D product family is based on Broadwell microarchitecture and supports the MSR interfaces listed in Table 2-20, Table 2-29, Table 2-34, Table 2-36, and Table 2-37.

Table 2-37. Additional MSRs Supported by Intel® Xeon® Processor D with a CPUID Signature DisplayFamily_DisplayModel Value of 06_56H

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1ACH, 428	MSR_TURBO_RATIO_LIMIT3	
Config Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0, and R/W if MSR_PLATFORM_INFO.[28] = 1.		Package
62:0	Reserved.	Package
63	Semaphore for Turbo Ratio Limit Configuration If 1, the processor uses override configuration ¹ specified in MSR_TURBO_RATIO_LIMIT, MSR_TURBO_RATIO_LIMIT1. If 0, the processor uses factory-set configuration (Default).	Package
Register Address: 286H, 646	IA32_MC6_CTL2	
See Table 2-2.		Package
Register Address: 287H, 647	IA32_MC7_CTL2	
See Table 2-2.		Package
Register Address: 289H, 649	IA32_MC9_CTL2	
See Table 2-2.		Package

See Table 2-20, Table 2-29, Table 2-34, and Table 2-36 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_56H.		

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.16.2 Additional MSRs Supported in Intel® Xeon® Processors E5 v4 and E7 v4 Families

The MSRs listed in Table 2-37 are available to the Intel® Xeon® Processor E5 v4 and E7 v4 Families (CPUID Signature DisplayFamily_DisplayModel value of 06_4FH). The Intel® Xeon® processor E5 v4 family is based on Broadwell microarchitecture and supports the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-29, Table 2-34, Table 2-36, and Table 2-38.

See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the home agent HA 0.		Package
Register Address: 420H, 1056	IA32_MC8_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 421H, 1057	IA32_MC8_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 422H, 1058	IA32_MC8_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 423H, 1059	IA32_MC8_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the home agent HA 1.		Package
Register Address: 424H, 1060	IA32_MC9_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 425H, 1061	IA32_MC9_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 426H, 1062	IA32_MC9_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 427H, 1063	IA32_MC9_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 428H, 1064	IA32_MC10_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 429H, 1065	IA32_MC10_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package
Register Address: 42AH, 1066	IA32_MC10_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 through MC 16 report MC errors from each channel of the integrated memory controllers.		Package

Register Address: 452H, 1106	IA32_MC20_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 453H, 1107	IA32_MC20_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC20 reports MC errors from the Intel QPI 1 module.		Package
Register Address: 454H, 1108	IA32_MC21_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 455H, 1109	IA32_MC21_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 456H, 1110	IA32_MC21_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: 457H, 1111	IA32_MC21_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC21 reports MC errors from the Intel QPI 2 module.		Package
Register Address: C81H, 3201	IA32_L3_QOS_CFG	
Cache Allocation Technology Configuration (R/W)		Package
0	CAT Enable. Set 1 to enable Cache Allocation Technology.	
63:1	Reserved.	
See Table 2-20, Table 2-21, Table 2-29, and Table 2-30 for other MSR definitions applicable to processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_45H.		

NOTES:

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

2.17 MSRS IN THE 6TH—13TH GENERATION INTEL® CORE™ PROCESSORS, 1ST—5TH GENERATION INTEL® XEON® SCALABLE PROCESSOR FAMILIES, INTEL® CORE™ ULTRA 7 PROCESSORS, 8TH GENERATION INTEL® CORE™ i3 PROCESSORS, INTEL® XEON® E PROCESSORS, INTEL® XEON® 6 P-CORE PROCESSORS, INTEL® XEON® 6 E-CORE PROCESSORS, AND INTEL® SERIES 2 CORE™ ULTRA PROCESSORS

6th generation Intel® Core™ processors are based on Skylake microarchitecture and have a CPUID Signature DisplayFamily_DisplayModel value of 06_4EH or 06_5EH.

The Intel® Xeon® Scalable Processor Family based on the Skylake microarchitecture, the 2nd generation Intel® Xeon® Scalable Processor Family based on the Cascade Lake product, and the 3rd generation Intel® Xeon® Scalable Processor Family based on the Cooper Lake product all have a CPUID Signature DisplayFamily_DisplayModel value of 06_55H.

7th generation Intel® Core™ processors are based on the Kaby Lake microarchitecture, 8th generation and 9th generation Intel® Core™ processors, and Intel® Xeon® E processors are based on Coffee Lake microarchitecture; these processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_8EH or 06_9EH.

8th generation Intel® Core™ i3 processors are based on Cannon Lake microarchitecture and have a CPUID Signature DisplayFamily_DisplayModel value of 06_66H.

10th generation Intel® Core™ processors are based on Comet Lake microarchitecture (with a CPUID Signature DisplayFamily_DisplayModel value of 06_A5H or 06_A6H) and Ice Lake microarchitecture (with a CPUID Signature DisplayFamily_DisplayModel value of 06_7EH).

11th generation Intel® Core™ processors are based on Tiger Lake microarchitecture and have a CPUID Signature DisplayFamily_DisplayModel value of 06_8CH or 06_8DH.

The 3rd generation Intel® Xeon® Scalable Processor Family is based on Ice Lake microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_6AH or 06_6CH.

12th generation Intel® Core™ processors supporting the Alder Lake performance hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_97H or 06_9AH.

13th generation Intel® Core™ processors supporting the Raptor Lake performance hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_BAH, 06_B7H, or 06_BFH.

The 4th generation Intel® Xeon® Scalable Processor Family is based on Sapphire Rapids microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_8FH.

The 5th generation Intel® Xeon® Scalable Processor Family is based on Emerald Rapids microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_CFH.

The Intel® Core™ Ultra 7 processors supporting the Meteor Lake hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_AAH.

The Intel® Xeon® 6 P-core processor is based on the Granite Rapids microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_ADH or 06_AEH.

The Intel® Xeon® 6 E-core processor is based on the Sierra Forest microarchitecture and has a CPUID Signature DisplayFamily_DisplayModel value of 06_AFH.

The Intel® Series 2 Core™ Ultra processors supporting the Lunar Lake performance hybrid architecture have a CPUID Signature DisplayFamily_DisplayModel value of 06_BDH.

These processors support the MSR interfaces listed in Table 2-20, Table 2-21, Table 2-25, Table 2-29, Table 2-35, and Table 2-39¹. For an MSR listed in Table 2-39 that also appears in the model-specific tables of prior generations, Table 2-39 supersedes prior generation tables.

Tables 2-40 through 2-60 list additional supported MSR interfaces introduced in specific processors; see each table for additional details.

The notation of “Platform” in the Scope column (with respect to MSR_PLATFORM_ENERGY_COUNTER and MSR_PLATFORM_POWER_LIMIT) is limited to the power-delivery domain and the specifics of the power delivery integration may vary by platform vendor’s implementation.

Table 2-39. Additional MSRs Supported by the 6th–13th Generation Intel® Core™ Processors, 1st–5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 E-Core Processors, Intel® Xeon® 6 P-Core Processors, and Intel® Series 2 Core™ Ultra Processors

Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
Maximum Ratio Limit of Turbo Mode R/O if MSR_PLATFORM_INFO.[28] = 0, and R/W if MSR_PLATFORM_INFO.[28] = 1		Package
7:0	Maximum Ratio Limit for 1C Maximum turbo ratio limit of 1 core active.	Package
15:8	Maximum Ratio Limit for 2C Maximum turbo ratio limit of 2 core active.	Package
23:16	Maximum Ratio Limit for 3C Maximum turbo ratio limit of 3 core active.	Package
31:24	Maximum Ratio Limit for 4C Maximum turbo ratio limit of 4 core active.	Package
63:32	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-4) that points to the MSR containing the most recent branch record.		Thread

Table 2-39. Additional MSRs Supported by the 6th–13th Generation Intel® Core™ Processors, 1st–5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 E-Core Processors, Intel® Xeon® 6 P-Core Processors, and Intel® Series 2 Core™ Ultra Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1FCH, 508	MSR_POWER_CTL	
Power Control Register See http://biosbits.org .		Core
0	Reserved.	
1	C1E Enable (R/W) When set to '1', will enable the CPU to switch to the Minimum Enhanced Intel SpeedStep Technology operating point when all execution cores enter MWAIT (C1).	Package
18:2	Reserved.	
19	Disable Energy Efficiency Optimization (R/W) Setting this bit disables the P-States energy efficiency optimization. Default value is 0. Disable/enable the energy efficiency optimization in P-State legacy mode (when IA32_PM_ENABLE[HWP_ENABLE] = 0), has an effect only in the turbo range or into PERF_MIN_CTL value if it is not zero set. In HWP mode (IA32_PM_ENABLE[HWP_ENABLE] == 1), has an effect between the OS desired or OS maximize to the OS minimize performance setting.	
20	Disable Race to Halt Optimization (R/W) Setting this bit disables the Race to Halt optimization and avoids this optimization limitation to execute below the most efficient frequency ratio. Default value is 0 for processors that support Race to Halt optimization.	
63:21	Reserved.	
Register Address: 300H, 768	MSR_SGXOWNERPOCH0	
Lower 64 Bit CR_SGXOWNERPOCH (W) Writes do not update CR_SGXOWNERPOCH if CPUID.12H.00H:EAX.SGX1 is 1 on any thread in the package.		Package
63:0	Lower 64 bits of an 128-bit external entropy value for key derivation of an enclave.	
Register Address: 301H, 769	MSR_SGXOWNERPOCH1	
Upper 64 Bit CR_SGXOWNERPOCH (W) Writes do not update CR_SGXOWNERPOCH if CPUID.12H.00H:EAX.SGX1 is 1 on any thread in the package.		Package
63:0	Upper 64 bits of an 128-bit external entropy value for key derivation of an enclave.

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Core-count Weighted C0 Residency (R/O)		Package
63:0	Increment at the same rate as the TSC. The increment each cycle is weighted by the number of processor cores in the package that reside in C0. If N cores are simultaneously in C0, then each cycle the counter increments by N.	
Register Address: 659H, 1625	MSR_ANY_CORE_C0	
Any Core C0 Residency (R/O)		Package
63:0	Increment at the same rate as the TSC. The increment each cycle is one if any processor core in the package is in C0.	
Register Address: 65AH, 1626	MSR_ANY_GFXE_C0	
Any Graphics Engine C0 Residency (R/O)		Package
63:0	Increment at the same rate as the TSC. The increment each cycle is one if any processor graphic device's compute engines are in C0.	
Register Address: 65BH, 1627	MSR_CORE_GFXE_OVERLAP_C0	
Core and Graphics Engine Overlapped C0 Residency (R/O)		Package
63:0	Increment at the same rate as the TSC. The increment each cycle is one if at least one compute engine of the processor graphics is in C0 and at least one processor core in the package is also in C0.	
Register Address: 65CH, 1628	MSR_PLATFORM_POWER_LIMIT	
Platform Power Limit Control (R/W-L) Allows platform BIOS to limit power consumption of the platform devices to the specified values. The Long Duration power consumption is specified via Platform_Power_Limit_1 and Platform_Power_Limit_1_Time. The Short Duration power consumption limit is specified via the Platform_Power_Limit_2 with duration chosen by the processor. The processor implements an exponential-weighted algorithm in the placement of the time windows.		Platform
14:0	Platform Power Limit #1 Average Power limit value which the platform must not exceed over a time window as specified by Power_Limit_1_TIME field. The default value is the Thermal Design Power (TDP) and varies with product skus. The unit is specified in MSR_RAPLPOWER_UNIT.	
15	Enable Platform Power Limit #1 When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #1 over the time window specified by Power Limit #1 Time Window.	
16	Platform Clamping Limitation #1 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #1 value. This bit is writeable only when CPUID.06H:EAX[4] is set.	

Table 2-39. Additional MSRs Supported by the 6th–13th Generation Intel® Core™ Processors, 1st–5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 E-Core Processors, Intel® Xeon® 6 P-Core Processors, and Intel® Series 2 Core™ Ultra Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
23:17	Time Window for Platform Power Limit #1 Specifies the duration of the time window over which Platform Power Limit 1 value should be maintained for sustained long duration. This field is made up of two numbers from the following equation: Time Window = (float) $((1+(X/4)) \cdot (2^Y))$, where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17] The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN]. The default value is 0DH, and the unit is specified in MSR_RAPL_POWER_UNIT[Time Unit].	
31:24	Reserved.	
46:32	Platform Power Limit #2 Average Power limit value which the platform must not exceed over the Short Duration time window chosen by the processor. The recommended default value is 1.25 times the Long Duration Power Limit (i.e., Platform Power Limit # 1).	
47	Enable Platform Power Limit #2 When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #2 over the Short Duration time window.	
48	Platform Clamping Limitation #2 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #2 value.	
62:49	Reserved.	
63	Lock. Setting this bit will lock all other bits of this MSR until system RESET.	
Register Address: 690H, 1680	MSR_LASTBRANCH_16_FROM_IP

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
3	Slice 3 select.	
4	Slice 4select.	
18:5	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: E02H, 3586	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	

2.17.1 MSRs Introduced in 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture

Table 2-41 lists additional MSRs for 7th generation and 8th generation Intel Core processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_8EH or 06_9EH. For an MSR listed in Table 2-41 that also appears in the model-specific tables of prior generations, Table 2-41 supersedes prior generation tables.

Table 2-41. Additional MSRs Supported by the 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 80H, 128	MSR_TRACE_HUB_STH ACPIBAR_BASE	
NPK Address Used by AET Messages (R/W)		Package
0	Lock Bit If set, this MSR cannot be re-written anymore. Lock bit has to be set in order for the AET packets to be directed to NPK MMIO.	
17:1	Reserved.	
63:18	ACPIBAR_BASE_ADDRESS AET target address in NPK MMIO space.	
Register Address: 1F4H, 500	MSR_PRMRR_PHYS_BASE	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MemType PRMRR BASE MemType.	
11:3	Reserved.	

Table 2-41. Additional MSRs Supported by the 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
45:12	Base PRMRR Base Address.	
63:46	Reserved.	
Register Address: 1F5H, 501	MSR_PRMRR_PHYS_MASK	
Processor Reserved Memory Range Register - Physical Mask Control Register (R/W)		Core
9:0	Reserved.	
10	Lock Lock bit for the PRMRR.	
11	VLD Enable bit for the PRMRR.	
45:12	Mask PRMRR MASK bits.	
63:46	Reserved.	
Register Address: 1FBH, 507	MSR_PRMRR_VALID_CONFIG	
Valid PRMRR Configurations (R/W)		Core
0	1M supported MEE size.	
4:1	Reserved.	
5	32M supported MEE size.	
6	64M supported MEE size.	
7	128M supported MEE size.	
31:8	Reserved.	
Register Address: 2F4H, 756	MSR_UNCORE_PRMRR_PHYS_BASE ¹	
(R/W) The PRMRR range is used to protect the processor reserved memory from unauthorized reads and writes. Any IO access to this range is aborted. This register controls the location of the PRMRR range by indicating its starting address. It functions in tandem with the PRMRR mask register.		Package
11:0	Reserved.	
PAWIDTH-1:12	Range Base This field corresponds to bits PAWIDTH-1:12 of the base address memory range which is allocated to PRMRR memory.	
63:PAWIDTH	Reserved.	
Register Address: 2F5H, 757	MSR_UNCORE_PRMRR_PHYS_MASK ¹	
(R/W) This register controls the size of the PRMRR range by indicating which address bits must match the PRMRR base register value.		Package
9:0	Reserved.	
10	Lock Setting this bit locks all writeable settings in this register, including itself.	

Table 2-41. Additional MSRs Supported by the 7th Generation and 8th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture and Coffee Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
11	Range_En Indicates whether the PRMRR range is enabled and valid.	
38:12	Range_Mask This field indicates which address bits must match PRMRR base in order to qualify as an PRMRR access.	
63:39	Reserved.	
Register Address: 620H, 1568	MSR_RING_RATIO_LIMIT	
Ring Ratio Limit (R/W) This register provides Min/Max Ratio Limits for the LLC and Ring.		Package
6:0	MAX_Ratio This field is used to limit the max ratio of the LLC/Ring.	
7	Reserved.	
14:8	MIN_Ratio Writing to this field controls the minimum possible ratio of the LLC/Ring.	
63:15	Reserved.	

NOTES:

1. This MSR is specific to 7th generation and 8th generation Intel® Core™ processors.

2.17.2 MSRs Specific to 8th Generation Intel® Core™ i3 Processors

Table 2-42 lists additional MSRs for 8th generation Intel Core i3 processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_66H. For an MSR listed in Table 2-42 that also appears in the model-specific tables of prior generations, Table 2-42 supersedes prior generation tables.

Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors Based on Cannon Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Thread
0	Lock (R/WL)	
1	Enable VMX Inside SMX Operation (R/WL)	
2	Enable VMX Outside SMX Operation (R/WL)	
14:8	SENTER Local Functions Enables (R/WL)	
15	SENTER Global Functions Enable (R/WL)	
17	SGX Launch Control Enable (R/WL) This bit must be set to enable runtime reconfiguration of SGX Launch Control via IA32_SGXLEPUBKEYHASHn MSR. Available only if CPUID.07H.00H:ECX[30] = 1.	

**Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors
Based on Cannon Lake Microarchitecture (Contd.)**

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
18	SGX Global Functions Enable (R/WL)	
63:21	Reserved.	
Register Address: 350H, 848	MSR_BR_DETECT_CTRL	
Branch Monitoring Global Control (R/W)		
0	EnMonitoring Global enable for branch monitoring.	
1	EnExcept Enable branch monitoring event signaling on threshold trip. The branch monitoring event handler is signaled via the existing PMI signaling mechanism as programmed from the corresponding local APIC LVT entry.	
2	EnLBRFrz Enable LBR freeze on threshold trip. This will cause the LBR frozen bit 58 to be set in IA32_PERF_GLOBAL_STATUS when a triggering condition occurs and this bit is enabled.	
3	DisableInGuest When set to '1', branch monitoring, event triggering and LBR freeze actions are disabled when operating at VMX non-root operation.	
7:4	Reserved.	
17:8	WindowSize Window size defined by WindowCntSel. Values 0 - 1023 are supported. Once the Window counter reaches the WindowSize count both the Window Counter and all Branch Monitoring Counters are cleared.	
23:18	Reserved.	
25:24	WindowCntSel Window event count select: '00 = Instructions retired. '01 = Branch instructions retired '10 = Return instructions retired. '11 = Indirect branch instructions retired.	
26	CntAndMode When set to '1', the overall branch monitoring event triggering condition is true only if all enabled counters' threshold conditions are true. When '0', the threshold tripping condition is true if any enabled counters' threshold is true.	
63:27	Reserved.	
Register Address: 351H, 849	MSR_BR_DETECT_STATUS	
Branch Monitoring Global Status (R/W)		
0	Branch Monitoring Event Signaled When set to '1', Branch Monitoring event signaling is blocked until this bit is cleared by software.	

**Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors
Based on Cannon Lake Microarchitecture (Contd.)**

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
1	LBRsValid This status bit is set to '1' if the LBR state is considered valid for sampling by branch monitoring software.	
7:2	Reserved.	
8	CntrHit0 Branch monitoring counter #0 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.	
9	CntrHit1 Branch monitoring counter #1 threshold hit. This status bit is sticky and once set requires clearing by software. Counter operation continues independent of the state of the bit.	
15:10	Reserved. Reserved for additional branch monitoring counters threshold hit status.	
25:16	CountWindow The current value of the window counter. The count value is frozen on a valid branch monitoring triggering condition. This is a 10-bit unsigned value.	
31:26	Reserved. Reserved for future extension of CountWindow.	
39:32	Count0 The current value of counter 0 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit0 will also be set). This is an 8-bit signed value (2's complement). Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256). RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).	
47:40	Count1 The current value of counter 1 updated after each occurrence of the event being counted. The count value is frozen on a valid branch monitoring triggering condition (in which case CntrHit1 will also be set). This is an 8-bit signed value (2's complement). Heuristic events which only increment will saturate and freeze at maximum value 0xFF (256). RET-CALL event counter saturate at maximum value 0x7F (+127) and minimum value 0x80 (-128).	
63:48	Reserved.	
Register Address: 354H–355H, 852–853	MSR_BR_DETECT_COUNTER_CONFIG_i	
Branch Monitoring Detect Counter Configuration (R/W)		
0	CntrEn Enable counter.	

**Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors
Based on Cannon Lake Microarchitecture (Contd.)**

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
7:1	CntrEvSel Event select (other values #GP) '0000000 = RETs. '0000001 = RET-CALL bias. '0000010 = RET mispredicts. '0000011 = Branch (all) mispredicts. '0000100 = Indirect branch mispredicts. '0000101 = Far branch instructions.	
14:8	CntrThreshold Threshold (an unsigned value of 0 to 127 supported). The value 0 of counter threshold will result in event signaled after every instruction. #GP if threshold is < 2.	
15	MispredEventCnt Mispredict events counting behavior: '0 = Mispredict events are counted in a window. '1 = Mispredict events are counted based on a consecutive occurrence. CntrThreshold is treated as # of consecutive mispredicts. This control bit only applies to events specified by CntrEvSel that involve a prediction (0000010, 0000011, 0000100). Setting this bit for other events is ignored.	
63:16	Reserved.	
Register Address: 3F8H, 1016	MSR_PKG_C3_RESIDENCY	
Package C3 Residency Counter (R/O)		Package
63:0	Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.	
Register Address: 620H, 1568	MSR_RING_RATIO_LIMIT	
Ring Ratio Limit (R/W) This register provides Min/Max Ratio Limits for the LLC and Ring.		Package
6:0	MAX_Ratio This field is used to limit the max ratio of the LLC/Ring.	
7	Reserved.	
14:8	MIN_Ratio Writing to this field controls the minimum possible ratio of the LLC/Ring.	
63:15	Reserved.	
Register Address: 660H, 1632	MSR_CORE_C1_RESIDENCY	
Core C1 Residency Counter (R/O)		Core

Table 2-42. Additional MSRs Supported by the 8th Generation Intel® Core™ i3 Processors Based on Cannon Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
63:0	Value since last reset for the Core C1 residency. Counter rate is the Max Non-Turbo frequency (same as TSC). This counter counts in case both of the core's threads are in an idle state and at least one of the core's thread residency is in a C1 state or in one of its sub states. The counter is updated only after a core C state exit. Note: Always reads 0 if core C1 is unsupported. A value of zero indicates that this processor does not support core C1 or never entered core C1 level state.	
Register Address: 662H, 1634	MSR_CORE_C3_RESIDENCY	
Core C3 Residency Counter (R/O)		Core
63:0	Will always return 0.	

Table 2-43 lists the MSRs of uncore PMU for Intel processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_66H.

Table 2-43. Uncore PMU MSRs Supported by Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 394H, 916	MSR_UNC_PERF_FIXED_CTRL	
Uncore Fixed Counter Control (R/W)		Package
19:0	Reserved.	
20	Enable overflow propagation.	
21	Reserved	
22	Enable counting.	
63:23	Reserved.	
Register Address: 395H, 917	MSR_UNC_PERF_FIXED_CTR	
Uncore Fixed Counter		Package
47:0	Current count.	
63:48	Reserved.	
Register Address: 396H, 918	MSR_UNC_CBO_CONFIG	
Uncore C-Box Configuration Information (R/O)		Package
3:0	Report the number of C-Box units with performance counters, including processor cores and processor graphics.	
63:4	Reserved.	
Register Address: 3B0H, 946	MSR_UNC_ARB_PERFCTR0	
Uncore Arb Unit, Performance Counter 0		Package
Register Address: 3B1H, 947	MSR_UNC_ARB_PERFCTR1	
Uncore Arb Unit, Performance Counter 1		Package
Register Address: 3B2H, 944	MSR_UNC_ARB_PERFEVTSEL0	
Uncore Arb Unit, Counter 0 Event Select MSR		Package

3	Slice 3 select.	
4	Slice 4select.	
18:5	Reserved.	
29	Enable all uncore counters.	

Table 2-43. Uncore PMU MSRs Supported by Intel® Core™ Processors Based on Cannon Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: E02H, 3586	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	

2.17.3 MSRs Introduced in 10th Generation Intel® Core™ Processors

Table 2-44 lists additional MSRs for 10th generation Intel Core processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_7EH. For an MSR listed in Table 2-44 that also appears in the model-specific tables of prior generations, Table 2-44 supersedes prior generation tables.

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register		Core
28:0	Reserved.	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
30	Reserved.	
31	Reserved.	
Register Address: 48H, 72	IA32_SPEC_CTRL	
See Table 2-2.		Core
Register Address: 49H, 73	IA32_PREDICT_CMD	
See Table 2-2.		Thread
Register Address: 8CH, 140	IA32_SGXLEPUBKEYHASH0	
See Table 2-2.		Thread
Register Address: 8DH, 141	IA32_SGXLEPUBKEYHASH1	
See Table 2-2.		Thread
Register Address: 8EH, 142	IA32_SGXLEPUBKEYHASH2	
See Table 2-2.		Thread
Register Address: 8FH, 143	IA32_SGXLEPUBKEYHASH3	

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
See Table 2-2.		Thread
Register Address: A0H, 160	MSR_BIOS_MCU_ERRORCODE	
BIOS MCU ERRORCODE (R/O) This MSR indicates if WRMSR 0x79 failed to configure PRM memory and gives a hint to debug BIOS.		Package
15:0	Error Codes (R/O)	Package
30:16	Reserved.	
31	MCU Partial Success (R/O) When set to 1, WRMSR 0x79 skipped part of the functionality during BIOS.	Thread
Register Address: A5H, 165	MSR_FIT_BIOS_ERROR	
FIT BIOS ERROR (R/W) Report error codes for debug in case the processor failed to parse the Firmware Table in BIOS. Can also be used to log BIOS information.		Thread
7:0	Error Codes (R/W) Error codes for debug.	
15:8	Entry Type (R/W) Failed FIT entry type.	
16	FIT MCU Entry (R/W) FIT contains MCU entry.	
62:17	Reserved.	
63	LOCK (R/W) When set to 1, writes to this MSR will be skipped.	
Register Address: 10BH, 267	IA32_FLUSH_CMD	
See Table 2-2.		Thread
Register Address: 151H, 337	MSR_BIOS_DONE	
BIOS Done (R/WO)		Thread
0	BIOS Done Indication (R/WO) Set by BIOS when it finishes programming the processor and wants to lock the memory configuration from changes by software that is running on this thread. Writes to the bit will be ignored if EAX[0] is 0.	Thread
1	Package BIOS Done Indication (R/O) When set to 1, all threads in the package have bit 0 of this MSR set.	Package
31:2	Reserved.	
Register Address: 1F1H, 497	MSR_CRASHLOG_CONTROL	
Write Data to a Crash Log Configuration		Thread
0	CDDIS: CrashDump_Disable If set, indicates that Crash Dump is disabled.	
63:1	Reserved.	
Register Address: 2A0H, 672	MSR_PRMRM_BASE_0	

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE: PRMRR BASE Memory Type.	
3	CONFIGURED: PRMRR BASE Configured.	
11:4	Reserved.	
51:12	BASE: PRMRR Base Address.	
63:52	Reserved.	
Register Address: 30CH, 780	IA32_FIXED_CTR3	
Fixed-Function Performance Counter Register 3 (R/W) Bit definitions are the same as found in IA32_FIXED_CTR0, offset 309H. See Table 2-2.		Thread
Register Address: 329H, 809	MSR_PERF_METRICS	
Performance Metrics (R/W) Reports metrics directly. Software can check (and/or expose to its guests) the availability of PERF_METRICS feature using IA32_PERF_CAPABILITIES.PERF_METRICS_AVAILABLE (bit 15).		Thread
7:0	Retiring. Percent of utilized slots by uops that eventually retire (commit).	
15:8	Bad Speculation. Percent of wasted slots due to incorrect speculation, covering utilized by uops that do not retire, or recovery bubbles (unutilized slots).	
23:16	Frontend Bound. Percent of unutilized slots where front-end did not deliver a uop while back-end is ready.	
31:24	Backend Bound. Percent of unutilized slots where a uop was not delivered to back-end due to lack of back-end resources.	
63:32	Reserved.	
Register Address: 3F2H, 1010	MSR_PEBS_DATA_CFG	
PEBS Data Configuration (R/W) Provides software the capability to select data groups of interest and thus reduce the record size in memory and record generation latency. Hence, a PEBS record's size and layout vary based on the selected groups. The MSR also allows software to select LBR depth for branch data records.		Thread
0	Memory Info. Setting this bit will capture memory information such as the linear address, data source and latency of the memory access in the PEBS record.	
1	GPRs. Setting this bit will capture the contents of the General Purpose registers in the PEBS record.	
2	XMMs. Setting this bit will capture the contents of the XMM registers in the PEBS record.	
3	LBRs. Setting this bit will capture LBR TO, FROM, and INFO in the PEBS record.	
23:4	Reserved.	

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
31:24	LBR Entries. Set the field to the desired number of entries - 1. For example, if the LBR_entries field is 0, a single entry will be included in the record. To include 32 LBR entries, set the LBR_entries field to 31 (0x1F). To ensure all PEBS records are 16-byte aligned, software can use LBR_entries that is multiple of 3.	
Register Address: 541H, 1345	MSR_CORE_UARCH_CTL	
Core Microarchitecture Control MSR (R/W)		Core
0	L1 Scrubbing Enable When set to 1, enable L1 scrubbing.	
31:1	Reserved.	
Register Address: 657H, 1623	MSR_FAST_UNCORE_MSRS_CTL	
Fast WRMSR/RDMSR Control MSR (R/W)		Thread
3:0	FAST_ACCESS_ENABLE: Bit 0: When set to '1', provides a hint for the hardware to enable fast access mode for the IA32_HWP_REQUEST MSR. This bit is sticky and is cleaned by the hardware only during reset time. This bit is valid only if FAST_UNCORE_MSRS_CAPABILITY[0] is set. Setting this bit will cause CPUID.06H:EAX[18] to be set.	
31:4	Reserved.	
Register Address: 65EH, 1630	MSR_FAST_UNCORE_MSRS_STATUS	
Indication of Uncore MSRs, Post Write Activates		Thread
0	Indicates whether the CPU is still in the middle of writing IA32_HWP_REQUEST MSR, even after the WRMSR instruction has retired. A value of 1 indicates the last write of IA32_HWP_REQUEST is still ongoing. A value of 0 indicates the last write of IA32_HWP_REQUEST is visible outside the logical processor. Software can use the status of this bit to avoid overwriting IA32_HWP_REQUEST.	
31:1	Reserved.	
Register Address: 65FH, 1631	MSR_FAST_UNCORE_MSRS_CAPABILITY	
Fast WRMSR/RDMSR Enumeration MSR (R/O)		Thread
3:0	MSRS_CAPABILITY: Bit 0: If set to '1', hardware supports the fast access mode for the IA32_HWP_REQUEST MSR.	
31:4	Reserved.	
Register Address: 772H, 1906	IA32_HWP_REQUEST_PKG	
See Table 2-2.		Package
Register Address: 775H, 1909	IA32_PECI_HWP_REQUEST_INFO	
See Table 2-2.		Package
Register Address: 777H, 1911	IA32_HWP_STATUS	

Table 2-44. MSRs Supported by the 10th Generation Intel® Core™ Processors (Ice Lake Microarchitecture) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
See Table 2-2.		Thread

2.17.4 MSRs Introduced in the 11th Generation Intel® Core™ Processors based on Tiger Lake Microarchitecture

Table 2-45 lists additional MSRs for 11th generation Intel Core processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_8CH or 06_8DH. The MSRs listed in Table 2-44 are also supported by these processors. For an MSR listed in Table 2-45 that also appears in the model-specific tables of prior generations, Table 2-45 supersedes prior generation tables.

Table 2-45. Additional MSRs Supported by the 11th Generation Intel® Core™ Processors Based on Tiger Lake Microarchitecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: A0H, 160	MSR_BIOS_MCU_ERRORCODE	
BIOS MCU ERRORCODE (R/O)		Package
15:0	Error Codes	
31:16	Reserved.	
Register Address: A7H, 167	MSR_BIOS_DEBUG	
BIOS DEBUG (R/O) This MSR indicates if WRMSR 79H failed to configure PRM memory and gives a hint to debug BIOS.		Thread
30:0	Reserved.	
31	MCU Partial Success When set to 1, WRMSR 79H skipped part of the functionality during BIOS.	
63:32	Reserved.	
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/O) If CPUID.07H.00H:EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Package
1:0	Reserved.	
2	FUSA_SUPPORTED	
3	RSM_IN_CPL0_ONLY When set to 1, the RSM instruction is only allowed in CPL0 (#GP triggered in any CPL != 0). When set to 0, then any CPL may execute the RSM instruction.	
4	Reserved.	
5	SPLIT_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 29 of MSR_MEMORY_CTRL (MSR address 33H).	
31:6	Reserved.	

Table 2-45. Additional MSRs Supported by the 11th Generation Intel® Core™ Processors Based on Tiger Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 492H, 1170	IA32_VMX_PROCBASED_CTLSS3	
IA32_VMX_PROCBASED_CTLSS3 This MSR enumerates the allowed 1-settings of the third set of processor-based controls. Specifically, VM entry allows bit X of the tertiary processor-based VM-execution controls to be 1 if and only if bit X of the MSR is set to 1. If bit X of the MSR is cleared to 0, VM entry fails if control X and the “activate tertiary controls” primary processor-based VM-execution control are both 1.	Core	
0	LOADIWKEY This control determines whether executions of LOADIWKEY cause VM exits.	
63:1	Reserved.	
Register Address: 601H, 1537	MSR_VR_CURRENT_CONFIG	
Power Limit 4 (PL4) Package-level maximum power limit (in Watts). It is a proactive, instantaneous limit.	Package	
12:0	PL4 Value PL4 value in 0.125 A increments. This field is locked by VR_CURRENT_CONFIG[LOCK]. When the LOCK bit is set to 1b, this field becomes Read Only.	
30:13	Reserved.	
31	Lock Indication (LOCK) This bit will lock the CURRENT_LIMIT settings in this register and will also lock this setting. This means that once set to 1b, the CURRENT_LIMIT setting and this bit become Read Only until the next Warm Reset.	
62:32	Not in use.	
63	Reserved.	
Register Address: 6A0H, 1696	IA32_U_CET	
Configure User Mode CET (R/W) See Table 2-2.		
Register Address: 6A2H, 1698	IA32_S_CET	
Configure Supervisor Mode CET (R/W) See Table 2-2.		
Register Address: 6A4H, 1700	IA32_PL0_SSP	
Linear address to be loaded into SSP on transition to privilege level 0. (R/W) See Table 2-2.		
Register Address: 6A5H, 1701	IA32_PL1_SSP	
Linear address to be loaded into SSP on transition to privilege level 1. (R/W) See Table 2-2.		
Register Address: 6A6H, 1702	IA32_PL2_SSP	
Linear address to be loaded into SSP on transition to privilege level 2. (R/W) See Table 2-2.		
Register Address: 6A7H, 1703	IA32_PL3_SSP	

Table 2-45. Additional MSRs Supported by the 11th Generation Intel® Core™ Processors Based on Tiger Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Linear address to be loaded into SSP on transition to privilege level 3. (R/W) See Table 2-2.		
Register Address: 6A8H, 1704	IA32_INTERRUPT_SSP_TABLE_ADDR	
Linear address of a table of seven shadow stack pointers that are selected in IA-32e mode using the IST index (when not 0) from the interrupt gate descriptor. (R/W) See Table 2-2.		
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
See Table 2-2.		
Register Address: 982H, 2434	IA32_TME_ACTIVATE	
See Table 2-2.		
Register Address: 983H, 2435	IA32_TME_EXCLUDE_MASK	
See Table 2-2.		
Register Address: 984H, 2436	IA32_TME_EXCLUDE_BASE	
See Table 2-2.		
Register Address: 990H, 2448	IA32_COPY_STATUS ¹	
See Table 2-2.		Thread
Register Address: 991H, 2449	IA32_IWKEYBACKUP_STATUS ¹	
See Table 2-2.		Platform
Register Address: C82H, 3202	IA32_L2_QOS_CFG	
IA32_CR_L2_QOS_CFG This MSR provides software an enumeration of the parameters that L2 QoS (Intel RDT) support in any particular implementation.		Core
0	CDP_ENABLE When set to 1, it will enable the code and data prioritization for the L2 CAT/Intel RDT feature. When set to 0, code and data prioritization is disabled for L2 CAT/Intel RDT. See Chapter 19, “Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features,” for further details on CDP.	
31:1	Reserved.	
Register Address: D10H–D17H, 3220–3351	IA32_L2_QOS_MASK [0-7]	
IA32_CR_L2_QOS_MASK [0-7] Controls MLC (L2) Intel RDT allocation. For more details on CAT/RDT, see Chapter 19, “Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features.”		Package
19:0	WAYS_MASK Setting a 1 in this bit X allows threads with CLOS <n> (where N is [0-7]) to allocate to way X in the MLC. Ones are only allowed to be written to ways that physically exist in the MLC (CPUID.04H.02H:EBX[31:22] will indicate this). Writing a 1 to a value beyond the highest way or a non-contiguous set of 1s will cause a #GP on the WRMSR to this MSR.	
31:20	Reserved.	

Table 2-45. Additional MSRs Supported by the 11th Generation Intel® Core™ Processors Based on Tiger Lake Microarchitecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: D91H, 3473	IA32_COPY_LOCAL_TO_PLATFORM ¹	
See Table 2-2.		Thread
Register Address: D92H, 3474	IA32_COPY_PLATFORM_TO_LOCAL ¹	
See Table 2-2.		Thread

NOTES:

1. Further details on Key Locker and usage of this MSR can be found here:

<https://software.intel.com/content/www/us/en/develop/download/intel-key-locker-specification.html>.

2.17.5 MSRs Introduced in the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture

Table 2-46 lists additional MSRs for 12th and 13th generation Intel Core processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_97H, 06_9AH, 06_BAH, 06_B7H, or 06_BFH. Table 2-47 lists the MSRs unique to the processor P-core. Table 2-48 lists the MSRs unique to the processor E-core.

The MSRs listed in Table 2-44¹ and Table 2-45 are also supported by these processors. For an MSR listed in Table 2-46, Table 2-47, or Table 2-48 that also appears in the model-specific tables of prior generations, Table 2-46, Table 2-47, and Table 2-48 supersede prior generation tables.

Table 2-46. Additional MSRs Supported by the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register		Core
26:0	Reserved.	
27	UC_STORE_THROTTLE If set to 1, when enabled, the processor will only allow one in-progress UC store at a time.	
28	UC_LOCK_DISABLE If set to 1, a UC lock will cause a #GP(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
30	Reserved.	
31	Reserved.	
Register Address: BCH, 188	IA32_MISC_PACKAGE_CTL5	

1. MSRs at the following addresses are not supported in the 12th and 13th generation Intel Core processor E-core: 30CH, 329H, 541H, and 657H. The MSR at address 657H is not supported in the 12th and 13th generation Intel Core processor P-core.

Table 2-46. Additional MSRs Supported by the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Power Filtering Control (R/W) IA32_ARCH_CAPABILITIES[bit 10] enumerates support for this MSR. See Table 2-2.		Package
Register Address: C7H, 199	IA32_PMC6	
General Performance Counter 6 (R/W) See Table 2-2.		Core
Register Address: C8H, 200	IA32_PMC7	
General Performance Counter 7 (R/W) See Table 2-2.		Core
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/O) If CPUID.07H:EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Package
0	STLB_QOS_SUPPORTED When set to 1, the STLB QoS feature is supported and the STLB QoS MSRs (1A8FH - 1A97H) are accessible. When set to 0, access to these MSRs will #GP.	
1	Reserved.	
2	FUSA_SUPPORTED	
3	RSM_IN_CPL0_ONLY When set to 1, the RSM instruction is only allowed in CPL0 (#GP triggered in any CPL != 0). When set to 0, then any CPL may execute the RSM instruction.	
4	UC_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 28 of MSR_MEMORY_CTRL (MSR address 33H).	
5	SPLIT_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 29 of MSR_MEMORY_CTRL.	
6	SNOOP_FILTER_QOS_SUPPORTED When set to 1, the Snoop Filter Qos Mask MSRs are supported. When set to 0, access to these MSRs will #GP.	
7	UC_STORE_THROTTLING_SUPPORTED When set 1, UC Store throttle capability exist through MSR_MEMORY_CTRL (33H) bit 27.	
31:8	Reserved.	
Register Address: E1H, 225	IA32_UMWAIT_CONTROL	
UMWAIT Control (R/W) See Table 2-2.		
Register Address: 10AH, 266	IA32_ARCH_CAPABILITIES	

Table 2-46. Additional MSRs Supported by the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Enumeration of Architectural Features (R/O) See Table 2-2.		
Register Address: 18CH, 396	IA32_PERFEVTSEL6	
See Table 2-20.		Core
Register Address: 18DH, 397	IA32_PERFEVTSEL7	
See Table 2-20.		Core
Register Address: 195H, 405	IA32_OVERCLOCKING_STATUS	
Overclocking Status (R/O) IA32_ARCH_CAPABILITIES[bit 23] enumerates support for this MSR. See Table 2-2.		Package
Register Address: 1ADH, 429	MSR_PRIMARY_TURBO_RATIO_LIMIT	
Primary Maximum Turbo Ratio Limit (R/W) Software can configure these limits when MSR_PLATFORM_INFO[28] = 1. Specifies Maximum Ratio Limit for each group. Maximum ratio for groups with more cores must decrease monotonically.		Package
7:0	MAX_TURBO_GROUP_0: Maximum turbo ratio limit with 1 core active.	
15:8	MAX_TURBO_GROUP_1: Maximum turbo ratio limit with 2 cores active.	
23:16	MAX_TURBO_GROUP_2: Maximum turbo ratio limit with 3 cores active.	
31:24	MAX_TURBO_GROUP_3: Maximum turbo ratio limit with 4 cores active.	
39:32	MAX_TURBO_GROUP_4: Maximum turbo ratio limit with 5 cores active.	
47:40	MAX_TURBO_GROUP_5: Maximum turbo ratio limit with 6 cores active.	
55:48	MAX_TURBO_GROUP_6: Maximum turbo ratio limit with 7 cores active.	
63:56	MAX_TURBO_GROUP_7: Maximum turbo ratio limit with 8 cores active.	
Register Address: 493H, 1171	IA32_VMX_EXIT_CTL2	
See Table 2-2.		
Register Address: 4C7H, 1223	IA32_A_PMC6	
Full Width Writable IA32_PMC6 Alias (R/W) See Table 2-2.		
Register Address: 4C8H, 1224	IA32_A_PMC7	
Full Width Writable IA32_PMC7 Alias (R/W) See Table 2-2.		
Register Address: 650H, 1616	MSR_SECONDARY_TURBO_RATIO_LIMIT

Secondary Maximum Turbo Ratio Limit (R/W) Software can configure these limits when MSR_PLATFORM_INFO[28] = 1. Specifies Maximum Ratio Limit for each group. Maximum ratio for groups with more cores must decrease monotonically.		Package
7:0	MAX_TURBO_GROUP_0: Maximum turbo ratio limit with 1 core active.	
15:8	MAX_TURBO_GROUP_1: Maximum turbo ratio limit with 2 cores active.	
23:16	MAX_TURBO_GROUP_2: Maximum turbo ratio limit with 3 cores active.	
31:24	MAX_TURBO_GROUP_3: Maximum turbo ratio limit with 4 cores active.	
39:32	MAX_TURBO_GROUP_4: Maximum turbo ratio limit with 5 cores active.	
47:40	MAX_TURBO_GROUP_5: Maximum turbo ratio limit with 6 cores active.	
55:48	MAX_TURBO_GROUP_6: Maximum turbo ratio limit with 7 cores active.	
63:56	MAX_TURBO_GROUP_7: Maximum turbo ratio limit with 8 cores active.	
Register Address: 664H, 1636	MSR_MC6_RESIDENCY_COUNTER	
Module C6 Residency Counter (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Module
63:0	Time that this module is in module-specific C6 states since last reset. Counts at 1 Mhz frequency.	
Register Address: 6E1H, 1761	IA32_PKRS	
Specifies the PK permissions associated with each protection domain for supervisor pages (R/W) See Table 2-2.		
Register Address: 776H, 1910	IA32_HWP_CTL	
See Table 2-2.		
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
Memory Encryption Capability MSR See Table 2-2.		
Register Address: 1200H–121FH, 4608–4639	IA32_LBR_x_INFO	
Last Branch Record Entry X Info Register (R/W) See Table 2-2.		
Register Address: 14CEH, 5326	IA32_LBR_CTL	
Last Branch Record Enabling and Configuration Register (R/W) See Table 2-2.		

Table 2-46. Additional MSRs Supported by the 12th and 13th Generation Intel® Core™ Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 14CFH, 5327	IA32_LBR_DEPTH	
Last Branch Record Maximum Stack Depth Register (R/W) See Table 2-2.		
Register Address: 1500H–151FH, 5376–5407	IA32_LBR_x_FROM_IP	
Last Branch Record Entry X Source IP Register (R/W) See Table 2-2.		
Register Address: 1600H–161FH, 5632–5663	IA32_LBR_x_TO_IP	
Last Branch Record Entry X Destination IP Register (R/W) See Table 2-2.		
Register Address: 17D2H, 6098	IA32_THREAD_FEEDBACK_CHAR	
Thread Feedback Characteristics (R/O) See Table 2-2.		
Register Address: 17D4H, 6100	IA32_HW_FEEDBACK_THREAD_CONFIG	
Hardware Feedback Thread Configuration (R/W) See Table 2-2.		
Register Address: 17DAH, 6106	IA32_HRESET_ENABLE	
History Reset Enable (R/W) See Table 2-2.		

The MSRs listed in Table 2-47 are unique to the 12th and 13th generation Intel Core processor P-core. These MSRs are not supported on the processor E-core.

Table 2-47. MSRs Supported by 12th and 13th Generation Intel® Core™ Processor P-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1A4H, 420	MSR_PREFETCH_CONTROL	
Prefetch Disable Bits (R/W)		
0	L2_HARDWARE_PREFETCHER_DISABLE If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	
1	L2_ADJACENT_CACHE_LINE_PREFETCHER_DISABLE If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).	
2	DCU_HARDWARE_PREFETCHER_DISABLE If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	
3	DCU_IP_PREFETCHER_DISABLE If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction pointer of previous loads) to determine whether to prefetch additional lines.	
4	Reserved.	

Table 2-47. MSRs Supported by 12th and 13th Generation Intel® Core™ Processor P-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
5	AMP_PREFETCH_DISABLE If 1, disables the L2 Adaptive Multipath Probability (AMP) prefetcher.	
63:6	Reserved.	
Register Address: 3F7H, 1015	MSR_PEBS_FRONTEND	
FrontEnd Precise Event Condition Select (R/W) See Table 2-39.		Thread
Register Address: 540H, 1344	MSR_THREAD_UARCH_CTL	
Thread Microarchitectural Control (R/W)		Thread
0	WB_MEM_STRM_LD_DISABLE Disable streaming behavior for MOVNTDQA loads to WB memory type. If set, these accesses will be treated like regular cacheable loads (Data will be cached).	
63:1	Reserved.	
Register Address: 541H, 1345	MSR_CORE_UARCH_CTL	
Core Microarchitecture Control MSR (R/W) See Table 2-44.		Core
Register Address: D10H–D17H, 3220–3351	IA32_L2_QOS_MASK_[0-7]	
IA32_CR_L2_QOS_MASK_[0-7] If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] ≥ 0. Controls MLC (L2) Intel RDT allocation. For more details on CAT/RDT, see Chapter 19, “Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features.”		Core
19:0	WAYS_MASK Setting a 1 in this bit X allows threads with CLOS <n> (where N is [0-7]) to allocate to way X in the MLC. Ones are only allowed to be written to ways that physically exist in the MLC (CPUID.04H.02H:EBX[31:22] will indicate this). Writing a 1 to a value beyond the highest way or a non-contiguous set of 1s will cause a #GP on the WRMSR to this MSR.	
31:20	Reserved.	

The MSRs listed in Table 2-48 are unique to the 12th and 13th generation Intel Core processor E-core. These MSRs are not supported on the processor P-core.

Table 2-48. MSRs Supported by 12th and 13th Generation Intel® Core™ Processor E-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: D10H–D1FH, 3220–3359	IA32_L2_QOS_MASK_[0-15]	
IA32_CR_L2_QOS_MASK_[0-15] If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] ≥ 0. Controls MLC (L2) Intel RDT allocation. For more details on CAT/RDT, see Chapter 19, “Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features.”		Module

Table 2-48. MSRs Supported by 12th and 13th Generation Intel® Core™ Processor E-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
19:0	WAYS_MASK Setting a 1 in this bit X allows threads with CLOS <n> (where N is [0-7]) to allocate to way X in the MLC. Ones are only allowed to be written to ways that physically exist in the MLC (CPUID.04H.02H:EBX[31:22] will indicate this). Writing a 1 to a value beyond the highest way or a non-contiguous set of 1s will cause a #GP on the WRMSR to this MSR.	
31:20	Reserved.	
Register Address: 1309H–130BH, 4873–4875	MSR_RELOAD_FIXED_CTRx	
Reload value for IA32_FIXED_CTRx (R/W)		
47:0	Value loaded into IA32_FIXED_CTRx when a PEBS record is generated while PEBS_EN_FIXEDx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and FIXED_CTRx is overflowed.	
63:48	Reserved.	
Register Address: 14C1H–14C6H, 5313–5318	MSR_RELOAD_PMCx	
Reload value for IA32_PMCx (R/W)		Core
47:0	Value loaded into IA32_PMCx when a PEBS record is generated while PEBS_EN_PMCx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and PMCx is overflowed.	
63:48	Reserved.	

Table 2-49 lists the MSRs of uncore PMU for Intel processors with a CPUID Signature DisplayFamily_DisplayModel value of 06_97H, 06_9AH, 06_BAH, 06_B7H, or 06_BFH.

Table 2-49. Uncore PMU MSRs Supported by 12th and 13th Generation Intel® Core™ Processors

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 396H, 918	MSR_UNC_CBO_CONFIG	
Uncore C-Box Configuration Information (R/O)		Package
3:0	Specifies the number of C-Box units with programmable counters (including processor cores and processor graphics).	
63:4	Reserved.

Uncore Arb Unit 1, Performance Control		Package
Register Address: 2FDEH, 12254	MSR_UNC_PERF_FIXED_CTRL	
Uncore Fixed Counter Control (R/W)		Package
19:0	Reserved.	
20	Enable overflow propagation.	
21	Reserved.	
22	Enable counting.	
63:23	Reserved.	
Register Address: 2FDFH, 12255	MSR_UNC_PERF_FIXED_CTR	
Uncore Fixed Counter		Package
43:0	Current count.	
63:44	Reserved.	
Register Address: 2FF0H, 12272	MSR_UNC_PERF_GLOBAL_CTRL	
Uncore PMU Global Control		Package
0	Slice 0 select.	
1	Slice 1 select.	
2	Slice 2 select.	

Table 2-49. Uncore PMU MSRs Supported by 12th and 13th Generation Intel® Core™ Processors

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
3	Slice 3 select.	
4	Slice 4 select.	
18:5	Reserved.	
29	Enable all uncore counters.	
30	Enable wake on PMI.	
31	Enable Freezing counter when overflow.	
63:32	Reserved.	
Register Address: 2FF2H, 12274	MSR_UNC_PERF_GLOBAL_STATUS	
Uncore PMU Main Status		Package
0	Fixed counter overflowed.	
1	An ARB counter overflowed.	
2	Reserved.	
3	A CBox counter overflowed (on any slice).	
63:4	Reserved.	

2.17.6 MSRs Introduced in the Intel® Xeon® Scalable Processor Family

The Intel® Xeon® Scalable Processor Family (CUID Signature DisplayFamily_DisplayModel value of 06_55H) supports the MSRs listed in Table 2-50.

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CUID Signature DisplayFamily_DisplayModel Value of 06_55H

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64 Processor (R/W) See Table 2-2.		Thread
0	Lock (R/WL)	
1	Enable VMX Inside SMX Operation (R/WL)	
2	Enable VMX Outside SMX Operation (R/WL)	
14:8	SENTER Local Functions Enables (R/WL)	
15	SENTER Global Functions Enable (R/WL)	
18	SGX Global Functions Enable (R/WL)	
20	LMCE_ENABLED (R/WL)	
63:21	Reserved.	
Register Address: 4EH, 78	IA32_PPIN_CTL (MSR_PPIN_CTL)	
Protected Processor Inventory Number Enable Control (R/W)		Package
0	LockOut (R/WO) See Table 2-2.	

**Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CUID Signature
DisplayFamily_DisplayModel Value of 06_55H (Contd.)**

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
1	Enable_PPIN (R/W) See Table 2-2.	
63:2	Reserved.	
Register Address: 4FH, 79	IA32_PPIN (MSR_PPIN)	
Protected Processor Inventory Number (R/O)		Package
63:0	Protected Processor Inventory Number (R/O) See Table 2-2.	
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) See Table 2-26.	Package
22:16	Reserved.	
23	PPIN_CAP (R/O) See Table 2-26.	Package
27:24	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) See Table 2-26.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) See Table 2-26.	Package
30	Programmable TJ OFFSET (R/O) See Table 2-26.	Package
39:31	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) See Table 2-26.	Package
63:48	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states. See http://biosbits.org .		Core

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
2:0	Package C-State Limit (R/W) Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings are supported: 000b: C0/C1 (no package C-state support) 001b: C2 010b: C6 (non-retention) 011b: C6 (retention) 111b: No Package C state limits. All C states supported by the processor are available.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W)	
14:11	Reserved.	
15	CFG Lock (R/W0)	
16	Automatic C-State Conversion Enable (R/W) If 1, the processor will convert HALT or MWAIT(C1) to MWAIT(C6).	
24:17	Reserved.	
25	C3 State Auto Demotion Enable (R/W)	
26	C1 State Auto Demotion Enable (R/W)	
27	Enable C3 Undemotion (R/W)	
28	Enable C1 Undemotion (R/W)	
29	Package C State Demotion Enable (R/W)	
30	Package C State Undemotion Enable (R/W)	
63:31	Reserved.	
Register Address: 179H, 377	IA32_MCG_CAP	
Global Machine Check Capability (R/O)		Thread
7:0	Count.	
8	MCG_CTL_P	
9	MCG_EXT_P	
10	MCP_CMCI_P	
11	MCG_TES_P	
15:12	Reserved.	
23:16	MCG_EXT_CNT	
24	MCG_SER_P	
25	MCG_EM_P	
26	MCG_ELOG_P	
63:27	Reserved.	
Register Address: 17DH, 381	MSR_SMM_MCA_CAP	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Enhanced SMM Capabilities (SMM-RO) Reports SMM capability Enhancement. Accessible only while in SMM.		Thread
57:0	Reserved.	
58	SMM_Code_Access_Chk (SMM-RO) If set to 1 indicates that the SMM code access restriction is supported and a host-space interface is available to SMM handler.	
59	Long_Flow_Indication (SMM-RO) If set to 1 indicates that the SMM long flow indicator is supported and a host-space interface is available to SMM handler.	
63:60	Reserved.	
Register Address: 19CH, 412	IA32_THERM_STATUS	
Thermal Monitor Status (R/W) See Table 2-2.		Core
0	Thermal Status (R/O) See Table 2-2.	
1	Thermal Status Log (R/WC0) See Table 2-2.	
2	PROTCHOT # or FORCEPR# Status (R/O) See Table 2-2.	
3	PROTCHOT # or FORCEPR# Log (R/WC0) See Table 2-2.	
4	Critical Temperature Status (R/O) See Table 2-2.	
5	Critical Temperature Status Log (R/WC0) See Table 2-2.	
6	Thermal Threshold #1 Status (R/O) See Table 2-2.	
7	Thermal Threshold #1 Log (R/WC0) See Table 2-2.	
8	Thermal Threshold #2 Status (R/O) See Table 2-2.	
9	Thermal Threshold #2 Log (R/WC0) See Table 2-2.	
10	Power Limitation Status (R/O) See Table 2-2.	
11	Power Limitation Log (R/WC0) See Table 2-2.	
12	Current Limit Status (R/O) See Table 2-2.	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
13	Current Limit Log (R/WC0) See Table 2-2.	
14	Cross Domain Limit Status (R/O) See Table 2-2.	
15	Cross Domain Limit Log (R/WC0) See Table 2-2.	
22:16	Digital Readout (R/O) See Table 2-2.	
26:23	Reserved.	
30:27	Resolution in Degrees Celsius (R/O) See Table 2-2.	
31	Reading Valid (R/O) See Table 2-2.	
63:32	Reserved.	
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target		Package
15:0	Reserved.	
23:16	Temperature Target (R/O) See Table 2-26.	
27:24	TCC Activation Offset (R/W) See Table 2-26.	
63:28	Reserved.	
Register Address: 1ADH, 429	MSR_TURBO_RATIO_LIMIT	
This register defines the ratio limits. RATIO[0:7] must be populated in ascending order. RATIO[i+1] must be less than or equal to RATIO[i]. Entries with RATIO[i] will be ignored. If any of the rules above are broken, the configuration is silently rejected. If the programmed ratio is:		Package
- Above the fused ratio for that core count, it will be clipped to the fuse limits (assuming !OC). - Below the min supported ratio, it will be clipped.		
7:0	RATIO_0 Defines ratio limits.	
15:8	RATIO_1 Defines ratio limits.	
23:16	RATIO_2 Defines ratio limits.	
31:24	RATIO_3 Defines ratio limits.	
39:32	RATIO_4 Defines ratio limits.	
47:40	RATIO_5 Defines ratio limits.	

**Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CUID Signature
DisplayFamily_DisplayModel Value of 06_55H (Contd.)**

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
55:48	RATIO_6 Defines ratio limits.	
63:56	RATIO_7 Defines ratio limits.	
Register Address: 1AEH, 430	MSR_TURBO_RATIO_LIMIT_CORES	
This register defines the active core ranges for each frequency point. NUMCORE[0:7] must be populated in ascending order. NUMCORE[i+1] must be greater than NUMCORE[i]. Entries with NUMCORE[i] == 0 will be ignored. The last valid entry must have NUMCORE >= the number of cores in the SKU. If any of the rules above are broken, the configuration is silently rejected.		Package
7:0	NUMCORE_0 Defines the active core ranges for each frequency point.	
15:8	NUMCORE_1 Defines the active core ranges for each frequency point.	
23:16	NUMCORE_2 Defines the active core ranges for each frequency point.	
31:24	NUMCORE_3 Defines the active core ranges for each frequency point.	
39:32	NUMCORE_4 Defines the active core ranges for each frequency point.	
47:40	NUMCORE_5 Defines the active core ranges for each frequency point.	
55:48	NUMCORE_6 Defines the active core ranges for each frequency point.	
63:56	NUMCORE_7 Defines the active core ranges for each frequency point.	
Register Address: 280H, 640	IA32_MCO_CTL2	
See Table 2-2.		Core
Register Address: 281H, 641	IA32_MC1_CTL2

See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC3 reports MC errors from the MLC module.		Core
Register Address: 40EH, 1038	IA32_MC3_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC3 reports MC errors from the MLC module.		Core
Register Address: 40FH, 1039	IA32_MC3_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC3 reports MC errors from the MLC module.		Core

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 410H, 1040	IA32_MC4_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC4 reports MC errors from the PCU module.		Package
Register Address: 411H, 1041	IA32_MC4_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC4 reports MC errors from the PCU module.		Package
Register Address: 412H, 1042	IA32_MC4_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC4 reports MC errors from the PCU module.		Package
Register Address: 413H, 1043	IA32_MC4_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC4 reports MC errors from the PCU module.		Package
Register Address: 414H, 1044	IA32_MC5_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC5 reports MC errors from a link interconnect module.		Package
Register Address: 415H, 1045	IA32_MC5_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC5 reports MC errors from a link interconnect module.		Package
Register Address: 416H, 1046	IA32_MC5_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC5 reports MC errors from a link interconnect module.		Package
Register Address: 417H, 1047	IA32_MC5_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC5 reports MC errors from a link interconnect module.		Package
Register Address: 418H, 1048	IA32_MC6_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 419H, 1049	IA32_MC6_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41AH, 1050	IA32_MC6_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41BH, 1051	IA32_MC6_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC6 reports MC errors from the integrated I/O module.		Package
Register Address: 41CH, 1052	IA32_MC7_CTL

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the M2M 0.		Package
Register Address: 41DH, 1053	IA32_MC7_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the M2M 0.		Package
Register Address: 41EH, 1054	IA32_MC7_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the M2M 0.		Package
Register Address: 41FH, 1055	IA32_MC7_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC7 reports MC errors from the M2M 0.		Package
Register Address: 420H, 1056	IA32_MC8_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the M2M 1.		Package
Register Address: 421H, 1057	IA32_MC8_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the M2M 1.		Package
Register Address: 422H, 1058	IA32_MC8_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the M2M 1.		Package
Register Address: 423H, 1059	IA32_MC8_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC8 reports MC errors from the M2M 1.		Package
Register Address: 424H, 1060	IA32_MC9_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 425H, 1061	IA32_MC9_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 426H, 1062	IA32_MC9_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 427H, 1063	IA32_MC9_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package
Register Address: 428H, 1064	IA32_MC10_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC9 - MC11 report MC errors from the CHA.		Package

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 436H, 1078	IA32_MC13_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 437H, 1079	IA32_MC13_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 438H, 1080	IA32_MC14_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 439H, 1081	IA32_MC14_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43AH, 1082	IA32_MC14_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43BH, 1083	IA32_MC14_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43CH, 1084	IA32_MC15_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43DH, 1085	IA32_MC15_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43EH, 1086	IA32_MC15_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 43FH, 1087	IA32_MC15_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 440H, 1088	IA32_MC16_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 441H, 1089	IA32_MC16_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 442H, 1090	IA32_MC16_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 443H, 1091	IA32_MC16_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 444H, 1092	IA32_MC17_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 445H, 1093	IA32_MC17_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 446H, 1094	IA32_MC17_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 447H, 1095	IA32_MC17_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 448H, 1096	IA32_MC18_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 449H, 1097	IA32_MC18_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 44AH, 1098	IA32_MC18_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 44BH, 1099	IA32_MC18_MISC	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Banks MC13 through MC 18 report MC errors from the integrated memory controllers.		Package
Register Address: 44CH, 1100	IA32_MC19_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC19 reports MC errors from a link interconnect module.		Package
Register Address: 44DH, 1101	IA32_MC19_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC19 reports MC errors from a link interconnect module.		Package
Register Address: 44EH, 1102	IA32_MC19_ADDR	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
See Section 17.3.2.1, "IA32_MCI_CTL MSRs," through Section 17.3.2.4, "IA32_MCI_MISC MSRs." Bank MC19 reports MC errors from a link interconnect module.		Package
Register Address: 44FH, 1103	IA32_MC19_MISC	
See Section 17.3.2.1, "IA32_MCI_CTL MSRs," through Section 17.3.2.4, "IA32_MCI_MISC MSRs." Bank MC19 reports MC errors from a link interconnect module.		Package
Register Address: 606H, 1542	MSR_RAPL_POWER_UNIT	
Unit Multipliers Used in RAPL Interfaces (R/O)		Package
3:0	Power Units See Section 16.10.1, "RAPL Interfaces."	Package
7:4	Reserved.	Package
12:8	Energy Status Units Energy related information (in Joules) is based on the multiplier, $1/2^{\text{ESU}}$; where ESU is an unsigned integer represented by bits 12:8. Default value is 0EH (or 61 micro-joules).	Package
15:13	Reserved.	Package
19:16	Time Units See Section 16.10.1, "RAPL Interfaces."	Package
63:20	Reserved.	
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
DRAM RAPL Power Limit Control (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) Energy consumed by DRAM devices.		Package
31:0	Energy in 15.3 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM RAPL Parameters (R/W) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 620H, 1568	MSR_UNCORE_RATIO_LIMIT	
Uncore Ratio Limit (R/W) Out of reset, the min_ratio and max_ratio fields represent the widest possible range of uncore frequencies. Writing to these fields allows software to control the minimum and the maximum frequency that hardware will select.		Package
63:15	Reserved.	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
14:8	MIN_RATIO Writing to this field controls the minimum possible ratio of the LLC/Ring.	
7	Reserved.	
6:0	MAX_RATIO This field is used to limit the max ratio of the LLC/Ring.	
Register Address: 639H, 1593	MSR_PPO_ENERGY_STATUS	
Reserved (R/O) Reads return 0.		Package
Register Address: C8DH, 3213	IA32_QM_EVTSEL	
Monitoring Event Select Register (R/W) If CPUID.07H.00H:EBX.RDT_M[12] = 1.		Thread
7:0	EventID (R/W) Event encoding: 0x00: No monitoring. 0x01: L3 occupancy monitoring. 0x02: Total memory bandwidth monitoring. 0x03: Local memory bandwidth monitoring. All other encoding reserved.	
31:8	Reserved.	
41:32	RMID (R/W)	
63:42	Reserved.	
Register Address: C8FH, 3215	IA32_PQR_ASSOC	
Resource Association Register (R/W)		Thread
9:0	RMID	
31:10	Reserved.	
51:32	CLOS (R/W)	
63: 52	Reserved.	
Register Address: C90H, 3216	IA32_L3_QOS_MASK_0	
L3 Class Of Service Mask - CLOS 0 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 0.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 0 enforcement.	
63:20	Reserved.	
Register Address: C91H, 3217	IA32_L3_QOS_MASK_1	
L3 Class Of Service Mask - CLOS 1 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 1.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 1 enforcement.	
63:20	Reserved.	
Register Address: C92H, 3218	IA32_L3_QOS_MASK_2	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
L3 Class Of Service Mask - CLOS 2 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 2 >= 2.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 2 enforcement.	
63:20	Reserved.	
Register Address: C93H, 3219	IA32_L3_QOS_MASK_3	
L3 Class Of Service Mask - CLOS 3 (R/W). If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 3.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 3 enforcement.	
63:20	Reserved.	
Register Address: C94H, 3220	IA32_L3_QOS_MASK_4	
L3 Class Of Service Mask - CLOS 4 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 4.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 4 enforcement.	
63:20	Reserved.	
Register Address: C95H, 3221	IA32_L3_QOS_MASK_5	
L3 Class Of Service Mask - CLOS 5 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 5.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 5 enforcement.	
63:20	Reserved.	
Register Address: C96H, 3222	IA32_L3_QOS_MASK_6	
L3 Class Of Service Mask - CLOS 6 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 6.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 6 enforcement.	
63:20	Reserved.	
Register Address: C97H, 3223	IA32_L3_QOS_MASK_7	
L3 Class Of Service Mask - CLOS 7 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 7.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 7 enforcement.	
63:20	Reserved.	
Register Address: C98H, 3224	IA32_L3_QOS_MASK_8	
L3 Class Of Service Mask - CLOS 8 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 8.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 8 enforcement.	
63:20	Reserved.	
Register Address: C99H, 3225	IA32_L3_QOS_MASK_9	
L3 Class Of Service Mask - CLOS 9 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 9.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 9 enforcement.	

Table 2-50. MSRs Supported by the Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_55H (Contd.)

Register Address: Hex, Decimal	Register Name (Former Register Name)	
Register Information / Bit Fields	Bit Description	Scope
63:20	Reserved.	
Register Address: C9AH, 3226	IA32_L3_QOS_MASK_10	
L3 Class Of Service Mask - CLOS 10 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 10.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 10 enforcement.	
63:20	Reserved.	
Register Address: C9BH, 3227	IA32_L3_QOS_MASK_11	
L3 Class Of Service Mask - CLOS 11 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 11.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 11 enforcement.	
63:20	Reserved.	
Register Address: C9CH, 3228	IA32_L3_QOS_MASK_12	
L3 Class Of Service Mask - CLOS 12 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 12.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 12 enforcement.	
63:20	Reserved.	
Register Address: C9DH, 3229	IA32_L3_QOS_MASK_13	
L3 Class Of Service Mask - CLOS 13 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 13.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 13 enforcement.	
63:20	Reserved.	
Register Address: C9EH, 3230	IA32_L3_QOS_MASK_14	
L3 Class Of Service Mask - CLOS 14 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 14.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 14 enforcement.	
63:20	Reserved.	
Register Address: C9FH, 3231	IA32_L3_QOS_MASK_15	
L3 Class Of Service Mask - CLOS 15 (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] >= 15.		Package
0:19	CBM: Bit vector of available L3 ways for CLOS 15 enforcement.	
63:20	Reserved.	

2.17.7 MSRs Specific to the 3rd Generation Intel® Xeon® Scalable Processor Family Based on Ice Lake Microarchitecture

The 3rd generation Intel® Xeon® Scalable Processor Family based on Ice Lake microarchitecture (CPUID Signature DisplayFamily_DisplayModel value of 06_6AH or 06_6CH) support the MSRs listed in Table 2-51.

Table 2-51. MSRs Supported by the 3rd Generation Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_6AH or 06_6CH

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 612H, 1554	MSR_PACKAGE_ENERGY_TIME_STATUS	
Package energy consumed by the entire CPU (R/W)		Package
31:0	Total amount of energy consumed since last reset.	
63:32	Total time elapsed when the energy was last updated. This is a monotonic increment counter with auto wrap back to zero after overflow. Unit is 10ns.	
Register Address: 618H, 1560	MSR_DRAM_POWER_LIMIT	
Allows software to set power limits for the DRAM domain and measurement attributes associated with each limit.		Package
14:0	DRAM_PP_PWR_LIM: Power Limit[0] for DDR domain. Units = Watts, Format = 11.3, Resolution = 0.125W, Range = 0-2047.875W.	
15	PWR_LIM_CTRL_EN: Power Limit[0] enable bit for DDR domain.	
16	Reserved.	
23:17	CTRL_TIME_WIN: Power Limit[0] time window Y value, for DDR domain. Actual time_window for RAPL is: $(1/1024 \text{ seconds}) * (1 + (x/4)) * (2^y)$	
62:24	Reserved.	
63	PP_PWR_LIM_LOCK: When set, this entire register becomes read-only. This bit will typically be set by BIOS during boot.	
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
31:0	Energy in 15.3 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 61BH, 1563	MSR_DRAM_PERF_STATUS	
DRAM Performance Throttling Status (R/O) See Section 16.10.5, "DRAM RAPL Domain."		Package
Register Address: 61CH, 1564	MSR_DRAM_POWER_INFO	
DRAM Power Parameters (R/W)		Package
14:0	Spec DRAM Power (DRAM_TDP): The Spec power allowed for DRAM. The TDP setting is typical (not guaranteed). The units for this value are defined in MSR_DRAM_POWER_INFO_UNIT[PWR_UNIT].	
15	Reserved.	

Table 2-51. MSRs Supported by the 3rd Generation Intel® Xeon® Scalable Processor Family with a CPUID Signature DisplayFamily_DisplayModel Value of 06_6AH or 06_6CH (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
30:16	Minimal DRAM Power (DRAM_MIN_PWR): The minimal power setting allowed for DRAM. Lower values will be clamped to this value. The minimum setting is typical (not guaranteed). The units for this value are defined in MSR_DRAM_POWER_INFO_UNIT[PWR_UNIT].	
31	Reserved.	
46:32	Maximal Package Power (DRAM_MAX_PWR): The maximal power setting allowed for DRAM. Higher values will be clamped to this value. The maximum setting is typical (not guaranteed). The units for this value are defined in MSR_DRAM_POWER_INFO_UNIT[PWR_UNIT].	
47	Reserved.	
54:48	Maximal Time Window (DRAM_MAX_WIN): The maximal time window allowed for the DRAM. Higher values will be clamped to this value. $x = \text{PKG\_MAX\_WIN}[54:53]$ $y = \text{PKG\_MAX\_WIN}[52:48]$ The timing interval window is a floating-point number given by $1.x * \text{power}(2,y)$. The unit of measurement is defined in MSR_DRAM_POWER_INFO_UNIT[TIME_UNIT].	
62:55	Reserved.	
63	LOCK: Lock bit to lock the register.	
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
See Table 2-2.		
Register Address: 982H, 2434	IA32_TME_ACTIVATE	
See Table 2-2.		
Register Address: 983H, 2435	IA32_TME_EXCLUDE_MASK	
See Table 2-2.		
Register Address: 984H, 2436	IA32_TME_EXCLUDE_BASE	
See Table 2-2.		

2.17.8 MSRs Specific to the 4th and 5th Generation Intel® Xeon® Scalable Processor Families

The 4th generation Intel® Xeon® Scalable Processor Family based on Sapphire Rapids microarchitecture (CPUID Signature DisplayFamily_DisplayModel value of 06_8FH) and the 5th generation Intel® Xeon® Scalable Processor Family based on Emerald Rapids microarchitecture (CPUID Signature DisplayFamily_DisplayModel value of 06_CFH) both support the MSRs listed in Section 2.17, “MSRs In the 6th—13th Generation Intel® Core™ Proces-

sors, 1st—5th Generation Intel® Xeon® Scalable Processor Families, Intel® Core™ Ultra 7 Processors, 8th Generation Intel® Core™ i3 Processors, Intel® Xeon® E Processors, Intel® Xeon® 6 P-core processors, Intel® Xeon® 6 E-core processors, and Intel® Series 2 Core™ Ultra Processors,” including Table 2-52. For an MSR listed in Table 2-52 that also appears in the model-specific tables of prior generations, Table 2-52 supersedes prior generation tables.

Certain bit field positions may be related to the maximum physical address width, the value of which is expressed as “MAXPHYADDR” in Table 2-52. See Section 2.1 for an explanation of this value.

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register (R/W)		Core
27:0	Reserved.	
28	UC_LOCK_DISABLE If set to 1, a UC lock will cause a #GP(0) exception. See Section 10.1.2.3, “Features to Disable Bus Locks.”	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, “Features to Disable Bus Locks.”	
31:30	Reserved.	
Register Address: A7H, 167	MSR_BIOS_DEBUG	
BIOS DEBUG (R/O) See Table 2-45.		Thread
Register Address: BCH, 188	IA32_MISC_PACKAGE_CTLs	
Power Filtering Control (R/W) IA32_ARCH_CAPABILITIES[bit 10] enumerates support for this MSR. See Table 2-2.		Package
Register Address: BFH, 191	IA32_PBOPT_CTRL	
IA32_PBOPT_OPT_CTRL If IA32_ARCH_CAPABILITIES[32] = 1 This MSR provides an architectural enumeration function for model-specific behavior.		
0	PREDICTION_CONTROL_BARRIER (R/W) When set to 0 (default), original Indirect Branch Predictor Barrier Target Array Return (IBPB TA RET) mitigation is enabled. When set to 1, alternative IBPB mitigation is enabled.	
63:1	Reserved.	
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/W) If CUID.07H.00H:EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Core
0	Reserved: returns zero.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
1	Reserved: returns zero.	
2	INTEGRITY_CAPABILITIES When set to 1, the processor supports MSR_INTEGRITY_CAPABILITIES.	
3	RSM_IN_CPLD_ONLY Indicates that RSM will only be allowed in CPLD and will #GP for all non-CPLD privilege levels.	
4	UC_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 28 of MSR_MEMORY_CTRL (MSR address 33H).	
5	SPLIT_LOCK_DISABLE_SUPPORTED When read as 1, software can set bit 29 of MSR_MEMORY_CTRL.	
6	Reserved: returns zero.	
7	UC_STORE_THROTTLING_SUPPORTED Indicates that the snoop filter quality of service MSRs are supported on this core. This is based on the existence of a non-inclusive cache and the L2/MLC QoS feature supported.	
63:8	Reserved: returns zero.	
Register Address: E1H, 225	IA32_UWAIT_CONTROL	
UWAIT Control (R/W) See Table 2-2.		
Register Address: EDH, 237	MSR_RAR_CONTROL	
RAR Control (R/W)		Thread
29:0	Reserved.	
30	IGNORE_IF Allow RAR servicing at the RLP regardless of the value of RFLAGS.IF.	
31	ENABLE RAR events are recognized. When RAR is not enabled, RARs are dropped.	
63:32	Reserved.	
Register Address: EEH, 238	MSR_RAR_ACTION_VECTOR_BASE	
Pointer to RAR Action Vector (R/W)		Thread
5:0	Reserved.	
MAXPHYADDR-1:6	VECTOR_PHYSICAL_ADDRESS Pointer to the physical address of the 64B aligned RAR action vector.	
63:MAXPHYADDR	Reserved.	
Register Address: EFH, 239	MSR_RAR_PAYLOAD_TABLE_BASE	
Pointer to Base of RAR Payload Table (R/W)		Thread
11:0	Reserved.	
MAXPHYADDR-1:12	TABLE_PHYSICAL_ADDRESS Pointer to the base physical address of the 4K aligned RAR payload table.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
63:MAXPHYADDR	Reserved.	
Register Address: F0H, 240	MSR_RAR_INFO	
Read Only RAR Information (R/O)		Thread
31:0	Supported payload type bitmap. A value of 1 in bit position [i] indicates that payload type [i] is supported.	
37:32	Table Max Index Maximum supported payload table index.	
63:38	Always zero.	
Register Address: 105H, 261	MSR_CORE_BIST	
Core BIST (R/W) Controls Array BIST activation and status checking as part of FUSA.		Core
31:0	BIST_ARRAY Bitmap indicating which arrays to run BIST on (WRITE). Bitmap indicating which arrays were not processed, i.e., completion mask (READ).	
39:32	BANK Array bank of the [least significant set bit] array indicated in EAX to start BIST(WRITE). Array bank interrupted or failed (READ).	
47:40	DWORD Array dword of the [least significant set bit] array indicated in EAX to start BIST (WRITE). Array dword interrupted or failed (READ).	
62:48	Reserved.	
63	CTRL_RESULT Indicates whether WRMSR should signal Machine-Check upon BIST-error (WRITE). BIST result PASS(0)/FAIL(1) of the (least significant set bit) array indicated in EAX (READ).	
Register Address: 10AH, 266	IA32_ARCH_CAPABILITIES	
Enumeration of Architectural Features (R/O) See Table 2-2.		
Register Address: 1A4H, 420	MSR_PREFETCH_CONTROL	
Prefetch Disable Bits (R/W)		
0	L2_HARDWARE_PREFETCHER_DISABLE If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	
1	L2_ADJACENT_CACHE_LINE_PREFETCHER_DISABLE If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
2	DCU_HARDWARE_PREFETCHER_DISABLE If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	
3	DCU_IP_PREFETCHER_DISABLE If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction pointer of previous loads) to determine whether to prefetch additional lines.	
4	Reserved.	
5	AMP_PREFETCH_DISABLE If 1, disables the L2 Adaptive Multipath Probability (AMP) prefetcher.	
63:6	Reserved.	
Register Address: 1ADH, 429	MSR_PRIMARY_TURBO_RATIO_LIMIT	
Primary Maximum Turbo Ratio Limit (R/W) See Table 2-46.		Package
Register Address: 1AEH, 430	MSR_TURBO_RATIO_LIMIT_CORES	
See Table 2-50.		Package
Register Address: 1C4H, 452	IA32_XFD	
Extended Feature Detect (R/W) See Table 2-2.		
Register Address: 1C5H, 453	IA32_XFD_ERR	
XFD Error Code (R/W) See Table 2-2.		
Register Address: 2C2H, 706	MSR_COPY_SCAN_HASHES	
COPY_SCAN_HASHES (W)		Die
63:0	SCAN_HASH_ADDR Contains the linear address of the SCAN Test HASH Binary loaded into memory.	
Register Address: 2C3H, 707	MSR_SCAN_HASHES_STATUS	
SCAN_HASHES_STATUS (R/O)		
15:0	CHUNK_SIZE Chunk size of the test in KB.	Die
23:16	NUM_CHUNKS Total number of chunks.	Die
31:24	Reserved: all zeros.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
39:32	ERROR_CODE The error-code refers to the LP that runs WRMSR(2C2H). 0x0: No error reported. 0x1: Attempt to copy scan-hashes when copy already in progress. 0x2: Secure Memory not set up correctly. 0x3: Scan-image header Image_info.ProgramID doesn't match RDMSR(2D9H)[31:24], or scan-image header Processor-Signature doesn't match F/M/S, or scan-image header Processor-Flags doesn't match PlatformID. 0x4: Reserved 0x5: Integrity check failed. 0x6: Re-install of scan test image attempted when current scan test image is in use by other LPs.	Thread
50:40	Reserved: set to all zeros.	
62:51	MAX_CORE_LIMIT Maximum Number of cores that can run Intel® In-field Scan simultaneously minus 1. 0 means 1 core at a time.	Die
63	Valid Valid bit is set when COPY_SCAN_HASHES has completed successfully.	Die
Register Address: 2C4H, 708	MSR_AUTHENTICATE_AND_COPY_CHUNK	
AUTHENTICATE_AND_COPY_CHUNK (W)		Die
7:0	CHUNK_INDEX Chunk Index, should be less than the total number of chunks defined by NUM_CHUNKS (MSR_SCAN_HASHES_STATUS[23:16]).	
63:8	CHUNK_ADDR Bits 63:8 of 256B aligned Linear address of scan chunk in memory.	
Register Address: 2C5H, 709	MSR_CHUNKS_AUTHENTICATION_STATUS	
CHUNKS_AUTHENTICATION_STATUS (R/O)		
7:0	VALID_CHUNKS Total number of Valid (authenticated) chunks.	Die
15:8	TOTAL_CHUNKS Total number of chunks.	Die
31:16	Reserved: all zeros.	
39:32	ERROR_CODE The error code refers to the LP that runs WRMSR(2C4H). 0x0: No error reported. 0x1: Attempt to authenticate a CHUNK which is already marked as authentic or is currently being installed by another core. 0x2: CHUNK authentication error. HASH of chunk did not match expected value.	Thread
63:40	Reserved: set to all zeros.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 2C6H, 710	MSR_ACTIVATE_SCAN	
ACTIVATE_SCAN (W)		Thread
7:0	CHUNK_START_INDEX Indicates chunk index to start from.	
15:8	CHUNK_STOP_INDEX Indicates what chunk index to stop at (inclusive).	
31:16	Reserved: all zeros.	
62:32	THREAD_WAIT_DELAY TSC based delay to allow threads to rendezvous.	
63	SIGNAL_MCE If 1, then on scan-error log MC in MC4_STATUS and signal MCE if machine check signaling enabled in MC4_CTL[0]. If 0, then no logging/no signaling.	
Register Address: 2C7H, 711	MSR_SCAN_STATUS	
SCAN_STATUS (R/O)		
7:0	CHUNK_NUM SCAN Chunk that was reached.	Core
15:8	CHUNK_STOP_INDEX Indicates what chunk index to stop at (inclusive). Maps to same field in WRMSR(ACTIVATE_SCAN).	Core
31:16	Reserved: return all zeros.	
39:32	ERROR_CODE 0x0: No error. 0x1: SCAN operation did not start. Other thread did not join in time. 0x2: SCAN operation did not start. Interrupt occurred prior to threads rendezvous. 0x3: SCAN operation did not start. Power Management conditions are inadequate to run Intel In-field Scan. 0x4: SCAN operation did not start. Non-valid chunks in the range CHUNK_STOP_INDEX : CHUNK_START_INDEX. 0x5: SCAN operation did not start. Mismatch in arguments between threads T0/T1. 0x6: SCAN operation did not start. Core not capable of performing SCAN currently. 0x8: SCAN operation did not start. Exceeded number of Logical Processors (LP) allowed to run Intel In-field Scan concurrently. MAX_CORE_LIMIT exceeded. 0x9: Interrupt occurred. Scan operation aborted prematurely, not all chunks requested have been executed.	Thread
61:40	Reserved: return all zeros.	
62	SCAN_CONTROL_ERROR Scan-System-Controller malfunction.	Core

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
63	SCAN_SIGNATURE_ERROR Core failed SCAN-SIGNATURE checking for this chunk.	Core
Register Address: 2C8H, 712	MSR_SCAN_MODULE_ID	
SCAN_MODULE_ID (R/O)		Module
31:0	RevID of the currently installed scan test image. Maps to Revision field in external header (offset 4).	
63:32	Reserved: return all zeros.	
Register Address: 2C9H, 713	MSR_LAST_SAF_WP	
LAST_SAF_WP (R/O)		Core
31:0	LAST_WP Provides information about the core when the last WRMSR(ACTIVATE_SCAN) was executed. Available only if enumerated in MSR_INTEGRITY_CAPABILITIES[10:9].	
63:32	Reserved: return all zeros.	
Register Address: 2D9H, 729	MSR_INTEGRITY_CAPABILITIES	
INTEGRITY_CAPABILITIES (R/O)		Module
0	STARTUP_SCAN_BIST When set, supports Intel In-field Scan.	
3:1	Reserved: return all zeros.	
4	PERIODIC_SCAN_BIST When set, supports Intel In-field Scan.	
23:5	Reserved: return all zeros.	
31:24	ID of the scan programs supported for this part. WRMSR(2C2H) verifies this value against the corresponding value in the scan-image header, i.e., Image_info.	
Register Address: 410H, 1040	IA32_MC4_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC4 reports MC errors from the PCU module. If SIGNAL_MCE is set, a Scan Status is logged in MC4_STATUS and MC4_MISC.		Package
Register Address: 411H, 1041	IA32_MC4_STATUS	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC4 reports MC errors from the PCU module. If SIGNAL_MCE is set, a Scan Status is logged in MC4_STATUS and MC4_MISC.		Package
Register Address: 412H, 1042	IA32_MC4_ADDR	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs," through Section 17.3.2.4, "IA32_MCi_MISC MSRs." Bank MC4 reports MC errors from the PCU module. If SIGNAL_MCE is set, a Scan Status is logged in MC4_STATUS and MC4_MISC.		Package
Register Address: 413H, 1043	IA32_MC4_MISC	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
See Section 17.3.2.1, "IA32_MCI_CTL MSRs," through Section 17.3.2.4, "IA32_MCI_MISC MSRs." Bank MC4 reports MC errors from the PCU module. If SIGNAL_MCE is set, a Scan Status is logged in MC4_STATUS and MC4_MISC.		Package
Register Address: 492H, 1170	IA32_VMX_PROCBASED_CTL3	
Capability Reporting Register of Tertiary Processor-Based VM-Execution Controls (R/O) See Table 2-2.		
Register Address: 493H, 1171	IA32_VMX_EXIT_CTL2	
Capability Reporting Register of Secondary VM-Exit Controls (R/O) See Table 2-2.		
Register Address: 540H, 1344	MSR_THREAD_UARCH_CTL	
Thread Microarchitectural Control (R/W) See Table 2-47.		Thread
Register Address: 619H, 1561	MSR_DRAM_ENERGY_STATUS	
DRAM Energy Status (R/O) Energy consumed by DRAM devices.		Package
31:0	Energy in 61 micro-joules. Requires BIOS configuration to enable DRAM RAPL mode 0 (Direct VR).	
63:32	Reserved.	
Register Address: 64DH, 1613	MSR_PLATFORM_ENERGY_STATUS	
Platform Energy Status (R/O)		Package
31:0	TOTAL_ENERGY_CONSUMED Total energy consumption in J (32.0), in 10nsec units.	
63:32	TIME_STAMP Time stamp (U32.0).	
Register Address: 65CH, 1628	MSR_PLATFORM_POWER_LIMIT	
Platform Power Limit Control (R/W-L)		Package
16:0	POWER_LIMIT_1 The average power limit value that the platform must not exceed over a time window as specified by the Power_Limit_1_TIME field. The default value is the Thermal Design Power (TDP) and varies with product skus. The unit is specified in MSR_RAPL_POWER_UNIT.	
17	POWER_LIMIT_1_EN When set, the processor can apply control policies such that the platform average power does not exceed the Power_Limit_1 value over an exponential weighted moving average of the time window.	
18	CRITICAL_POWER_CLAMP_1 When set, the processor can go below the OS-requested P States to maintain the power below the specified Power_Limit_1 value.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
25:19	POWER_LIMIT_1_TIME This indicates the time window over which the Power_Limit_1 value should be maintained. This field is made up of two numbers from the following equation: Time Window = (float) ((1+(X/4))*(2^Y)), where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17] The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN]. The default value is 0DH, and the unit is specified in MSR_RAPL_POWER_UNIT[Time Unit].	
31:26	Reserved.	
48:32	POWER_LIMIT_2 This is the Duration Power limit value that the platform must not exceed. The unit is specified in MSR_RAPL_POWER_UNIT.	
49	Enable Platform Power Limit #2 When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit #2 over the Short Duration time window.	
50	Platform Clamping Limitation #2 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit #2 value.	
57:51	POWER_LIMIT_2_TIME This indicates the time window over which the Power_Limit_2 value should be maintained. This field has the same format as the POWER_LIMIT_1_TIME field.	
62:58	Reserved.	
63	LOCK Setting this bit will lock all other bits of this MSR until system RESET.	
Register Address: 665H, 1637	MSR_PLATFORM_POWER_INFO	
Platform Power Information (R/W)		Package
16:0	MAX_PPL1 Maximum PP L1 value. The unit is specified in MSR_RAPL_POWER_UNIT.	
31:17	MIN_PPL1 Minimum PP L1 value. The unit is specified in MSR_RAPL_POWER_UNIT.	
48:32	MAX_PPL2 Maximum PP L2 value. The unit is specified in MSR_RAPL_POWER_UNIT.	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
55:49	MAX_TW Maximum time window. The unit is specified in MSR_RAPL_POWER_UNIT.	
62:56	Reserved.	
63	LOCK Setting this bit will lock all other bits of this MSR until system RESET.	
Register Address: 666H, 1638	MSR_PLATFORM_RAPL_SOCKET_PERF_STATUS	
Platform RAPL Socket Performance Status (R/O)		Package
31:0	Count of limited performance due to platform RAPL limit.	
Register Address: 6A0H, 1696	IA32_U_CET	
Configure User Mode CET (R/W) See Table 2-2.		
Register Address: 6A2H, 1698	IA32_S_CET	
Configure Supervisor Mode CET (R/W) See Table 2-2.		
Register Address: 6A4H, 1700	IA32_PL0_SSP	
Linear address to be loaded into SSP on transition to privilege level 0. (R/W) See Table 2-2.		
Register Address: 6A5H, 1701	IA32_PL1_SSP	
Linear address to be loaded into SSP on transition to privilege level 1. (R/W) See Table 2-2.		
Register Address: 6A6H, 1702	IA32_PL2_SSP	
Linear address to be loaded into SSP on transition to privilege level 2. (R/W) See Table 2-2.		
Register Address: 6A7H, 1703	IA32_PL3_SSP	
Linear address to be loaded into SSP on transition to privilege level 3. (R/W) See Table 2-2.		
Register Address: 6A8H, 1704	IA32_INTERRUPT_SSP_TABLE_ADDR	
Linear address of a table of seven shadow stack pointers that are selected in IA-32e mode using the IST index (when not 0) from the interrupt gate descriptor. (R/W) See Table 2-2.		
Register Address: 6E1H, 1761	IA32_PKRS	
Specifies the PK permissions associated with each protection domain for supervisor pages (R/W) See Table 2-2.		
Register Address: 776H, 1910	IA32_HWP_CTL	
See Table 2-2.		
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
Memory Encryption Capability MSR See Table 2-2.		

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 985H, 2437	IA32_UINTR_RR	
User Interrupt Request Register (R/W) See Table 2-2.		
Register Address: 986H, 2438	IA32_UINTR_HANDLER	
User Interrupt Handler Address (R/W) See Table 2-2.		
Register Address: 987H, 2439	IA32_UINTR_STACKADJUST	
User Interrupt Stack Adjustment (R/W) See Table 2-2.		
Register Address: 988H, 2440	IA32_UINTR_MISC	
User-Interrupt Target-Table Size and Notification Vector (R/W) See Table 2-2.		
Register Address: 989H, 2441	IA32_UINTR_PD	
User Interrupt PID Address (R/W) See Table 2-2.		
Register Address: 98AH, 2442	IA32_UINTR_TT	
User-Interrupt Target Table (R/W) See Table 2-2.		
Register Address: C70H, 3184	MSR_B1_PMON_EVNT_SELO	
Uncore B-box 1 PerfMon event select MSR.		Package
Register Address: C71H, 3185	MSR_B1_PMON_CTR0	
Uncore B-box 1 PerfMon counter MSR.		Package
Register Address: C72H, 3186	MSR_B1_PMON_EVNT_SEL1	
Uncore B-box 1 PerfMon event select MSR.		Package
Register Address: C73H, 3187	MSR_B1_PMON_CTR1	
Uncore B-box 1 PerfMon counter MSR.		Package
Register Address: C74H, 3188	MSR_B1_PMON_EVNT_SEL2	
Uncore B-box 1 PerfMon event select MSR.		Package
Register Address: C75H, 3189	MSR_B1_PMON_CTR2	
Uncore B-box 1 PerfMon counter MSR.		Package
Register Address: C76H, 3190	MSR_B1_PMON_EVNT_SEL3	
Uncore B-box 1vPerfMon event select MSR.		Package
Register Address: C77H, 3191	MSR_B1_PMON_CTR3	
Uncore B-box 1 PerfMon counter MSR.		Package
Register Address: C82H, 3122	MSR_W_PMON_BOX_OVF_CTRL	
Uncore W-box PerfMon local box overflow control MSR.		Package
Register Address: C8FH, 3215	IA32_PQR_ASSOC	

Table 2-52. Additional MSRs Supported by the 4th and 5th Generation Intel® Xeon® Scalable Processor Families (CPUID Signature DisplayFamily_DisplayModel Values of 06_8FH and 06_CFH) (Contd.)

Register Information / Bit Fields	Bit Description	Scope
See Table 2-2.		
Register Address: C90H—C9EH, 3216—3230	IA32_L3_QOS_MASK_0 through IA32_L3_QOS_MASK_14	
See Table 2-50.		Package
Register Address: D10H—D17H, 3344—3351	IA32_L2_QOS_MASK_[0-7]	
IA32_CR_L2_QOS_MASK_[0-7] If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] ≥ 0. See Table 2-2.		Core
Register Address: D93H, 3475	IA32_PASID	
See Table 2-2.		
Register Address: 1200H—121FH, 4608—4639	IA32_LBR_x_INFO	
Last Branch Record Entry X Info Register (R/W) See Table 2-2.		
Register Address: 1406H, 5126	IA32_MCU_CONTROL	
See Table 2-2.		
Register Address: 14CEH, 5326	IA32_LBR_CTL	
Last Branch Record Enabling and Configuration Register (R/W) See Table 2-2.		
Register Address: 14CFH, 5327	IA32_LBR_DEPTH	
Last Branch Record Maximum Stack Depth Register (R/W) See Table 2-2.		
Register Address: 1500H—151FH, 5376—5407	IA32_LBR_x_FROM_IP	
Last Branch Record Entry X Source IP Register (R/W) See Table 2-2.		
Register Address: 1600H—161FH, 5632—5663	IA32_LBR_x_TO_IP	
Last Branch Record Entry X Destination IP Register (R/W) See Table 2-2.		

2.17.9 MSRs Introduced in the Intel® Core™ Ultra 7 Processor Supporting Performance Hybrid Architecture

Table 2-53 lists additional MSRs for the Intel Core Ultra 7 processor with a CPUID Signature DisplayFamily_DisplayModel value of 06_AAH. Table 2-54 lists the MSRs unique to the processor P-core. Table 2-55 lists the MSRs unique to the processor E-core.

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 33H, 51	MSR_MEMORY_CTRL	
Memory Control Register		Core
26:0	Reserved.	
27	UC_STORE_THROTTLE If set to 1, when enabled, the processor will only allow one in-progress UC store at a time.	
28	UC_LOCK_DISABLE If set to 1, a UC lock will cause a #GP(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will cause an #AC(0) exception. See Section 10.1.2.3, "Features to Disable Bus Locks."	
63:30	Reserved.	
Register Address: 7AH, 122	IA32_FEATURE_ACTIVATION	
Feature Activation (R/W) Implements Feature Activation command. WRMSR to this address activates all 'activatable' features on this thread. See Table 2-2.		
Register Address: 80H, 128	MSR_TRACE_HUB_STH ACPIBAR_BASE	
MSR_TRACE_HUB_STH ACPIBAR_BASE (R/W) This register is used by BIOS to program Trace Hub STH base address that will be used by AET messages.		Thread
0	LOCK Lock bit. If set, this MSR cannot be re-written anymore. The lock bit has to be set in order for the AET packets to be directed to Trace Hub MMIO.	
17:1	Reserved.	
45:18	ADDRESS AET target address in Trace Hub MMIO space.	
63:46	Reserved.	
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration (R/W)		Core

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
3:0	PKG_C_STATE_LIMIT Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit. The following C-state code name encodings may be supported: 0000b: C0/C1 (no package C-state support) 0001b: C2 0010b: C3 0011b: C6 0100b: C7 0101b: C7s 0110b: C8 0111b: C9 1000b: C10	
7:4	MAX_CORE_C_STATE Possible values are: 0000—reserved; 0001—C1; 0010—C3, 0011—C6.	
9:8	Reserved.	
10	IO_MWAIT_REDIRECTION_ENABLE When set, will map IO_read instructions sent to IO registers PMG_IO_BASE_ADDR.PMB0+0/1/2 to MWAIT(C2,3,4) instructions; applies to deepc4 too.	
14:11	Reserved.	
15	CFG_LOCK When set, locks bits 15:0 of this register for further writes, until the next reset occurs.	
24:16	Reserved.	
25	C3_STATE_AUTO_DEMOTION_ENABLE When set, processor will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.	
26	C1_STATE_AUTO_DEMOTION_ENABLE When set, processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	ENABLE_C3_UNDEMOTION Enable Un-Demotion from Demoted C3.	
28	ENABLE_C1_UNDEMOTION Enable Un-Demotion from Demoted C1.	
29	ENABLE_PKGC_AUTODEMOTION Enable Package C-State Auto-Demotion. It enables use of the history of past package C-state depth and residence, as a factor in determining C-State depth.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
30	ENABLE_PKGC_UNDEMOTION Enable Package C-State Un-Demotion. It enables considering cases where demotion was the incorrect decision in determining C-State depth.	
31	TIMED_MWAIT_ENABLE When set, enables Timed MWAIT feature. MWAIT would #GP on attempts to do setup MWAIT timer if this bit is not set.	
63:32	Reserved.	
Register Address: E4H, 228	MSR_IO_CAPTURE_BASE	
IO Capture Base (R/W) Power Management IO Redirection in C-state. See http://biosbits.org .		Core
15:0	LVL_2_BASE_ADDRESS Specifies the base address visible to software for IO redirection. If MSR_PKG_CST_CONFIG_CONTROL.IO_MWAIT_REDIRECTION_ENABLE, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software.	
18:16	CST_RANGE Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL.IO_MWAIT_REDIRECTION_ENABLE: 000b—C3 is the max C-State to include. 001b—C6 is the max C-State to include. 010b—C7 is the max C-State to include.	
63:19	Reserved.	
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Feature Configuration (R/W)		Core
0	AESNI_LOCK Once this bit is set, writes to this register will not be allowed.	
1	AESNI_DISABLE This bit disables Advanced Encryption Standard feature on this processor core. To disable AES, BIOS will write '11 to this MSR on every core.	
63:2	Reserved.	
Register Address: 140H, 320	MSR_FEATURE_ENABLES	
Feature Enable (R/W) Miscellaneous enables for thread specific features.		Thread
0	CPUID_GP_ON_CPL_GT_0 Causes CPUID to #GP if CPL greater than 0 and not in SMM.	
63:1	Reserved.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1A2H, 418	MSR_TEMPERATURE_TARGET	
Temperature Target (R/W) Legacy register holding temperature related constants for Platform use.		Package
6:0	TCC Offset Time Window Describes the RATL averaging time window.	
7	TCC Offset Clamping Bit When enabled will allow RATL throttling below P1.	
15:8	Temperature Control Offset Fan Temperature Target Offset (a.k.a. T-Control) indicates the relative offset from the Thermal Monitor Trip Temperature at which fans should be engaged.	
23:16	TCC Activation Temperature The minimum temperature at which PROCHOT# will be asserted. The value is degrees C.	
30:24	TCC Activation Offset Specifies a temperature offset in degrees C from the temperature target (bits 23:16). PROCHOT# will assert at the offset target temperature. Write is permitted only if MSR_PLATFORM_INFO[30] is set.	
31	LOCKED When set, this entire register becomes read-only.	
63:2	Reserved.	
Register Address: 1A4H, 420	MSR_PREFETCH_CONTROL	
PREFETCH Control (R/W) Prefetch disable bits.		Thread
0	L2_HARDWARE_PREFETCHER_DISABLE If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache.	
1	L2_ADJACENT_CACHE_LINE_PREFETCHER_DISABLE If 1, disables the adjacent cache line prefetcher, which fetches the cache line that comprises a cache line pair (128 bytes).	
2	DCU_HARDWARE_PREFETCHER_DISABLE If 1, disables the L1 data cache prefetcher, which fetches the next cache line into L1 data cache.	
3	DCU_IP_PREFETCHER_DISABLE If 1, disables the L1 data cache IP prefetcher, which uses sequential load history (based on instruction pointer of previous loads) to determine whether to prefetch additional lines.	
4	DCU_NEXT_PAGE_PREFETCH_DISABLE If 1, disables Next Page prefetcher.	
5	AMP_PREFETCH_DISABLE If 1, disables L2 Adaptive Multipath Probability (AMP) prefetcher.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
6	LLC_PAGE_PREFETCH_DISABLE If 1, disables the LLC Page prefetcher.	
7	AOP_PREFETCH_DISABLE	
8	STREAM_PREFETCH_CODE_FETCH_DISABLE	
63:9	Reserved.	
Register Address: 1A6H, 422	MSR_OFFCORE_RSP_0	
OFFCORE_RSP_0 (R/W) Offcore Response Event Select Register		Thread
0	TRUE_DEMAND_CACHE_LOAD Demand Data Rd = DCU reads (includes partials) that is not tagged homeless.	
1	DEMAND_RFO Demand Instruction fetch = IFU Fetches. ItoM or RFO that is not tagged homeless.	
2	DEMAND_CODE_READ Demand Instruction fetch = IFU Fetches. CRd or CRd_UC.	
3	CORE_MODIFIED_WRITEBACK WBMtoI or WBMtoE.	
4	HW_PREFETCH_MLC_LOAD L2 prefetcher requests triggered by reads from MEC (except those triggered by I-side).	
5	HW_PREFETCH_MLC_RFO L2 prefetcher requests triggered by RFOs.	
6	HW_PREFETCH_MLC_CODE L2 prefetcher requests triggered by I-side requests.	
7	HW_PREFETCH_LLC_LOAD LLC prefetch requests triggered by DRd.	
8	HW_PREFETCH_LLC_RFO LLC prefetch requests triggered by RFO.	
9	HW_PREFETCH_LLC_CODE LLC prefetch requests triggered by CRd.	
10	L1_HWPREFETCH Covers Hardware PFRFO, PFNEAR, PFMED, PFFAR, PFHW, PFNTA, PFNPP, PFIPP including the homeless versions.	
11	ALL_STREAMING_STORE Write Combining. WCIL or WCILF.	
12	CORE_NON_MODIFIED_WB WBEFtoI or WBEFtoE.	
13	LLC_PREFETCH LLC prefetch of load/code/RFO.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
14	L1_SWPREFETCH Covers Software PFRFO, PFNEAR, PFMED, PFFAR, PFHW, PFNTA, PFNPP, PFIPP including the homeless versions.	
15	OTHER Includes CLFlush, CLFlushOPT, CLDemote, CLWB, Enqueue SetMonitor, PortIn, IntA, Lock, SplitLock, Unlock, SpCyc, ClrMonitor, PortOut, IntPriUp, IntLog, IntPhy, EOI, RdCurr, WbStol, LLCWBInv, LLCInv, NOP, PCOMMIT.	
16	ANY_RESP Match on any response.	
17	SUPPLIER_NONE No Supplier Details. DATA_PRE [6:3] = 0.	
18	LLC_HIT_M_STATE LLC/L3, M-state, DATA_PRE [6:3] = 2.	
19	LLC_HIT_E_STATE LLC/L3, E-state, DATA_PRE [6:3] = 4.	
20	LLC_HIT_S_STATE LLC/L3, S-state, DATA_PRE [6:3] = 6.	
21	LLC_HIT_F_STATE LLC/L3, F-state, DATA_PRE [6:3] = 8.	
22	FAR_MEM_LOCAL Far Memory, Local, DATA_PRE [6:3] = 1.	
23	FAR_MEM_REMOTE_0_HOP Far Memory, Remote 0-hop, DATA_PRE [6:3] = 3.	
24	FAR_MEM_REMOTE_1_HOP Far Memory, Remote 1-hop, DATA_PRE [6:3] = 5.	
25	FAR_MEM_REMOTE_2_PLUS_HOP Far Memory, Rem 2+ hop, DATA_PRE [6:3] = 7.	
26	NEAR_MEM_MISS_LOCAL_NODE LLC Miss Local Node. Near Memory, Local DATA_PRE [6:3] = E.	
27	NEAR_MEM_REMOTE_0_HOP Near Memory, Remote 0-hop, DATA_PRE [6:3] = B	
28	NEAR_MEM_REMOTE_1_HOP Near Memory, Remote 1-hop, DATA_PRE [6:3] = D.	
29	NEAR_MEM_REMOTE_2_PLUS_HOP Near Memory, Remote 2+ hop, DATA_PRE [6:3] = F.	
30	SPL_HIT Snoop Info: SPL-hit, DATA_PRE [2:0] = 6.	
31	SNOOP_NONE No details as to Snoop-related info. Snoop Info: None, DATA_PRE [2:0] = 0.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
32	NOT_NEEDED No snoop was needed to satisfy the request. Snoop Info: Not needed, DATA_PRE [2:0] = 1.	
33	MISS No snoop was needed to satisfy the request. Snoop Info: Miss, DATA_PRE [2:0] = 2.	
34	HIT_NO_FWD A snoop was needed and it Hits in at least one snooped cache. Hit denotes a cache-line was valid before snoop effect. Snoop Info: Hit No Fwd, DATA_PRE [2:0] = 3.	
35	HIT_EF_WITH_FWD A snoop was needed and data was Forwarded from a remote socket. Snoop Info: Hit EF w/Fwd, DATA_PRE [2:0] = 4.	
36	HITM A snoop was needed and it HitMed in local or remote cache. HitM denotes a cache-line was modified before snoop effect. Snoop Info: HitM, DATA_PRE [2:0] = 5.	
37	NON_DRAM Target was non-DRAM system address. Snoop Info: HitM, DATA_PRE [2:0] = 5.	
38	GO_ERR GO-ERR, RspData[3:0] = 0100.	
39	GO_NO_GO GO-NoGO, RspData[3:0] = 0111.	
40	INPKG_MEM_LOCAL In-package Memory, Local, DATA_PRE [6:3] = 9.	
41	INPKG_MEM_NONLOCAL In-package Memory, Non-Local, DATA_PRE [6:3] = C.	
43:42	Reserved.	
44	UC_LOAD PRd or UCRdF.	
45	UC_STORE WiL.	
46	PARTIAL_STREAMING_STORES WCiL.	
47	FULL_STREAMING_STORES WCiLF.	
48	L1_MODIFIED_WB EVICTIION EXTTYPE from MEC.	
49	L2_MODIFIED_WB WBMtol or WBMtoE.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
50	PSMI MemPushWr_NS (PSMI only).	
51	ITOM ItoM.	
63:52	Reserved.	
Register Address: 1A7H, 423	MSR_OFFCORE_RSP_1	
OFFCORE_RSP_1 (R/W) Offcore Response Event Select Register. See MSR_OFFCORE_RSP_0 (at 1A6H).		Thread
Register Address: 1AAH, 426	MSR_MISC_PWR_MGMT	
Miscellaneous Power Management Control (R/W) Various model-specific features enumeration. See http://biosbits.org .		Package
0	Reserved.	
1	ENABLE_HWP_VOTING_RIGHT When set (1), The CPU will take into account thread HWP requests for threads that have voting rights only (ignores thread requests if they do not have voting rights). When reset(0), The CPU will take into account all thread HWP requests, even for threads that don't have voting rights. Setting this bit will cause the HWP Base feature bit to be reported in CPUID as present; clearing will cause it to be reported as non-present.	
5:2	Reserved.	
6	ENABLE_HWP Setting this bit will cause the HWP Base feature bit to report as present in CPUID; clearing this bit will cause CPUID to report the feature as non-present.	
7	ENABLE_HWP_INTERRUPT Setting this bit will cause the HWP Interrupt feature CPUID.06H:EAX[8] bit to report as present; clearing will report as non-present.	
8	ENABLE_OUT_OF_BAND_AUTONOMOUS Setting this bit will cause the HWP Autonomous feature bit to report as present; clearing will report as non-present.	
11:9	Reserved.	
12	ENABLE_HWP_EPP Enable HWP EPP. Setting this bit (1) will cause the HWP CPUID.06H:EAX[10] Energy Performance Preference bit to report as present (1); clearing will report as non-present (0).	
13	LOCK Setting this bit will prevent the BIOS specific bits from changing until the next reset. i.e., only Bits [0,22] which are meant for OS use can be changed once the LOCK bit is set.	
63:14	Reserved.	
Register Address: 1ADH, 429	MSR_PRIMARY_TURBO_RATIO_LIMIT	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Primary Maximum Turbo Ratio Limit (R/W) Software can configure these limits when MSR_PLATFORM_INFO[28] = 1. Specifies Maximum Ratio Limit for each group. Maximum ratio for groups with more cores must decrease monotonically.		Package
7:0	MAX_TURBO_GROUP_0: Maximum turbo ratio limit with 1 core active.	
15:8	MAX_TURBO_GROUP_1: Maximum turbo ratio limit with 2 cores active.	
23:16	MAX_TURBO_GROUP_2: Maximum turbo ratio limit with 3 cores active.	
31:24	MAX_TURBO_GROUP_3: Maximum turbo ratio limit with 4 cores active.	
39:32	MAX_TURBO_GROUP_4: Maximum turbo ratio limit with 5 cores active.	
47:40	MAX_TURBO_GROUP_5: Maximum turbo ratio limit with 6 cores active.	
55:48	MAX_TURBO_GROUP_6: Maximum turbo ratio limit with 7 cores active.	
63:56	MAX_TURBO_GROUP_7: Maximum turbo ratio limit with 8 cores active.	
Register Address: 1F1H, 497	MSR_CRASHLOG_CONTROL	
Crash Log Control (R/W) Write data to a Crash Log configuration.		Thread
0	CDDIS CrashDump_Disable: If set, indicates that Crash Dump is disabled.	
1	EN_GPRS Collect GPRs on a crash dump. Only meaningful when CDDIS is zero.	
2	EN_GPRS_IN_SMM Collect GPRs in SMM on a crash dump. Only meaningful when CDDIS is zero. EN_GPRS will override this control,	
3	TRIPLE_FAULT_SHUTDOWN Collect a crash log on a triple fault shutdown. Only meaningful when CDDIS is zero.	
63:4	Reserved.	
Register Address: 1F5H, 501	MSR_PRMRR_PHYS_MASK	
Processor Reserved Memory Range Register - Physical Mask (R/W)		Core
9:0	Reserved.	
10	LOCK Once set, this bit prevents software from modifying the PRMRR.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
11	VALID This bit serves as the enable for the PRMRR; the PRMRR must be LOCKed before it can be enabled.	
19:12	Reserved.	
45:20	MASK PRMRR Address Mask.	
63:46	Reserved.	
Register Address: 1FCH, 508	MSR_POWER_CTL	
Power Control Register (R/W) See http://biosbits.org .		Package
0	ENABLE_BIDIR_PROCHOT Used to enable or disable the response to PROCHOT# input. When set/enabled, the platform can force the CPU to throttle to a lower power condition such as Pn/Pm by asserting proshot#. When clear/disabled (default), the CPU ignores the status of the proshot input signal.	
1	C1E_ENABLE When set to '1', will enable the CPU to switch to the Minimum Enhanced Intel SpeedStep Technology operating point when all execution cores enter MWAIT (C1).	
2	SAPM_IMC_C2_POLICY This bit determines if self-refresh activation is allowed when entering Package C2 State. If it is set to 0b, PCODE will keep the FORCE_SR_OFF bit asserted in Package C2 State and allow its negation according to the defined latency negotiations with the PCH and Display Engine in Package C3 and deeper states. Otherwise, self-refresh is allowed in Package C2 State.	
3	FAST_BRK_SNP_EN This bit controls the VID swing rate for the OTHER_SNP_WAKE events that are detected by the iMPH. This is the event that is detected by the iMPH when a non-DMI snoopable request is observed while UCLK domain is not functional. 0b: Use slow VID swing rate. 1b: Use fast VID swing rate.	
17:4	Reserved.	
18	PWR_PERF_PLTFRM_OVR Power performance platform override.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
19	EE_TURBO_DISABLE Setting this bit disables the P-States energy efficiency optimization. Default value is 0. Disable/enable the energy efficiency optimization in P-State legacy mode (when IA32_PM_ENABLE[HWP_ENABLE] = 0), has an effect only in the turbo range or into PERF_MIN_CTL value if it is not zero set. In HWP mode (IA32_PM_ENABLE[HWP_ENABLE] == 1), has an effect between the OS desired or OS maximize to the OS minimize performance setting.	
20	RTH_DISABLE Setting this bit disables the Race to Halt optimization and avoids this optimization limitation to execute below the most efficient frequency ratio. Default value is 0 for processors that support Race to Halt optimization.	
21	DIS_PROCHOT_OUT Prochot output disable.	
22	PROCHOT_RESPONSE Prochhot configurable response enable.	
23	VR_THERM_ALERT_DISABLE_LOCK When set to 1, locks PROCHOT related bits of this MSR. Once set, a reset is required to clear this bit.	
24	VR_THERM_ALERT_DISABLE When set to 1, disables the VR_THERMAL_ALERT signaling.	
25	DISABLE_RING_EE Disable Ring EE.	
26	DISABLE_SA_OPTIMIZATION Disable SA optimization.	
27	DISABLE_OOK Disable OOK.	
28	DISABLE_AUTONOMOUS Disable HWP autonomous mode.	
29	Reserved.	
30	CSTATE_PREWAKE_DISABLE C-state pre-wake disable.	
63:31	Reserved.	
Register Address: 2A0H, 672	MSR_PRMRR_BASE_0	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE Memory type for PRMRR accesses.

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
2	SMM_CODE_CHK_EN When clear (default) none of the logical processors are prevented from executing SMM code outside the ranges defined by the SMRR. When set, any logical processor in the package that attempts to execute SMM code not within the ranges defined by the SMRR will assert an unrecoverable MCE.	
63:3	Reserved.	
Register Address: 601H, 1537	MSR_VR_CURRENT_CONFIG	
Power Limit 4 (PL4) (R/W) Package-level maximum power limit (in Watts). It is a proactive, instantaneous limit.		Package
15:0	CURRENT_LIMIT PL4 Value in 0.125 A increments. This field is locked by MSR_VR_CURRENT_CONFIG.LOCK. When the LOCK bit is set to 1, this field becomes Read Only.	
30:16	Reserved.	
31	LOCK This bit will lock the CURRENT_LIMIT settings in this register and will also lock this setting. This means that once set to 1, the CURRENT_LIMIT setting and this bit become Read Only until the next Warm Reset.	
63:32	Reserved.	
Register Address: 620H, 1568	MSR_UNCORE_RATIO_LIMIT	
Uncore Ratio Limit (R/W) Min/Max Ratio Limits for Uncore LLC and Ring.		Package
6:0	MAX_CLR_RATIO Maximum allowed ratio for the Ring and Last Level Cache (LLC).	
7	Reserved.	
14:8	MIN_CLR_RATIO Minimum allowed ratio for the Ring and Last Level Cache (LLC).	
63:15	Reserved.	
Register Address: 638H, 1592	MSR_PPO_POWER_LIMIT	
MSR_PPO_POWER_LIMIT (R/W) PPO RAPL power unit control.		Package
14:0	IA_PP_PWR_LIM This is the power limitation on the IA cores power plane. The unit of measurement is defined in PACKAGE_POWER_SKU_UNIT_MSR[PWR_UNIT].	
15	PWR_LIM_CTRL_EN This bit must be set in order to limit the power of the IA cores power plane. 0b: IA cores power plane power limitation is disabled. 1b: IA cores power plane power limitation is enabled.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
16	PP_CLAMP_LIM Power Plane Clamping limitation; allow going below P1. 0b: PBM is limited between P1 and P0. 1b: PBM can go below P1.	
23:17	CTRL_TIME_WIN x = CTRL_TIME_WIN[23:22] y = CTRL_TIME_WIN[21:17] The timing interval window is Floating Point number given by $1.x * \text{power}(2,y)$. The unit of measurement is defined in PACKAGE_POWER_SKU_UNIT_MSR[TIME_UNIT]. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR[PKG_MAX_WIN]. The minimum time window is 1 unit of measurement (as defined above).	
30:24	Reserved.	
31	PP_PWR_LIM_LOCK When set, all settings in this register are locked and are treated as Read Only.	
63:32	Reserved.	
Register Address: 64FH, 1615	MSR_CORE_PERF_LIMIT_REASONS	
Core Performance Limit Reasons Indicator of Frequency Clipping in Processor Cores. (Frequency refers to processor core frequency.)		Package
0	PROCHOT (R/O) PROCHOT Status. When set, frequency is reduced below the operating system request due to assertion of external PROCHOT.	
1	THERMAL (R/O) Thermal Status. When set, frequency is reduced below the operating system request due to a thermal event.	
3:2	Reserved.	
4	RSR_LIMIT (R/O) Residency State Regulation Status. When set, frequency is reduced below the operating system request due to residency state regulation limit.	
5	RATL (R/O) Running Average Thermal Limit Status. When set, frequency is reduced below the operating system request due to Running Average Thermal Limit (RATL).	
6	VR_THERMALERT (R/O) VR Therm Alert Status. When set, frequency is reduced below the operating system request due to a thermal alert from a processor Voltage Regulator (VR).	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
7	VR_TDC (R/O) VR Therm Design Current Status. When set, frequency is reduced below the operating system request due to VR thermal design current limit.	
8	OTHER (R/O) Other Status. When set, frequency is reduced below the operating system request due to electrical or other constraints.	
9	Reserved.	
10	PBM_PL1 (R/O) Package/Platform-Level Power Limiting PL1 Status. When set, frequency is reduced below the operating system request due to package/platform-level power limiting PL1.	
11	PBM_PL2 (R/O) Package/Platform-Level PL2 Power Limiting Status. When set, frequency is reduced below the operating system request due to package/platform-level power limiting PL2/PL3.	
12	MAX_TURBO_LIMIT (R/O) Max Turbo Limit Status. When set, frequency is reduced below the operating system request due to multi-core turbo limits.	
13	TURBO_ATTEN (R/O) Turbo Transition Attenuation Status. When set, frequency is reduced below the operating system request due to Turbo transition attenuation. This prevents performance degradation due to frequent operating ratio changes.	
15:14	Reserved.	
16	PROCHOT_LOG (R/W) PROCHOT Log. When set, indicates that the PROCHOT Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
17	THERMAL_LOG (R/W) Thermal Log When set, indicates that the Thermal Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
19:18	Reserved.	
20	RSR_LIMIT_LOG (R/W) Residency State Regulation Log. When set, indicates that the Residency State Regulation Status bit has asserted since the log bit was last cleared. This log bit will remain set until cleared by software writing 0.	
21	RATL_LOG (R/W) Running average thermal limit Log, RW, When set by PCODE indicates that Running average thermal limit has cause IA frequency clipping. Software should write to this bit to clear the status in this bit.	

Table 2-53. Additional MSRs Supported by the Intel® Core™ Ultra 7 Processors Supporting Performance Hybrid Architecture (Contd.)

31:24	MAX_TURBO_GROUP_3: Maximum turbo ratio limit with 4 cores active.	
39:32	MAX_TURBO_GROUP_4: Maximum turbo ratio limit with 5 cores active.	
47:40	MAX_TURBO_GROUP_5: Maximum turbo ratio limit with 6 cores active.	
55:48	MAX_TURBO_GROUP_6: Maximum turbo ratio limit with 7 cores active.	
63:56	MAX_TURBO_GROUP_7: Maximum turbo ratio limit with 8 cores active.	
Register Address: 65CH, 1628	MSR_PLATFORM_POWER_LIMIT	
Platform Power Limit Control (R/W) Allows platform BIOS to limit power consumption of the platform devices to the specified values. The Long Duration power consumption is specified via Platform_Power_Limit_1 and Platform_Power_Limit_1_Time. The Short Duration power consumption limit is specified via the Platform_Power_Limit_2 with duration chosen by the processor. The processor implements an exponential-weighted algorithm in the placement of the time windows.		Package
14:0	POWER_LIMIT_1 Average Power limit value which the platform must not exceed over a time window as specified by Power_Limit_1_TIME field. The default value is the Thermal Design Power (a.k.a TDP) and varies with product skus. The unit is specified in MSR_RAPLPOWER_UNIT.	
15	POWER_LIMIT_1_EN When set, enables the processor to apply control policy such that the platform power does not exceed Platform Power limit 1 over the time window specified by Power Limit 1 Time Window.	
16	CRITICAL_POWER_CLAMP_1 When set, allows the processor to go below the OS requested P states in order to maintain the power below specified Platform Power Limit 1 value.	
23:17	POWER_LIMIT_1_TIME Specifies the duration of the time window over which Platform Power Limit 1 value should be maintained for sustained long duration. This field is made up of two numbers from the following equation: Time Window = (float) ((1+(X/4))*(2^Y)), where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17] The maximum allowed value in this field is defined in MSR_PKG_POWER_INFO[PKG_MAX_WIN]. The default value is 0DH, The unit is specified in MSR_RAPLPOWER_UNIT[Time Unit]	
31:24	Reserved.

31:0	Reserved.	
35:32	READ_MK_TME_KEYID_BITS This value will be returned on a RDMSR, but must be zero on a WRMSR.	
39:36	TDX_RESERVED_KEYID_BITS (read only) The number of key identifier bits allocated to TDX usage. This is a read-only field and must be zero on a WRMSR.	
63:40	Reserved.	

The MSRs listed in Table 2-54 are unique to the Intel Core Ultra 7 processor P-core. These MSRs are not supported on the processor E-core.

Table 2-54. MSRs Supported by the Intel® Core™ Ultra 7 Processor P-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 30CH, 780	IA32_FIXED_CTR3	
Fixed-Function Performance Counter 3 (R/W)		Thread
47:0	FIXED_COUNTER Top-down Microarchitecture Analysis unhalting number of available slots counter.	
63:48	Reserved.	
Register Address: 329H, 809	MSR_PERF_METRICS	
Performance Metrics (R/W) This register provides built-in support for Top-down Micro-architecture Analysis (TMA) metrics. It exposes the four TMA Level 1 metrics where the lower 32 bits are divided into four 8 bit fields, each of which is an integer percentage of the total TOPDOWN.SLOTS (as reported by fixed counter 3).		Thread
7:0	RETIRING Percent of utilized by uops that eventually retire (commit).	
15:8	BAD_SPECULATION Percent of Wasted due to incorrect speculation, covering Utilized by uops that do not retire, or Recovery Bubbles (unutilized slots).	
23:16	FRONTEND_BOUND Percent of Unutilized slots where Front-end did not deliver a uop while Back-end is ready.	
31:24	BACKEND_BOUND Percent of Unutilized slots where a uop was not delivered to Back-end due to lack of Back-end resources.	
39:32	MULTI_UOPS Frontend bound.	
47:40	BRANCH_MISPREDICTS Frontend bound.	

Table 2-54. MSRs Supported by the Intel® Core™ Ultra 7 Processor P-core (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
55:48	FRONTEND_LATENCY Frontend bound.	
63:56	MEMORY_BOUND Frontend bound.	
Register Address: 540H, 1344	MSR_THREAD_UARCH_CTL	
Thread Microarchitectural Control (R/W) See Table 2-47.		Thread
Register Address: 541H, 1345	MSR_CORE_UARCH_CTL	
Core Microarchitecture Control MSR (R/W) See Table 2-44.		Core

The MSRs listed in Table 2-48 are unique to the Intel Core Ultra 7 processor E-core. These MSRs are not supported on the processor P-core.

Table 2-55. MSRs Supported by the Intel® Core™ Ultra 7 Processor E-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 4F0H, 1264	MSR_SAF_CTRL	
SAF Control (W/O) Extension to SAF.		Package
0	INVALIDATE_CURRENT_STRIDE Invalidate all chunks in current stride.	
63:1	Reserved.	
Register Address: D18H–D1FH, 3352–3359	IA32_L2_MASK_[8-15]	
IA32_L2_MASK_[8-15] (R/W) If CPUID.10H.01H:EDX.CAT_MAX_CLOS[15:0] ≥ 0. Controls MLC (L2) Intel RDT allocation. For more details on CAT/RDT, see Chapter 19, “Debug, Branch Profile, TSC, and Intel® Resource Director Technology (Intel® RDT) Features.”		Module
15:0	WAY_MASK Capacity Bit Mask. Available ways vectors for class of service of IA core. ‘1 in bit indicates allocation to the way is allowed. ‘0 indicates allocation to the way is not allowed.	
31:16	Reserved.	
Register Address: 1309H–130BH, 4873–4875	MSR_RELOAD_FIXED_CTRx	
Reload value for IA32_FIXED_CTRx (R/W)		Thread
47:0	Value loaded into IA32_FIXED_CTRx when a PEBS record is generated while PEBS_EN_FIXEDx = 1 and PEBS_OUTPUT = 01B in IA32_PEBES_ENABLE, and FIXED_CTRx is overflowed.	
63:48	Reserved.	
Register Address: 14C1H–14C8H, 5313 –5320	MSR_RELOAD_PMCx	
Reload value for IA32_PMCx (R/W)		Thread

Table 2-55. MSRs Supported by the Intel® Core™ Ultra 7 Processor E-core (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
47:0	Value loaded into IA32_PMCx when a PEBS record is generated while PEBS_EN_PMCx = 1 and PEBS_OUTPUT = 01B in IA32_PEBS_ENABLE, and PMCx is overflowed.	
63:48	Reserved.	
Register Address: 1A8EH, 6798	MSR_STLB_FILL_TRANSLATION	
STLB Fill Translation (W/O) STLB QoS MSR to fill translations into STLB.		Core
3:0	CLOS Class of service to use for the fill.	
9:4	Reserved.	
10	X Set to 1 when LA is to an executable page.	
11	RW Set to 1 when LA is to a writeable page.	
63:12	LA Logical address to use for fill.	

2.17.10 MSRs Introduced in the Intel® Xeon® 6 P-Core Processors

Table 2-56 lists additional MSRs for the Intel Xeon 6 P-core processors. Intel Xeon 6 P-core processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_ADH or 06_AEH.

For an MSR listed in Table 2-56 that also appears in the model-specific tables of prior generations, Table 2-56 supersedes prior generation tables.

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 33H, 51	MSR_MEMORY_CONTROL	
MSR_MEMORY_CONTROL (R/W) Disables split locks, which are locked instructions that split a cache line.		Core
26:0	Reserved.	
27	UC_STORE_THROTTLE If set to 1, when enabled, the processor allows one in-progress, post-retirement UC stores at a time.	
28	UC_LOCK_DISABLE If set to 1, a UC load lock will trigger a fault. If clear to 0, UC load locks proceed normally.	
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will trigger an #AC fault. If clear to 0, split locks proceed normally	
63:30	Reserved.	
Register Address: 34H, 52	MSR_SMI_COUNT	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
SMI Counter (R/W)		Thread
31:0	SMI_COUNT Running count of SMI events since the last reset.	
63:32	Reserved.	
Register Address: 39H, 57	MSR_SOCKET_ID	
Socket ID (R/W) Reassigns the package-specific portions of the APIC ID. This MSR is used on scalable DP and high-end MP platforms to resolve legacy-mode APIC ID conflicts.		Package
10:0	PACKAGE_ID: Holds package ID. This reflects the upper bits of the APIC ID.	
63:11	Reserved.	
Register Address: 7AH, 122	IA32_FEATURE_ACTIVATION	
IA32_FEATURE_ACTIVATION (R/W) Implements Feature Activation command. WRMSR to this address activates all 'activatable' features on this thread. See Table 2-2.		Thread
Register Address: 7BH, 123	IA32_MCU_ENUMERATION	
IA32_MCU_ENUMERATION (R/O) Enumeration of architectural features. See Table 2-2.		Package
Register Address: 7CH, 124	IA32_MCU_STATUS	
IA32_MCU_STATUS (R/O) Communicates results from the previous patch loads. See Table 2-2.		Package
Register Address: 82H, 130	IA32_FZM_RANGE_INDEX	
IA32_FZM_RANGE_INDEX (R/W) Index and Domain handle for a valid FZM region. Programmed by SW and used by other FRM MSRs FZM Range Index register to R/W Domain Index. See Table 2-2.		Thread
Register Address: 83H, 131	IA32_FZM_DOMAIN_CONFIG	
IA32_FZM_DOMAIN_CONFIG (R/O) Bit mask of valid regions within the domain identified by FZM_RANGE_INDEX. See Table 2-2.		Thread
Register Address: 84H, 132	IA32_FZM_RANGE_STARTADDR	
IA32_FZM_RANGE_STARTADDR (R/O) Start address of the FZM range pointed to by FZM_RANGE_INDEX. See Table 2-2.		Thread
Register Address: 85H, 133	IA32_FZM_RANGE_ENDADDR	
IA32_FZM_RANGE_ENDADDR (R/O) End address of the specified domain in FZM_RANGE_INDEX. See Table 2-2.		Thread
Register Address: 86H, 134	IA32_FZM_RANGE_WRITESTATUS	
IA32_FZM_RANGE_WRITESTATUS (R/O) Write status of the FZM range pointed to by FZM_RANGE_INDEX. See Table 2-2.		Thread
Register Address: 87H, 135	IA32_MKTME_KEYID_PARTITIONING	
MKTME KEY ID Partitioning (R/O) Enumerates the number of activated KeyIDs for Intel TME-MK and Intel TDX. See Table 2-2.		Package

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 90H, 144	IA32_SGXLEPUBKEYHASH4	
IA32_SGXLEPUBKEYHASH4 (R/W) See Table 2-2.		Thread
Register Address: 91H, 145	IA32_SGXLEPUBKEYHASH5	
IA32_SGXLEPUBKEYHASH5 (R/W) See Table 2-2.		Thread
Register Address: 98H, 152	MSR_SEAM_WBINVDP	
SEAM WBINVDP (R/W) Allows software to WBINVD sections of the LLC.		Thread
63:0	HANDLE Caches sub-block to invalidate.	
Register Address: 99H, 153	MSR_SEAM_WBNOINVDP	
SEAM WBNOINVDP (R/W) Allows software to WBNOINVDP sections of the LLC.		Thread
63:0	HANDLE Caches sub-block to invalidate.	
Register Address: 9AH, 154	MSR_SEAM_INTR_PENDING	
SEAM Interrupt Pending (R/O) Report out some event pending bits.		Thread
0	INTR Interrupt is pending.	
1	NMI NMI is pending.	
2	SMI SMI is pending.	
4:3	OTHER_EVENTS Other events pending.	
63:5	Reserved.	
Register Address: 9BH, 155	IA32_SMM_MONITOR_CTL	
SMM Monitor Control (R/W) The SMM Monitor Configuration involves SMM code specifying the MSEG location and enabling dual-monitor treatment by writing to the corresponding MSR. See Table 2-2.		Thread
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/W) If CPUID.07H.00H:EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Core
0	STLB_QOS When set to 1, processor supports STLB QoS.	
1	Reserved.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
2	INTEGRITY_SUPPORTED When set to 1, processor supports Functional Safety. Specific FUSA capabilities are enumerated in MSR_FUSA_CAPABILITIES.	
3	RSM_IN_CPLO_ONLY Intel System Resources Defense: When set to 1, RSM will only be allowed in CPLO and will #GP for all non-CPLO privilege levels.	
4	UC_LOCK_DISABLE When set to 1, processor supports UC load lock disable.	
5	SPLIT_LOCK_DISABLE When set to 1, processor supports #AC on split locks.	
6	SNP_FILTER_QOS When set to 1, processor supports Snoop Filter Quality of Service MSRs.	
7	UC_STORE_THROTTLING When set to 1, processor supports UC store throttling through MSR_MEMORY_CTRL[UC_STORE_THROTTLE].	
63:8	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: FEH, 254	IA32_MTRRCAP	
Memory Type Range Register (R/O) See Table 2-2.		Core
Register Address: 105H, 261	MSR_ARRAY_BIST	
MSR_ARRAY_BIST (R/W) Triggered by writing and reading an MSR that can be written by Ring 0 software.		Core

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
31:0	ARRAY_LIST: Bit map which indicates which arrays to run MarchC- BIST ▪ Bit[0] MLC Data ▪ Bit[1] MLC Tag ▪ Bit[2] C6SRAM Data (NOP for WRMSR – used for reporting error only) ▪ Bit[3] PMA BIST (NOP for WRMSR – used for reporting error only) ▪ Bit[4] STLB Data ▪ Bit[5] IFU Data ▪ Bit[6] STLB Tag ▪ Bit[7] DCU Data ▪ Bit[8] DSB Data ▪ Bit[9] TMUL Data ▪ Bit[10] UROM pointer0 ▪ Bit[11] UROM pointer1-3 ▪ Bit[12] UROM pointer4-7 ▪ Bit[13] UROM unique0 ▪ Bit[14] UROM unique1/2 The WRMSR will run PBIST on all the arrays indicated in the bitmap, starting from the LSB. NOTE2: C6SRAM[Bit 2] and PMA[Bit 3] are only for reporting and do not execute BIST (done by EDX[15:0]uCode during Fusa-Reset).	
46:32	Reserved.	
62:47	Reserved.	
63	SIGNAL_MCE: Signal MCERR upon BIST failure.	
Register Address: 105H, 261	MSR_ARRAY_BIST_STATUS	
MSR_ARRAY_BIST_STATUS (R/O)		Core
31:0	ARRAY_COMPLETION_MASK Bitmap indicating which arrays from the ARRAY_BIST.ARRAY_LIST was not processed. 1 means not tested and 0 means tested.	
62:32	Reserved. Returns all 0s.	
63	PASS_FAIL: 0 means Pass on all arrays in the WRMSR(ARRAY_BIST.ARRAY_LIST) 1 means Fail on the LSB array in the RDMSR(ARRAY_BIST_STATUS.ARRAY_COMPLETION_MASK).	
Register Address: 122H, 290	IA32_TSX_CTRL	
IA32_TSX_CTRL (R/W) See Table 2-2.		Thread
Register Address: 140H, 320	MSR_FEATURE_ENABLES	
Miscellaneous enables for thread-specific features. (R/W)		Thread

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
0	AESNI_LOCK Once this bit is set, writes to this register will not be allowed.	
63:1	Reserved.	
Register Address: 1E0H, 480	IA32_LER_INFO	
IA32_LER_INFO (R/W) Last Event Record Destination IP Register. See Table 2-2.		Thread
Register Address: 1F9H, 505	IA32_CPU_DCA_CAP	
IA32_CPU_DCA_CAP (R/O) See Table 2-2.		Thread
Register Address: 2A1H, 673	MSR_PRMRR_BASE_1	
MSR_PRMRR_BASE_1 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register.		Core
2:0	MEMTYPE Memory Type for PRMRR accesses.	
3	CONFIGURED PRMRR base configured.	
19:4	Reserved.	
51:20	BASE PRMRR Base address.	
63:52	Reserved.	
Register Address: 2A2H, 674	MSR_PRMRR_BASE_2	
MSR_PRMRR_BASE_2 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A3H, 675	MSR_PRMRR_BASE_3	
MSR_PRMRR_BASE_3 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A4H, 676	MSR_PRMRR_BASE_4	
MSR_PRMRR_BASE_4 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A5H, 677	MSR_PRMRR_BASE_5	
MSR_PRMRR_BASE_5 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A6H, 678	MSR_PRMRR_BASE_6	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
MSR_PRMRR_BASE_6 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2A7H, 679	MSR_PRMRR_BASE_7	
MSR_PRMRR_BASE_7 (R/W) Processor Reserved Memory Range Register - Physical Base Control Register. See MSR_PRMRR_BASE_1 (2A1H) for reference; similar format.		Core
Register Address: 2B8H, 696	MSR_COPY_SBFT_HASHES	
MSR_COPY_SBFT_HASHES (W/O)		Module
63:0	SBFT_PROGRAM_SOURCE_ADDR EDX:EAX contains the linear address base of the SBFT Binary loaded into memory.	
Register Address: 2B9H, 697	MSR_SBFT_HASHES_STATUS	
MSR_COPY_SBFT_HASHES (R/O)		Core
15:0	CHUNK_SIZE EAX[15:0] - Chunk size of the test in KB.	
31:16	TOTAL_NUM_CHUNKS EAX[31:16] - Total number of chunks.	
39:32	ERROR_CODE - EDX[7:0] The error code refers to the LP that runs WRMSR(2B8H). 0x0: Reserved. 0x1: Attempt to copy SBFT-hashtes when copy already in progress. 0x2: Secure Memory not set up correctly. 0x3: Scan-Image Header Image_info.ProgramID does not match MSR_INTEGRITY_CAPABILITIES[31:24], or scan-image header Processor-Signature doesn't match F/M/S, or scan-image header Processor-Flags doesn't match PlatformID. 0x4: Reserved. 0x5: Integrity check failed. 0x6: WRMSR(0x2B8) (ACTIVATE_SBAF) Reinstall of SBFT test image attempted when current SBFT test image is in use by other LPs. 0x7: Aborted due to #PF (Page Fault). 0x8: Unable to generate a Random Value.	
48:40	NUM_CHUNKS_IN_STRIDE EDX[16:8] - Number of Chunks in stride. This is the number of chunks that are installed. 0 in this field means that the CPU does not support strides, otherwise, stride value must be >= 1.	
50:49	Reserved. EDX[18:17] - Set to all zeros.	
62:51	MAX_CORE_LIMIT EDX[30:19] - Maximum Number of Cores that can run SBFTAFSBAF simultaneously -1. 0 means 1 core at a time.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
63	Valid. EDX[31] - Valid bit is set when COPY_SBFT_HASHES completed successfully.	
Register Address: 2BAH, 698	MSR_AUTHENTICATE_AND_COPY_SBFT_CHUNK	
MSR_AUTHENTICATE_AND_COPY_SBFT_CHUNK (w/o)		Core
63:0	BASE_CHUNK_TABLE_ADDR EDX:EAX[63:0] - Linear Address pointing to the CHUNK TABLE (TABLE_BASE).	
Register Address: 2BBH, 699	MSR_SBFT_CHUNKS_AUTHENTICATION_STATUS	
MSR_SBFT_CHUNKS_AUTHENTICATION_STATUS (R/O)		Core
15:0	NUM_VALID_CHUNKS EAX[15:0] - Total number of Valid (authenticated) chunks.	
31:16	NUM_CHUNKS_IN_STRIDE EAX[31:16] - Number of Chunks in Stride.	
39:32	ERROR_CODE EDX[7:0] 0x0 - No error reported. 0x1 - Attempt to authenticate a CHUNK already marked as authentic or is currently being installed by another core. 0x2 - CHUNK authentication error. HASH of chunk did not match expected value. 0x3 - Aborted due to #PF. 0x4 - Chunk Outside the current Stride. 0x5 - Interrupted.	
47:40	Reserved. EDX[15:8] - Set to all zeros.	
63:48	CURRENT_MAX_BUNDLE_INDX EDX[31:16] - Maximum Bundle Index in current stride.	
Register Address: 2BCH, 700	MSR_ACTIVATE_SBFT	
MSR_ACTIVATE_SBFT (w/o)		Core
13:0	SBFT_BUNDLE_INDEX EAX[13:0] - Indicates SBFT Bundle Index to start from.	
15:14	SBFT_PRGM_INDEX EAX[15:14] - Indicates what SBFT Program index to run.	
31:16	Reserved. Set to all zeros.	
62:32	THREAD_WAIT_DELAY EDX[30:0] - TSC-based delay to allow threads to rendezvous.	
63	Reserved. EDX[31] - Must be set to 0. #GP fault otherwise.	
Register Address: 2BDH, 701	MSR_SBFT_STATUS	
MSR_SBFT_STATUS (R/O)		Core

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
13:0	SBFT_BUNDLE_INDEX EAX[13:0] - SBFT Bundle that was executed.	
15:14	SBFT_PGM_INDEX EAX[15:14] - Indicates what SBFT Program index that was last ran. Maps to same field in WRMSR(ACTIVATE_SBFT). On a test pass this field will be 2'b00.	
31:16	Reserved. EAX[31:16] - Return all zeros.	
39:32	ERROR_CODE EDX[7:0] 0x0 - No Error. 0x1 - SBFT operation did not start. Other thread could not join. 0x2 - SBFT operation did not start. Interrupt occurred prior to SBFT coordination. 0x3 - Reserved. 0x4 - SBFT operation did not start. Non-valid SBFT BUNDLES in the SBFT_BUNDLE_INDEX. 0x5 - SBFT operation did not start. Mismatch in arguments between threads T0/T1. 0x6 - SBFT operation did not start. Core is not capable of performing SBFT currently. 0x7 - Reserved. 0x8 - SBFT operation did not start. Exceeded number of Logical Processors (LP) allowed to run SBFT-At-Field concurrently. 0x9 - SBFT operation did not start. Interrupt occurred or timer about to expire. 0xA - SBFT operation did not start. SBFT_PGM_INDEX is not valid. 0xB - SBFT operation aborted due to corrupted chunk. 0xC - SBFT operation did not start. TAP Data error. 0xD - SBFT operation did not start. SBFT program is not valid. All other error codes are reserved.	
60:40	Reserved. EDX[28:8] - Return all zeros.	
61	TEST_FAIL EDX[29:29] - Architectural Signature failed. Last thread executed HLT and completed SBFT and EBX != 0xACED.	
63:62	SBFT_STATUS EDX[31:30] - SBFT status (result of running SBAF). 00 - PASS. 10 - INTERRUPTED. 01 - FAILED SIGNATURE CHECK. 11 - FAILED.	
Register Address: 2BEH, 702	MSR_SBFT_MODULE_ID	
MSR_SBFT_MODULE_ID (R/O)		Module
31:0	SBFT-AT-FIELD_REVID EAX[31:0] - Maps to Revision field in external header (offset 4).	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
40:32	CURRENT_STRIDE_INDEX EDX[8:0] - Stride Index.	
63:41	Reserved. EDX[31:9] - Return all zeros.	
Register Address: 2BFH, 703	MSR_SBFTAF_LAST_WP	
MSR_SBFTAF_LAST_WP (R/O)		Module
31:0	LAST_WP EAX[31:0] - Provides information about the core when the last WRMSR(ACTIVATE_SBFT) was executed. Available only if enumerated in INTEGRITY_CAPABILITIES[10:9].	
39:32	Reserved.	
63:40	Reserved. EDX[31:8] - Return all zeros.	
Register Address: 2C2H, 706	MSR_COPY_SCAN_HASHES	
MSR_COPY_SCAN_HASHES (W/O)		Module
63:0	SCAN_HASH-ADDR EDX:EAX contains the linear address of the SCAN Test HASH Binary loaded into memory	
Register Address: 2C3H, 707	MSR_SCAN_HASHES_STATUS	
MSR_SCAN_HASHES_STATUS (R/O)		Core
15:0	CHUNK_SIZE EAX[15:0] - Chunk size of the test in KB.	
31:16	TOTAL_NUM_CHUNKS EAX[31:16] - Total number of chunks.	
39:32	ERROR_CODE EDX[7:0] - The error code refers to the LP that runs WRMSR(2C2H). ▪ 0x0 - Reserved. ▪ 0x1 - Attempt to copy scan-hashes when copy already in progress. ▪ 0x2 - Secure Memory not set up correctly. ▪ 0x3 - Scan-Image Header Image_info.ProgramID does not match MSR_INTEGRITY_CAPABILITIES[31:24], or scan-image header Processor-Signature doesn't match F/M/S, or scan-image header Processor-Flags doesn't match PlatformID. ▪ 0x4 - Reserved. ▪ 0x5 - Integrity check failed. ▪ 0x6 - WRMSR(0x2C6) Re-install of scan test image attempted when current scan test image is in use by other LPs. ▪ 0x7 - Aborted due to #PF (Page Fault). ▪ 0x8 - Unable to generate a Random Value.	
48:40	NUM_CHUNKS_IN_STRIDE EDX[16:8] - Number of Chunks in stride. This is the number of chunks that are installed. 0 in this field means that the CPU does not support strides, otherwise, the stride value must be >= 1.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
50:49	Reserved. EDX[18:17] - Set to all zeros.	
62:51	NAME EDX[30:19] - Maximum Number of cores that can run Intel® In-field Scan simultaneously minus 1. 0 means 1 core at a time.	
63	VALID EDX[31] - Valid bit is set when COPY_SCAN_HASHES completed.	
Register Address: 2C4H, 708	MSR_AUTHENTICATE_AND_COPY_CHUNK	
MSR_AUTHENTICATE_AND_COPY_CHUNK (R/O)		Core
63:0	BASE_CHUNK_TABLE_ADDR EDX:EAX[63:0] - Linear Address pointing to the CHUNK TABLE (TABLE_BASE).	
Register Address: 2C5H, 709	MSR_CHUNKS_AUTHENTICATION_STATUS	
MSR_CHUNKS_AUTHENTICATION_STATUS (R/O)		Core
15:0	VALID_CHUNKS EAX[15:0] - Total number of Valid (authenticated) chunks.	
31:16	NUM_CHUNKS_IN_STRIDE EAX[31:16] - Number of Chunks in Stride.	
39:32	ERROR_CODE EDX[7:0] ▪ 0x0 - No-error reported. ▪ 0x1 - Attempt to authenticate a CHUNK which is already marked as authentic or is currently being installed by another core. ▪ 0x2 - CHUNK authentication error. HASH of chunk did not match expected value. ▪ 0x3 - Aborted due to #PF (Page Fault). ▪ 0x4 - Chunk Outside the current Stride.	
63:40	Reserved. EDX[31:8] - Set to all zeros.	
Register Address: 2C6H, 710	MSR_ACTIVATE_SCAN	
MSR_ACTIVATE_SCAN (W/O)		Core
15:0	CHUNK_START_INDEX EAX[15:0] - Indicates Chunk Index from which to start.	
31:16	CHUNK_STOP_INDEX EAX[31:16] - Indicates what chunk index to stop at (inclusive).	
62:32	THREAD_WAIT_DELAY EDX[30:0] - TSC based delay to allow threads to rendezvous.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
63	SIGNAL_MCE EDX[31] - If 1: On scan-error log MC in MC4_STATUS and signal MCE if machine check signaling enabled in MC4_CTL[0]. - If 0: Don't no-logging/no-signaling.	
Register Address: 2C7H, 711	MSR_SCAN_STATUS	
MSR_SCAN_STATUS (R/O)		Core
15:0	CHUNK_NUM EAX[15:0] - SCAN Chunk that was reached.	
31:16	CHUNK_STOP_INDEX EAX[31:16] - Indicates what chunk index to stop at (inclusive). - Maps to same field in WRMSR(ACTIVATE_SCAN).	
39:32	ERROR_CODE EDX[7:0] 0x0 - No Error. 0x1 - SCAN operation did not start. Other thread could not join. 0x2 - SCAN operation did not start. Interrupt occurred prior to SCAN coordination. 0x3 - SCAN operation did not start. Power Management conditions are inadequate to run SAF. 0x4 - SCAN operation did not start. Non valid chunks in the range CHUNK_STOP_INDEX : CHUNK_START_INDEX. 0x5 - SCAN operation did not start. Mismatch in arguments between threads T0/T1. 0x6 - SCAN operation did not start. Core not capable of performing SCAN currently. 0x7 - Debug Mode. Scan-At-Field results not to be trusted. 0x8 - SCAN operation did not start. Exceeded number of Logical Processors (LP) allowed to run Scan-At-Field concurrently. MAX_CORE_LIMIT exceeded. 0x9 - Interrupt occurred. Scan operation aborted prematurely, not all chunks requested have been executed. 0xB - Scan operation aborted due to corrupted chunk. 0xC - Scan operation did not start. All other error codes are reserved.	
61:40	Reserved. EDX[29:8] - Return all zeros.	
62	SCAN_CONTROL_ERROR EDX[30] - SCAN error in the Scan-At-Field controller. - Non ECC error.	
63	SCAN_SIGNATURE_ERROR EDX[31] - SCAN SIGNATURE error in the SCAN pattern fetched from main memory. - Non ECC error.	
Register Address: 2C8H, 712	MSR_SCAN_MODULE_ID	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
MSR_SCAN_MODULE_ID (R/O)		Module
31:0	SCAN-AT-FIELD_REVID EAX[31:0] - Maps to Revision field in external header (offset 4).	
40:32	CURRENT_STRIDE_INDEX EDX[8:0] - Stride Index.	
63:41	Reserved. EDX[31:9] - Return all zeros.	
Register Address: 2C9H, 713		
MSR_LAST_SAF_WP		
MSR_LAST_SAF_WP (R/O)		Module
31:0	LAST_WP EAX[31:0] - Provides information about the core when the last WRMSR(ACTIVATE_SCAN) was executed. - Available only if enumerated in INTEGRITY_CAPABILITIES[10:9].	
39:32	Reserved. EDX[7:0]	
63:40	Reserved. EDX[31:8] - Return all zeros.	
Register Address: 2D9H, 729		
MSR_INTEGRITY_CAPABILITIES		
MSR_INTEGRITY_CAPABILITIES (R/O) Enumerates features supported in Functional Safety.		Thread
0	STARTUP_SCAN_BIST When set to 1, processor supports Startup SCAN BIST.	
1	STARTUP_MEM_BIST When set to 1, processor supports Startup MEM BIST.	
2	PERIODIC_MEM_BIST When set to 1, processor supports Periodic MEM BIST.	
3	LOCKSTEP When set to 1, processor supports Lock Step Mode.	
4	PERIODIC_SCAN_BIST When set to 1, processor supports Periodic SCAN BIST.	
5	PLL_LOSS_DETECT When set to 1, processor supports PLL LOSS detection.	
6	PWR_LOSS_DETECT When set to 1, processor supports Power Loss detection.	
7	PERRINJ When set to 1, processor supports FUSA PERRINJ.	
8	SBFT_AT_FIELD When set to 1, processor supports SBFT-At-Field.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
10:9	SAF_GEN_REV 00 = REV1; 01 = REV2; 10 = REV3; 11 = REV4.	
14:11	Reserved.	
15	PRESERVE_MEMORY_NEEDED When set to 1, processor supports FUSARR_BASE/MASK MSRs.	
20:16	TID_BIT_SHIFT Number of bits to shift right on x2APICID to get a unique topology ID of all logical processors that share a scan test engine.	
21	ALL_LP_JOIN_NEEDED All logical processors that share scan test engine need to be tested together and must join using MSR_ACTIVATE_SCAN.	
23:22	Reserved.	
31:24	PATTERN_ID Processor scan pattern ID. ID of the startup and periodic scan programs supported for this part.	
63:32	Reserved.	
Register Address: 30CH, 780	IA32_FIXED_CTR3	
Fixed-Function Performance Counter 3 (R/W) See Table 2-2.		Thread
Register Address: 4D0H, 1232	IA32_MCG_EXT_CTL	
IA32_MCG_EXT_CTL (R/W) See Table 2-2.		Thread
Register Address: 4F0H, 1264	MSR_SAF_CTRL	
MSR_SAF_CTRL (W/O)		Core
0	INVALIDATE_CURRENT_STRIDE EAX[0] - Write of 1 invalidates the currently installed stride. - Clears only the VALID_CHUNKS field on a RDMSR(CHUNKS_AUTHENTICATION_STATUS).	
63:1	Reserved.	
Register Address: 4F8H, 1272	MSR_SBFT_CTRL	
MSR_SBFT_CTRL (W/O)		Module
0	INVALIDATE_CURRENT_STRIDE EAX[0] - Write of 1 invalidates the currently installed stride.	
63:1	Reserved. EDX[31:0], EAX[31:1]	
Register Address: 540H, 1344	MSR_THREAD_UARCH_CTL	
Thread Microarchitectural Control (R/W)		Thread

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
0	WB_MEM_STRM_LD_DISABLE Disable streaming behavior for MOVNTDQA loads to WB memory type. If set, these accesses will be treated like regular cacheable loads (Data will be cached).	
63:1	Reserved.	
Register Address: 541H, 1345	MSR_CORE_UARCH_CTL	
Core Microarchitecture Control MSR (R/W)		Core
0	SCRUB_DIS L1 scrubbing disable.	
63:1	Reserved.	
Register Address: 664H, 1636	MSR_MC6_RESIDENCY	
MSR_MC6_RESIDENCY (R/O) Time spent in the Module C6-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).		Module
63:0	RESIDENCY Time that this module is in module-specific C6 states since last reset.	
Register Address: 6E1H, 1761	IA32_PKRS	
IA32_PKRS (R/W) Specifies the PK permissions associated with each protection domain for supervisor pages. See Table 2-2.		Thread
Register Address: 7A3H, 1955	IA32_MCU_EXT_SERVICE	
MCU Extended Service MSR (R/O) If IA32_ARCH_CAPABILITIES[22] = 1. See Table 2-2.		Module
Register Address: 7A4H, 1956	IA32_MCU_ROLLBACK_MIN_ID	
Minimal MCU Revision ID for Rollback (R/O) See Table 2-2.		Module
Register Address: 7BOH, 1968	IA32_ROLLBACK_SIGN_ID_0	
Rollback ID 0 (R/O) See Table 2-2.		Module
Register Address: 7B1H, 1969	IA32_ROLLBACK_SIGN_ID_1	
Rollback ID 1 (R/O) See Table 2-2.		Module
Register Address: 7B2H, 1970	IA32_ROLLBACK_SIGN_ID_2	
Rollback ID 2 (R/O) See Table 2-2.		Module
Register Address: 7B3H, 1971	IA32_ROLLBACK_SIGN_ID_3	
Rollback ID 3 (R/O) See Table 2-2.		Module
Register Address: 7B4H, 1972	IA32_ROLLBACK_SIGN_ID_4	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Rollback ID 4 (R/O) See Table 2-2.		Module
Register Address: 7B5H, 1973	IA32_ROLLBACK_SIGN_ID_5	
Rollback ID 5 (R/O) See Table 2-2.		Module
Register Address: 7B6H, 1974	IA32_ROLLBACK_SIGN_ID_6	
Rollback ID 6 (R/O) See Table 2-2.		Module
Register Address: 7B7H, 1975	IA32_ROLLBACK_SIGN_ID_7	
Rollback ID 7 (R/O) See Table 2-2.		Module
Register Address: 7B8H, 1976	IA32_ROLLBACK_SIGN_ID_8	
Rollback ID 8 (R/O) See Table 2-2.		Module
Register Address: 7B9H, 1977	IA32_ROLLBACK_SIGN_ID_9	
Rollback ID 9 (R/O) See Table 2-2.		Module
Register Address: 7BAH, 1978	IA32_ROLLBACK_SIGN_ID_10	
Rollback ID 10 (R/O) See Table 2-2.		Module
Register Address: 7BBH, 1979	IA32_ROLLBACK_SIGN_ID_11	
Rollback ID 11 (R/O) See Table 2-2.		Module
Register Address: 7BCH, 1980	IA32_ROLLBACK_SIGN_ID_12	
Rollback ID 12 (R/O) See Table 2-2.		Module
Register Address: 7BDH, 1981	IA32_ROLLBACK_SIGN_ID_13	
Rollback ID 13 (R/O) See Table 2-2.		Module
Register Address: 7BEH, 1982	IA32_ROLLBACK_SIGN_ID_14	
Rollback ID 14 (R/O) See Table 2-2.		Module
Register Address: 7BFH, 1983	IA32_ROLLBACK_SIGN_ID_15	
Rollback ID 15 (R/O) See Table 2-2.		Module
Register Address: 981H, 2433	IA32_TME_CAPABILITY	
IA32_TME_CAPABILITY (R/O) See Table 2-2.		Package
Register Address: 982H, 2434	IA32_TME_ACTIVATE	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
IA32_TME_ACTIVATE (R/W) See Table 2-2.		Package
Register Address: 983H, 2435	IA32_TME_EXCLUDE_MASK	
Intel TME Exclude Mask (R/W) See Table 2-2.		Package
Register Address: 984H, 2436	IA32_TME_EXCLUDE_BASE	
Intel TME Exclude Base (R/W) See Table 2-2.		Package
Register Address: 985H, 2437	IA32_UINTR_RR	
User Interrupt Request Register (R/W) See Table 2-2.		Thread
Register Address: 986H, 2438	IA32_UINTR_HANDLER	
User Interrupt Handler Address (R/W) See Table 2-2.		Thread
Register Address: 987H, 2439	IA32_UINTR_STACKADJUST	
User Interrupt Stack Adjustment (R/W) See Table 2-2.		Thread
Register Address: 988H, 2440	IA32_UINTR_NV	
User-Interrupt Size and Notification Vector (R/W) See Table 2-2.		Thread
Register Address: 989H, 2441	IA32_UINTR_PD	
User Interrupt PID Address (R/W) See Table 2-2.		Thread
Register Address: 98AH, 2442	IA32_UINTR_TT	
User-Interrupt Target Table (R/W) See Table 2-2.		Thread
Register Address: 990H, 2448	IA32_COPY_STATUS	
IA32_COPY_STATUS (R/O) See Table 2-2.		Thread
Register Address: 991H, 2449	IA32_IWKEYBACKUP_STATUS	
IA32_IWKEYBACKUP_STATUS (R/O) See Table 2-2.		Package
Register Address: 9FBH, 2555	IA32_TME_CLEAR_SAVED_KEY	
IA32_TME_CLEAR_SAVED_KEY (R/W) See Table 2-2.		Package
Register Address: 9FFH, 2559	MSR_CORE_MKTME_ACTIVATE	
MSR to read TME_ACTIVATE[MK_TME_KEYID_BITS] (R/O)		Core
31:0	Reserved.	

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
35:32	READ_MK_TME_KEYID_BITS This value will be returned on a RDMSR, but must be zero on a WRMSR.	
39:36	TDX_RESERVED_KEYID_BITS (read only) The number of key identifier bits allocated to TDX usage. This is a read-only field. #GP on a non-zero write.	
63:40	Reserved.	
Register Address: C84H, 3204	MSR_MBA_CFG	
Memory Bandwidth Allocation (MBA) Configuration (R/W)		Package
1:0	Reserved.	
2	RAMBAE Resource Aware MBA Enable.	
63:3	Reserved.	
Register Address: CA0H, 3232	MSR_RMID_SNC_CONFIG	
RMID_SNC_CONFIG (R/W)		Package
0	RMID_LOCALIZED_DISTRIBUTION_MODE_ENABLE If set, Localized RMID distribution mode is enabled. If Clear, RMID Sharing mode is enabled.	
63:1	Reserved.	
Register Address: D50H, 3408	IA32_L2_QOS_EXT_BW_THRTL_0	
Memory Bandwidth Enforcement for COS0 (R/W) See Table 2-2.		Package
Register Address: D51H, 3409	IA32_L2_QOS_EXT_BW_THRTL_1	
Memory Bandwidth Enforcement for COS1 (R/W) See Table 2-2.		Package
Register Address: D52H, 3410	IA32_L2_QOS_EXT_BW_THRTL_2	
Memory Bandwidth Enforcement for COS2 (R/W) See Table 2-2.		Package
Register Address: D53H, 3411	IA32_L2_QOS_EXT_BW_THRTL_3	
Memory Bandwidth Enforcement for COS3 (R/W) See Table 2-2.		Package
Register Address: D54H, 3412	IA32_L2_QOS_EXT_BW_THRTL_4	
Memory Bandwidth Enforcement for COS4 (R/W) See Table 2-2.		Package
Register Address: D55H, 3413	IA32_L2_QOS_EXT_BW_THRTL_5	
Memory Bandwidth Enforcement for COS5 (R/W) See Table 2-2.		Package
Register Address: D56H, 3414	IA32_L2_QOS_EXT_BW_THRTL_6	
Memory Bandwidth Enforcement for COS6 (R/W) See Table 2-2.		Package

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: D57H, 3415	IA32_L2_QOS_EXT_BW_THRTL_7	
Memory Bandwidth Enforcement for COS7 (R/W) See Table 2-2.		Package
Register Address: D58H, 3416	IA32_L2_QOS_EXT_BW_THRTL_8	
Memory Bandwidth Enforcement for COS8 (R/W) See Table 2-2.		Package
Register Address: D59H, 3417	IA32_L2_QOS_EXT_BW_THRTL_9	
Memory Bandwidth Enforcement for COS9 (R/W) See Table 2-2.		Package
Register Address: D5AH, 3418	IA32_L2_QOS_EXT_BW_THRTL_10	
Memory Bandwidth Enforcement for COS10 (R/W) See Table 2-2.		Package
Register Address: D5BH, 3419	IA32_L2_QOS_EXT_BW_THRTL_11	
Memory Bandwidth Enforcement for COS11 (R/W) See Table 2-2.		Package
Register Address: D5CH, 3420	IA32_L2_QOS_EXT_BW_THRTL_12	
Memory Bandwidth Enforcement for COS12 (R/W) See Table 2-2.		Package
Register Address: D5DH, 3421	IA32_L2_QOS_EXT_BW_THRTL_13	
Memory Bandwidth Enforcement for COS13 (R/W) See Table 2-2.		Package
Register Address: D5EH, 3422	IA32_L2_QOS_EXT_BW_THRTL_14	
Memory Bandwidth Enforcement for COS14 (R/W) See Table 2-2.		Package
Register Address: D91H, 3473	IA32_COPY_LOCAL_TO_PLATFORM	
See Table 2-2.		Thread
Register Address: D92H, 3474	IA32_COPY_PLATFORM_TO_LOCAL	
See Table 2-2.		Thread
Register Address: D93H, 3475	IA32_PASID	
See Table 2-2.		Thread
Register Address: 1400H, 5120	IA32_SEAMRR_BASE	
SEAM Memory Range Register for TDx - Base Address (R/W) See Table 2-2.		Core
Register Address: 1401H, 5121	IA32_SEAMRR_MASK	
SEAM Memory Range Register for TDX (R/W) See Table 2-2.		Core
Register Address: 1A8FH, 6799	MSR_STLB_QOS_INFO	
STLB_QOS_INFO (R/O) STLB QoS MASK configuration.		Core

Table 2-56. Additional MSRs Supported by the Intel® Xeon® 6 P-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
5:0	NCLOS Number of CLOS supported for STLB resource using minus-1 notation.	
15:6	Reserved.	
19:16	4K_2M_CBM Length of capacity bitmask for 4K and 2M pages using minus-1 notation.	
28:20	Reserved.	
29	STLB_FILL_TRANSLATION_MSR_SUPPORTED MSR interface to fill STLB translations supported.	
30	4K_2M_ALIAS Indicates that 4K/2M pages alias into the same structure.	
63:31	Reserved.	
Register Address: 1B01H, 6913	IA32_UARCH_MISC_CTL	
IA32_UARCH_MISC_CTL (R/W) See Table 2-2.		Thread

2.17.11 MSRs Introduced in the Intel® Xeon® 6 E-Core Processors

Table 2-57 lists additional MSRs for the Intel Xeon 6 E-core processors. Intel Xeon 6 E-core processors have a CPUID Signature DisplayFamily_DisplayModel value of 06_AFH.

For an MSR listed in Table 2-57 that also appears in the model-specific tables of prior generations, Table 2-57 supersedes prior generation tables.

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 2FH, 47	IA32_BARRIER	
BARRIER (R/O) The IA32_BARRIER MSR ensures ordered execution by acting like LFENCE, controlling the sequencing of subsequent MSR reads after prior MSR reads and instructions. See Table 2-2.		Core
Register Address: 33H, 51	MSR_MEMORY_CONTROL	
Memory Control (R/W) Disables split locks, which are locked instructions that split a cache line.		Core
26:0	Reserved.	
27	UC_STORE_THROTTLE If set to 1, when enabled, the processor allows one in-progress, post-retirement UC stores at a time.	
28	UC_LOCK_DISABLE If set to 1, a UC load lock will trigger a fault. If clear to 0, UC load locks proceed normally.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
29	SPLIT_LOCK_DISABLE If set to 1, a split lock will trigger an #AC fault. If clear to 0, split locks proceed normally.	
63:30	Reserved.	
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/W)		Thread
31:0	SMI_COUNT Running count of SMI events since the last reset.	
63:32	Reserved.	
Register Address: 39H, 57	MSR_SOCKET_ID	
Socket ID (R/W) Reassigns the package-specific portions of the APIC ID. This MSR is used on scalable DP and high-end MP platforms to resolve legacy-mode APIC ID conflicts.		Package
10:0	PACKAGE_ID Holds package ID. This reflects the upper bits of the APIC ID.	
63:11	Reserved.	
Register Address: 7BH, 123	IA32_MCU_ENUMERATION	
Enumeration of Architectural Features (R/O) See Table 2-2.		Package
Register Address: 7CH, 124	IA32_MCU_STATUS	
MCU Status (R/O) Communicates results from the previous patch loads. See Table 2-2.		Package
Register Address: 87H, 135	IA32_MKTME_KEYID_PARTITIONING	
MKTME KEY ID Partitioning (R/O) Enumerates the number of activated KeyIDs for Intel TME-MK and Intel TDX. See Table 2-2.		Package
Register Address: 98H, 152	MSR_SEAM_WBINVDP	
SEAM WBINVDP (R/W) Allows software to WBINVD sections of the LLC.		Thread
63:0	HANDLE Caches sub-block to invalidate.	
Register Address: 99H, 153	MSR_SEAM_WBNINVD	
SEAM WBNINVD (R/W) Allows software to WBNINVD sections of the LLC.		Thread
63:0	HANDLE Caches sub-block to invalidate.	
Register Address: 9AH, 154	MSR_SEAM_INTR_PENDING	
SEAM Interrupt Pending (R/O) Report out some event pending bits.		Thread
0	INTR Interrupt is pending.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
1	NMI NMI is pending.	
2	SMI SMI is pending.	
4:3	OTHER_EVENTS Other events pending.	
63:5	Reserved.	
Register Address: 9BH, 155	IA32_SMM_MONITOR_CTL	
SMM Monitor Control (R/W) The SMM Monitor Configuration involves SMM code specifying the MSEG location and enabling dual-monitor treatment by writing to the corresponding MSR. See Table 2-2.		Thread
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information (R/O) Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
15:8	MAX_NON_TURBO_LIM_RATIO This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	
25:16	Reserved.	
26	DCU_16K_MODE_AVAIL 0b: Indicates that the part does not support the 16K DCU mode. 1b: Indicates that the part supports 16K DCU mode.	
27	Reserved.	
28	PRG_TURBO_RATIO_EN Programmable Turbo Ratios per number of Active Cores. 0 = Programming Not Allowed. 1 = Programming Allowed.	
34:29	Reserved.	
35	BIOS_GUARD_ENABLE Indicates whether the BIOS Guard feature is enabled in the CPU.	
36	PEG2DMIDIS_EN 0 = PEG2DMIDIS is disabled. 1 = PEG2DMIDIS is enabled.	
39:37	Reserved.	
47:40	MAX_EFFICIENCY_RATIO Maximum Efficiency Ratio. This is given in units of 100 MHz.	
58:48	Reserved.	
59	SMM_SUPOVR_STATE_LOCK_ENABLE When set, indicates that the CPU supports MSR SMM_SUPOVR_STATE_LOCK and the Hardware Shield feature.	
63:60	Reserved.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: CFH, 207	IA32_CORE_CAPABILITIES	
IA32 Core Capabilities Register (R/W) If CPUID.07H.00H:EDX[30] = 1. This MSR provides an architectural enumeration function for model-specific behavior.		Core
0	STLB_QOS When set to 1, processor supports STLB QoS.	
1	Reserved.	
2	INTEGRITY_SUPPORTED When set to 1, processor supports Functional Safety. Specific FUSA capabilities are enumerated in MSR_FUSA_CAPABILITIES.	
3	RSM_IN_CPLO_ONLY Intel System Resources Defense: When set to 1, RSM will only be allowed in CPLO and will #GP for all non-CPLO privilege levels.	
4	UC_LOCK_DISABLE When set to 1, processor supports UC load lock disable.	
5	SPLIT_LOCK_DISABLE When set to 1, processor supports #AC on split locks.	
6	SNP_FILTER_QOS When set to 1, processor supports Snoop Filter Quality of Service MSRs.	
7	UC_STORE_THROTTLING When set to 1, processor supports UC store throttling through MSR_MEMORY_CTRL[UC_STORE_THROTTLE].	
63:8	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF	
Actual Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: FEH, 254	IA32_MTRRCAP	
Memory Type Range Register (R/O) See Table 2-2.		Core
Register Address: 140H, 320	MSR_FEATURE_ENABLES	
Miscellaneous Enables for Thread-Specific Features (R/W)		Thread
0	AESNI_LOCK Once this bit is set, writes to this register will not be allowed.	
63:1	Reserved.	
Register Address: 1BOH, 432	IA32_ENERGY_PERF_BIAS	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
IA32_ENERGY_PERF_BIAS (R/W) See Table 2-2.		Thread
Register Address: 1B1H, 433	IA32_PACKAGE_THERM_STATUS	
IA32_PACKAGE_THERM_STATUS See Table 2-2.		Package
Register Address: 1B2H, 434	IA32_PACKAGE_THERM_INTERRUPT	
IA32_PACKAGE_THERM_INTERRUPT (R/W) See Table 2-2.		Package
Register Address: 2A1H, 673	MSR_PRMRR_BASE_1	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE Memory Type for PRMRR accesses.	
3	CONFIGURED PRMRR base configured.	
11:4	Reserved.	
51:12	BASE PRMRR Base address.	
63:52	Reserved.	
Register Address: 2A2H, 674	MSR_PRMRR_BASE_2	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE Memory Type for PRMRR accesses.	
3	CONFIGURED PRMRR base configured.	
11:4	Reserved.	
51:12	BASE PRMRR Base address.	
63:52	Reserved.	
Register Address: 2A3H, 675	MSR_PRMRR_BASE_3	
Processor Reserved Memory Range Register - Physical Base Control Register (R/W)		Core
2:0	MEMTYPE Memory Type for PRMRR accesses.	
3	CONFIGURED PRMRR base configured.	
11:4	Reserved.	
51:12	BASE PRMRR Base address.	
63:52	Reserved.	
Register Address: 2C2H, 706	MSR_COPY_SCAN_HASHES	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
MSR_COPY_SCAN_HASHES (W/O)		Module
63:0	SCAN_HASH-ADDR EDX:EAX contains the linear address of the SCAN Test HASH Binary loaded into memory	
Register Address: 2C3H, 707		MSR_SCAN_HASHES_STATUS
MSR_SCAN_HASHES_STATUS (R/O)		Core
15:0	CHUNK_SIZE EAX[15:0] - Chunk size of the test in KB.	
31:16	TOTAL_NUM_CHUNKS EAX[31:16] - Total number of chunks.	
39:32	ERROR_CODE EDX[7:0] - The error code refers to the LP that runs WRMSR(2C2H). 0x0 - Reserved. 0x1 - Attempt to copy scan-hashees when copy already in progress. 0x2 - Secure Memory not set up correctly. 0x3 - Scan-Image Header Image_info.ProgramID does not match MSR_INTEGRITY_CAPABILITIES[31:24], or scan-image header Processor-Signature doesn't match F/M/S, or scan-image header Processor-Flags doesn't match PlatformID. 0x4 - Reserved. 0x5 - Integrity check failed. 0x6 - WRMSR(0x2C6) Re-install of scan test image attempted when current scan test image is in use by other LPs. 0x7 - Aborted due to #PF (Page Fault). 0x8 - Unable to generate a Random Value.	
48:40	NUM_CHUNKS_IN_STRIDE EDX[16:8] - Number of Chunks in stride. This is the number of chunks that are installed. 0 in this field means that the CPU does not support strides, otherwise, the stride value must be >= 1	
50:49	Reserved. EDX[18:17] - Set to all zeros.	
62:51	NAME EDX[30:19] - Maximum Number of cores that can run Intel® In-field Scan simultaneously minus 1. 0 means 1 core at a time.	
63	VALID EDX[31] - Valid bit is set when COPY_SCAN_HASHES completed.	
Register Address: 2C4H, 708		MSR_AUTHENTICATE_AND_COPY_CHUNK
MSR_AUTHENTICATE_AND_COPY_CHUNK(R/O)		Core
63:0	BASE_CHUNK_TABLE_ADDR EDX:EAX[63:0] - Linear Address pointing to the CHUNK TABLE (TABLE_BASE).	
Register Address: 2C5H, 709		MSR_CHUNKS_AUTHENTICATION_STATUS

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
MSR_CHUNKS_AUTHENTICATION_STATUS (R/O)		Core
15:0	VALID_CHUNKS EAX[15:0] - Total number of Valid (authenticated) chunks.	
31:16	NUM_CHUNKS_IN_STRIDE EAX[31:16] - Number of Chunks in Stride.	
39:32	ERROR_CODE EDX[7:0] ▪ 0x0 - No-error reported. ▪ 0x1 - Attempt to authenticate a CHUNK which is already marked as authentic or is currently being installed by another core. ▪ 0x2 - CHUNK authentication error. HASH of chunk did not match expected value. ▪ 0x3 - Aborted due to #PF (Page Fault). ▪ 0x4 - Chunk Outside the current Stride.	
63:40	Reserved. EDX[31:8] - Set to all zeros.	
Register Address: 2C6H, 710	MSR_ACTIVATE_SCAN	
MSR_ACTIVATE_SCAN (W/O)		Core
15:0	CHUNK_START_INDEX EAX[15:0] - Indicates Chunk Index from which to start.	
31:16	CHUNK_STOP_INDEX EAX[31:16] - Indicates what chunk index to stop at (inclusive).	
62:32	THREAD_WAIT_DELAY EDX[30:0] - TSC based delay to allow threads to rendezvous.	
63	SIGNAL_MCE EDX[31] ▪ If 1: On scan-error log MC in MC4_STATUS and signal MCE if machine check signaling enabled in MC4_CTL[0]. ▪ If 0: Don't no-logging/no-signaling.	
Register Address: 2C7H, 711	MSR_SCAN_STATUS	
MSR_SCAN_STATUS (R/O)		Core
15:0	CHUNK_NUM EAX[15:0] - SCAN Chunk that was reached.	
31:16	CHUNK_STOP_INDEX EAX[31:16] ▪ Indicates what chunk index to stop at (inclusive). ▪ Maps to same field in WRMSR(ACTIVATE_SCAN).	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
39:32	ERROR_CODE EDX[7:0] 0x0 - No Error. 0x1 - SCAN operation did not start. Other thread could not join. 0x2 - SCAN operation did not start. Interrupt occurred prior to SCAN coordination. 0x3 - SCAN operation did not start. Power Management conditions are inadequate to run SAF. 0x4 - SCAN operation did not start. Non valid chunks in the range CHUNK_STOP_INDEX : CHUNK_START_INDEX. 0x5 - SCAN operation did not start. Mismatch in arguments between threads T0/T1. 0x6 - SCAN operation did not start. Core not capable of performing SCAN currently. 0x7 - Debug Mode. Scan-At-Field results not to be trusted. 0x8 - SCAN operation did not start. Exceeded number of Logical Processors (LP) allowed to run Scan-At-Field concurrently. MAX_CORE_LIMIT exceeded. 0x9 - Interrupt occurred. Scan operation aborted prematurely, not all chunks requested have been executed. 0xB - Scan operation aborted due to corrupted chunk. 0xC - Scan operation did not start. All other error codes are reserved.	
61:40	Reserved. EDX[29:8] - Return all zeros.	
62	SCAN_CONTROL_ERROR EDX[30] - SCAN error in the Scan-At-Field controller. - Non ECC error.	
63	SCAN_SIGNATURE_ERROR EDX[31] - SCAN SIGNATURE error in the SCAN pattern fetched from main memory. - Non ECC error.	
Register Address: 2C8H, 712	MSR_SCAN_MODULE_ID	
MSR_SCAN_MODULE_ID (R/O)		Module
31:0	SCAN-AT-FIELD_REVID EAX[31:0] - Maps to Revision field in external header (offset 4).	
40:32	CURRENT_STRIDE_INDEX EDX[8:0] - Stride Index.	
63:41	Reserved. EDX[31:9] - Return all zeros.	
Register Address: 2C9H, 713	MSR_LAST_SAF_WP	
MSR_LAST_SAF_WP (R/O)		Module

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
31:0	LAST_WP EAX[31:0] - Provides information about the core when the last WRMSR(ACTIVATE_SCAN) was executed. - Available only if enumerated in INTEGRITY_CAPABILITIES[10:9].	
39:32	Reserved. EDX[7:0]	
63:40	Reserved. EDX[31:8] - Return all zeros.	
Register Address: 2D6H, 726	MSR_TRIGGER_PERIODIC_MEM_BIST	
MSR_TRIGGER_PERIODIC_MEM_BIST (W/O)		Core
0	SIGNAL_MCE EAX[0] - If 1, then signal MCE on fail if machine check signaling enabled in the corresponding MCI_CTL. If 0 then don't signal machine checks.	
7:1	ARRAY_BANK EAX[7:1] - Reserved.	
15:8	TST_STEP_PARAM EAX[15:8] 0: Test All Arrays, or Test Arrays in STEPs of NUM_STEPS.	
31:16	Reserved. EAX[31:16]	
63:32	Reserved. EAX[31:0]	
Register Address: 2D7H, 727	MSR_PERIODIC_MEM_BIST_STATUS	
MSR_PERIODIC_MEM_BIST_STATUS (R/O)		Core
0	MEM_BIST_STATUS 0: PASS. 1: FAIL.	
63:1	Reserved.	
Register Address: 2D9H, 729	MSR_INTEGRITY_CAPABILITIES	
MSR_INTEGRITY_CAPABILITIES (R/O) Enumerates features supported in Functional Safety.		Thread
0	STARTUP_SCAN_BIST When set to 1, processor supports Startup SCAN BIST.	
1	STARTUP_MEM_BIST When set to 1, processor supports Startup MEM BIST.	
2	PERIODIC_MEM_BIST When set to 1, processor supports Periodic MEM BIST.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
3	LOCKSTEP When set to 1, processor supports Lock Step Mode.	
4	PERIODIC_SCAN_BIST When set to 1, processor supports Periodic SCAN BIST.	
5	PLL_LOSS_DETECT When set to 1, processor supports PLL LOSS detection.	
6	PWR_LOSS_DETECT When set to 1, processor supports Power Loss detection.	
7	PERRINJ When set to 1, processor supports FUSA PERRINJ.	
8	SBFT_AT_FIELD When set to 1, processor supports SBFT-At-Field.	
10:9	SAF_GEN_REV 00 = REV1; 01 = REV2; 10 = REV3; 11 = REV4.	
14:11	Reserved.	
15	PRESERVE_MEMORY_NEEDED When set to 1, processor supports FUSARR_BASE/MASK MSRs.	
20:16	TID_BIT_SHIFT Number of bits to shift right on x2APICID to get a unique topology ID of all logical processors that share a scan test engine.	
21	ALL_LP_JOIN_NEEDED All logical processors that share scan test engine need to be tested together and must join using MSR_ACTIVATE_SCAN.	
23:22	Reserved.	
31:24	PATTERN_ID Processor scan pattern ID. ID of the startup and periodic scan programs supported for this part.	
63:32	Reserved.	
Register Address: 2DCH, 732	IA32_INTEGRITY_STATUS	
IA32_INTEGRITY_STATUS (R/O) Provides status information for integrity features. See Table 2-2.		Thread
Register Address: 3F9H, 1017	MSR_PKG_C6_RESIDENCY	
MSR_PKG_C6_RESIDENCY (R/O)		Package
63:0	Package C6 Residency Counter	
Register Address: 3FAH, 1018	MSR_PKG_C7_RESIDENCY	
MSR_PKG_C7_RESIDENCY (R/O)		Package
63:0	Package C7 Residency Counter	
Register Address: 3FCH, 1020	MSR_CORE_C3_RESIDENCY	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
MSR_CORE_C3_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C3 Residency Counter Time spent in the Core C-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).	
Register Address: 3FDH, 1021	MSR_CORE_C6_RESIDENCY	
MSR_CORE_C6_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C6 Residency Counter Time spent in the Core C-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).	
Register Address: 3FEH, 1022	MSR_CORE_C7_RESIDENCY	
MSR_CORE_C7_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Core
63:0	CORE C7 Residency Counter Time spent in the Core C-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).	
Register Address: 4F0H, 1264	MSR_SAF_CTRL	
MSR_SAF_CTRL (W/O)		Core
0	INVALIDATE_CURRENT_STRIDE EAX[0] - Write of 1 invalidates the currently installed stride. - Clears only the VALID_CHUNKS field on a RDMSR(CHUNKS_AUTHENTICATION_STATUS).	
63:1	Reserved.	
Register Address: 664H, 1636	MSR_MC6_RESIDENCY	
MSR_MC6_RESIDENCY (R/O) Time spent in the Module C6-State. Provided in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).		Module
63:0	RESIDENCY Time that this module is in module-specific C6 states since last reset.	
Register Address: 6E0H, 1760	IA32_TSC_DEADLINE	
TSC Target of Local APIC's TSC Deadline Mode (R/W) See Table 2-2.		Thread

CBA Levels Based on COS for Bandwidth Throttling (R/W) See Table 2-2.		Thread
Register Address: 1400H, 5120	IA32_SEAMRR_BASE	
SEAM Memory Range Register for TDX - Base Address (R/W) See Table 2-2.		Core
Register Address: 1401H, 5121	IA32_SEAMRR_MASK	
SEAM Memory Range Register for TDX (R/W) See Table 2-2.		Core
Register Address: 1A8FH, 6799	MSR_STLB_QOS_INFO	
STLB_QOS_INFO (R/O) STLB QoS MASK configuration.		Core
5:0	NCLOS Number of CLOS supported for STLB resource using minus-1 notation.	
15:6	Reserved.	
19:16	4K_2M_CBM Length of capacity bitmask for 4K and 2M pages using minus-1 notation.	
28:20	Reserved.	
29	STLB_FILL_TRANSLATION_MSR_SUPPORTED MSR interface to fill STLB translations supported.	

Table 2-57. Additional MSRs Supported by the Intel® Xeon® 6 E-Core Processors (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
30	4K_2M_ALIAS Indicates that 4K/2M pages alias into the same structure.	
63:31	Reserved.	

2.17.12 MSRs Introduced in the Intel® Series 2 Core™ Ultra Processor Supporting Performance Hybrid Architecture

Table 2-58 lists additional MSRs for the Intel Series 2 Core Ultra processor with a CPUID Signature DisplayFamily_DisplayModel value of 06_BDH. Table 2-59 lists the MSRs unique to the processor P-core. Table 2-60 lists the MSRs unique to the processor E-core.

For an MSR listed in Table 2-58, Table 2-59, or Table 2-60 that also appears in the model-specific tables of prior generations, Table 2-58, Table 2-59, and Table 2-60 supersede prior generation tables.

Table 2-58. Additional MSRs Supported by the Intel® Series 2 Core™ Ultra Processors Supporting Performance Hybrid Architecture

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Thread
Register Address: 19AH, 410	IA32_CLOCK_MODULATION	
Clock Modulation (R/W) See Table 2-2.		Thread
Register Address: 601H, 1537	MSR_PKG_POWER_LIMIT_4	
Package Power Limit 4 (R/W) Package-level maximum power limit (in Watts).		Package
15:0	POWER_LIMIT_4 PL4 Value in 0.125 W increments. This field is locked by PKG_POWER_LIMIT_4.LOCK. When the LOCK bit is set to 1, this field becomes Read Only. If the value is 0, PL4 limit is disabled.	
30:16	Reserved.	
31	LOCK This bit will lock the POWER_LIMIT_4 settings in this register and will also lock this setting. This means that once set to 1, the POWER_LIMIT_4 setting and this bit become Read Only until the next Warm Reset.	
63:32	Reserved.	
Register Address: 630H, 1584	MSR_PKG_C8_RESIDENCY	
MSR_PKG_C8_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package

Table 2-58. Additional MSRs Supported by the Intel® Series 2 Core™ Ultra Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
59:0	Package C8 Residency Counter Value since last reset that this package is in processor-specific C8 states. Count at the same frequency as the TSC.	
63:60	Reserved.	
Register Address: 631H, 1585	MSR_PKG_C9_RESIDENCY	
MSR_PKG_C9_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
59:0	Package C9 Residency Counter Value since last reset that this package is in processor-specific C9 states. Count at the same frequency as the TSC.	
63:60	Reserved.	
Register Address: 632H, 1586	MSR_PKG_C10_RESIDENCY	
MSR_PKG_C10_RESIDENCY (R/O) Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.		Package
59:0	Package C10 Residency Counter Value since last reset that this package is in processor-specific C10 states. Count at the same frequency as the TSC.	
63:60	Reserved.	
Register Address: 651H, 1617	MSR_SECONDARY_TURBO_RATIO_LIMIT_CORES	
SECONDARY_TURBO_RATIO_LIMIT_CORES (R/W) This register defines the active core ranges for each frequency point. - NUMCORE[0:7] must be populated in ascending order. - NUMCORE[i+1] must be greater than NUMCORE[i]. - Entries with NUMCORE[i] == 0 will be ignored. - The last valid entry must have NUMCORE >= the number of cores in the SKU. If any of the rules above are broken, we will silently reject the configuration.		Package
7:0	CORE_COUNT_0 Defines the active core ranges for each frequency point.	
15:8	CORE_COUNT_1 Defines the active core ranges for each frequency point.	
23:16	CORE_COUNT_2 Defines the active core ranges for each frequency point.	
31:24	CORE_COUNT_3 Defines the active core ranges for each frequency point.	
39:32	CORE_COUNT_4 Defines the active core ranges for each frequency point.	
47:40	CORE_COUNT_5 Defines the active core ranges for each frequency point.	
55:48	CORE_COUNT_6 Defines the active core ranges for each frequency point.	

Table 2-58. Additional MSRs Supported by the Intel® Series 2 Core™ Ultra Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
63:56	CORE_COUNT_7 Defines the active core ranges for each frequency point.	
Register Address: 658H, 1624	MSR_WEIGHTED_CORE_CO	
Core-Count Weighted C0 Residency (R/O)		Package
63:0	DATA Increment at the same rate as the TSC. The increment each cycle is weighted by the number of processor cores in the package that reside in C0. If N cores are simultaneously in C0, then each cycle the counter increments by N.	
Register Address: 659H, 1625	MSR_ANY_CORE_CO	
Any Core C0 Residency (R/O)		Package
63:0	DATA Increment at the same rate as the TSC. The increment each cycle is weighted by the number of processor cores in the package that reside in C0. If N cores are simultaneously in C0, then each cycle the counter increments by N.	
Register Address: 65AH, 1626	MSR_ANY_GFXE_CO	
Any Graphics Engine C0 Residency (R/O)		Package
63:0	DATA Increment at the same rate as the TSC. The increment each cycle is one if any processor graphic device's compute engines are in C0.	
Register Address: 65BH, 1627	MSR_CORE_GFXE_OVERLAP_CO	
Core and Graphics Engine Overlapped C0 Residency (R/O)		Package
63:0	DATA Increment at the same rate as the TSC. The increment each cycle is one if at least one compute engine of the processor graphics is in C0 and at least one processor core in the package is also in C0.	
Register Address: C88H, 3208	IA32_RESOURCE_PRIORITY	
Thread scope Resource Priority Enable (R/W) See Table 2-2.		Thread
Register Address: C89H, 3209	IA32_RESOURCE_PRIORITY_PKG	
IA32_RESOURCE_PRIORITY_PKG (R/W) See Table 2-2.		Package
Register Address: 1900H, 6400	IA32_PMC_GPO_CTR	
Full Width Writable General Performance Counter 0 (R/W) See Table 2-2.		Thread
Register Address: 1901H, 6401	IA32_PMC_GPO_CFG_A	
IA32_PMC_GPO_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 0. See Table 2-2.		Thread

Table 2-58. Additional MSRs Supported by the Intel® Series 2 Core™ Ultra Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 1904H, 6404	IA32_PMC_GP1_CTR	
Full Width Writable General Performance Counter 1 (R/W) See Table 2-2.		Thread
Register Address: 1905H, 6405	IA32_PMC_GP1_CFG_A	
IA32_PMC_GP1_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 1. See Table 2-2.		Thread
Register Address: 1908H, 6408	IA32_PMC_GP2_CTR	
Full Width Writable General Performance Counter 2 (R/W) See Table 2-2.		Thread
Register Address: 1909H, 6409	IA32_PMC_GP2_CFG_A	
IA32_PMC_GP2_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 2. See Table 2-2.		Thread
Register Address: 190CH, 6412	IA32_PMC_GP3_CTR	
Full Width Writable General Performance Counter 3 (R/W) See Table 2-2.		Thread
Register Address: 190DH, 6413	IA32_PMC_GP3_CFG_A	
IA32_PMC_GP3_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 3. See Table 2-2.		Thread
Register Address: 1910H, 6416	IA32_PMC_GP4_CTR	
Full Width Writable General Performance Counter 4 (R/W) See Table 2-2.		Thread
Register Address: 1911H, 6417	IA32_PMC_GP4_CFG_A	
IA32_PMC_GP4_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 4. See Table 2-2.		Thread
Register Address: 1914H, 6420	IA32_PMC_GP5_CTR	
Full Width Writable General Performance Counter 5 (R/W) See Table 2-2.		Thread
Register Address: 1915H, 6421	IA32_PMC_GP5_CFG_A	
IA32_PMC_GP5_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 5. See Table 2-2.		Thread
Register Address: 1918H, 6424	IA32_PMC_GP6_CTR	
Full Width Writable General Performance Counter 6 (R/W) See Table 2-2.		Thread
Register Address: 1919H, 6425	IA32_PMC_GP6_CFG_A	

Table 2-58. Additional MSRs Supported by the Intel® Series 2 Core™ Ultra Processors Supporting Performance Hybrid Architecture (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
IA32_PMC_GP6_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 6. See Table 2-2.		Thread
Register Address: 191CH, 6428	IA32_PMC_GP7_CTR	
Full Width Writable General Performance Counter 7 (R/W) See Table 2-2.		Thread
Register Address: 191DH, 6429	IA32_PMC_GP7_CFG_A	
IA32_PMC_GP7_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 7. See Table 2-2.		Thread
Register Address: 1980H, 6528	IA32_PMC_FX0_CTR	
IA32_PMC_FX0_CTR (R/W) Fixed-Function Performance Counter 0 - Instructions Retired. See Table 2-2.		Thread
Register Address: 1984H, 6532	IA32_PMC_FX1_CTR	
IA32_PMC_FX1_CTR (R/W) Fixed-Function Performance Counter 1 - Unhalted core clock cycles. See Table 2-2.		Thread
Register Address: 1988H, 6536	IA32_PMC_FX2_CTR	
IA32_PMC_FX2_CTR (R/W) Fixed-Function Performance Counter 2 - Unhalted core reference cycles. See Table 2-2.		Thread

The MSRs listed in Table 2-59 are unique to the Intel Series 2 Core Ultra processor P-core. These MSRs are not supported on the processor E-core.

Table 2-59. MSRs Supported by the Intel® Series 2 Core™ Ultra Processor P-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: C9H, 201	IA32_PMC8	
General Performance Counter 8 (R/W) See Table 2-2.		Thread
Register Address: CAH, 202	IA32_PMC9	
General Performance Counter 9 (R/W) See Table 2-2.		Thread
Register Address: 18EH, 398	IA32_PERFEVTSEL8	
Performance Event Select Register 8 (R/W) See Table 2-2.		Thread
Register Address: 18FH, 399	IA32_PERFEVTSEL9	
Performance Event Select Register 9 (R/W) See Table 2-2.		Thread
Register Address: 30CH, 780	IA32_FIXED_CTR3	

Table 2-59. MSRs Supported by the Intel® Series 2 Core™ Ultra Processor P-core (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Fixed-Function Performance Counter 3 (R/W) See Table 2-2.		Thread
Register Address: 329H, 809	MSR_PERF_METRICS	
MSR_PERF_METRICS (R/W) This register provides built-in support for Top-down Micro-architecture Analysis (TMA) metrics. It exposes the four TMA Level 1 metrics where the lower 32 bits are divided into four 8 bit fields, each of which is an integer percentage of the total TOPDOWN.SLOTS (as reported by fixed-function counter 3).		Thread
7:0	RETIRING Percent of utilized by uops that eventually retire (commit).	
15:8	BAD_SPECULATION Percent of Wasted due to incorrect speculation, covering Utilized by uops that do not retire, or Recovery Bubbles (unutilized slots).	
23:16	FRONTEND_BOUND Percent of Unutilized slots where Front-end did not deliver a uop while Back-end is ready.	
31:24	BACKEND_BOUND Percent of Unutilized slots where a uop was not delivered to Back-end due to lack of Back-end resources.	
39:32	MULTI_UOPS Frontend bound.	
47:40	BRANCH_MISPREDICTS Frontend bound.	
55:48	FRONTEND_LATENCY Frontend bound.	
63:56	MEMORY_BOUND Frontend bound.	
Register Address: 4C9H, 1225	IA32_A_PMC8	
Full Width Writable IA32_PMC8 Alias (R/W) See Table 2-2.		Thread
Register Address: 4CAH, 1226	IA32_A_PMC9	
Full Width Writable IA32_PMC9 Alias (R/W) See Table 2-2.		Thread
Register Address: 540H, 1344	MSR_THREAD_UARCH_CTL	
Thread Uarch Control (R/W)		Thread
0	WB_MEM_STRM_LD_DISABLE Disable streaming behavior for MOVNTDQA loads to WB memory type. If set, these accesses will be treated like regular cacheable loads (Data will be cached).	
63:1	Reserved.	
Register Address: 540H, 1344	MSR_CORE_UARCH_CTL	
Core Uarch Control (R/W)		Core

Table 2-59. MSRs Supported by the Intel® Series 2 Core™ Ultra Processor P-core (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
0	SCRUB_DIS L1 scrubbing disable.	
63:1	Reserved.	
Register Address: 1920H, 6432	IA32_PMC_GP8_CTR	
Full Width Writable General Performance Counter 8 (R/W) See Table 2-2.		Thread
Register Address: 1921H, 6433	IA32_PMC_GP8_CFG_A	
IA32_PMC_GP8_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 8. See Table 2-2.		Thread
Register Address: 1924H, 6436	IA32_PMC_GP9_CTR	
Full Width Writable General Performance Counter 9 (R/W) See Table 2-2.		Thread
Register Address: 1925H, 6437	IA32_PMC_GP9_CFG_A	
IA32_PMC_GP9_CFG_A (R/W) Performance Event Select Register used to control the operation of the General Performance Counter 9. See Table 2-2.		Thread
Register Address: 198CH, 6540	IA32_PMC_FX3_CTR	
IA32_PMC_FX3_CTR (R/W) See Table 2-2.		Thread

The MSRs listed in Table 2-60 are unique to the Intel Series 2 Core Ultra processor E-core. These MSRs are not supported on the processor P-core.

Table 2-60. MSRs Supported by the Intel® Series 2 Core™ Ultra Processor E-core

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 2DCH, 732	IA32_INTEGRITY_STATUS	
Status Information for Integrity Features (R/O) See Table 2-2.		Thread
Register Address: 30DH, 781	IA32_FIXED_CTR4	
Fixed-Function Performance Counter 4 - Top-down Bad Speculation (R/W) See Table 2-2.		Thread
Register Address: 30EH, 782	IA32_FIXED_CTR5	
Fixed-Function Performance Counter 5 - Top-down Frontend Bound (R/W) See Table 2-2.		Thread
Register Address: 30FH, 783	IA32_FIXED_CTR6	
Fixed-Function Performance Counter 6 - Top-down Retiring (R/W) See Table 2-2.		Thread

Extended Perf Event Selector for Fixed-Function Counter 6 (R/W) See Table 2-2.		Thread

2.18 MSRS IN THE INTEL® XEON PHI™ PROCESSOR 3200/5200/7200 SERIES AND THE INTEL® XEON PHI™ PROCESSOR 7215/7285/7295 SERIES

The Intel® Xeon Phi™ processor 3200, 5200, 7200 series, with a CPUID Signature DisplayFamily_DisplayModel value of 06_57H, supports the MSR interfaces listed in Table 2-61. These processors are based on the Knights Landing microarchitecture. The Intel® Xeon Phi™ processor 7215, 7285, 7295 series, with a CPUID Signature DisplayFamily_DisplayModel value of 06_85H, supports the MSR interfaces listed in Table 2-61 and Table 2-62. These processors are based on the Knights Mill microarchitecture. Some MSRs are shared between a pair of processor cores, and the scope is marked as module.

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: 0H, 0	IA32_P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors."		Module
Register Address: 1H, 1	IA32_P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors."		Module
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination." See Table 2-2.		Thread
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and Table 2-2.		Thread
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2.		Package
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Thread
Register Address: 34H, 52	MSR_SMI_COUNT	
SMI Counter (R/O)		Thread
31:0	SMI Count (R/O)	
63:32	Reserved.	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in Intel 64Processor (R/W) See Table 2-2.		Thread
0	Lock. (R/WL)	
1	Reserved.	
2	Enable VMX outside SMX operation. (R/WL)	
Register Address: 3BH, 59	IA32_TSC_ADJUST	
Per-Logical-Processor TSC ADJUST (R/W) See Table 2-2.		Thread
Register Address: 4EH, 78	IA32_PPIN_CTL (MSR_PPIN_CTL)	
Protected Processor Inventory Number Enable Control (R/W)		Package
0	LockOut (R/WO) See Table 2-2.	

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
1	Enable_PPIN (R/W) See Table 2-2.	
63:2	Reserved	
Register Address: 4FH, 79	IA32_PPIN (MSR_PPIN)	
Protected Processor Inventory Number (R/O)		Package
63:0	Protected Processor Inventory Number (R/O) See Table 2-2.	
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG	
BIOS Update Trigger Register (W) See Table 2-2.		Core
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID	
BIOS Update Signature ID (R/W) See Table 2-2.		Thread
Register Address: C1H, 193	IA32_PMC0	
Performance Counter Register See Table 2-2.		Thread
Register Address: C2H, 194	IA32_PMC1	
Performance Counter Register See Table 2-2.		Thread
Register Address: CEH, 206	MSR_PLATFORM_INFO	
Platform Information Contains power management and other model specific features enumeration. See http://biosbits.org .		Package
7:0	Reserved.	
15:8	Maximum Non-Turbo Ratio (R/O) This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz.	Package
27:16	Reserved.	
28	Programmable Ratio Limit for Turbo Mode (R/O) When set to 1, indicates that Programmable Ratio Limit for Turbo mode is enabled. When set to 0, indicates Programmable Ratio Limit for Turbo mode is disabled.	Package
29	Programmable TDP Limit for Turbo Mode (R/O) When set to 1, indicates that TDP Limit for Turbo mode is programmable. When set to 0, indicates TDP Limit for Turbo mode is not programmable.	Package
39:30	Reserved.	
47:40	Maximum Efficiency Ratio (R/O) This is the minimum ratio (maximum efficiency) that the processor can operate, in units of 100MHz.	Package
63:48	Reserved.	

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Register Address: E2H, 226	MSR_PKG_CST_CONFIG_CONTROL	
C-State Configuration Control (R/W)		Package
2:0	Package C-State Limit (R/W) Specifies the lowest C-state for the package. This feature does not limit the processor core C-state. The power-on default value from bit[2:0] of this register reports the deepest package C-state the processor is capable to support when manufactured. It is recommended that BIOS always read the power-on default value reported from this bit field to determine the supported deepest C-state on the processor and leave it as default without changing it. 000b - C0/C1 (No package C-state support) 001b - C2 010b - C6 (non retention)* 011b - C6 (Retention)* 100b - Reserved 101b - Reserved 110b - Reserved 111b - No package C-state limit. All C-States supported by the processor are available. Note: C6 retention mode provides more power saving than C6 non-retention mode. Limiting the package to C6 non retention mode does prevent the MSR_PKG_C6_RESIDENCY counter (MSR 3F9h) from being incremented.	
9:3	Reserved.	
10	I/O MWAIT Redirection Enable (R/W) When set, will map IO_read instructions sent to IO registers at MSR_PMG_IO_CAPTURE_BASE[15:0] to MWAIT instructions.	
14:11	Reserved.	
15	CFG Lock (R/O) When set, locks bits [15:0] of this register for further writes until the next reset occurs.	
25	Reserved.	
26	C1 State Auto Demotion Enable (R/W) When set, the processor will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.	
27	Reserved.	
28	C1 State Auto Undemotion Enable (R/W) When set, enables Undemotion from Demoted C1.	
29	PKG C-State Auto Demotion Enable (R/W) When set, enables Package C state demotion.	
63:30	Reserved.	
Register Address: E4H, 228	MSR_PMG_IO_CAPTURE_BASE	
Power Management IO Capture Base (R/W)		Tile

Table 2-61. Selected MSRs Supported by Intel® Xeon Phi™ Processors with a CPUID Signature DisplayFamily_DisplayModel Value of 06_57H or 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
15:0	LVL_2 Base Address (R/W) Microcode will compare IO-read zone to this base address to determine if an MWAIT(C2/3/4) needs to be issued instead of the IO-read. Should be programmed to the chipset Plevel_2 IO address.	
22:16	C-State Range (R/W) The IO-port block size in which IO-redirection will be executed (0-127). Should be programmed based on the number of LVLx registers existing in the chipset.	
63:23	Reserved.	
Register Address: E7H, 231	IA32_MPERF	
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.		Thread
Register Address: E8H, 232	IA32_APERF

Memory Type Range Register (R/O) See Table 2-2.		Core
Register Address: 13CH, 316	MSR_FEATURE_CONFIG	
AES Configuration (RW-L) Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.		Core
1:0	AES Configuration (RW-L) Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows: 11b: AES instructions are not available until next RESET. Otherwise, AES instructions are available. Note, the AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instructions can be mis-configured if a privileged agent unintentionally writes 11b.	
63:2	Reserved.	
Register Address: 140H, 320	MISC_FEATURE_ENABLES	
MISC_FEATURE_ENABLES		Thread
0	Reserved.	
1	User Mode MONITOR and MWAIT (R/W) If set to 1, the MONITOR and MWAIT instructions do not cause invalid-opcode exceptions when executed with CPL > 0 or in virtual-8086 mode. If MWAIT is executed when CPL > 0 or in virtual-8086 mode, and if EAX indicates a C-state other than C0 or C1, the instruction operates as if EAX indicated the C-state C1.	
63:2	Reserved.

Capability Reporting Register of VM-exit Controls (R/O) See Table 2-2.		Core
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTLS	
Capability Reporting Register of VM-entry Controls (R/O) See Table 2-2.		Core
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Table 2-2.		Core
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Table 2-2.		Core
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Table 2-2.		Core
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Table 2-2.		Core
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Table 2-2.		Core
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Table 2-2.		Core
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLS2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Table 2-2.		Core
Register Address: 48CH, 1164	IA32_VMX_EPT_VPID_ENUM	
Capability Reporting Register of EPT and VPID (R/O) See Table 2-2.		Core
Register Address: 48DH, 1165	IA32_VMX_TRUE_PINBASED_CTLS	

Table 2-62. Additional MSRs Supported by the Intel® Xeon Phi™ Processor 7215, 7285, 7295 Series with a CPUID Signature DisplayFamily_DisplayModel Value of 06_85H (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Scope
Capability Reporting Register of Pin-Based VM-Execution Flex Controls (R/O) See Table 2-2.		Core
Register Address: 48EH, 1166	IA32_VMX_TRUE_PROCBASED_CTLS	
Capability Reporting Register of Primary Processor-Based VM-Execution Flex Controls (R/O) See Table 2-2.		Core
Register Address: 48FH, 1167	IA32_VMX_TRUE_EXIT_CTLS	
Capability Reporting Register of VM-Exit Flex Controls (R/O) See Table 2-2.		Core
Register Address: 490H, 1168	IA32_VMX_TRUE_ENTRY_CTLS	
Capability Reporting Register of VM-Entry Flex Controls (R/O) See Table 2-2.		Core
Register Address: 491H, 1169	IA32_VMX_FMFUNC	
Capability Reporting Register of VM-Function Controls (R/O) See Table 2-2.		Core

2.19 MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS

Table 2-63 lists MSRs (architectural and model-specific) that are defined across processor generations based on Intel NetBurst microarchitecture. The processor can be identified by its CPUID signatures of DisplayFamily encoding of 0FH, see Table 2-1.

- MSRs with an "IA32_" prefix are designated as "architectural." This means that the functions of these MSRs and their addresses remain the same for succeeding families of IA-32 processors.
- MSRs with an "MSR_" prefix are model specific with respect to address functionalities. The column "Model Availability" lists the model encoding value(s) within the Pentium 4 and Intel Xeon processor family at the specified register address. The model encoding value of a processor can be queried using CPUID. See "CPUID—CPU Identification" in Chapter 3 of the Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A.

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/Unique ¹
Register Address: 0H, 0	IA32_P5_MC_ADDR		
See Section 2.23, "MSRs in Pentium Processors."		0, 1, 2, 3, 4, 6	Shared
Register Address: 1H, 1	IA32_P5_MC_TYPE		
See Section 2.23, "MSRs in Pentium Processors."		0, 1, 2, 3, 4, 6	Shared
Register Address: 6H, 6	IA32_MONITOR_FILTER_LINE_SIZE		
See Section 10.10.5, "Monitor/Mwait Address Range Determination."		3, 4, 6	Shared
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER		
Time Stamp Counter See Table 2-2.		0, 1, 2, 3, 4, 6	Unique

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
On earlier processors, only the lower 32 bits are writable. On any write to the lower 32 bits, the upper 32 bits are cleared. For processor family 0FH, models 3 and 4: all 64 bits are writable.			
Register Address: 17H, 23	IA32_PLATFORM_ID		
Platform ID (R) See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.		0, 1, 2, 3, 4, 6	Shared
Register Address: 1BH, 27	IA32_APIC_BASE		
APIC Location and Status (R/W) See Table 2-2. See Section 12.4.4, "Local APIC Status and Location."		0, 1, 2, 3, 4, 6	Unique
Register Address: 2AH, 42	MSR_EBC_HARD_POWERON		
Processor Hard Power-On Configuration (R/W) Enables and disables processor features. (R) Indicates current processor configuration.		0, 1, 2, 3, 4, 6	Shared
0	Output Tri-state Enabled (R) Indicates whether tri-state output is enabled (1) or disabled (0) as set by the strapping of SMI#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
1	Execute BIST (R) Indicates whether the execution of the BIST is enabled (1) or disabled (0) as set by the strapping of INIT#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
2	In Order Queue Depth (R) Indicates whether the in order queue depth for the system bus is 1 (1) or up to 12 (0) as set by the strapping of A7#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
3	MCERR# Observation Disabled (R) Indicates whether MCERR# observation is enabled (0) or disabled (1) as determined by the strapping of A9#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
4	BINIT# Observation Enabled (R) Indicates whether BINIT# observation is enabled (0) or disabled (1) as determined by the strapping of A10#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
6:5	APIC Cluster ID (R) Contains the logical APIC cluster ID value as set by the strapping of A12# and A11#. The logical cluster ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
7	Bus Park Disable (R) Indicates whether bus park is enabled (0) or disabled (1) as set by the strapping of A15#. The value in this bit is written on the deassertion of RESET#; the bit is set to 1 when the address bus signal is asserted.		
11:8	Reserved.		
13:12	Agent ID (R) Contains the logical agent ID value as set by the strapping of BR[3:0]. The logical ID value is written into the field on the deassertion of RESET#; the field is set to 1 when the address bus signal is asserted.		
63:14	Reserved.		
Register Address: 2BH, 43	MSR_EBC_SOFT_POWERON		
Processor Soft Power-On Configuration (R/W) Enables and disables processor features.		0, 1, 2, 3, 4, 6	Shared
0	RCNT/SCNT On Request Encoding Enable (R/W) Controls the driving of RCNT/SCNT on the request encoding. Set to enable (1); clear to disabled (0, default).		
1	Data Error Checking Disable (R/W) Set to disable system data bus parity checking; clear to enable parity checking.		
2	Response Error Checking Disable (R/W) Set to disable (default); clear to enable.		
3	Address/Request Error Checking Disable (R/W) Set to disable (default); clear to enable.		
4	Initiator MCERR# Disable (R/W) Set to disable MCERR# driving for initiator bus requests (default); clear to enable.		
5	Internal MCERR# Disable (R/W) Set to disable MCERR# driving for initiator internal errors (default); clear to enable.		
6	BINIT# Driver Disable (R/W) Set to disable BINIT# driver (default); clear to enable driver.		
63:7	Reserved.		
Register Address: 2CH, 44	MSR_EBC_FREQUENCY_ID		
Processor Frequency Configuration The bit field layout of this MSR varies according to the MODEL value in the CPUID version information. The following bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding equal or greater than 2. (R) The field Indicates the current processor frequency configuration.		2,3, 4, 6	Shared
15:0	Reserved.		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
18:16	Scalable Bus Speed (R/W) Indicates the intended scalable bus speed: <u>Encoding Scalable Bus Speed</u> 000B 100 MHz (Model 2) 000B 266 MHz (Model 3 or 4) 001B 133 MHz 010B 200 MHz 011B 166 MHz 100B 333 MHz (Model 6)		
	133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 011B.		
	266.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 000B and model encoding = 3 or 4. 333.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 100B and model encoding = 6. All other values are reserved.		
23:19	Reserved.		
31:24	Core Clock Frequency to System Bus Frequency Ratio (R) The processor core clock frequency to system bus frequency ratio observed at the deassertion of the reset pin.		
63:32	Reserved.		
Register Address: 2CH, 44	MSR_EBC_FREQUENCY_ID		
Processor Frequency Configuration (R) The bit field layout of this MSR varies according to the MODEL value of the CPUID version information. This bit field layout applies to Pentium 4 and Xeon Processors with MODEL encoding less than 2. Indicates current processor frequency configuration.		0, 1	Shared
20:0	Reserved.		
23:21	Scalable Bus Speed (R/W) Indicates the intended scalable bus speed: <u>Encoding Scalable Bus Speed</u> 000B 100 MHz All others values reserved.		
63:24	Reserved.		
Register Address: 3AH, 58	IA32_FEATURE_CONTROL		
Control Features in IA-32 Processor (R/W) See Table 2-2. (If CPUID.01H:ECX[5])		3, 4, 6	Unique
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
Register Address: 19AH, 410	IA32_CLOCK_MODULATION		
Thermal Monitor Control (R/W) See Table 2-2 and Section 16.8.3, "Software Controlled Clock Modulation."		0, 1, 2, 3, 4, 6	Unique
Register Address: 19BH, 411	IA32_THERM_INTERRUPT		
Thermal Interrupt Control (R/W) See Section 16.8.2, "Thermal Monitor," and Table 2-2.		0, 1, 2, 3, 4, 6	Unique
Register Address: 19CH, 412	IA32_THERM_STATUS		
Thermal Monitor Status (R/W) See Section 16.8.2, "Thermal Monitor," and Table 2-2.		0, 1, 2, 3, 4, 6	Shared
Register Address: 19DH, 413	MSR_THERM2_CTL		
Thermal Monitor 2 Control			
For Family F, Model 3 processors: When read, specifies the value of the target TM2 transition last written. When set, it sets the next target value for TM2 transition.		3	Shared
For Family F, Model 4 and Model 6 processors: When read, specifies the value of the target TM2 transition last written. Writes may cause #GP exceptions.		4, 6	Shared
Register Address: 1A0H, 416	IA32_MISC_ENABLE		
Enable Miscellaneous Processor Features (R/W)		0, 1, 2, 3, 4, 6	Shared
0	Fast-Strings Enable. See Table 2-2.		
1	Reserved.		
2	x87 FPU Fopcode Compatibility Mode Enable		
3	Thermal Monitor 1 Enable See Section 16.8.2, "Thermal Monitor," and Table 2-2.		
4	Split-Lock Disable When set, the bit causes an #AC exception to be issued instead of a split-lock cycle. Operating systems that set this bit must align system structures to avoid split-lock scenarios. When the bit is clear (default), normal split-locks are issued to the bus. This debug feature is specific to the Pentium 4 processor.		
5	Reserved.		
6	Third-Level Cache Disable (R/W) When set, the third-level cache is disabled; when clear (default) the third-level cache is enabled. This flag is reserved for processors that do not have a third-level cache. Note that the bit controls only the third-level cache; and only if overall caching is enabled through the CD flag of control register CR0, the page-level cache controls, and/or the MTRRs. See Section 13.5.4, "Disabling and Enabling the L3 Cache."		
7	Performance Monitoring Available (R) See Table 2-2.		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
8	Suppress Lock Enable When set, assertion of LOCK on the bus is suppressed during a Split Lock access. When clear (default), LOCK is not suppressed.		
9	Prefetch Queue Disable When set, disables the prefetch queue. When clear (default), enables the prefetch queue.		
10	FERR# Interrupt Reporting Enable (R/W) When set, interrupt reporting through the FERR# pin is enabled; when clear, this interrupt reporting function is disabled. When this flag is set and the processor is in the stop-clock state (STPCLK# is asserted), asserting the FERR# pin signals to the processor that an interrupt (such as, INIT#, BINIT#, INTR, NMI, SMI#, or RESET#) is pending and that the processor should return to normal operation to handle the interrupt. This flag does not affect the normal operation of the FERR# pin (to indicate an unmasked floating-point error) when the STPCLK# pin is not asserted.		
11	Branch Trace Storage Unavailable (BTS_UNAVAILABLE) (R) See Table 2-2. When set, the processor does not support branch trace storage (BTS); when clear, BTS is supported.		
12	PEBS_UNAVAILABLE: Processor Event Based Sampling Unavailable (R) See Table 2-2. When set, the processor does not support processor event-based sampling (PEBS); when clear, PEBS is supported.		
13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.	3	
17:14	Reserved.		
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	3, 4, 6	

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
19	Adjacent Cache Line Prefetch Disable (R/W) When set to 1, the processor fetches the cache line of the 128-byte sector containing currently required data. When set to 0, the processor fetches both cache lines in the sector. Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing. BIOS may contain a setup option that controls the setting of this bit.		
21:20	Reserved.		
22	Limit CPUID MAXVAL (R/W) See Table 2-2. Setting this can cause unexpected behavior to software that depends on the availability of CPUID leaves greater than 3.	3, 4, 6	
23	xTPR Message Disable (R/W) See Table 2-2.		Shared
24	L1 Data Cache Context Mode (R/W) When set, the L1 data cache is placed in shared mode; when clear (default), the cache is placed in adaptive mode. This bit is only enabled for IA-32 processors that support Intel Hyper-Threading Technology. See Section 13.5.6, "L1 Data Cache Context Mode." When L1 is running in adaptive mode and CR3s are identical, data in L1 is shared across logical processors. Otherwise, L1 is not shared and cache use is competitive. If the Context ID feature flag (ECX[10]) is set to 0 after executing CPUID with EAX = 1, the ability to switch modes is not supported. BIOS must not alter the contents of IA32_MISC_ENABLE[24].		
33:25	Reserved.		
34	XD Bit Disable (R/W) See Table 2-3.		Unique
63:35	Reserved.		
Register Address: 1A1H, 417	MSR_PLATFORM_BRV		
Platform Feature Requirements (R)		3, 4, 6	Shared
17:0	Reserved.		
18	PLATFORM Requirements When set to 1, indicates the processor has specific platform requirements. The details of the platform requirements are listed in the respective data sheets of the processor.		
63:19	Reserved.		
Register Address: 1D7H, 471	MSR_LER_FROM_LIP		

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 19.13.3, "Last Exception Records."		0, 1, 2, 3, 4, 6	Unique
31:0	From Linear IP Linear address of the last branch instruction.		
63:32	Reserved.		
Register Address: 1D7H, 471	MSR_LER_FROM_LIP		
63:0	From Linear IP Linear address of the last branch instruction (If IA-32e mode is active).		Unique
Register Address: 1D8H, 472	MSR_LER_TO_LIP		
Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 19.13.3, "Last Exception Records."		0, 1, 2, 3, 4, 6	Unique
31:0	From Linear IP Linear address of the target of the last branch instruction.		
63:32	Reserved.		
Register Address: 1D8H, 472	MSR_LER_TO_LIP		
63:0	From Linear IP Linear address of the target of the last branch instruction (If IA-32e mode is active).		Unique
Register Address: 1D9H, 473	MSR_DEBUGCTLA		
Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 19.13.1, "MSR_DEBUGCTLA MSR."		0, 1, 2, 3, 4, 6	Unique
Register Address: 1DAH, 474	MSR_LASTBRANCH_TOS		
Last Branch Record Stack TOS (R/O) Contains an index (0-3 or 0-15) that points to the top of the last branch record stack (that is, that points the index of the MSR containing the most recent branch record). See Section 19.13.2, "LBR Stack for Processors Based on Intel NetBurst® Microarchitecture," and addresses 1DBH-1DEH and 680H-68FH.		0, 1, 2, 3, 4, 6	Unique
Register Address: 1DBH, 475	MSR_LASTBRANCH_0		
Last Branch Record 0 (R/O) One of four last branch record registers on the last branch record stack. It contains pointers to the source and destination instruction for one of the last four branches, exceptions, or interrupts that the processor took. MSR_LASTBRANCH_0 through MSR_LASTBRANCH_3 at 1DBH-1DEH are available only on family 0FH, models 0H-02H. They have been replaced by the MSRs at 680H-68FH and 6C0H-6CFH. See Section 19.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."		0, 1, 2	Unique

Register Address: 3F0H, 1008	MSR_TC_PRECISE_EVENT		
See Section 21.6.3.1, "ESCR MSRs."		0, 1, 2, 3, 4, 6	Shared
Register Address: 3F1H, 1009	IA32_PEBS_ENABLE (MSR_PEBS_ENABLE)		
Processor Event Based Sampling (PEBS) (R/W) Controls the enabling of processor event sampling and replay tagging.		0, 1, 2, 3, 4, 6	Shared
12:0	See https://perfmon-events.intel.com/ .		
23:13	Reserved.		
24	UOP Tag Enables replay tagging when set.		
25	ENABLE_PEBS_MY_THR (R/W) Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 21.6.4.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is called ENABLE_PEBS in IA-32 processors that do not support Intel Hyper-Threading Technology.		
26	ENABLE_PEBS_OTH_THR (R/W) Enables PEBS for the target logical processor when set; disables PEBS when clear (default). See Section 21.6.4.3, "IA32_PEBS_ENABLE MSR," for an explanation of the target logical processor. This bit is reserved for IA-32 processors that do not support Intel Hyper-Threading Technology.		
63:27	Reserved.		
Register Address: 3F2H, 1010	MSR_PEBS_MATRIX_VERT		
See https://perfmon-events.intel.com/ .		0, 1, 2, 3, 4, 6	Shared
Register Address: 400H, 1024	IA32_MCO_CTL		
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		0, 1, 2, 3, 4, 6	Shared

Register Address: 411H, 1041	IA32_MC4_STATUS		
See Section 17.3.2.2, "IA32_MCi_STATUS MSRs."		0, 1, 2, 3, 4, 6	Shared
Register Address: 412H, 1042	IA32_MC4_ADDR		
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.			
Register Address: 413H, 1043	IA32_MC4_MISC		
See Section 17.3.2.4, "IA32_MCi_MISC MSRs." The IA32_MC2_MISC MSR is either not implemented or does not contain additional information if the MISCV flag in the IA32_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.			
Register Address: 480H, 1152	IA32_VMX_BASIC		
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2 and Appendix A.1, "Basic VMX Information."		3, 4, 6	Unique
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTL		
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Table 2-2 and Appendix A.3, "VM-Execution Controls."		3, 4, 6	Unique
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTL		
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls," and Table 2-2.		3, 4, 6	Unique
Register Address: 483H, 1155	IA32_VMX_EXIT_CTL		
Capability Reporting Register of VM-Exit Controls (R/O) See Appendix A.4, "VM-Exit Controls," and Table 2-2.		3, 4, 6	Unique
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTL

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
Capability Reporting Register of VM-Entry Controls (R/O) See Appendix A.5, "VM-Entry Controls," and Table 2-2.		3, 4, 6	Unique
Register Address: 485H, 1157	IA32_VMX_MISC		
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Appendix A.6, "Miscellaneous Data," and Table 2-2.		3, 4, 6	Unique
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0		
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0," and Table 2-2.		3, 4, 6	Unique
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1		
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0," and Table 2-2.		3, 4, 6	Unique
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0		
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4," and Table 2-2.		3, 4, 6	Unique
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1		
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4," and Table 2-2.		3, 4, 6	Unique
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM		
Capability Reporting Register of VMCS Field Enumeration (R/O) See Appendix A.9, "VMCS Enumeration," and Table 2-2.		3, 4, 6	Unique
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTLSS2		
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls," and Table 2-2.		3, 4, 6	Unique
Register Address: 600H, 1536	IA32_DS_AREA		
DS Save Area (R/W) See Table 2-2 and Section 21.6.3.4, "Debug Store (DS) Mechanism."		0, 1, 2, 3, 4, 6	Unique
Register Address: 680H, 1664	MSR_LASTBRANCH_0_FROM_IP		
Last Branch Record 0 (R/W) One of 16 pairs of last branch record registers on the last branch record stack (680H-68FH). This part of the stack contains pointers to the source instruction for one of the last 16 branches, exceptions, or interrupts taken by the processor. The MSRs at 680H-68FH, 6C0H-6CFH are not available in processor releases before family 0FH, model 03H. These MSRs replace MSRs previously located at 1DBH-1DEH, which performed the same function for early releases. See Section 19.12, "Last Branch, Call Stack, Interrupt, and Exception Recording for Processors based on Skylake Microarchitecture."		3, 4, 6	Unique
Register Address: 681H, 1665	MSR_LASTBRANCH_1_FROM_IP		
Last Branch Record 1 See description of MSR_LASTBRANCH_0 at 680H.		3, 4, 6	Unique
Register Address: 682H, 1666	MSR_LASTBRANCH_2_FROM_IP

Table 2-63. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

Register Address: Hex, Decimal	Register Name		
Register Information / Bit Fields	Bit Description	Model Availability	Shared/ Unique ¹
NOTES 1. For HT-enabled processors, there may be more than one logical processors per physical unit. If an MSR is Shared, this means that one MSR is shared between logical processors. If an MSR is unique, this means that each logical processor has its own MSR.			

2.19.1 MSRs Unique to Intel® Xeon® Processor MP with L3 Cache

The MSRs listed in Table 2-64 apply to Intel® Xeon® Processor MP with up to 8MB level three cache. These processors can be detected by enumerating the deterministic cache parameter leaf, CPUID.04H, to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 3 or 4 (see CPUID instruction for more details).

Table 2-64. MSRs Unique to 64-bit Intel® Xeon® Processor MP with Up to an 8 MB L3 Cache

Register Address: Hex	Register Name		
Register Information		Model Availability	Shared/ Unique
Register Address: 107CCH	MSR_IFSB_BUSQ0		
IFSB BUSQ Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared
Register Address: 107CDH	MSR_IFSB_BUSQ1		
IFSB BUSQ Event Control and Counter Register (R/W)		3, 4	Shared
Register Address: 107CEH	MSR_IFSB_SNPQ0		
IFSB SNPQ Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared
Register Address: 107CFH	MSR_IFSB_SNPQ1		
IFSB SNPQ Event Control and Counter Register (R/W)		3, 4	Shared
Register Address: 107D0H	MSR_EFSB_DRDY0		
EFSB DRDY Event Control and Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared
Register Address: 107D1H	MSR_EFSB_DRDY1		
EFSB DRDY Event Control and Counter Register (R/W)		3, 4	Shared
Register Address: 107D2H	MSR_IFSB_CTL6		
IFSB Latency Event Control Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared
Register Address: 107D3H	MSR_IFSB_CNTR7		
IFSB Latency Event Counter Register (R/W) See Section 21.6.6, "Performance Monitoring on 64-bit Intel® Xeon® Processor MP with Up to 8-MByte L3 Cache."		3, 4	Shared

The MSRs listed in Table 2-65 apply to Intel® Xeon® Processor 7100 series. These processors can be detected by enumerating the deterministic cache parameter, CPUID.04H, to detect the presence of the third level cache, and

with CPUID reporting family encoding 0FH, model encoding 6 (See CPUID instruction for more details.). The performance monitoring MSRs listed in Table 2-65 are shared between logical processors in the same core, but are replicated for each core.

Table 2-65. MSRs Unique to Intel® Xeon® Processor 7100 Series

FSB Event Control and Counter Register (R/W)		6	Shared

2.20 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Model-specific registers (MSRs) for Intel Core Solo, Intel Core Duo processors, and Dual-core Intel Xeon processor LV are listed in Table 2-66. The column "Shared/Unique" applies to Intel Core Duo processor. "Unique" means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. "Shared" means the MSR or the bit field in an MSR address governs the operation of both processor cores.

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/Unique
Register Address: 0H, 0	P5_MC_ADDR	
See Section 2.23, "MSRs in Pentium Processors," and Table 2-2.		Unique
Register Address: 1H, 1	P5_MC_TYPE	
See Section 2.23, "MSRs in Pentium Processors," and Table 2-2.		Unique

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Register Address: 6H, 6	IA32_MONITOR_FILTER_SIZE	
See Section 10.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.		Unique
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER	
See Section 19.17, "Time-Stamp Counter," and Table 2-2.		Unique
Register Address: 17H, 23	IA32_PLATFORM_ID	
Platform ID (R) See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.		Shared
Register Address: 1BH, 27	IA32_APIC_BASE	
See Section 12.4.4, "Local APIC Status and Location," and Table 2-2.		Unique
Register Address: 2AH, 42	MSR_EBL_CR_POWERON	
Processor Hard Power-On Configuration (R/W) Enables and disables processor features; (R) indicates current processor configuration.		Shared
0	Reserved.	
1	Data Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
2	Response Error Checking Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
3	MCERR# Drive Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
4	Address Parity Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
6: 5	Reserved.	
7	BINIT# Driver Enable (R/W) 1 = Enabled; 0 = Disabled. Note: Not all processor implements R/W.	
8	Output Tri-state Enabled (R/O) 1 = Enabled; 0 = Disabled.	
9	Execute BIST (R/O) 1 = Enabled; 0 = Disabled.	
10	MCERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled.	
11	Reserved.	
12	BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled.	

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
13	Reserved	
14	1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes	
15	Reserved.	
17:16	APIC Cluster ID (R/O)	
18	System Bus Frequency (R/O) 0 = 100 MHz. 1 = Reserved.	
19	Reserved.	
21: 20	Symmetric Arbitration ID (R/O)	
26:22	Clock Frequency Ratio (R/O)	
Register Address: 3AH, 58	IA32_FEATURE_CONTROL	
Control Features in IA-32 Processor (R/W) See Table 2-2.		Unique
Register Address: 40H, 64	MSR_LASTBRANCH_0	
Last Branch Record 0 (R/W) One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the 'to' address. See also: - Last Branch Record Stack TOS at 1C9H. - Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."		Unique
Register Address: 41H, 65	MSR_LASTBRANCH_1	
Last Branch Record 1 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 42H, 66	MSR_LASTBRANCH_2	
Last Branch Record 2 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 43H, 67	MSR_LASTBRANCH_3	
Last Branch Record 3 (R/W) See description of MSR_LASTBRANCH_0.		Unique
Register Address: 44H, 68	MSR_LASTBRANCH_4	
Last Branch Record 4 (R/W) See description of MSR_LASTBRANCH_0.		Unique

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal		Register Name	
Register Information / Bit Fields		Bit Description	Shared/ Unique
Last Branch Record 7 (R/W) See description of MSR_LASTBRANCH_0.			Unique
Register Address: 79H, 121	IA32_BIOS_UPDT_TRIG		
BIOS Update Trigger Register (W) See Table 2-2.			Unique
Register Address: 8BH, 139	IA32_BIOS_SIGN_ID		
BIOS Update Signature ID (R/W) See Table 2-2.			Unique
Register Address: C1H, 193	IA32_PMC0		
Performance Counter Register See Table 2-2.			Unique
Register Address: C2H, 194	IA32_PMC1		
Performance Counter Register See Table 2-2.			Unique
Register Address: CDH, 205	MSR_FSB_FREQ		
Scaleable Bus Speed (R/O) This field indicates the scalable bus clock speed.			Shared
2:0	101B: 100 MHz (FSB 400) 001B: 133 MHz (FSB 533) 011B: 167 MHz (FSB 667) 133.33 MHz should be utilized if performing calculation with System Bus Speed when encoding is 101B. 166.67 MHz should be utilized if performing calculation with System Bus Speed when encoding is 001B.		
63:3	Reserved.		
Register Address: E7H, 231	IA32_MPERF		
Maximum Performance Frequency Clock Count (R/W) See Table 2-2.			Unique
Register Address: E8H, 232	IA32_APERF		
Actual Performance Frequency Clock Count (R/W) See Table 2-2.			Unique
Register Address: FEH, 254	IA32_MTRRCAP		
See Table 2-2.			Unique
Register Address: 11EH, 281	MSR_BBL_CR_CTL3		
Control Register 3 Used to configure the L2 Cache.			Shared
0	L2 Hardware Enabled (R/O) 1 = If the L2 is hardware-enabled. 0 = Indicates if the L2 is hardware-disabled.		

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
7:1	Reserved.	
8	L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.	
22:9	Reserved.	
23	L2 Not Present (R/O) 0 = L2 Present. 1 = L2 Not Present.	
63:24	Reserved.	
Register Address: 174H, 372	IA32_SYSENTER_CS	
See Table 2-2.		Unique
Register Address: 175H, 373	IA32_SYSENTER_ESP	
See Table 2-2.		Unique
Register Address: 176H, 374	IA32_SYSENTER_EIP	
See Table 2-2.		Unique
Register Address: 179H, 377	IA32_MCG_CAP	
See Table 2-2.		Unique
Register Address: 17AH, 378	IA32_MCG_STATUS	
Global Machine Check Status		Unique
0	RIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.	
1	EIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.	
2	MCIP When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.	
63:3	Reserved	
Register Address: 186H, 390	IA32_PERFVTSELO	
See Table 2-2.		Unique
Register Address: 187H, 391	IA32_PERFVTSEL1	
See Table 2-2.		Unique

Thermal Monitor Status (R/W) See Table 2-2 and Section 16.8.2, "Thermal Monitor".		Unique
Register Address: 19DH, 413	MSR_THERM2_CTL	
Thermal Monitor 2 Control		Unique
15:0	Reserved.	
16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.	
63:16	Reserved.	
Register Address: 1A0H, 416	IA32_MISC_ENABLE	
Enable Miscellaneous Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.		
2:0	Reserved.	
3	Automatic Thermal Control Circuit Enable (R/W) See Table 2-2.	Unique
6:4	Reserved.	
7	Performance Monitoring Available (R) See Table 2-2.	Shared
9:8	Reserved.	
10	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor 0 = Indicates compatible FERR# signaling behavior This bit must be set to 1 to support XAPIC interrupt model usage.	Shared
11	Branch Trace Storage Unavailable (R/O) See Table 2-2.	Shared

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
12	Reserved.	
13	TM2 Enable (R/W) When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0. When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state. If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states.	Shared
15:14	Reserved.	
16	Enhanced Intel SpeedStep Technology Enable (R/W) 1 = Enhanced Intel SpeedStep Technology enabled	Shared
18	ENABLE MONITOR FSM (R/W) See Table 2-2.	Shared
19	Reserved.	
22	Limit CPUID Maxval (R/W) See Table 2-2. Setting this bit may cause behavior in software that depends on the availability of CPUID leaves greater than 2.	Shared
33:23	Reserved.	
34	XD Bit Disable (R/W) See Table 2-3.	Shared
63:35	Reserved.	
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS	
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 40H).		Unique
Register Address: 1D9H, 473	IA32_DEBUGCTL	
Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in Table 2-2.		Unique
Register Address: 1DDH, 477	MSR_LER_FROM_LIP	
Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique
Register Address: 1DEH, 478	MSR_LER_TO_LIP	
Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.		Unique

See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 40AH, 1034	IA32_MC2_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 40CH, 1036	MSR_MC4_CTL	
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."		Unique
Register Address: 40DH, 1037	MSR_MC4_STATUS	
See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."		Unique
Register Address: 40EH, 1038	MSR_MC4_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 410H, 1040	IA32_MC3_CTL	
IA32_MC3_CTL	See Section 17.3.2.1, "IA32_MCi_CTL MSRs."	
Register Address: 411H, 1041	IA32_MC3_STATUS	
IA32_MC3_STATUS	See Section 17.3.2.2, "IA32_MCi_STATUS MSRS."	
Register Address: 412H, 1042	MSR_MC3_ADDR	
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.		Unique
Register Address: 413H, 1043	MSR_MC3_MISC	
Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISC_V flag in the IA32_MCi_STATUS register is set.		Unique
Register Address: 414H, 1044	MSR_MC5_CTL	
Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).		Unique
Register Address: 415H, 1045	MSR_MC5_STATUS	
Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCi_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.		Unique
Register Address: 416H, 1046	MSR_MC5_ADDR	
Machine Check Error Reporting Register - contains the address of the code or data memory location that produced the machine-check error if the ADDR_V flag in the IA32_MCi_STATUS register is set.		Unique
Register Address: 417H, 1047	MSR_MC5_MISC	

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

Register Address: Hex, Decimal	Register Name	
Register Information / Bit Fields	Bit Description	Shared/ Unique
Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCI_STATUS register is set.		Unique
Register Address: 480H, 1152	IA32_VMX_BASIC	
Reporting Register of Basic VMX Capabilities (R/O) See Table 2-2 and Appendix A.1, "Basic VMX Information." (If CPUID.01H:ECX[5])		Unique
Register Address: 481H, 1153	IA32_VMX_PINBASED_CTL	
Capability Reporting Register of Pin-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls." (If CPUID.01H:ECX[5])		Unique
Register Address: 482H, 1154	IA32_VMX_PROCBASED_CTL	
Capability Reporting Register of Primary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls." (If CPUID.01H:ECX[5])		Unique
Register Address: 483H, 1155	IA32_VMX_EXIT_CTL	
Capability Reporting Register of VM-Exit Controls (R/O) See Appendix A.4, "VM-Exit Controls." (If CPUID.01H:ECX[5])		Unique
Register Address: 484H, 1156	IA32_VMX_ENTRY_CTL	
Capability Reporting Register of VM-Entry Controls (R/O) See Appendix A.5, "VM-Entry Controls." (If CPUID.01H:ECX[5])		Unique
Register Address: 485H, 1157	IA32_VMX_MISC	
Reporting Register of Miscellaneous VMX Capabilities (R/O) See Appendix A.6, "Miscellaneous Data." (If CPUID.01H:ECX[5])		Unique
Register Address: 486H, 1158	IA32_VMX_CR0_FIXED0	
Capability Reporting Register of CR0 Bits Fixed to 0 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0." (If CPUID.01H:ECX[5])		Unique
Register Address: 487H, 1159	IA32_VMX_CR0_FIXED1	
Capability Reporting Register of CR0 Bits Fixed to 1 (R/O) See Appendix A.7, "VMX-Fixed Bits in CR0." (If CPUID.01H:ECX[5])		Unique
Register Address: 488H, 1160	IA32_VMX_CR4_FIXED0	
Capability Reporting Register of CR4 Bits Fixed to 0 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4." (If CPUID.01H:ECX[5])		Unique
Register Address: 489H, 1161	IA32_VMX_CR4_FIXED1	
Capability Reporting Register of CR4 Bits Fixed to 1 (R/O) See Appendix A.8, "VMX-Fixed Bits in CR4." (If CPUID.01H:ECX[5])		Unique
Register Address: 48AH, 1162	IA32_VMX_VMCS_ENUM	
Capability Reporting Register of VMCS Field Enumeration (R/O) See Appendix A.9, "VMCS Enumeration." (If CPUID.01H:ECX[5])		Unique
Register Address: 48BH, 1163	IA32_VMX_PROCBASED_CTL2	
Capability Reporting Register of Secondary Processor-Based VM-Execution Controls (R/O) See Appendix A.3, "VM-Execution Controls." (If CPUID.01H:ECX[5] and IA32_VMX_PROCBASED_CTL2[bit 63])		Unique
Register Address: 600H, 1536	IA32_DS_AREA	

Table 2-66. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)

2.21 MSRS IN THE PENTIUM M PROCESSOR

Model-specific registers (MSRs) for the Pentium M processor are similar to those described in Section 2.22 for P6 family processors. The following table describes new MSRs and MSRs whose behavior has changed on the Pentium M processor.

Table 2-67. MSRs in Pentium M Processors

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
Register Address: 0H, 0	P5_MC_ADDR
See Section 2.23, "MSRs in Pentium Processors."	
Register Address: 1H, 1	P5_MC_TYPE
See Section 2.23, "MSRs in Pentium Processors."	
Register Address: 10H, 16	IA32_TIME_STAMP_COUNTER
See Section 19.17, "Time-Stamp Counter," and see Table 2-2.	
Register Address: 17H, 23	IA32_PLATFORM_ID
Platform ID (R) See Table 2-2. The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.	
Register Address: 2AH, 42	MSR_EBL_CR_POWERON
Processor Hard Power-On Configuration (R/W) Enables and disables processor features. (R) Indicates current processor configuration.	
0	Reserved.
1	Data Error Checking Enable (R) 0 = Disabled. Always 0 on the Pentium M processor.

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
2	Response Error Checking Enable (R) 0 = Disabled. Always 0 on the Pentium M processor.
3	MCERR# Drive Enable (R) 0 = Disabled. Always 0 on the Pentium M processor.
4	Address Parity Enable (R) 0 = Disabled. Always 0 on the Pentium M processor.
6:5	Reserved.
7	BINIT# Driver Enable (R) 1 = Enabled; 0 = Disabled. Always 0 on the Pentium M processor.
8	Output Tri-state Enabled (R/O) 1 = Enabled; 0 = Disabled.
9	Execute BIST (R/O) 1 = Enabled; 0 = Disabled.
10	MCERR# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled. Always 0 on the Pentium M processor.
11	Reserved.
12	BINIT# Observation Enabled (R/O) 1 = Enabled; 0 = Disabled. Always 0 on the Pentium M processor.
13	Reserved.
14	1 MByte Power on Reset Vector (R/O) 1 = 1 MByte; 0 = 4 GBytes. Always 0 on the Pentium M processor.
15	Reserved.
17:16	APIC Cluster ID (R/O) Always 00B on the Pentium M processor.
18	System Bus Frequency (R/O) 0 = 100 MHz. 1 = Reserved. Always 0 on the Pentium M processor.
19	Reserved.
21:20	Symmetric Arbitration ID (R/O) Always 00B on the Pentium M processor.
26:22	Clock Frequency Ratio (R/O)
Register Address: 40H, 64	MSR_LASTBRANCH_0

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
Last Branch Record 0 (R/W) One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the to address. See also: ▪ Last Branch Record Stack TOS at 1C9H. ▪ Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."	
Register Address: 41H, 65	MSR_LASTBRANCH_1
Last Branch Record 1 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 42H, 66	MSR_LASTBRANCH_2
Last Branch Record 2 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 43H, 67	MSR_LASTBRANCH_3
Last Branch Record 3 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 44H, 68	MSR_LASTBRANCH_4
Last Branch Record 4 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 45H, 69	MSR_LASTBRANCH_5
Last Branch Record 5 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 46H, 70	MSR_LASTBRANCH_6
Last Branch Record 6 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 47H, 71	MSR_LASTBRANCH_7
Last Branch Record 7 (R/W) See description of MSR_LASTBRANCH_0.	
Register Address: 119H, 281	MSR_BBL_CR_CTL
Control Register Used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response.	
63:0	Reserved.
Register Address: 11EH, 281	MSR_BBL_CR_CTL3
Control Register 3 Used to configure the L2 Cache.	
0	L2 Hardware Enabled (R/O) 1 = If the L2 is hardware-enabled. 0 = Indicates if the L2 is hardware-disabled.
4:1	Reserved.

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
5	ECC Check Enable (R/O) This bit enables ECC checking on the cache data bus. ECC is always generated on write cycles. 0 = Disabled (default). 1 = Enabled. For the Pentium M processor, ECC checking on the cache data bus is always enabled.
7:6	Reserved.
8	L2 Enabled (R/W) 1 = L2 cache has been initialized. 0 = Disabled (default). Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.
22:9	Reserved.
23	L2 Not Present (R/O) 0 = L2 Present. 1 = L2 Not Present.
63:24	Reserved.
Register Address: 179H, 377	IA32_MCG_CAP
Read-only register that provides information about the machine-check architecture of the processor.	
7:0	Count (R/O) Indicates the number of hardware unit error reporting banks available in the processor.
8	IA32_MCG_CTL Present (R/O) 1 = Indicates that the processor implements the MSR_MCG_CTL register found at MSR 17BH. 0 = Not supported.
63:9	Reserved.
Register Address: 17AH, 378	IA32_MCG_STATUS
Global Machine Check Status	
0	RIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.
1	EIPV When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.
2	MCIP When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.
63:3	Reserved.
Register Address: 198H, 408	IA32_PERF_STATUS

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
See Table 2-2.	
Register Address: 199H, 409	IA32_PERF_CTL
See Table 2-2.	
Register Address: 19AH, 410	IA32_CLOCK_MODULATION
Clock Modulation (R/W). See Table 2-2 and Section 16.8.3, "Software Controlled Clock Modulation."	
Register Address: 19BH, 411	IA32_THERM_INTERRUPT
Thermal Interrupt Control (R/W) See Table 2-2 and Section 16.8.2, "Thermal Monitor."	
Register Address: 19CH, 412	IA32_THERM_STATUS
Thermal Monitor Status (R/W) See Table 2-2 and Section 16.8.2, "Thermal Monitor."	
Register Address: 19DH, 413	MSR_THERM2_CTL
Thermal Monitor 2 Control	
15:0	Reserved.
16	TM_SELECT (R/W) Mode of automatic thermal monitor: 0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle) 1 = Thermal Monitor 2 (thermally-initiated frequency transitions) If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.
63:16	Reserved.
Register Address: 1A0H, 416	IA32_MISC_ENABLE
Enable Miscellaneous Processor Features (R/W) Allows a variety of processor functions to be enabled and disabled.	
2:0	Reserved.
3	Automatic Thermal Control Circuit Enable (R/W) 1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows processor clocks to be automatically modulated based on the processor's thermal sensor operation. 0 = Disabled (default). The automatic thermal control circuit enable bit determines if the thermal control circuit (TCC) will be activated when the processor's internal thermal sensor determines the processor is about to exceed its maximum operating temperature. When the TCC is activated and TM1 is enabled, the processors clocks will be forced to a 50% duty cycle. BIOS must enable this feature. The bit should not be confused with the on-demand thermal control circuit enable bit.
6:4	Reserved.
7	Performance Monitoring Available (R) 1 = Performance monitoring enabled. 0 = Performance monitoring disabled.

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
9:8	Reserved.
10	FERR# Multiplexing Enable (R/W) 1 = FERR# asserted by the processor to indicate a pending break event within the processor. 0 = Indicates compatible FERR# signaling behavior. This bit must be set to 1 to support XAPIC interrupt model usage.
	Branch Trace Storage Unavailable (R/O) 1 = Processor doesn't support branch trace storage (BTS) 0 = BTS is supported
12	Processor Event Based Sampling Unavailable (R/O) 1 = Processor does not support processor event based sampling (PEBS); 0 = PEBS is supported. The Pentium M processor does not support PEBS.
15:13	Reserved.
16	Enhanced Intel SpeedStep Technology Enable (R/W) 1 = Enhanced Intel SpeedStep Technology enabled. On the Pentium M processor, this bit may be configured to be read-only.
22:17	Reserved.
23	xTPR Message Disable (R/W) When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority. The default is processor specific.
63:24	Reserved.
Register Address: 1C9H, 457	MSR_LASTBRANCH_TOS
Last Branch Record Stack TOS (R/W) Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See also: - MSR_LASTBRANCH_0_FROM_IP (at 40H). - Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."	
Register Address: 1D9H, 473	MSR_DEBUGCTLB
Debug Control (R/W) Controls how several debug features are used. Bit definitions are discussed in the referenced section. See Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."	
Register Address: 1DDH, 477	MSR_LER_TO_LIP
Last Exception Record To Linear IP (R) This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)," and Section 19.16.2, "Last Branch and Last Exception MSRs."	
Register Address: 1DEH, 478	MSR_LER_FROM_LIP

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
Last Exception Record From Linear IP (R) Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled. See Section 19.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)," and Section 19.16.2, "Last Branch and Last Exception MSRs."	
Register Address: 2FFH, 767	IA32_MTRR_DEF_TYPE
Default Memory Types (R/W) Sets the memory type for the regions of physical memory that are not mapped by the MTRRs. See Section 13.11.2.1, "IA32_MTRR_DEF_TYPE MSR."	
Register Address: 400H, 1024	IA32_MCO_CTL
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."	
Register Address: 401H, 1025	IA32_MCO_STATUS
See Section 17.3.2.2, "IA32_MCi_STATUS MSRs."	
Register Address: 402H, 1026	IA32_MCO_ADDR
See Section 14.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 404H, 1028	IA32_MC1_CTL
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."	
Register Address: 405H, 1029	IA32_MC1_STATUS
See Section 17.3.2.2, "IA32_MCi_STATUS MSRs."	
Register Address: 406H, 1030	IA32_MC1_ADDR
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 408H, 1032	IA32_MC2_CTL
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."	
Register Address: 409H, 1033	IA32_MC2_STATUS
See Chapter 17.3.2.2, "IA32_MCi_STATUS MSRs."	
Register Address: 40AH, 1034	IA32_MC2_ADDR
See Section 17.3.2.3, "IA32_MCi_ADDR MSRs." The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 40CH, 1036	MSR_MC4_CTL
See Section 17.3.2.1, "IA32_MCi_CTL MSRs."	
Register Address: 40DH, 1037	MSR_MC4_STATUS
See Section 17.3.2.2, "IA32_MCi_STATUS MSRs."	
Register Address: 40EH, 1038	MSR_MC4_ADDR

Table 2-67. MSRs in Pentium M Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 410H, 1040	MSR_MC3_CTL
See Section 17.3.2.1, "IA32_MCI_CTL MSRs."	
Register Address: 411H, 1041	MSR_MC3_STATUS
See Section 17.3.2.2, "IA32_MCI_STATUS MSRs."	
Register Address: 412H, 1042	MSR_MC3_ADDR
See Section 17.3.2.3, "IA32_MCI_ADDR MSRs." The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.	
Register Address: 600H, 1536	IA32_DS_AREA
DS Save Area (R/W) See Table 2-2. Points to the DS buffer management area, which is used to manage the BTS and PEBS buffers. See Section 21.6.3.4, "Debug Store (DS) Mechanism."	
31:0	DS Buffer Management Area Linear address of the first byte of the DS buffer management area.
63:32	Reserved.

2.22 MSRS IN THE P6 FAMILY PROCESSORS

The following MSRs are defined for the P6 family processors. The MSRs in this table that are shaded are available only in the Pentium II and Pentium III processors. Beginning with the Pentium 4 processor, some of the MSRs in this list have been designated as "architectural" and have had their names changed. See Table 2-2 for a list of the architectural MSRs.

Table 2-68. MSRs in the P6 Family Processors

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
Register Address: 0H, 0	P5_MC_ADDR
See Section 2.23, "MSRs in Pentium Processors."	
Register Address: 1H, 1	P5_MC_TYPE
See Section 2.23, "MSRs in Pentium Processors."	
Register Address: 10H, 16	TSC
See Section 19.17, "Time-Stamp Counter."	
Register Address: 17H, 23	IA32_PLATFORM_ID
Platform ID (R) The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.	
49:0	Reserved.

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
52:50	Platform Id (R) Contains information concerning the intended platform for the processor. 52 51 50 0 0 0 Processor Flag 0 0 0 1 Processor Flag 1 0 1 0 Processor Flag 2 0 1 1 Processor Flag 3 1 0 0 Processor Flag 4 1 0 1 Processor Flag 5 1 1 0 Processor Flag 6 1 1 1 Processor Flag 7
56:53	L2 Cache Latency Read.
59:57	Reserved.
60	Clock Frequency Ratio Read.
63:61	Reserved.
Register Address: 1BH, 27	APIC_BASE
Section 12.4.4, "Local APIC Status and Location."	
7:0	Reserved.
8	Boot Strap Processor Indicator Bit 1 = BSP
10:9	Reserved.
11	APIC Global Enable Bit - Permanent till reset 1 = Enabled. 0 = Disabled.
31:12	APIC Base Address.
63:32	Reserved.
Register Address: 2AH, 42	EBL_CR_POWERON
Processor Hard Power-On Configuration (R/W) Enables and disables processor features, and (R) indicates current processor configuration.	
0	Reserved ¹
1	Data Error Checking Enable (R/W) 1 = Enabled. 0 = Disabled.
2	Response Error Checking Enable FRCERR Observation Enable (R/W) 1 = Enabled. 0 = Disabled.
3	AERR# Drive Enable (R/W) 1 = Enabled. 0 = Disabled.
4	BERR# Enable for Initiator Bus Requests (R/W) 1 = Enabled. 0 = Disabled.

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
5	Reserved.
6	BERR# Driver Enable for Initiator Internal Errors (R/W) 1 = Enabled. 0 = Disabled.
7	BINIT# Driver Enable (R/W) 1 = Enabled. 0 = Disabled.
8	Output Tri-state Enabled (R) 1 = Enabled. 0 = Disabled.
9	Execute BIST (R) 1 = Enabled. 0 = Disabled.
10	AERR# Observation Enabled (R) 1 = Enabled. 0 = Disabled.
11	Reserved.
12	BINIT# Observation Enabled (R) 1 = Enabled. 0 = Disabled.
13	In Order Queue Depth (R) 1 = 1. 0 = 8.
14	1-MByte Power on Reset Vector (R) 1 = 1MByte. 0 = 4GBytes.
15	FRC Mode Enable (R) 1 = Enabled. 0 = Disabled.
17:16	APIC Cluster ID (R)
19:18	System Bus Frequency (R) 00 = 66MHz. 10 = 100Mhz. 01 = 133MHz. 11 = Reserved.
21:20	Symmetric Arbitration ID (R)
25:22	Clock Frequency Ratio (R)
26	Low Power Mode Enable (R/W)
27	Clock Frequency Ratio
63:28	Reserved. ¹
Register Address: 33H, 51	MSR_TEST_CTRL

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
Test Control Register	
29:0	Reserved.
30	Streaming Buffer Disable
31	Disable LOCK# Assertion for split locked access.
Register Address: 79H, 121	BIOS_UPDT_TRIG
BIOS Update Trigger Register.	
Register Address: 88H, 136	BBL_CR_D0[63:0]
Chunk 0 data register D[63:0]: used to write to and read from the L2.	
Register Address: 89H, 137	BBL_CR_D1
Chunk 1 data register D[63:0]: used to write to and read from the L2.	
Register Address: 8AH, 138	BBL_CR_D2
Chunk 2 data register D[63:0]: used to write to and read from the L2.	
Register Address: 8BH, 139	BIOS_SIGN/BBL_CR_D3
BIOS Update Signature Register or Chunk 3 data register D[63:0]. Used to write to and read from the L2 depending on the usage model.	
Register Address: C1H, 193	PerfCtr0 (PERFCTR0)
Performance Counter Register See Table 2-2.	
Register Address: C2H, 194	PerfCtr1 (PERFCTR1)
Performance Counter Register See Table 2-2.	
Register Address: FEH, 254	MTRRcap
Memory Type Range Registers	
Register Address: 116H, 278	BBL_CR_ADDR
Address register: used to send specified address (A31-A3) to L2 during cache initialization accesses.	
2:0	Reserved; set to 0.
31:3	Address bits [35:3].
63:32	Reserved.
Register Address: 118H, 280	BBL_CR_DECC
Data ECC register D[7:0]: used to write ECC and read ECC to/from L2.	
Register Address: 119H, 281	BBL_CR_CTL
Control register: used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response.	

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
4:0	L2 Command: 01100 = Data Read w/ LRU update (RLU). 01110 = Tag Read w/ Data Read (TRR). 01111 = Tag Inquire (TI). 00010 = L2 Control Register Read (CR). 00011 = L2 Control Register Write (CW). 010 + MESI encode = Tag Write w/ Data Read (TWR). 111 + MESI encode = Tag Write w/ Data Write (TWW). 100 + MESI encode = Tag Write (TW).
6:5	
7	State to L2
9:8	Reserved.
11:10	Way 0 - 00, Way 1 - 01, Way 2 - 10, Way 3 - 11 Way to L2
13:12	Modified - 11, Exclusive - 10, Shared - 01, Invalid - 00 Way from L2
15:14	State from L2.
16	Reserved.
17	L2 Hit.
18	Reserved.
20:19	User supplied ECC.
21	Processor number: ² Disable = 1. Enable = 0. Reserved.
63:22	Reserved.
Register Address: 11AH, 282	BBL_CR_TRIG
Trigger register: used to initiate a cache configuration accesses access, Write only with Data = 0.	
Register Address: 11BH, 283	BBL_CR_BUSY
Busy register: indicates when a cache configuration accesses L2 command is in progress. D[0] = 1 = BUSY.	
Register Address: 11EH, 286	BBL_CR_CTL3
Control register 3: used to configure the L2 Cache.	
0	L2 Configured (read/write).
4:1	L2 Cache Latency (read/write).
5	ECC Check Enable (read/write).
6	Address Parity Check Enable (read/write).
7	CRTN Parity Check Enable (read/write).
8	L2 Enabled (read/write).

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
10:9	L2 Associativity (read only): 00 = Direct Mapped. 01 = 2 Way. 10 = 4 Way. 11 = Reserved.
12:11	Number of L2 banks (read only).
17:13	Cache size per bank (read/write): 00001 = 256 KBytes. 00010 = 512 KBytes. 00100 = 1 MByte. 01000 = 2 MBytes. 10000 = 4 MBytes.
18	Cache State error checking enable (read/write).
19	Reserved.
22:20	L2 Physical Address Range support: 111 = 64 GBytes. 110 = 32 GBytes. 101 = 16 GBytes. 100 = 8 GBytes. 011 = 4 GBytes. 010 = 2 GBytes. 001 = 1 GByte. 000 = 512 MBytes.
23	L2 Hardware Disable (read only).
24	Reserved.
25	Cache bus fraction (read only).
63:26	Reserved.
Register Address: 174H, 372	SYSENTER_CS_MSR
CS register target for CPL 0 code	
Register Address: 175H, 373	SYSENTER_ESP_MSR
Stack pointer for CPL 0 stack	
Register Address: 176H, 374	SYSENTER_EIP_MSR
CPL 0 code entry point	
Register Address: 179H, 377	MCG_CAP
Machine Check Global Control Register	
Register Address: 17AH, 378	MCG_STATUS
Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCI_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.	
Register Address: 17BH, 379	MCG_CTL
Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).	
Register Address: 186H, 390	PerfEvtSel0 (EVNTSEL0)

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
Performance Event Select Register 0 (R/W)	
7:0	Event Select Refer to Performance Counter section for a list of event encodings.
15:8	UMASK (Unit Mask) Unit mask register set to 0 to enable all count options.
16	USER Controls the counting of events at Privilege levels of 1, 2, and 3.
17	OS Controls the counting of events at Privilege level of 0.
18	E Occurrence/Duration Mode Select: 1 = Occurrence. 0 = Duration.
19	PC Enabled the signaling of performance counter overflow via BPO pin.
20	INT Enables the signaling of counter overflow via input to APIC: 1 = Enable. 0 = Disable.
22	ENABLE Enables the counting of performance events in both counters: 1 = Enable. 0 = Disable.
23	INV Inverts the result of the CMASK condition: 1 = Inverted. 0 = Non-Inverted.
31:24	CMASK (Counter Mask)
Register Address: 187H, 391	PerfEvtSel1 (EVNTSEL1)
Performance Event Select for Counter 1 (R/W)	
7:0	Event Select Refer to Performance Counter section for a list of event encodings.
15:8	UMASK (Unit Mask) Unit mask register set to 0 to enable all count options.
16	USER Controls the counting of events at Privilege levels of 1, 2, and 3.
17	OS Controls the counting of events at Privilege level of 0.

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
18	E Occurrence/Duration Mode Select: 1 = Occurrence. 0 = Duration.
19	PC Enabled the signaling of performance counter overflow via BP0 pin.
20	INT Enables the signaling of counter overflow via input to APIC. 1 = Enable. 0 = Disable.
23	INV Inverts the result of the CMASK condition. 1 = Inverted. 0 = Non-Inverted.
31:24	CMASK (Counter Mask)
Register Address: 1D9H, 473	DEBUGCTLMR
Enables last branch, interrupt, and exception recording; taken branch breakpoints; the breakpoint reporting pins; and trace messages. This register can be written to using the WRMSR instruction, when operating at privilege level 0 or when in real-address mode.	
0	Enable/Disable Last Branch Records
1	Branch Trap Flag
2	Performance Monitoring/Break Point Pins
3	Performance Monitoring/Break Point Pins
4	Performance Monitoring/Break Point Pins
5	Performance Monitoring/Break Point Pins
6	Enable/Disable Execution Trace Messages
31:7	Reserved.
Register Address: 1DBH, 475	LASTBRANCHFROMIP
32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.	
Register Address: 1DCH, 476	LASTBRANCHTOIP
32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.	
Register Address: 1DDH, 477	LASTINTFROMIP
Last INT from IP	
Register Address: 1DEH, 478	LASTINTTOIP
Last INT to IP	
Register Address: 200H, 512	MTRRphysBase0
Memory Type Range Registers	
Register Address: 201H, 513	MTRRphysMask0
Memory Type Range Registers

Register Address: 2FFH, 767	MTRRdefType
Memory Type Range Registers	
2:0	Default memory type
10	Fixed MTRR enable
11	MTRR Enable
Register Address: 400H, 1024	MCO_CTL
Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).	
Register Address: 401H, 1025	MCO_STATUS
Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCI_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception.	
15:0	MC_STATUS_MCACOD
31:16	MC_STATUS_MSCOD
57	MC_STATUS_DAM
58	MC_STATUS_ADDRV
59	MC_STATUS_MISCV
60	MC_STATUS_EN. (Note: For MCO_STATUS only, this bit is hardcoded to 1.)
61	MC_STATUS_UC
62	MC_STATUS_O
63	MC_STATUS_V
Register Address: 402H, 1026	MCO_ADDR
Register Address: 403H, 1027	MCO_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
Register Address: 404H, 1028	MC1_CTL

Table 2-68. MSRs in the P6 Family Processors (Contd.)

Register Address: Hex, Decimal	Register Name
Register Information / Bit Fields	Bit Description
Register Address: 405H, 1029	MC1_STATUS
Bit definitions same as MC0_STATUS.	
Register Address: 406H, 1030	MC1_ADDR
Register Address: 407H, 1031	MC1_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
Register Address: 408H, 1032	MC2_CTL
Register Address: 409H, 1033	MC2_STATUS
Bit definitions same as MC0_STATUS.	
Register Address: 40AH, 1034	MC2_ADDR
Register Address: 40BH, 1035	MC2_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
Register Address: 40CH, 1036	MC4_CTL
Register Address: 40DH, 1037	MC4_STATUS
Bit definitions same as MC0_STATUS, except bits 0, 4, 57, and 61 are hardcoded to 1.	
Register Address: 40EH, 1038	MC4_ADDR
Defined in MCA architecture but not implemented in P6 Family processors.	
Register Address: 40FH, 1039	MC4_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
Register Address: 410H, 1040	MC3_CTL
Register Address: 411H, 1041	MC3_STATUS
Bit definitions same as MC0_STATUS.	
Register Address: 412H, 1042	MC3_ADDR
Register Address: 413H, 1043	MC3_MISC
Defined in MCA architecture but not implemented in the P6 family processors.	
NOTES 1. Bit 0 of this register has been redefined several times, and is no longer used in P6 family processors. 2. The processor number feature may be disabled by setting bit 21 of the BBL_CR_CTL MSR (model-specific register address 119h) to "1". Once set, bit 21 of the BBL_CR_CTL may not be cleared. This bit is write-once. The processor number feature will be disabled until the processor is reset. 3. The Pentium III processor will prevent FSB frequency overclocking with a new shutdown mechanism. If the FSB frequency selected is greater than the internal FSB frequency the processor will shutdown. If the FSB selected is less than the internal FSB frequency the BIOS may choose to use bit 11 to implement its own shutdown policy.	

2.23 MSRS IN PENTIUM PROCESSORS

The following MSRs are defined for the Pentium processors. The P5_MC_ADDR, P5_MC_TYPE, and TSC MSRs (named IA32_P5_MC_ADDR, IA32_P5_MC_TYPE, and IA32_TIME_STAMP_COUNTER in the Pentium 4 processor) are architectural; that is, code that accesses these registers will run on Pentium 4 and P6 family processors without generating exceptions (see Section 2.1, "Architectural MSRs"). The CESR, CTR0, and CTR1 MSRs are unique to Pentium processors; code that accesses these registers will generate exceptions on Pentium 4 and P6 family processors.

Table 2-69. MSRs in the Pentium Processor
